Behavior with organic hydroxy or mercapto compounds. With alcohols (or alkoxides). [ $\bar{C}$  in MeOH with MeOH/NaOMe gives (80% yield (11)) 1,2-diphenyl-1-methoxy-1,2-epoxyethane, h.p. 194–196° at 16 mm., accompanied by some *cis* + *trans* dibenzoylstilbene (see above).]

[ $\bar{C}$  in EtOH with EtOH/NaOEt gives similarly a prod., h.p. 188° at 12 mm., regarded (11) as 1,2-diphenyl-1-ethoxy-1,2-epoxypropane. — Note, however, that  $\bar{C}$  in EtOH/NaOEt or with alc. NaOH at 25° gives (5) cf. (1) benzoin (1:5210) and that under certain conditions an apparently intermediate benzoin diethylacetal  $C_6H_5CH(OH).C(OC_2H_5)_2.C_6H_5$ , m.p. 66–67°, can be isolated (5).]

With phenols (or alkali phenates). [ $\bar{C}$  with phenol + anhydrous  $K_2CO_3$  in acetone refluxed 5 hrs. (20) or  $\bar{C}$  with Na phenate (21) gives (59% yield (20)) desyl phenyl ether (the phenyl ether of benzoin), m.p. 85.5° (21), 85° (20); note that this prod. is isomeric with, but different from, *ms*-phenylbenzoin [Beil. VIII-211], whose m.p. is almost the same; note also that desyl phenyl ether on attempted distillation at ord. press. undergoes a fission into phenol and a cpd. regarded (21) as 2,2,4,4-tetraphenylcyclobutanedione-1,3, m.p. 244–245°.]

With mercaptans. [ $\bar{C}$  +  $\alpha$ -mercaptoacetic acid (thioglycolic acid) at 100° for 6 hrs. evolves  $HCl$  and yields (22) *S*-desylthioglycolic acid, m.p. 105° (corresp. oxime, m.p. 123°; corresp. semicarbazone, m.p. 178° (22)). —  $\bar{C}$  with  $\beta$ -mercapto propionic acid at 100° for 6 hrs. evolves  $HCl$  and yields (16)  $\beta$ -(desylthio)propionic acid, m.p. 108–109°.]

[ $\bar{C}$  with thiophenol in EtOH/NaOEt gives in good yield (16) desyl phenyl sulfide, m.p. 83–84° (16), 81° (23). —  $\bar{C}$  in MeOH with aq. sodium thiosalicylate gives (22) *S*-desylthiosalicylic acid, m.p. 189°.]

Behavior with carbonyl compounds. [For behavior of  $\bar{C}$  with cyclohexanone + sodium in di-*n*-butyl ether see (24).]

Behavior with organic acids (or their salts). [ $\bar{C}$  with anhydrous NaOAc in excess  $Ac_2O$  refluxed 1 hr. yields (11) mainly the  $\beta$ -stereoisomer, m.p. 153°, of 1,2-diacetoxy-1,2-diphenylethylene [Beil. VI-1026, VI<sub>1</sub>-(499)], accompanied by some of the more sol.  $\alpha$ -stereoisomer, m.p. 118°.]

[ $\bar{C}$  +  $K$  thiobenzoate in abs. alc. boiled 10 min. gives (100% yield (16)) desyl thiobenzoate, m.p. 110–112°.]

[ $\bar{C}$  in aq. alc. KCN does not directly eliminate  $KCl$  and give the corresp. desyl cyanide

(*ms*-cyanodesoxybenzoin) [Beil. X-755, X<sub>1</sub>-(360)] which might be expected although this compd., m p. 90-92° (25), 89-90° (26), is well known and preparable (yields 60% (25), 47% (26)) from benzyl cyanide + ethyl benzoate and otherwise. — Instead  $\bar{C}$  in aq. alc. KCN loses HCl and gives (27) (28) 1-cyano-1,2-diphenyl-1,2-epoxyethane ( $\alpha$ -cyano- $\alpha,\beta$ -diphenyl-ethylene oxide) which obviously can exist in two geometrically stereoisomeric forms: one has m p. 74° (27), 77-78° (28); the other has m.p. 52° (27); for much further detail especially with reference to further reactn prods of these epoxynitriles see (27) (28) ]

Behavior of  $\bar{C}$  with RMgBr reactants. (See also above under behavior of  $\bar{C}$  with hydrocarbons + AlCl<sub>3</sub>.)

[ $\bar{C}$  with C<sub>6</sub>H<sub>5</sub>MgBr (2 moles) gives (29) (21) the prod. normally to be expected, viz., 1,1,2,2-tetraphenylethanol-1 [Beil. VI-732, VI<sub>1</sub>-(364)], m p. 236° (21) (30), 230.5° (29); the intermediate ketone, viz., *ms*-phenyldesoxybenzoin (for consts. see above reference) may sometimes (21) be formed, but for discussion of possible alternative mechanisms see (21) (29) ]

$\bar{C}$  with the three tolyl MgBr reactants has been studied, but the reaction is complex and shows no tendency to go way through to the expected tetraarylethanol (only one of which has been reported by any means). — [ $\bar{C}$  with *o*-tolyl MgBr (2 moles) gives (29) a mixt. of prods., including the expected intermediate ketone, viz., *ms*-(*o*-tolyl)desoxybenzoin, m p. 56-57° (32); note, however, that the 1,2-diphenyl-1,2-di-(*o*-tolyl)ethanol-1 which should be the end prod. is unknown. —  $\bar{C}$  with *m*-tolyl MgBr gives (29) similarly a mixt. of prods. including the intermediate ketone, viz., *ms*-(*m*-tolyl)desoxybenzoin, m.p. 83-84° (32), 82.5-83.5° (29), 82-83° (33), but again the ultimate 1,2-diphenyl-1,2-di-(*m*-tolyl)-ethanol-1 is unknown. —  $\bar{C}$  with *p*-tolyl MgBr (2 moles) gives (31) the ketone *ms*-(*p*-tolyl)desoxybenzoin, m.p. 97-98° (17), 96-97° (31); the ultimate 1,1-diphenyl-1,2-di-(*p*-tolyl)ethanol-1, m.p. 195-196°, has been obtd. by other means (29) ]

Behavior of  $\bar{C}$  with amines. With primary amines [ $\bar{C}$  (1 mole) with aniline (2 moles) in alc. at room temp. for 24 hrs gives (6) *N*-(desyl)aniline (benzoin anil = *ms*-anilindesoxybenzoin) [Beil. XIV-103, XIV<sub>1</sub>-(395)], m p. 99°; note that  $\bar{C}$  with aniline at 140-150° for 1 hr. (34) ppt. aniline hydrochloride and leaves a mixt. contg. benzoin-anil = anilide (cf. (35)) since with benzaldehyde at 150-160° for 1 hr. under CO<sub>2</sub> it yields pentaphenyldihydroimidazole (34) —  $\bar{C}$  with *p*-toluidine in alc. at room temp. for 24 hrs gives (3) similarly *N*-(desyl)-*p*-toluidine (*ms*-(*p*-toluidine)desoxybenzoin), m.p. 145° ]

[For corresp. reactns. of  $\bar{C}$  with *m*-chloroaniline, *p*-chloroaniline, *m*-bromoaniline, *p*-iodoaniline, *p*-aminophenol, *p*-phenetidine, *p*-aminoacetanilide, or ethyl *p*-aminobenzoate see (3), for study of rate of this group of reactns. see (4); note that *o*-toluidine, *o*-chloroaniline, and *o*-anisidine do not undergo this reactn. (3).]

With secondary amines. [ $\bar{C}$  with Me<sub>2</sub>NH (2-3 moles) in alc. in s.t. at 100-110° gives (36) *ms*-(dimethylamino)desoxybenzoin, m.p. 59-61° (36).]

[ $\bar{C}$  (1 mole) with *N*-methylaniline (2 moles) in alc. refluxed 2½ hrs. gives (47% yield (3)) *ms*-(*N*-methyl-*N*-phenylamino)desoxybenzoin, m.p. 100°; if reactants in alc. are stood at room temp. for 100 days, yield is 61% (3).]

[ $\bar{C}$  with piperidine at 100° for 20 min. gives (8) *ms*-(piperidino)desoxybenzoin [Beil. XXI-(14)], m p. 85-86° (3).]

With phenylhydrazine  $\bar{C}$  (1 mole) with phenylhydrazine (2 moles) in abs. alc. at room temp. for 3 days ppt. phenylhydrazine hydrochloride and yields (37) benzil bis-(phenylhydrazone) = benzil-phenyllosazone, m.p. 233° dec. (37) [cf. under benzil (1:9015)]

⑦ *N*-Desylphthalimide [Beil. XXI-480, XXI<sub>1</sub>-(374)]: pale yel. cryst. from AcOH. m p. 157-158° (38), 155-156° (39). [From  $\bar{C}$  with K phthalimide at 100° for 2 hrs. (24% yield (39)); note that  $\bar{C}$  + potassium phthalimide in nitrobenzene at 150-160°

for 1½ hrs. gives a mixt. of *N*-desylphthalimide with the lower-melting stereoisomer of dibenzoylstilbene (1,2-dibenzoyl-1,2-diphenylethylene) [Beil. VII-843, VII-(453)], m.p. 208° (39) (see also above).]

64-65°	(8)		
63°	(9)		

Colorless ndls. from alc. or lgr. — Volatile with steam. — Sublimes.

[For prepn. of  $\bar{C}$  from 1,2,4,5-tetrachlorobenzene (3:4115) with MeOH/NaOH in s.t. at 160° for 7 hrs. (yields: 85% (5), 80% (10)) (note that by this method  $\bar{C}$  is sometimes sole product (5), at others is accompanied (7) (10) by some of its methyl ether (2,4,5-trichloroanisole) (see below)) see indic. refs.; from 2,4,5-trichloroaniline via diazotization in conc. H<sub>2</sub>SO<sub>4</sub> as directed followed by htg. at 170-180° (65% yield (9)) see indic. refs.; from 2,4,5-trichloro-1-fluorobenzene with NaOMe see (6); from 3,5,6-trichloro-2-hydroxybenzoic acid by htg. with soda-lime at 185° see (3); from 2,4-dichloro-5-aminophenyl *o*-amino-*p*-toluenesulfonate via diazotization, use of Cu<sub>2</sub>Cl<sub>2</sub> reactn., and subsequent hydrolysis as directed see (4); from 2,5-dichlorophenol (3:1190) with Cl<sub>2</sub> in AcOH (9) or in AcOH + NaOAc (4) see indic. refs.]

$\bar{C}$  behaves as a weak monobasic acid (ioniz. const. at 25° =  $4.3 \times 10^{-8}$  (2)) but can be titrated with *N*/10 nq. NaOH; Neut. Eq. calcd. 197.5, found 197.1 (1). —  $\bar{C}$  forms a spar.

sol. K salt (4). —  $\bar{C}$  in toluene treated with MeOH/NaOH yields (11) anhydrous Na salt; from aq. this prod. cryst. as pentahydrate (12). — [For prepn. of Na, K, or Li salts see (12), of Ca or Ba salts see (13), of Zn salt see (14). — For use of these salts as fungicides see (11) (12) (13) (14) (15); for use of  $\bar{C}$  with triphenyl phosphate as wood preservative see (16).]

$\bar{C}$  with Br<sub>2</sub> in AcOH (9) or with excess Br<sub>2</sub>/aq (17) yields 6-bromo-2,4,5-trichlorophenol, cryst. from AcOH or lt. pet., m.p. 81–82° (17), 81° (9) (corresp. benzoate, m.p. 116–117° (9)). —  $\bar{C}$  with Br<sub>2</sub> in pres. of Fe powder yields (9) 3,6-dibromo-2,4,5-trichlorophenol, ndls. from AcOH, m.p. 195° (9) (corresp. benzoate, m.p. 176° (9)).

$\bar{C}$  treated below 10° with conc. HNO<sub>3</sub> (*D* = 1.43) in AcOH gives (90% yield (5)) 6-nitro-2,4,5-trichlorophenol, pale yel. lts. from lgr., m.p. 92–93° (5), 81° (9).

$\bar{C}$  dislvd. in 20% NaOH refluxed with Me<sub>2</sub>SO<sub>4</sub> gives (78.5% yield (5)) (9) corresp. methyl ether (2,4,5-trichloroanisole), ndls. from alc., m.p. 75° (5), 77.5° (9).

⑥ 2,4,5-Trichlorophenyl benzoate: ndls. from alc., m.p. 92–93° (9), 91–92° (4), 89–90° (3). [From  $\bar{C}$  in dil. alk. by shaking with benzoyl chloride (9).]

⑦ 2,4,5-Trichlorophenoxyacetic acid: m.p. 153° (see 3:4335).

### 3:1625 1,4,6-TRICHLORONAPHTHALENE

M.P. 69° (4)

68° (1)

65° (2) (3) (5) (7)

58° (1)

56° (2) (3) (7) (8) see text

Ndls. from alc.; spar. sol. boilg. alc. (2). — Volatile with steam. — Sublimes.

$\bar{C}$  shows the double m.p. phenomena also exhibited by several of its isomers; if the fused  $\bar{C}$  in a m.p. tube is allowed to cool and then withdrawn from the bath it soon solidifies to a translucent mass which upon immediate reimmersion melts at 58°, but if left for a short time in the air it becomes opaque and then shows m.p. 68°; the translucent form rarely persists more than 20 min. (1).

[For prepn. of  $\bar{C}$  from 5,8-dichloronaphthylamine-2 [Beil. XII-1310] via diazotization and use of Cu<sub>2</sub>Cl<sub>2</sub> reactn. see (4); for prepn. of  $\bar{C}$  from 1,6-dichloro-4-nitronaphthalene [Beil. V-556] (5) (2), from 4,6-dichloronaphthalenesulfonyl chloride-1 [Beil. XI-162] (6), from 4,7-dichloronaphthalenesulfonyl chloride-1 [Beil. XI-163] (7), from 1,4-dichloronaphthalenesulfonyl chloride-7 [Beil. XI-183] (8) (6), from 1-chloro-4-nitronaphthalene-

$\bar{C}$  is readily nitrated; e.g.,  $\bar{C}$  (16 g.) dislvd. in a soln. of  $\text{NaNO}_3$  (12 g.) in aq. (180 ml.), treated during 1 hr. at 90–100° by grad. addn. of dil.  $\text{H}_2\text{SO}_4$  (1:5; 48 ml.), htd. 2 hrs. then steam-distd., gave (3) in distillate 3,5-dichloro-2-nitrophenol (5 g.), lemon-yel. ndls. from pet. ether m.p. 51°, and by repeated hot dil.  $\text{HCl}$  extraction of tarry residue 3,5-dichloro-4-nitrophenol (6 g.) pale yel. ndls. from aq., m.p. 150° (3). [This latter product also results from the action of nitrous acid (3).]

$\bar{C}$  dislvd. in 4 pts.  $\text{AcOH}$  and treated with 3 pts. fuming  $\text{HNO}_3$  for  $\frac{3}{4}$  hr. at 70° (2) gives (60% yield (2)) of 3,5-dichloro-2,4,6-trinitrophenol, pale yel. pr. from  $\text{AcOH}$ , m.p. 139–140° cor. (2).

$\bar{C}$  dislvd. in 5 pts.  $\text{AcOH}$  gives with  $\text{Br}_2$  (as specified (4)) 100% yield of 3,5-dichloro-2,4,6-tribromophenol, cryst. from  $\text{AcOH}$ , m.p. 183° (4).

$\bar{C}$  dislvd. in aq.  $\text{NaOH}$  and shaken with  $(\text{CH}_3)_2\text{SO}_4$  gives the methyl ether, 3,5-dichloro-anisole, m.p. 39° (6). [The value of 65° given in Ref. 6, p. 104, is probably erroneous.]

Ⓔ 3,5-Dichlorophenyl acetate: m.p. 38° (5).

Ⓕ 3,5-Dichlorophenyl benzoate: m.p. 55° (5).

Colorless cryst. from lgr. — Ndl. with 1 mole solvate from  $\text{AcOH}$ , latter lost over  $\text{CaO}$  (17).

$\bar{C}$  is almost insol. aq.: 1000 g. aq. at 11.2° dis. 0.51 g.  $\bar{C}$  (14); at 25.4°, 0.858 g.  $\bar{C}$  (14); at 96°, 2.43 g.  $\bar{C}$  (14). —  $\bar{C}$  is volatile with steam, but not from alk. soln. (difference and sepn. from o-chlorophenol (3:5980) or p-chlorophenol (3:0475) (18)). —  $\bar{C}$  is eas. sol. alc. or ether.

Binary systems contg.  $\bar{C}$ . —  $\bar{C}$  + nitrobenzene: this system forms a 1:1 molecular compound, m.p. 31°; this compd. forms with  $\bar{C}$  a eutectic, m.p. 28.7° contg. 65 wt. %  $\bar{C}$ , and with nitrobenzene a eutectic, m.p. + 2.0° contg. 15.5 wt. %  $\bar{C}$ ; for data and f.p./compn. diagram see (13). —  $\bar{C}$  + diphenylamine: for partial f.p./compn. data and diag. see (19). —  $\bar{C}$  + 2,4,6-tribromophenol: for f.p./compn. data and diag. see (20). —  $\bar{C}$  +  $\alpha,\alpha,\alpha,\alpha'$ -tetramethylphthalan: for study of this system see (15). —  $\bar{C}$  + 2,4,6-trinitroresorcinol (styphnic acid): forms no mol. cpd. but gives a eutectic, m.p. 60° contg. 91.8%  $\bar{C}$  (21).

PREPARATION OF  $\bar{C}$ 

From phenol. *By direct action of chlorine.* [For prepn. of  $\bar{C}$  from phenol (1:1420) with  $Cl_2$  see (3) (for very old initial work cf. (22) (12)); with  $Cl_2$  + aq. alk. (i.e., with  $NaOCl$ ) see (23) (16) (24)]

*By indirect action of chlorine.* [For prepn. of  $\bar{C}$  from phenol (1:1420) by chlorination with ethyl *N,N*-dichlorocarbamate (25), with *N,N'*-dichlorourea (26), with conc.  $HCl$  + 30%  $H_2O_2$  (27), or with  $HCl$  +  $KClO_3$  (28) (29) see indic. refs.]

From other phenols or their relatives. [For formn. of  $\bar{C}$  from 2,4,6-trichloro-3-hydroxybenzaldehyde (6) by elimination of the aldehyde group with 50% aq.  $KOH$  at 60-70° for 4 hrs. (89.9% yield) see (6); from 2,4,6-trichloro-3-bromophenol (see below) or from 2,4,6-trichloro-3,5-dibromophenol (see below) by replacement of  $Br$  by  $H$  through use of  $Zn$  +  $AcOH$  see (9); from 2,4,6-tribromophenol [Beil. VI-203, VI-1(107)] by replacement of all bromine by chlorine using  $Cl_2$  in  $AcOH$  see (30).]

[For formn. of  $\bar{C}$  from phenol-*p*-sulfonic acid [Beil. XI-241, XI-1(55)] (10) or its alkali salts (31) (32) in aq. soln. with  $Cl_2$  (100% yield (10)) see indic. refs.; from aq. *p*-hydroxyazobenzene [Beil. XVI-96, XVI-1(233)] (75% yield (11)), from benzyl phenyl ether [Beil. VI-432, VI-1(220)] (33), from *o*-hydroxybenzyl alcohol (saligenin) (1:1490) (34) with  $Cl_2$  see indic. refs.; from dipotassium salt of salicylic acid (1:6780) with aq.  $KOCl$  (4 moles) see (8).]

From other miscellaneous sources. [For formn. of  $\bar{C}$  from aniline in  $HCl$  soln. with  $Cl_2$  see (35); from 2,4,6-trichloroaniline via diazotization and subsequent hydrolysis as directed see (7); from indigo [Beil. XXIV-417, XXIV-1(370)] in aq. suspension with  $Cl_2$  see (36) (37); from benzene (1:7400) with  $Cl_2O$  see (38); from 2,4,6-trichlorophenyl hypochlorite (see below) by warming with acids or alkalis see (75).]

USES OF  $\bar{C}$  (OR ITS SALTS)

Although the topic cannot here be exhaustively pursued, the bactericidal, fungicidal, and general antiseptic action of  $\bar{C}$  or its salts has attracted much attention [for examples of useful articles in this general connection, see (39) (40) (41) (42) (43) (44) (45) (46); for patents on use of  $\bar{C}$  or its salts in the indicated fields see the following: for use of  $\bar{C}$  (with triaryl phosphates) as wood preservative (47), as preservative for glue (48), as insecticide and fungicide for board-like compns. from vegetable fibers (49), as bactericide (50) (51), as  $Na\bar{A}$  for anti-mildew treatment of textiles (52), as textile asst. in mercerization (53); for various complexes contg.  $\bar{C}$  and intended for use as insecticides, etc., see (54) (55) (56)].

CHEMICAL BEHAVIOR OF  $\bar{C}$ 

Reduction of  $\bar{C}$ . [The catalytic hydrogenation of  $\bar{C}$  apparently has not been extensively studied, but it is said (57) to be more stable toward  $H_2$  +  $PdCl_2$  than the corresponding 2,4,6-tribromophenol.]

Oxidation of  $\bar{C}$ .  $\bar{C}$  on oxidn. gives various products according to circumstances [e.g.,  $\bar{C}$  in 2 *N*  $H_2SO_4$  on electrolytic oxidn. gives (58) 2,6-dichlorohydroquinone (3:4600);  $\bar{C}$  on oxidn. with  $CrO_3/AcOH$  (59) (60) (61) (62) (63), with cold fuming  $HNO_3$  (12) (63), with  $HNO_3/H_2SO_4$  (64), with  $NO$  +  $NO_2$  in alc. (65) (66) or  $AcOH$  (61), or with  $PbO_2$  in  $AcOH$  or  $C_4H_6$  (61) gives (yields: 69% (59), 45% (60), 27% (61)) 2,6-dichlorobenzoquinone-1,4 (3:3750) (note that this product may be accompanied (61) by more or less 2-chloro-6-(2',4',6'-trichlorophenoxy)benzoquinone-1,4, m.p. 131-135°, and 2,6-bis-(2',4',6'-trichlorophenoxy)benzoquinone-1,4, m.p. 245°, which resemble the main prod. in appearance, composition, and behavior (61))].

[ $\bar{C}$  on oxidn. with boilg. mixt. of conc.  $\text{HNO}_3 + \text{HCl}$  gives (16) 2,3,5-trichlorobenzoquinone-1,4 (3:4672).]

[ $\bar{C}$  on oxidn. with  $\text{ClSO}_3\text{H}$  (67), with  $\text{Cl}_2 + \text{fumg. H}_2\text{SO}_4$  followed by  $\text{ClSO}_3\text{H}$  (68), with aqua regia (69) (70) (72), with  $\text{HCl} + \text{KClO}_2$  (28) (16), with  $\text{CrO}_3/\text{AcOH}$  (71) or  $\text{K}_2\text{Cr}_2\text{O}_7/\text{H}_2\text{SO}_4$  (71) gives (90% yield (68)) 2,3,5,6-tetrachlorobenzoquinone-1,4 (chloranil) (3:4978).]

[For study of oxidn. potential of  $\bar{C}$  see (73).]

Nuclear substitution of  $\bar{C}$ . *Chlorination*. [ $\bar{C}$  in  $\text{HCl}$  suspension with  $\text{Cl}_2$  (74) or in  $\text{AcOH}$  soln. with  $\text{Ca}(\text{OCl})_2$  (75) gives 2,4,6-trichlorophenyl hypochlorite (2,4,4,6-tetrachlorocyclohexadien-2,5-one-1) [Beil. VII-147, VII<sub>1</sub>-(96)], scales from ether/pet. ether, m.p.  $122^\circ$  (75) (10),  $121$ – $122^\circ$  (76),  $119^\circ$  (74).]

[ $\bar{C}$  with  $\text{Cl}_2 + \text{ShCl}_3$  at not above  $130^\circ$  gives (77) 2,3,4,4,5,6-hexachlorocyclohexadien-2,5-one-1 ("hexachlorophenol") (3:3180), m.p.  $107^\circ$ .]

[ $\bar{C}$  with  $\text{Cl}_2$  (3) in pres. of  $\text{I}_2$  at  $40^\circ$  (78), or  $\bar{C}$  with  $\text{Cl}_2$  in  $\text{CCl}_4$  in pres. of  $\text{FeCl}_3$  (79), or  $\bar{C}$  with  $\text{Cl}_2$  in pres. of  $\text{ShCl}_3$ ,  $\text{I}_2$ , or  $\text{FeCl}_3$  at  $70$ – $75^\circ$  (80), gives 2,3,4,6-tetrachlorophenol (3:1687), m.p.  $69^\circ$ .]

[ $\bar{C}$  with  $\text{Cl}_2$  in pres. of  $\text{ShCl}_3$ ,  $\text{I}_2$ , or  $\text{FeCl}_3$  at  $135$ – $140^\circ$  gives (81) pentachlorophenol (3:4850), m.p.  $190^\circ$ .]

[ $\bar{C}$  with  $\text{FeCl}_3$  (no details) yields (14) 1,2,3,5-tetrachlorobenzene (3:0915), m.p.  $51^\circ$ .]

*Bromination*. [ $\bar{C}$  with  $\text{Br}_2/\text{aq. KBr}$  soln. as directed (82) (83) gives a monobromo derivative of  $\bar{C}$  frequently designated as "trichlorophenol bromide"; which of the three structures 4-bromo-2,4,6-trichlorocyclohexadien-2,5-one-1, 2-bromo-2,4,6-trichlorocyclohexadien-2,5-one-1, or 2,4,6-trichlorophenyl hypobromite should be assigned to this prod. has never been decisively settled (83); however, on oxidn. with fumg.  $\text{HNO}_3$  it gives (82) 2,6-dichlorobenzoquinone-1,4 (3:3750) and with conc.  $\text{H}_2\text{SO}_4$  at  $100^\circ$  isomerizes (82) to 3-bromo-2,4,6-trichlorophenol, m.p.  $73^\circ$  (9) (corresp. benzoate, m.p.  $117^\circ$  (82)).]

[ $\bar{C}$  with  $\text{Br}_2$  (large excess) +  $\text{Fe}$  powder at room temp. for 24 hrs. gives (100% yield (84)) cf. (85) 3,5-dibromo-2,4,6-trichlorophenol, cryst. from  $\text{AcOH}$ , m.p.  $204^\circ$  cor. (corresp. methyl ether, m.p.  $127^\circ$ ; corresp. benzoate, m.p.  $196^\circ$  (84)).]

*Nitration*. [The direct nitration of  $\bar{C}$  has not been reported, presumably because nitration reagents readily oxidize free  $\bar{C}$  to 2,6-dichlorobenzoquinone-1,4 (3:3750) (see above under oxidn. of  $\bar{C}$ ). — However, both possible nitration products have been obtained by indirect means: for 3-nitro-2,4,6-trichlorophenol, m.p.  $71$ – $72^\circ$ , see (86); for 3,5-dinitro-2,4,6-trichlorophenol, m.p.  $165$ – $167^\circ$ , see (87).]

*Sulfonation*. [ $\bar{C}$  with fumg.  $\text{H}_2\text{SO}_4$  (65%  $\text{SO}_3$ ) at  $50^\circ$  gives (93% yield (88)) 2,4,6-trichlorophenolsulfonic acid-3.]

*Miscellaneous*. [ $\bar{C}$  with  $\text{SCl}_2 + \text{AlCl}_3$  in  $\text{CS}_2$  or  $\text{CCl}_4$  gives (89) a product, m.p.  $285^\circ$ , which may be 3,3'-dihydroxy-2,4,6,2',4',6'-hexachlorodiphenyl sulfide.]

Reactions of the phenolic group of  $\bar{C}$ . (See also under  $\bar{O}$ 's below.)

*Acidic character of  $\bar{C}$* .  $\bar{C}$  in aq. behaves as an acid and can be titrated with  $N/10$  aq.  $\text{NaOH}$  (3); Neut. Eq. = 197.5. — [Data on dissoc. const. of  $\bar{C}$  include the following: in aq. at  $25^\circ$   $1.0 \times 10^{-7}$  (90),  $3.9 \times 10^{-7}$  (2) cf. (91) (92). — For study of acid strength of  $\bar{C}$  in formamide see (93). — For study of exchange reaction of  $\bar{C}$  with heavy water see (94).]

*Salts of  $\bar{C}$* . [ $\text{NH}_4\bar{A}$ : spar. sol. cold aq., eas. sol. hot aq. (22), somewhat spar. sol. alc. (24); loses  $\text{NH}_3$  in air (12). —  $\text{K}\bar{A}$ ,  $\frac{1}{2}\text{H}_2\text{O}$ : (24) (12). —  $\text{Na}\bar{A}$ : prepn. (95), behavior with  $\text{I}_2$  in various solvents (95) (96), behavior with chloroacetone (3:5425) giving acetonyl 2,4,6-trichlorophenyl ether, m.p.  $75^\circ$  (96).]

$\text{Mg}\bar{A} \cdot 2\text{H}_2\text{O}$ : eas. sol. aq. (12). —  $\text{Ba}\bar{A} \cdot 4\text{H}_2\text{O}$ : spar. sol. aq. (12). —  $\text{Pb}\bar{A}_2$  (12).

$\text{Ag}\bar{A} \cdot \text{H}_2\text{O}$ : yellow (97) [study of decompositions (98) (96) (99)].

*Etherification of  $\bar{C}$* . (See also below under  $\bar{O}$ 's.)

[ $\bar{C}$  with 1,2-dibromoethane (ethylene dibromide) in alk. soln. gives (100)  $\beta$ -bromoethyl 2,4,6-trichlorophenyl ether, m.p. 47–48°. —  $\bar{C}$  with ethylene oxide (1:6105) in alc. NaOEt gives (101)  $\beta$ -hydroxyethyl 2,4,6-trichlorophenyl ether, m.p. 77° (101) (for study of rate of this reaction see (102)) —  $\bar{C}$  (as Na $\bar{A}$ ) with benz-*o*-chlorophenylimino-chloride gives (103) *N*-(*o*-chlorophenyl)benzimidazole 2,4,6-trichlorophenyl ether, m.p. 99–100°, which at 250–270° for 2 hrs. rearr. (103) to the *N*-benzoyl derivative (m.p. 131–132°) of 2,4,6,2'-tetrachloro-diphenylamine. —  $\bar{C}$  with 2,4,6-trichlorobenzyl chloride + NaOH gives (104) 2,4,6-trichlorobenzyl 2,4,6-trichlorophenyl ether, m.p. 101–103°.]

*Esterification of  $\bar{C}$ .* (See also below under  $\bar{C}$ 's.)

[ $\bar{C}$  with  $\text{SOCl}_2$  in pyridine +  $\text{C}_6\text{H}_6$  gives (4) bis-(2,4,6-trichlorophenyl) sulfite, cryst. from  $\text{C}_6\text{H}_6$ , m.p. 87–88°; note, however, that this prod. is unstable and even within a few hours reverts to  $\bar{C}$ .]

[ $\bar{C}$  with  $\text{PCl}_5$  in  $\text{C}_6\text{H}_6$  gives (105) bis-(2,4,6-trichlorophenoxy)phosphoryl chloride,  $(\text{C}_6\text{H}_2\text{OCl}_3)_2\text{P}(\text{O})\text{Cl}$ , cryst. from  $\text{C}_6\text{H}_6$ , m.p. 126–129° (105). (Note that  $\bar{C}$  with  $\text{PCl}_5$  in s.t. at 200–300° gives also (106) some 1,2,3,5-tetrachlorobenzene (3:0915).) —  $\bar{C}$  (3 moles) with  $\text{POCl}_3$  (1 mole) refluxed several days gives (107) tris-(2,4,6-trichlorophenyl) phosphate, m.p. 201° (107).]

[ $\bar{C}$  (2 moles) with  $\text{COCl}_2$  (3:5000) in aq. alk. gives (108) bis-(2,4,6-trichlorophenyl) carbonate, m.p. 153–154° (109).]

① 2,4,6-Trichlorophenyl methyl ether (2,4,6-trichloroanisole) [Beil. VI-192]: cryst. from alc., m.p. 61–62° (9), 60° (110) (111), 59.5° (112); b.p. 240° cor. at 738 mm. (110) cf. (87). [From  $\bar{C}$  with  $\text{Me}_2\text{SO}_4$  + 15% KOH (87); for crystallographic data see (82); for attempted cleavage with pyridine or piperidine see (113); for nitration see (87).]

② 2,4,6-Trichlorophenyl ethyl ether (2,4,6-trichlorophenetole) [Beil. VI-102, VI-104]: m.p. 43–44° (12), b.p. 240° (12). [From  $\text{K}\bar{A}$  +  $\text{EtI}$  (12) or from  $\text{Ag}\bar{A}$  +  $\text{EtI}$  (98).]

— 2,4,6-Trichlorophenyl acetate: oil, b.p. 261–262° (114). [From  $\bar{C}$  with  $\text{AcCl}$  (114).]

③ 2,4,6-Trichlorophenyl benzoate [Beil. IX-117]. m.p. 75.5° (9), 74° (115), 73–74° (6), 70° (14). [From  $\bar{C}$  with benzoyl chloride (3:6240) in pres. of aq. NaOH (115) (9); for study of rate of benzylation of  $\bar{C}$  at 25° and 85° see (116).]

— 2,4,6-Trichlorophenyl *o*-nitrobenzoate: unreported.

— 2,4,6-Trichlorophenyl *m*-nitrobenzoate: unreported.

④ 2,4,6-Trichlorophenyl *p*-nitrobenzoate: m.p. 106° (115).

— 2,4,6-Trichlorophenyl 3,5-dinitrobenzoate: unreported.

⑤ 2,4,6-Trichlorophenyl benzenesulfonate: m.p. 66° (117). [From  $\bar{C}$  with benzenesulfonyl chloride in aq. alk. (117).]

⑥ 2,4,6-Trichlorophenyl *o*-nitrobenzenesulfonate: m.p. 142° (118). [From  $\bar{C}$  with *o*-nitrobenzenesulfonyl chloride +  $\text{K}_2\text{CO}_3$  in acetone (118).]

— 2,4,6-Trichlorophenyl *p*-toluenesulfonate: unreported.

— 2,4,6-Trichlorophenyl phenyl ether: unreported.

⑦ 2,4,6-Trichlorophenyl 2,4-dinitrophenyl ether: m.p. 136° (119). [From  $\bar{C}$  with 2,4-dinitrochlorobenzene in alc. alk. (119).]

— 2,4,6-Trichlorophenyl benzyl ether: unreported.

— 2,4,6-Trichlorophenyl *p*-nitrobenzyl ether: unreported.

⑧ 2,4,6-Trichlorophenyl acetic acid: m.p. 177° (120).

— 2,4,6-Trichlorophenyl *N*-phenylcarbamate: unreported.

⑨ 2,4,6-Trichlorophenyl *N*-(*p*-bromophenyl)carbamate: pl. from  $\text{C}_6\text{H}_6$  +  $\text{EtOAc}$ , m.p. 162–164° cor. (121). [From  $\bar{C}$  with *p*-bromobenzazide (121) in lgr. (121).]

⑩ 2,4,6-Trichlorophenyl *N*-(*p*-iodophenyl)carbamate: m.p. 172–173° (122). [From  $\bar{C}$  with *p*-iodobenzazide (122) in lgr. (122).]

- ① 2,4,6-Trichlorophenyl *N*-(*m*-nitrophenyl)carbamate: white rods from lgr., m.p. 165–167° u.c.; 169–170° cor. (123). [From  $\bar{C}$  with *m*-nitrobenzazide (123) in lgr. (123).]
- ② 2,4,6-Trichlorophenyl *N*-(*p*-nitrophenyl)carbamate: pale yel. rods from lgr., m.p. 166° cor. (124). [From  $\bar{C}$  with *p*-nitrobenzazide (124) in lgr. (124).]
- 2,4,6-Trichlorophenyl *N*-(3,5-dinitrophenyl)carbamate: unreported.
- ③ 2,4,6-Trichlorophenyl *N*-(3,5-dinitro-4-methylphenyl)carbamate: yel. pr. from lgr. or EtOAc, m.p. 195–196° u.c., 201–202° cor. (125). [From  $\bar{C}$  with 3,5-dinitro-4-methylbenzazide (125) in lgr. (125).]
- 2,4,6-Trichlorophenyl *N*-( $\alpha$ -naphthyl)carbamate: unreported.
- ④ 2,4,6-Trichlorophenyl *N*-( $\beta$ -naphthyl)carbamate: pr. from lgr., m.p. 157–158° u.c., 161–162° cor. (126). [From  $\bar{C}$  with  $\beta$ -naphthyl isocyanate (126) or  $\beta$ -naphthazide (126) in lgr. (126).]
- ⑤ 2,4,6-Trichlorophenyl *N,N*-diphenylcarbamate: m.p. 143° (127). [From  $\bar{C}$  with *N,N*-diphenylcarbamyl chloride (127).]

3:1676 DECACHLORODIETHYL  
ETHER  
(bis-(Pentachloroethyl) ether;  
"Perchloroether")

$\text{C}_4\text{OCl}_{10}$  Beil. II-210  
II<sub>1</sub>—  
II<sub>2</sub>—

M.P. 69° (1)

$D_{25}^{145} = 1.900$  (2)

[For crystallog. data see (3).]

[For prepn. of  $\bar{\text{C}}$  from nbs. diethyl ether (1:6116) with excess dry  $\text{Cl}_2$  in direct sunlight see (1).]

$\bar{\text{C}}$  on boilg. decomposes (2) into trichloroacetyl chloride (3:5420) and hexachloroethane (3:4835).

$\bar{\text{C}}$  with conc.  $\text{H}_2\text{SO}_4$  at 240° is slowly attacked yielding (2) trichloroacetyl chloride (3:5420).

$\bar{\text{C}}$  with alc.  $\text{K}_2\text{S}$  loses 2 atoms of chlorine yielding (2) di-(trichlorovinyl) ether (3:6373).

$\bar{\text{C}}$  with metallic potassium on htg. detonates; in this behavior  $\bar{\text{C}}$  behaves toward alkali metals like many other highly halogenated compounds.

Note that all these data on  $\bar{\text{C}}$  are very old; no later studies of  $\bar{\text{C}}$  are reported in the literature.

3:1676 (1) Regnault, *Ann.* 34, 27-29 (1840). (2) Malaguti, *Ann. chim.* (3) 16, 13-28 (1846). (3) Nickles, *Ann. chim.* (3) 22, 29 (1848).

3:1685 CHLOROPROPIONIC ACID  $\text{Cl.C}\equiv\text{C.COOH}$   $\text{C}_2\text{HO}_2\text{Cl}$  Beil. II-478  
II<sub>1</sub>—  
II<sub>2</sub>-(451)

M.P. 69-70° (1)

Colorless cryst. from pet. eth.; eas. sol. ether; eas. vol. (even in desiccator). Very irritating and poisonous; salts extremely toxic (1). — Stable in dry state at room temperature.

[For prepn. from propionic ac. [Beil. II-477] by actn. of  $\text{KOH/KOCl}$  soln. at 0° see (1) (2).]

$\bar{\text{C}}$  on htg. with  $\text{Ba}(\text{OH})_2$  soln. yields chloroacetylene (3:7000) +  $\text{BaCO}_3$  while acidification and ether extraction of the aq. layer yields malonic ac. (1:0480), m.p. 133-134° (1). [An alk. soln. of  $\bar{\text{C}}$  on stdg. is also partly converted to malonic ac. (1).]

157° at 19 mm. (4)

155° at 18 mm. (4)

152.5° at 17 mm. (4)

150° at 16 mm. (4)

Ndls. from lgr., AcOH, or ether. — Almost insol. cold aq.; spar. sol. hot aq.; but volatile with steam. — Eas. sol. alc.,  $C_6H_6$ ,  $CHCl_3$ ,  $CS_2$ , lgr.; fairly sol. hot pet. eth. — Odorless at ord. temp.

### PREPARATION OF $\bar{C}$

[For prepn. of  $\bar{C}$  from phenol (1:1420) with  $Cl_2$  at  $80^\circ$  for 14 days (7) or with  $Cl_2$  in pres. of 2-3%  $I_2$  or 4-5%  $SbCl_3$  or 5-6%  $FeCl_3$  for shorter periods (7), from sodium phenolate with  $SO_2Cl_2$  (13), or from 2,4,6-trichlorophenol (3:1673) with  $Cl_2$  (1) in pres. of  $I_2$  at  $40^\circ$  (8) or with  $Cl_2$  in  $CCl_4$  soln. in pres. of  $FeCl_3$  (14), see indic. refs.]

[For formn. of  $\bar{C}$  from 3,5,6-trichloro-2-hydroxybenzoic acid (3,5,6-trichlorosalicylic acid) (5) with  $Cl_2$  in 30% AcOH see (5); from 2,4,5,6-tetrachloro-3-hydroxybenzoic acid [Beil. X-144] (11) by htg. with lime see (11); from 2,4,5,6-tetrachloro-3-hydroxybenzaldehyde (6) with 50% aq. KOH at  $100^\circ$  for 2 hrs. (the CO group being eliminated as K formate) see (6); from  $\alpha$ -(2,4,5,6-tetrachloro-3-hydroxybenzoyl)benzoic acid (3) by cleavage with conc.  $H_2SO_4$  see (3)]

[For formn. of  $\bar{C}$  from 1,2,4,4,5,6,6-heptachlorocyclohexen-1-one-3 [Beil. VII-51] by reduction with  $SnCl_2/HCl/AcOH$  (4) or with  $KI/AcOH$  or  $Na_2SO_3/AcOH$  see (12); from "6-hydroxyphenylene diazosulfide" with  $Cl_2$  in AcOH followed by reduction with  $SnCl_2$  see (10).]

### USES OF $\bar{C}$ (OR ITS SALTS)

[For patents on use of  $\bar{C}$  (or its salts) as bactericide (15) (16) in preservation of rubber latex (17), as insecticide (18), or in triphenyl phosphate as wood preservative (19) see indic. refs.]

[For general articles on  $\bar{C}$  (or its salts) as bactericides (20), fungicides (21) (27) for paint (22) or leather (23) (24) (25) (26), or in preservation of brine samples for analysis (28) see indic. refs.]

### PHYSIOLOGICAL EFFECTS OF $\bar{C}$ (OR ITS SALTS)

[For studies on dermatitis from  $\bar{C}$  or its salts see (29) (30); for report on toxicity of  $\bar{C}$  in leather see (31).]

### CHEMICAL BEHAVIOR OF $\bar{C}$

Action of chlorine. [ $\bar{C}$  with  $Cl_2$  in AcOH gives (4) (12) 1,2,4,4,5,6,6-heptachlorocyclohexen-1-one-3 [Beil. VII-51].]

Action of bromine.  $\bar{C}$  with  $Br_2$  (1 mole) in pres. of Fe powder gives (8) 5-bromo-2,3,4,6-tetrachlorophenol [Beil. VI-1(106)], cryst. from AcOH, m.p.  $197^\circ$  (8) (32),  $192^\circ$  (33) (corresp. acetyl deriv., m.p.  $144^\circ$  (33); corresp. benzoyl deriv., m.p.  $169^\circ$  (33)).

Action of nitric acid. [ $\bar{C}$  with fuming  $HNO_3$  (5 wt. parts) is oxidized (70% yield (4)) (12) to 2,3,5-trichlorobenzoquinone-1,4 (3:4672). — Note, however, that the mononitro deriv. of  $\bar{C}$ , viz., 5-nitro-2,3,4,6-tetrachlorophenol, ndls. from  $C_6H_6$ , m.p.  $122^\circ$ , has been ohtd. (8) by HBr cleavage of the corresp. methyl ether (see below).]

Behavior of  $\bar{C}$  as an acid.  $\bar{C}$  in aq. behaves as an acid,  $K$  at  $25^\circ = 4.2 \times 10^{-6}$  (2) cf. (34), and can be titrated with  $N/10$  aq. NaOH (1); Neut. Eq. = 232. — [For prepn. of alk. salts of  $\bar{C}$  by neutralization in mixtures of org. solvents see (35); for uses of salts of  $\bar{C}$  see above.]

Miscellaneous reactions of  $\bar{C}$ . [ $\bar{C}$  (as  $K\bar{A}$ ) in conc. aq. soln with  $COCl_2$  (3:5000) in toluene gives (36) bis-(2,3,4,6-tetrachlorophenyl) carbonate, m.p.  $155-156^\circ$  (36).]

- ① 2,3,4,6-Tetrachlorophenyl methyl ether (2,3,4,6-tetrachloroanisole): ndls. from MeOH, m.p. 64-65° (4), 60° (8), b.p. 266-270° u.c. at 244 mm. (8). [From  $\bar{C}$  with MeI in MeOH/NaOMe soln. (4) cf. (8). — Note that this prod. on nitration with 7-8 wt. pts. fuming  $HNO_3$  gives 5-nitro-2,3,4,6-tetrachloroanisole, m.p. 58° (8).]
- ② 2,3,4,6-Tetrachlorophenyl ethyl ether (2,3,4,6-tetrachlorophenetole): ndls. from alc., m.p. 59-60° (4), 55° (6). [From  $\bar{C}$  with EtI in EtOH/NaOEt soln. (4); also indirectly (6).]
- ③ 2,3,4,6-Tetrachlorophenyl acetate: cryst. from alc., m.p. 66° (5), 65-66° (4), 59° (12). [From  $\bar{C}$  with  $Ac_2O$  (4) or with AcCl (12).]
- ④ 2,3,4,6-Tetrachlorophenyl benzoate: cryst. from alc., m.p. 116° (10) (13) (3), 115° (4), 114.5° (12), 113-115° (11). [From  $\bar{C}$  as NaA with BzCl (4). — Note that this prod. depresses m.p. (110°) of the corresp. benzoate from 2,3,4,5-tetrachlorophenol (3:3523) (9).]
- ⑤ 2,3,4,6-Tetrachlorophenyl *N*-phenylcarbamate: ndls. from alc., m.p. 141-142° (4). [From  $\bar{C}$  with phenyl isocyanate in  $C_6H_6$  24 hrs. at room temp. (4).]

## 3:1090 2,6-DICHLOROBENZALDEHYDE

 $C_7H_4OCl_2$ Beil. VII - 237  
VII<sub>1</sub>-(134)

M.P. 71° (1)  
70-71° (2)  
70° (3)  
69-70° (4) (5)

Colorless cryst. from pet. ether (b.p. 40–60°) or lgr.

[For prepn. of  $\bar{C}$  from 2,6-dichlorotoluene (3:6270) by oxidn. with  $MnO_2 + H_2SO_4$  see (2); for prepn. of  $\bar{C}$  from 2,6-dichlorobenzaldehyde diethylacetal (see below) by hydrolysis on shaking with dil. HCl see (6)]

[ $\bar{C}$  on reduction would presumably yield 2,6-dichlorobenzyl alc., but this prod. is unreported in the literature.]

$\bar{C}$  in alk. suspension on oxidn. with air gives (7) 2,6-dichlorobenzoic acid (3:4200), m.p. 144°.

[ $\bar{C}$  (fused) with  $Cl_2$  in brilliant artificial light gives (58% yield (8)) 2,6-dichlorobenzoyl chloride, b.p. 126–128° at 18 mm. —  $\bar{C}$  with  $PCl_5$  at 160° gives (90% yield (9)) (4) (5) 2,6-dichlorobenzal (di)chloride (3:9398) oil, b.p. 124–126° at 16 mm. (9), accompanied in some preparations (4) (5) by some bis-( $\alpha$ ,2,6-trichlorobenzyl) ether, m.p. 180–185° (4) (5).]

[ $\bar{C}$  with alkali sulfite (1 mole) under press. reacts at one of the two halogen atoms giving (2) 6-chlorobenzaldehydesulfonic acid-2 [Beil. XI-324] —  $\bar{C}$  with alkali sulfite (2 moles) under press. gives (2) benzaldehyde disulfonic acid-2,6 [Beil. XI-326]]

$\bar{C}$  dissolvd. in 7–8 wt. pts. conc.  $H_2SO_4$ , and at 10–15° mononitrated with a mixt. of fuming  $HNO_3 +$  conc.  $H_2SO_4$  poured into aq. gives (yield not stated (10)) (2) 2,6-dichloro-3-nitrobenzaldehyde [Beil. VII-263], pl. from  $CS_2$  (10) or lfts. from  $C_6H_6$  (2), m.p. 76° (10), 76–77° (2) (corresp.  $\alpha$ -oxime, m.p. 156–157° (10),  $\beta$ -oxime, m.p. 154–155° (10); note that a mixt. of the two oximes melts 128–130° (10)) — [Note that no dinitro-2,6-dichlorobenzaldehyde has been reported; also that the m.p.'s of certain of the isomeric mononitrodichlorobenzaldehydes are very close to the above mononitration prod.: e.g., 2,4-dichloro-6-nitrobenzaldehyde (from 2,4-dichlorobenzaldehyde 3:1800) has m.p. 74–75°; 2,5-dichloro-3-nitrobenzaldehyde (from 2,5-dichlorobenzaldehyde 3:1145) has m.p. 66.5–67°; 3,4-dichloro-6-nitrobenzaldehyde (from 3,4-dichlorobenzaldehyde 3:0350) has m.p. 73°.]

[ $\bar{C}$  on sulfonation gives (2) 2,6-dichlorobenzaldehydesulfonic acid-3 [Beil. XI-325].]

[ $\bar{C}$  with 50% KOH at 100° for 5 hrs. under  $N_2$  undergoes cleavage of the aldehyde group giving (84% yield (11)) *m*-dichlorobenzene (3.5960) q.v. and the corresp. K formate.]

[ $\bar{C}$  with aq. alc. hydrazine sulfate gives (86% yield (18)) 2,6-dichlorobenzaldazine, m.p. 153° cor.; but this prod. or  $\bar{C}$  with hydrazine hydrate refluxed 5 hrs. gives 2,6-dichlorobenzaldehyde hydrazone, m.p. 134°, which by Wolff-Kishner reduction gives (80% yield (18)) 2,6-dichlorotoluene (3:6270).]

[ $\bar{C}$  with EtOH contg. 1½ wt. % dry HCl refluxed 24 hrs. gives (13.6% yield (6)) 2,6-dichlorobenzaldehyde diethylacetal, oil, b.p. 142–144° at 10 mm., m.p. –1° (6); this prod. with dil. HCl readily hydrolyzes back to  $\bar{C} +$  EtOH.]

[ $\bar{C}$  with  $\beta$ -naphthol (2 moles) in AcOH with 30% HBr in AcOH at 100° for 2 hrs. or at room temp. for 24 hrs. condenses and ring-closes giving (88% yield (8)) 9-(2,6-dichlorophenyl)-1,2,7,8-dibenzoxanthene ( $C_{27}H_{16}OCl_2$ ), cryst. from lgr., m.p. 264–265° (8). — Note that  $\bar{C}$  with  $\beta$ -thionaphthol (2 moles) under similar conditions yields a prod.  $C_{27}H_{16}S_2Cl_2$ , of unknown structure.]

$\bar{C}$  with anhydrous NaOAc +  $Ac_2O$  in Perkin synthesis (12) (13) (1), or  $\bar{C}$  with malonic acid in AcOH (13) gives (yields: 81–83% (12), 80% (1), 18% (13)) 2,6-dichlorocinnamic acid [Beil. IX-1-(239)], cryst. from AcOH, m.p. 196° (12), 193° (13), 183° (1); note that in this reaction some 2,6-dichlorobenzal diacetate [Beil. VII-1-(134)], ndla. from lgr., m.p. 85° (1), is sometimes formed.

$\bar{C}$  appears to behave normally with  $RMgX$  reactants [e.g.,  $\bar{C}$  with  $MeMgI$  in dry ether followed by usual hydrolysis gives (68.6% yield (14)) 2,6-dichlorophenyl-methyl-carbinol,

m.p. 34-35°, h.p. 137-138° at 17 mm., 134-136° at 13 mm. (corresp. benzoate, m.p. 77°);  $\bar{C}$  with  $C_6H_5MgBr$  similarly gives in good yield (1) 2,6-dichlorophenyl-phenyl-carbinol, m.p. 57° (corresp. acetate, m.p. 105°). [For conversion of  $\bar{C}$  to 2,6-dichlorostyrene (16) (17) via formn. of 2,6-dichlorophenyl-methyl-carbinol (above) and dehydration of latter with  $KHSO_4$  (31.5% yield (16)) see indic. refs.]

$\bar{C}$  with aniline readily condenses yielding (1) 2,6-dichlorobenzaldehyde anil, m.p. 64-65°.

② 2,6-Dichlorobenzaldoxime: colorless ndls. from  $C_6H_6$  (10) or lgr. (1), m.p. 149-150° (10), 146-147° (1). [From  $\bar{C}$  with  $NH_2OH.HCl + Na_2CO_3$  in dil. alc. at 100° for 5 hrs. (10) cf. (1); with cold  $Ac_2O$  this prod. gives an acetyl deriv., m.p. 51° (10); with boilg.  $Ac_2O$  for 5 min. the oxime loses  $H_2O$  giving (1) 2,6-dichlorobenzonitrile [Beil. IX-343, IX<sub>1</sub>-(141)], ndls. from lgr. or by sublimation, m.p. 143° (1), 144.5-146.5° (15).]

— 2,6-Dichlorobenzaldehyde phenylhydrazone: unreported.

— 2,6-Dichlorobenzaldehyde o-nitrophenylhydrazone: m.p. 154° (1).

— 2,6-Dichlorobenzaldehyde p-nitrophenylhydrazone: unreported.

— 2,6-Dichlorobenzaldehyde 2,4-dinitrophenylhydrazone: unreported.

— 2,6-Dichlorobenzaldehyde p-bromophenylhydrazone: m.p. 142° (1).

— 2,6-Dichlorobenzaldehyde semicarbazone: unreported.

70° (4) (11) (20) (27)

68-69° (5)

68° (8)

Ndls. from hot aq., ndls. from lgr., pr. from  $CHCl_3$ ; eas. sol. alc.,  $AcOH$ ,  $C_6H_6$ ,  $CHCl_3$ , hoilg. lgr. — For crystallographic constants see (4). — Volatile with steam.

[For prepn. of  $\bar{C}$  from  $\beta$ -naphthol (1:1540) with  $Cl_2$  in  $AcOH$  (80% yield (21)) (3) (4) (6), with  $SO_2Cl_2$  in  $CS_2$  (7) or with  $C_6H_5ICl_2$  (84% yield (2)) see indic. refs.; from sodium  $\beta$ -naphtholate in  $CS_2$  suspension on treatment with  $Cl_2$  (8) or in cold aq. with  $NaOCl$  (84% yield (5)) (9) see indic. refs.; for formn. of  $\bar{C}$  from  $\beta$ -naphthol (1:1540) as hy-prod. of its

oxidn. with  $\text{FeCl}_3$  to  $\beta$ -dinaphthol (2,2'-dihydroxybinaphthyl-1,1') see (10) (11) (the proportion of  $\bar{C}$  increases with increasing acidity (11)); for formn. of  $\bar{C}$  from  $\beta$ -naphthol as by-prod. of react. with  $\text{SeOCl}_2$  see (20) ]

$\bar{C}$  with 1 mole  $\text{Cl}_2$  in  $\text{AcOH}$  soln. gives (12) 1,6-dichloronaphthol-2 (3:3600), m.p. 119.5° (12);  $\bar{C}$  with 1 mole  $\text{Br}_2$  yields (7) (13) 6-bromo-2-chloronaphthol-2 [Beil. VI-651], ndls. from  $\text{AcOH}$  with 1 mole solvent, r.o.p. 92°, anhydrous ndls. by sublimation, m.p. 101° (7). [Note, however, that  $\bar{C}$  in  $\text{AcOH} + \text{NaOAc}$  with 1 mole  $\text{Br}_2$  yields (1) "1-bromo-1-chloro-2-oxonaphthalenedihydride-1,2," pale yel. pr. from lgr., m.p. 90° when pure but on short stdg. soon becoming lower ]

[ $\bar{C}$  in  $\text{AcOH}$  with conc.  $\text{HI}$  ( $D = 1.5$ ) boiled 5 hrs gives (79% yield (5))  $\beta$ -naphthol (1:1540), m.p. 121° (5); note, however, that  $\bar{C}$  is unaffected by  $\text{SnCl}_2$  either in acid or alk. even after protracted refluxing, but in  $\text{AcOH}/\text{HCl}$  in s.t. 8 hrs. at 100° (1) reduces to  $\beta$ -naphthol ]

[ $\bar{C}$  in alk. soln. treated with  $p$ -nitrobenzenediazonium chloride soln loses its halogen atom and yields (14) (15) (16) cf. (21) 1-( $p$ -nitrobenzeneazo)naphthol-2 ("Para Red") [Beil. XVI-165, XVI-1-(255)], red ndls from pyridine, m.p. 246-247° u.c. (14), from  $\text{AcOH}$ , m.p. 250° cor. (15). (Note, however, that as much as 40% of a light yel. by-prod., m.p. 125° dec., is also formed (16) )]

[ $\bar{C}$  melted with  $\text{PCl}_5$  and then treated with aq. (4), or  $\bar{C}$  in alk. soln shaken with  $\text{POCl}_3$  (17), or sodium salt of  $\bar{C}$  shaken in xylene with  $\text{POCl}_3$  (18), yields *tris*-(1-chloronaphthyl-2) phosphate, ndls from alc., m.p. 152° (4) (note that by the second method (above) *bis*-(1-chloronaphthyl-2)phosphoric acid, ndls. from alc. +  $\text{HCl}$ , m.p. 251° (4), is also formed (4))]

[ $\bar{C}$  (2 moles) with  $\text{Na}_2\text{S}$  (1 mole) htd. in aq. under  $\text{N}_2$  gives (97.5% yield (10)) *bis*-(2-hydroxynaphthyl-1) sulfide [Beil. VI-976, VI-1-(470)], colorless cryst. from  $\text{AcOH}$ , m.p. 226° cor. (10).]

$\bar{C}$  under many circumstances yields ethers with difficulty and small yields; e.g.,  $\bar{C}$  with  $\text{MeOH} + \text{conc. H}_2\text{SO}_4$  (25) or  $p$ -toluenesulfonic acid (26) gives only 2-7% methyl ether; however,  $\bar{C}$  in  $\text{MeOH}/\text{KOH}$  htd. with  $\text{MeI}$  in s.t. at 100° for 5 hrs. (25), or  $\bar{C}$  in 15%  $\text{KOH}$  shaken with  $\text{Me}_2\text{SO}_4$  for  $\frac{1}{2}$  hr. (91% yield (5)), gives 1-chloro-2-methoxynaphthalene, pr. from alc., m.p. 70-71° (5), 68° (25), 78° (27); this methyl ether on protracted htg. with conc.  $\text{HCl}$  in s.t. at 200-250° yields  $\bar{C} + \text{MeCl}$  (17) (27). —  $\bar{C}$  with  $\text{EtOH} + \text{conc. H}_2\text{SO}_4$  (25) gives only 0.5-10% ethyl ether, but  $\bar{C}$  with  $\text{EtOH}/\text{KOH} + \text{EtBr}$  htd. 3 hrs. at 100° (25) gives 1-chloro-2-ethoxynaphthalene, lts. from alc., m.p. 58° (25).

③ 1-Chloro-2-naphthyl acetate: tbs. from alc., m.p. 42-43° (3). [From  $\bar{C}$  with  $\text{AcCl}$  (3).]

④ 1-Chloro-2-naphthyl benzoate: lts. from alc., m.p. 101° (27). [From  $\bar{C}$  in alk. soln by shaking with  $\text{BzCl}$  (27)]

Ndls. from hot aq., ndls. from lgr., pr. from  $CHCl_3$ ; eas. sol. alc.,  $AcOH$ ,  $C_6H_6$ ,  $CHCl_3$ , boilg. lgr. — For crystallographic constants see (4). — Volatile with steam.

[For prepn. of  $\bar{C}$  from  $\beta$ -naphthol (1:1540) with  $Cl_2$  with  $SO_2Cl_2$  in  $CS_2$  (7) or with  $C_6H_5ICl_2$  (84% yield naphtholate in  $CS_2$  suspension on treatment with  $Cl_2$  yield (5)) (9) see indic. refs.; for formn. of  $\bar{C}$  from  $\beta$ -naphthol (1:1540) as by-prod. of its

oxdn. with  $\text{FeCl}_3$  to  $\beta$ -dinaphthol (2,2'-dihydroxybinaphthyl-1,1') see (10) (11) (the proportion of  $\bar{C}$  increases with increasing acidity (11)); for formn. of  $\bar{C}$  from  $\beta$ -naphthol as by-prod. of react. with  $\text{SeOCl}_2$  see (20).]

$\bar{C}$  with 1 mole  $\text{Cl}_2$  in  $\text{AcOH}$  soln. gives (12) 1,6-dichloronaphthol-2 (3:3600), m.p. 119.5° (12);  $\bar{C}$  with 1 mole  $\text{Br}_2$  yields (7) (13) 6-bromo-2-chloronaphthol-2 [Beil. VI-651], ndls. from  $\text{AcOH}$  with 1 mole solvent, m.p. 92°, anhydrous ndls. by sublimation, m.p. 101° (7). [Note, however, that  $\bar{C}$  in  $\text{AcOH} + \text{NaOAc}$  with 1 mole  $\text{Br}_2$  yields (1) "1-bromo-1-chloro-2-oxonaphthalenedihydride-1,2," pale yel. pr. from lgr., m.p. 90° when pure but on short stdg. soon becoming lower]

[ $\bar{C}$  in  $\text{AcOH}$  with conc.  $\text{HI}$  ( $D = 1.5$ ) boiled 5 hrs. gives (79% yield (5))  $\beta$ -naphthol (1:1540), m.p. 121° (5); note, however, that  $\bar{C}$  is unaffected by  $\text{SnCl}_2$  either in acid or alk. even after protracted refluxing, but in  $\text{AcOH}/\text{HCl}$  in s.t. 8 hrs. at 100° (1) reduces to  $\beta$ -naphthol.]

[ $\bar{C}$  in alk. soln. treated with *p*-nitrobenzenediazonium chloride soln. loses its halogen atom and yields (14) (15) (16) cf. (21) 1-(*p*-nitrobenzeneazo)naphthol-2 ("Para Red") [Beil. XVI-165, XVI-1-(255)], red ndls. from pyridine, m.p. 246-247° u.c. (14), from  $\text{AcOH}$ , m.p. 250° cor. (15) (Note, however, that as much as 40% of a light yel. by-prod., m.p. 125° dec., is also formed (16).)]

[ $\bar{C}$  melted with  $\text{PCl}_3$  and then treated with aq. (4), or  $\bar{C}$  in alk. soln. shaken with  $\text{POCl}_3$  (17), or sodium salt of  $\bar{C}$  shaken in xylene with  $\text{POCl}_3$  (18), yields *tris*-(1-chloronaphthyl-2) phosphate, ndls. from alc., m.p. 152° (4) (note that by the second method (above) *bis*-(1-chloronaphthyl-2)phosphoric acid, ndls. from alc. +  $\text{HCl}$ , m.p. 251° (4), is also formed (4)).]

[ $\bar{C}$  (2 moles) with  $\text{Na}_2\text{S}$  (1 mole) htd. in aq. under  $\text{N}_2$  gives (97.5% yield (19)) *bis*-(2-hydroxynaphthyl-1) sulfide [Beil. VI-976, VI-1-(470)], colorless cryst. from  $\text{AcOH}$ , m.p. 226° cor. (19).]

[ $\bar{C}$  on refluxing a few hrs. with aniline (best under  $\text{N}_2$  (23)) yields (22) 1-anilinonaphthol-2 [Beil. XIII-678], ndls. from lgr., m.p. 153-154° (22), 155-156° (23); for corresp. reactn. with many other monamines (22) (23) and diamines (24) see indic. refs.]

$\bar{C}$  under many circumstances yields ethers with difficulty and small yields; e.g.,  $\bar{C}$  with  $\text{MeOH} + \text{conc. H}_2\text{SO}_4$  (25) or *p*-toluenesulfonic acid (26) gives only 2-7% methyl ether; however,  $\bar{C}$  in  $\text{MeOH}/\text{KOH}$  htd. with  $\text{MeI}$  in s.t. at 100° for 5 hrs. (25), or  $\bar{C}$  in 15%  $\text{KOH}$  shaken with  $\text{Me}_2\text{SO}_4$  for  $\frac{1}{2}$  hr. (91% yield (5)), gives 1-chloro-2-methoxynaphthalene, pr. from alc., m.p. 70-71° (5), 68° (25), 78° (27); this methyl ether on protracted htg. with conc.  $\text{HCl}$  in s.t. at 200-250° yields  $\bar{C} + \text{MeCl}$  (17) (27). —  $\bar{C}$  with  $\text{EtOH} + \text{conc. H}_2\text{SO}_4$  (25) gives only 0.5-10% ethyl ether, but  $\bar{C}$  with  $\text{EtOH}/\text{KOH} + \text{EtBr}$  htd. 3 hrs. at 100° (25) gives 1-chloro-2-ethoxynaphthalene, lfts. from alc., m.p. 58° (25).

③ 1-Chloro-2-naphthyl acetate: this, from alc., m.p. 42-43° (3). [From  $\bar{C}$  with  $\text{AcCl}$  (3).]

④ 1-Chloro-2-naphthyl benzoate: lfts. from alc., m.p. 101° (27). [From  $\bar{C}$  in alk. soln. by shaking with  $\text{BzCl}$  (27).]

3:1754 6-CHLORO-3,4-DIMETHYLPHENOL  $\text{OH}$   $\text{C}_8\text{H}_9\text{OCl}$  *Beil.* VI —  
(5-Chloro-*o*-4-xylenol)  $\text{Cl}$   $\text{VI}_1$  —  
 $\text{VI}_2$ -(456)

M.P. 71.5-72.5° (1)  
72° (2)  
71° (4)

Ndis. from lt. pet. — Volatile with steam.

[For prepn. of  $\bar{C}$  from 6-amino-3,4-dimethylphenol (5-amino-o-4-xylene) [Beil. XIII-629, XIII-1-(244)] (1) via diazotization and use of  $\text{Cu}_2\text{Cl}_2$  reaction (yield not stated) see (1); from 3,4-dimethylphenol (o-4-xylene) (1:1453) with  $\text{SO}_2\text{Cl}_2$  in  $\text{CHCl}_3$  (23% yield) see (4) cf. (2) (3).]

[For studies on bactericidal action of  $\bar{C}$  see (2) (3).]

$\bar{C}$  with  $\text{Cl}_2$  does not (1) give a trichloro derivative.

$\bar{C}$  with  $\text{HNO}_3$  in  $\text{AcOH}$  soln. as directed gives (5) 2-nitro-6-chloro-3,4-dimethylphenol (5-chloro-3-nitro-o-4-xylene), yel. pl from  $\text{C}_6\text{H}_6$ , m.p.  $127.5^\circ$  (5); note, however, that neither the isomeric mononitro deriv. nor the corresp. dinitro deriv. is known.

$\bar{C}$  does not (5) couple with benzenediazonium chloride.

[For behavior of  $\bar{C}$  with sulfur chloride +  $\text{AlCl}_3$  in  $\text{CS}_2$  see (6).]

— 6-Chloro-3,4-dimethylphenyl acetate: unreported.

Ⓢ 6-Chloro-3,4-dimethylphenyl benzoate: m.p.  $43^\circ$  (1).

### 3:1757 6-CHLORO-2-PHENYLPHENOL

(3-Chloro-2-hydroxybiphenyl;  
"o-chloro-o'-phenylphenol")

Beil. S.N. 539

M.P. $73-74^\circ$ (1)	B.P. $313^\circ$	at 745 mm. (4)
$72^\circ$ (4)	$172^\circ$	at 15 mm. (4)
$71-72^\circ$ (3) (6)	$137-138^\circ$ at 5 mm.	(6)
	$138-140^\circ$ at 3 mm.	(10)

[See also 4-chloro-2-phenylphenol (3:8980).]

**Important Note.** Through the year 1944 (and perhaps in some cases beyond) the chloro-phenylphenol of m.p.  $72^\circ$  ( $\bar{C}$ ) has been regarded as having the structure 4-chloro-2-phenylphenol = 5-chloro-2-hydroxybiphenyl = "p-chloro-o-phenylphenol." In 1945, however, this view was corrected by the paper of Weissberger and Salminen (1); in this text, therefore, expression of the facts is reported in the light of their paper. Particular care is, therefore, required in consulting reference prior to it since such material is universally expressed in the reverse sense of the present view.

[For prepn. of  $\bar{C}$  from 2-hydroxybiphenyl (1:1440) with  $\text{Cl}_2$  (note that 4-chloro-2-phenylphenol (3:8980) is also formed) see (2) (4); for prepn. of  $\bar{C}$  from 3-amino-2-hydroxybiphenyl (5) by diazotization and use of  $\text{Cu}_2\text{Cl}_2$  reaction (45% yield (1)) see indic. refs.]

$\bar{C}$  is sol. in aq. 25%  $\text{NaOH}$  at  $60^\circ$ , but resultant salt is more sol. than corresp. prod. from the isomeric 4-chloro-2-phenylphenol (3:8980) (for use in sepn. of  $\bar{C}$  from the latter see (4)); note that sodium salt of  $\bar{C}$  cryst. as trihydrate, i.e.,  $\text{Na}\bar{A}\cdot 3\text{H}_2\text{O}$  (4), and that anhydrous  $\text{Na}\bar{A}$  dec. at  $316^\circ$  without melting (4).

The calcium salt of  $\bar{C}$  is very spar. sol. aq. (use in sepn. of  $\bar{C}$  from the isomeric 4-chloro-2-phenylphenol (3)).

[For reaction of  $\bar{C}$  with methallyl chloride (3:7145) in pres. of alk. see (10).]

$\bar{C}$  on mononitration with  $\text{HNO}_3$  in  $\text{AcOH}$  at  $15-19^\circ$  as directed gives (31% yield (1)) 3-chloro-2-hydroxy-5-nitrobiphenyl, tan needles, m.p.  $130-131^\circ$  (1),  $129-131^\circ$  (6).

$\bar{C}$  (?) on condensation with formaldehyde + ethanolamine as directed (9) gives a prod., m.p.  $182-183^\circ$ ; for similar condens. of  $\bar{C}$  (?) with formaldehyde + morpholine see (7).]

— 6-Chloro-2-phenylphenyl benzoate: m.p.  $88.5^\circ$  (8). [Note that this prod. does not distinguish  $\bar{C}$  from the isomeric 4-chloro-2-phenylphenol (3:8980), whose benzoate has m.p.  $86-87^\circ$ .]

3:1816 5-CHLORO-2-METHYLPHENOL  
(5-Chloro-o-cresol)

C<sub>7</sub>H<sub>7</sub>OCl

Beil. VI —

VI<sub>1</sub>-(174)VI<sub>2</sub>-(332)

M.P. 73-74° (1) (4)

Long white hard ndls. from pet. eth.; eas. sol. alc., AcOH; less sol. pet. eth. (1).

$\bar{C}$  is eas. sol. alk. (1).

[For prepn. from 5-chloro-2-methylaniline [Beil. XII-835] see (1) (4).]

$\bar{C}$  on mononitration (2) in AcOH with fuming HNO<sub>3</sub> at 5° gives mixt. of two mononitration products: 6-nitro-5-chloro-2-methylphenol, volatile with steam, golden-yel. pr. from pet. eth., m.p. 54.5-55° (2), and 4-nitro-5-chloro-2-methylphenol, not volatile with steam, cryst. from aq. or C<sub>6</sub>H<sub>6</sub>, m.p. 144-145° (2).

$\bar{C}$  on nitration (3) with 3 pts. HNO<sub>3</sub> (*D* = 1.48) at 0° gives a dinitro compd., 4,6-dinitro-5-chloro-2-methylphenol [Beil. VI<sub>1</sub>-(181)], yel. ndls., from pet. eth., m.p. 146° (3); acetyl deriv., m.p. 103-110° (3).

[For action of HNO<sub>3</sub> on  $\bar{C}$  see (4).]

⑥ 6-Chloro-2-methylphenyl benzoate: from  $\bar{C}$  + BzCl + aq. alk., white lfts. from alc., m.p. 53-54° (1).

3:1815 (1) Zincke, *Ann.* 417, 207-208 (1918). (2) von Auwers, Schornstein, *Cent.* 1924, II 2299. (3) Zincke, *Ann.* 418, 234 (1918). (4) Hodgson, Moore, *J. Chem. Soc.* 1926, 2037.

3:1820 1,1,1-TRICHLORO-2-(*o*-  
CHLOROPHENYL)-2-(*p*-  
CHLOROPHENYL)ETHANE  
(" *o,p'*-DDT")

C<sub>14</sub>H<sub>9</sub>Cl<sub>5</sub>

Beil. S.N. 479

M.P. 74.0-74.5° (4) cor. (6)

73-74° (5)

This compound is the so-called *o,p*-isomer of "DDT" (3:3298). Although known to be a substantial contaminant (e.g., 18% (1) —19% (5)) of technical "DDT," very little information is at present available regarding it.

Cryst. from MeOH.

[For prepn. of  $\bar{C}$  from 2,2,2-trichloro-1-(*o*-chlorophenyl)ethanol (5) with chlorobenzene (3:7903) in pres. of conc. H<sub>2</sub>SO<sub>4</sub> at 60° (64% yield) see (5).]

$\bar{C}$  on dinitration with fuming HNO<sub>3</sub> at 50° for 1 hr. gives (5) a dinitro deriv., cryst. from 95% alc., m.p. 148.0-148.5° cor. (5); note that this prod. has same m.p. as corresp. deriv. from "DDT" but that m.p. of a mixt. of the two dinitro compds. is depressed.

$\bar{C}$  on tetranitration with a mixt. (1:1 by volume) of fuming HNO<sub>3</sub> + conc. H<sub>2</sub>SO<sub>4</sub> at 100° for 1 hr. gives (2) a prod., m.p. 229.5-230° cor.; note that the corresp. prod. from "DDT" has m.p. 223.5-224.5° cor. (2).

$\bar{C}$  with anhydrous AlCl<sub>3</sub> (1 mole) + large excess C<sub>6</sub>H<sub>6</sub> at ord. temp. evolves HCl and gives (10% yield (3)) 1,1,2,2-tetraphenylethane, m.p. 211°; in this connection see corresp. behavior of "DDT" (3:3298).

$\bar{C}$  with alc. KOH loses 1 HCl giving (97% yield (5)) (7) 1,1-dichloro-2-(*o*-chlorophenyl)-2-(*p*-chlorophenyl)ethylene (3:1925), accompanied by a little *o,p'*-dichlorodiphenylacetic acid, m.p. 106-107.5° cor. (7), the proportion of which may be increased by reaction of  $\bar{C}$  with Ba(OH)<sub>2</sub> in ethylene glycol at 175° (7).

3:1831  $\alpha,\alpha,\gamma$ -TRICHLORO-*n*-  
BUTYRIC ACID

 $C_4H_3O_2Cl_3$ 

Beil. II-281

 II<sub>1</sub>—

 II<sub>2</sub>—

M.P. 73-75° (1)

Cryst. with sharp odor suggesting chloroacetic acid. — Sol. in 20 pts. aq. —  $\bar{C}$  blisters skin. —  $\bar{C}$  in small amts. (5 g.) can (with care) be distilled, but attempts to distil larger units lead to decomposition with loss of  $HCl$  (2).

[For prepn. of  $\bar{C}$  from  $\alpha,\alpha,\gamma$ -trichloro-*n*-butyraldehyde (3:9094) by oxidn. with fung.  $HNO_3$  in cold see (1).]

$\bar{C}$  does not react with  $Zn$  dust in aq. or with aq.  $KI$  even at 100° (2);  $\bar{C}$  does not react with  $NH_2OH$  (2).

$\bar{C}$  on boilg. with aq. (100 pts.) for 4 days yields (2) a soln. which is strongly acid, reduces Fehling soln. and hot  $NH_4OH/AgNO_3$ , and presumably conts.  $HOCH_2CH_2CO.COOH$ .

$\bar{C}$  with aq.  $Na_2CO_3$  loses one of its three chlorine atoms (probably that in  $\gamma$  position) and upon acidification gives a soln. presumably contg. a lactone; for details see (2).

The acid chloride corresp. to  $\bar{C}$  is unreported.

— Methyl  $\alpha,\alpha,\gamma$ -trichloro-*n*-butyrate: unreported.

— Ethyl  $\alpha,\alpha,\gamma$ -trichloro-*n*-butyrate: unreported.

—  $\alpha,\alpha,\gamma$ -Trichloro-*n*-butyramide: unreported.

—  $\alpha,\alpha,\gamma$ -Trichloro-*n*-butyranilide: unreported.

—  $\alpha,\alpha,\gamma$ -Trichloro-*n*-butyr- $\alpha$ -naphthalide: unreported.

3:1840  $\alpha,\beta,\beta$ -TRICHLOROACRYLIC  
ACID $\text{C}_3\text{H}_2\text{O}_2\text{Cl}_3$ 
 Beil. II - 402  
 II<sub>1</sub>-(187)  
 II<sub>2</sub>-(388)

 M.P. 76° (1) (2) (13)  
 74-75° (3)  
 73° (4)  
 72.9° (5)

 B.P. 221-223° at 760 mm. (5)  
 133° cor. at 30 mm. (5)

Pr. from  $\text{CS}_2$  or dry ether. —  $\bar{\text{C}}$  is very eas. sol. hot aq. but spar. sol. cold aq.; at 25° its satd. aq. soln. conts. 6.4%  $\bar{\text{C}}$  (1), at 20° 6%  $\bar{\text{C}}$  (2). —  $\bar{\text{C}}$  with aq. within certain limits forms two liq. layers; for thermal anal. of the system see (5); note that  $\bar{\text{C}}$  with aq. forms a compd. of compn.  $\bar{\text{C}} + 2.5 \text{H}_2\text{O}$ , m.p.  $-0.6^\circ$ , and that  $\bar{\text{C}}$  with this compound forms a eutectic, m.p.  $17^\circ$  (5). —  $\bar{\text{C}}$  is very sol. in alc., ether, or  $\text{CHCl}_3$ .

[ $\bar{\text{C}}$  is usually prepd. from hexachloropropylene (3:6370) by direct or indirect hydrolysis of its terminal  $-\text{CCl}_2$  group to  $-\text{COOH}$ ; for prepn. of  $\bar{\text{C}}$  from hexachloropropylene by such hydrolysis with 90%  $\text{H}_2\text{SO}_4$  in pres. of  $\text{Al}_2(\text{SO}_4)_3$  at not above  $130^\circ$  (5) (1) cf. (6) (7) (81% yield (13)) or with boilg. aq. susp. of  $\text{BaCO}_3$  (isolated as  $\text{Ba}\bar{\text{A}}$  in 92% yield (1)) see indic. refs.; for prepn. of  $\bar{\text{C}}$  from hexachloropropylene (3:6370) via conversion with alc.  $\text{NaOEt}$  to triethyl orthotrichloroacrylate and subsequent quantitative hydrolysis with alc.  $\text{KOH}$  see (4).]

[For formn. of  $\bar{\text{C}}$  from hexachlorocyclopentanedione-1,3 [Beil. VII-553] by hydrolytic cleavage with 10%  $\text{NaOH}$  (3), or from  $\beta$ -bromo- $\alpha,\beta,\beta$ -trichloropropionic acid (see below) by elimination of  $\text{HBr}$  on stdg. several days with aq.  $\text{Ba}(\text{OH})_2$  (2), see indic. refs.]

$\bar{\text{C}}$  on reduction with  $\text{H}_2$  in pres. of  $\text{Pd}$  cat. at ord. temp. and press. absorbs 4 moles  $\text{H}_2$  yielding (8) propionic acid (1:1025).

$\bar{\text{C}}$  with  $\text{Cl}_2$  in  $\text{CCl}_4$  soln. in sunlight adds 1 mole halogen giving (9) (8) pentachloropropionic acid (3:4893).

[ $\bar{\text{C}}$  with  $\text{HBr}$  might be expected to yield  $\beta$ -bromo- $\alpha,\beta,\beta$ -trichloropropionic acid, but this reaction is unreported although the expected prod. [Beil. II-257], m.p.  $83-84^\circ$  has been prepd. by other means and with  $\text{Ba}(\text{OH})_2$  loses  $\text{HBr}$  giving  $\bar{\text{C}}$  (2).]

$\bar{\text{C}}$  with half its wt. of  $\text{PCl}_5$  at  $80^\circ$  loses  $\text{H}_2\text{O}$  between two molecules giving (4) trichloroacrylic acid anhydride, cryst., insol. aq., m.p.  $39-40^\circ$  (4) (5); this product is also formed during the distillation of  $\bar{\text{C}}$  even at reduced press. (5).

$\bar{\text{C}}$  with excess  $\text{SOCl}_2$ , however, gives (80-90% yield (1)) (13) trichloroacryloyl chloride (3:5845) q.v.

Salts of  $\bar{\text{C}}$ . [ $\text{Na}\bar{\text{A}}$  (conductivity of aq. solns.) (10);  $\text{K}\bar{\text{A}}$ , spar. sol. cold aq. (2);  $\text{Ag}\bar{\text{A}}$ , spar. sol. cold aq. but recryst. from hot aq. without decompn. (2) (4);  $\text{Mg}\bar{\text{A}}_2 \cdot 3\frac{1}{2}\text{H}_2\text{O}$ , sol. aq. (10);  $\text{Ca}\bar{\text{A}}_2 \cdot 3\frac{1}{2}\text{H}_2\text{O}$ , sol. aq. (10) (2);  $\text{Sr}\bar{\text{A}}_2 \cdot 5\text{H}_2\text{O}$ , sol. aq. (10);  $\text{Ba}\bar{\text{A}}_2 \cdot 3\frac{1}{2}\text{H}_2\text{O}$ , sol. aq. (10) (2) (note that this salt on htg. in atm. of  $\text{H}_2$  gives (11) dichloroacetylene (3:5010));  $\text{Zn}\bar{\text{A}}_2 \cdot 6\text{H}_2\text{O}$  and  $\text{Zn}\bar{\text{A}}_2 \cdot 3\frac{1}{2}\text{H}_2\text{O}$  (10);  $\text{Cd}\bar{\text{A}}_2 \cdot 2\text{H}_2\text{O}$  (10);  $\text{Hg}\bar{\text{A}}_2$  (no crystal aq.) (10).]

— Methyl  $\alpha,\beta,\beta$ -trichloroacrylate: unreported.

— Ethyl  $\alpha,\beta,\beta$ -trichloroacrylate: b.p.  $192-194^\circ$ ;  $112-114^\circ$  at 50 mm.;  $D_4^{20} = 1.2183$ ;  $n_D^{20} = 1.4649$  (4). [Prepd. indirectly from triethyl orthotrichloroacrylate (itself ohtd. from hexachloropropylene with  $\text{NaOEt}$ ) by shaking with conc.  $\text{HCl}$  (4).]

⑤  $\alpha,\beta,\beta$ -Trichloroacrylamide: m.p.  $97^\circ$  (12),  $96-97^\circ$  (4),  $96^\circ$  (2). [From trichloroacryloyl chloride (3:5845) with conc.  $\text{NH}_4\text{OH}$  (4) or from ethyl trichloroacrylate (above) with alc.  $\text{NH}_3$  (12).]

⑥  $\alpha,\beta,\beta$ -Trichloroacrylanilide: m.p.  $98^\circ$  (13). [From trichloroacryloyl chloride (3:5845) with aniline in  $\text{CHCl}_3$  at  $0^\circ$  (77% yield) (13).]

3:1850  $\alpha,\alpha,\beta,\beta$ -TETRACHLOROPROPIONIC ACID

M.P. 76° (1)

Colorless cryst. from  $\text{CS}_2 + \text{CHCl}_3$ ; fairly sol. aq.

[For prepn. of  $\bar{\text{C}}$  from  $\alpha,\beta$ -dichloroacrylic acid (3:2265) in  $\text{CS}_2$  with dry  $\text{Cl}_2$  in sunlight see (1).]

Salts:  $\text{K}\bar{\text{A}}$ ;  $\text{Ag}\bar{\text{A}}$  (readily dec. to  $\text{AgCl}$  on warming aq. soln.);  $\text{Ca}\bar{\text{A}}_2$ ;  $\text{Ba}\bar{\text{A}}_2$  (1).

3:1850 (1) Maberry, Smith, *Ber.* 22, 2059-2060 (1889).

3:1875  $\beta,\beta$ -DICHLOROACRYLIC ACID

M.P. 76-77° (1) (2) (3)

(Also see text.)

Ndls. from pet. ether or by sublimation. —  $\bar{\text{C}}$  is spar. sol. aq. but very eas. sol. ether or  $\text{CHCl}_3$ . —  $\bar{\text{C}}$  on htg. above its m.p. (e.g., to 120°), then rapidly cooled to 60° or below remelts at 63-64° (2) (3); on standing, however,  $\bar{\text{C}}$  finally reverts to the form of m.p. 76-77°.

—  $\bar{\text{C}}$  decomposes on attempted distn.

[For prepn. of  $\bar{\text{C}}$  from propiolic acid (acetylene-carboxylic acid) (Beil. II-477) by conversion to chloropropiolic acid (3:1685) and subsequent addn. of 1  $\text{HCl}$  by htg. with a large excess conc.  $\text{HCl}$  at 100° for 5 hrs. (77% overall yield from propiolic acid) see (1); for formn. from "chloralide" (3:3510) by reduction with  $\text{Zn} + \text{HCl}$  in alc. soln. see (2) (3).]

The behavior of  $\bar{\text{C}}$  toward hydrogenation has not been reported.

Neither  $\bar{\text{C}}$  nor its ethyl ester (see below) is stable to light.

[ $\bar{\text{C}}$  with  $\text{EtOH}$  gives  $\text{EtOOC}-\text{CH}=\text{CHCl}$  (3:3510) (1).]

the formn.

tion somet.

Salts:  $\text{K}\bar{\text{A}}$  (1);  $\text{Na}\bar{\text{A}}$  (2);  $\text{Ba}\bar{\text{A}}_2 \cdot 2\text{H}_2\text{O}$  (2);  $\text{Zn}\bar{\text{A}}_2 \cdot 2\text{H}_2\text{O}$  (3).

$\bar{\text{C}}$  with  $\text{PCl}_5$  gives (3)  $\beta,\beta$ -dichloroacryloyl chloride, b.p. above 145°; this prod. with  $\text{EtOH}$  or  $\bar{\text{C}}$  in  $\text{EtOH}$  with dry  $\text{HCl}$  gives (3) ethyl  $\beta,\beta$ -dichloroacrylate, b.p. 173-175°.

—  $\beta,\beta$ -Dichloroacrylamide: ndls. from  $\text{CHCl}_3$ , m.p. 112-113° (3). [From the above acid chloride with dry  $\text{NH}_3$  (3).]

**3:1899 1,1-DICHLORO-2-(*o*-CHLOROPHENYL)-2-(*p*-CHLOROPHENYL)ETHANE**  
 (" *o,p*-DDD ")

Bell. S.N. 474

M.P. 76-78° (1)

Colorless cryst. from MeOH or from pentane. — Note that  $\bar{C}$  is a minor impurity in technical grade "DDT" (3:3298).

[For prepn. of  $\bar{C}$  from 2,2-dichloro-1-(*o*-chlorophenyl)ethanol (1) with chlorobenzene (3:7903) in pres. of  $H_2SO_4$  (39% yield) see (1).]

$\bar{C}$  with alc. KOH loses 1 HCl giving (1) 1-chloro-2-(*o*-chlorophenyl)-2-(*p*-chlorophenyl)-ethyleno (not described) which upon oxidn. with  $CrO_3/AcOH$  gives (1) 2,4-dichlorobenzophenone (3:1565).

3:1890 (1) Haller, Bartlett, Drake, Newman, Cristol, et al., *J. Am. Chem. Soc.* **67**, 1600 (1945).

**3:1899 2-CHLORO-4-PHENYLPHENOL**  
 (3-Chloro-4-hydroxybiphenyl)

Bell. S.N. 539

M.P. 77° (1) (4) B.P. 176.6° at 5 mm. (5)

$\bar{C}$  is sol. in NaOH. [For prepn. of  $Na\bar{A}$  using solns. of  $\bar{C}$  in org. solv. such as MeOH, ether, or toluene see (2).]

$\bar{C}$  htd. with NaOH/ $Na_2CO_3$  soln. under press. for 3 hrs. at 290-300° gives 4-phenylpyrocatechol [Bell. VI-990], m.p. 145°; diacetate, m.p. 77.5-78° (3).

$\bar{C}$  in  $CCl_4$  stood 5 days with 1 mole  $Br_2$  gave (44% yield) 6-bromo-2-chloro-4-phenylphenol, wh. pr. (from  $CHCl_3$ ), m.p. 84-86° cor. (4);  $\bar{C}$  in AcOH (25% yield) or in  $CS_2$  (56% yield) stood 2 days with 2 moles  $Br_2$  gave 6-bromo-4-(*p*-bromophenyl)-2-chlorophenol, coarse wh. ndls., m.p. 143-145° cor. (4).

$\bar{C}$  in AcOH treated with 1 mole  $HNO_3$  in AcOH gave 38% yield of 2-chloro-6-nitro-4-phenylphenol, thick yel. pl. (from  $CCl_4$ ), m.p. 89-90° cor. (5).

$\bar{C}$  with  $(CH_3)_2SO_4 + NaOH$  (1) or  $CH_3I + aq. KOH$  (5) yields the corresp. Me ether, 2-chloro-4-phenylanisole, m.p. 91-92° (1), 93° cor. (5).

① 2-Chloro-4-phenyl-phenyl acetate: m.p. 68° (7). [From  $\bar{C} + Ac_2O + NaOAc$  in 92% yield (7).]

② 2-Chloro-4-phenyl-phenyl benzoate: from  $\bar{C} + BzCl + aq. alk.$  in 80% yield (4); cryst. from AcOH (4), m.p. 95-97° cor. (4), 110-111° (6).

③ 2-Chloro-4-phenyl-phenyl benzenesulfonate: m.p. 59-60° (8). [From  $\bar{C} + benzenesulfonyl chloride + aq. 10\% NaOH$  (8).]

④ 2-Chloro-4-phenyl 2,4-dinitrophenyl ether: from  $\bar{C} + 2,4$ -dinitrochlorobenzene in conc. aq. KOH refluxed for several hrs.; yield, 70%; m.p. 109-111°C. (4).

 77° (24)  
 74-74.5° (3)

[See also  $\alpha,\beta,\gamma$ -trichloro-*n*-butyraldehyde (butyrylchloral) (3:5910).]

Lfts. from aq. or alc. — Spar. sol. cold but fairly eas. sol. hot aq.; very eas. sol. alc. — For crystallographic data see (3) (5). — Note that because of tendency to dissociate on htg. into butyrylchloral (3:5910) + aq. the ro.p. observed for  $\bar{\text{C}}$  varies according to rate of htg. (3). — Note also that  $\bar{\text{C}}$  is isomeric with chloral ethylalcoholate (3:0860) with which it must not be confused; for distinction of  $\bar{\text{C}}$  from chloral hydrate (3:1270) see (9) (10).

$\bar{\text{C}}$  is employed in medicine as a sedative; from the body it is excreted in the urine as urobutyrylchlorallic acid [Beil. I-664], which upon hydrolysis yields (4) 2,2,3-trichlorobutanol-1 (3:1336) + glucuronic acid [Beil. III-884, III-(306)].

[For prepn. of  $\bar{C}$  from butyrylchloral (3:5910) by reactn. with aq. see (1) (2) (6).]

[ $\bar{C}$  is reduced by fermenting yeast giving (7) dextrorotatory 2,2,3-trichlorobutanol-1, m.p. 62°; for actn. of  $\bar{C}$  on alc. fermentation see (8).]

$\bar{C}$  on oxidn. with 3 wt. pts. fung.  $\text{HNO}_3$  ( $D = 1.504$ ) nt 30–35° for 1½ hrs. then stood at room temp. for 24 hrs. gives (95% yield (11))  $\alpha,\alpha,\beta$ -trichloro-*n*-butyric acid (3:1280).

$\bar{C}$  on distn. with half its wt. of  $\text{Ac}_2\text{O}$  (12), or shaking with conc.  $\text{H}_2\text{SO}_4$  (13), or on distn. with  $\text{CHCl}_3$  (14), or on htg. alone loses its combined aq. yielding butyrylchloral (3:5910), h.p. 165°.

$\bar{C}$  with conc.  $\text{H}_2\text{SO}_4$  (at least 6 wt. pts.) nt room temp. for 2 days trimerizes to a mixt. (80% yield (12)) of two parahutyrylchlorals: these are colorless crystn., sharp-melting solids, sol. in org. solvents, but insol. nq.; the less sol.  $\alpha$ -parahutyrylchloral, rhombic cryst. from boilg.  $\text{AcOH}$  or boilg.  $\text{EtOH}$ , has m.p. 180°; the more sol.  $\beta$ -parahutyrylchloral (stereoisomer?), cryst. from boilg.  $\text{AcOH}$  or boilg.  $\text{EtOH}$ , has m.p. 157°; these polymers can be distilled at 15 mm. but attempts to distil them at ord. press. result in complete dissociation to butyrylchloral (3:5910).

$\bar{C}$  with aq.  $\text{KOH}$  or  $\text{NaOH}$  evolves heat and yields (1) (15) 1,1-dichloropropene-1 (3:5120) + the salt of formic acid (1:1005).

[ $\bar{C}$  with conc. nq.  $\text{HCN}$  fails (16) to react, but upon addn. of alc. and subsequent digestion (15), or  $\bar{C}$  (1 mole) with aq.  $\text{KCN}$  (2 moles) at 40° (17), gives (20% yield (17))  $\alpha,\alpha,\beta$ -trichloro-*n*-butyraldehyde cyanohydrin [Beil. III-322, III<sub>2</sub>-(226)], pl. from aq., m.p. 101–102° (17) (18), accompanied by (61% yield (17))  $\alpha$ -chlorocrotonic acid (3:2760), m.p. 98.5–99° (17). — Note that  $\bar{C}$  (1 mole) in alc. treated gradually with powdered  $\text{KCN}$  (2 moles) below 15° over a 3–4 hr. period gives (90% yield (17)) ethyl  $\alpha$ -chlorocrotonate (3:8523); in this reactn. the intermediate ethyl  $\alpha,\beta$ -dichloro-*n*-butyrate readily loses  $\text{HCl}$  and is generally not isolated; use of alcs. other than  $\text{EtOH}$  gives good yields of the corresp. alkyl  $\alpha$ -chlorocrotonates (17). — Note that for  $\bar{C}$  with  $\text{KCN}$  in  $\text{C}_6\text{H}_6$  the reaction takes a different course (17). — Finally, note that  $\bar{C}$  (1 mole) in conc. aq.  $\text{NH}_4\text{OH}$  first dissolves, then ppts. butyrylchloral-ammonia as a heavy oil; the mixt. on sata. with dry  $\text{NH}_3$  gas in cold followed by treatment at 10° with powdered  $\text{KCN}$  (1 mole) evolves heat and gives (93% yield (17))  $\alpha$ -chlorocrotonamide, m.p. 113.5° (17).]

[ $\bar{C}$  undergoes cocondensation with various org. systems: e.g.,  $\bar{C}$  with phenyl isocyanide (1 mole) in ether for 4–5 days gives (53% yield (19))  $\alpha$ -hydroxy- $\beta,\beta,\gamma$ -trichloro-valerianilide, thls. from alc.,  $\text{C}_6\text{H}_6$ , or  $\text{CHCl}_3$ , m.p. 156–158° (19). —  $\bar{C}$  (1 pt.) with malonic acid (1:0480) (1 pt.) in pyridine (1 pt.) at 100° for 3 hrs. evolves  $\text{CO}_2$  and gives (20)  $\beta$ -hydroxy- $\gamma,\gamma,\delta$ -trichloro-*n*-caproic acid, cryst. from hot aq., m.p. 102° (20). —  $\bar{C}$  (1 mole) with nitromethane (1½ moles) in dil. alc. in pres. of  $\text{Na}_2\text{SO}_3$  nt 60° gives (100% yield (21)) 1-nitro-3,3,4-trichloropentanol-2, h.p. 156° at 4 mm., m.p. abt. 20° (21);  $\bar{C}$  (1 mole) with nitroethane (1 mole) in 50% alc. in pres. of  $\text{Na}_2\text{SO}_3 + \text{K}_2\text{CO}_3$  nt 70° gives (22) 2-nitro-4,4,5-trichlorohexanol-3, h.p. 138° nt 0.75 mm. (22).]

[ $\bar{C}$  forms with various org. substances molecular cpds. of pharmaceutical interest: e.g.,  $\bar{C}$  (1 mole) with quinine (base) (1 mole) in abs. alc. at 75° for 1 hr. gives 1:1 cpd., m.p. 139° (note that the corresp. cpd. from chloral (3:5210) + quinine has m.p. 149° (23)). —  $\bar{C}$  (1 mole) with 2,3-dimethyl-1-phenylpyrazolone-5 ("Antipyrine") (1 mole) (m.p. 112°) rubbed together and recrystd. from aq. gives (24) 1:1 molecular cpd., colorless pr., m.p. 72° (for f.p./compn. data and diagram of this system see (24)). —  $\bar{C}$  with 2,3-dimethyl-4-dimethylamino-1-phenylpyrazolone-5 ("Pyramidone") (m.p. 107.5°) on fusion or in aq. or  $\text{C}_6\text{H}_6$  (24) (25) (26) gives a 1:1 mol. cpd. ("Trigemin"), cryst. from  $\text{C}_6\text{H}_6$ , m.p. 85–86° (26), long ndls. from aq., m.p. 84° (24) (for f.p./compn. data and diagram on this system see (24)); for stabilization of "Trigemin" by addn. of 5–10% hexamethylenetetramine (27) or 2%  $\text{MgO}$  (28) see indic. refs.]

[ $\bar{C}$  with various org. hydroxy acids in pres. of conc.  $H_2SO_4$  condenses to give prods. of the chloralide type: e.g., for reactn. of  $\bar{C}$  with citric acid (1:0505), malic acid (1:0450), or tartaric acid (1:0525) see (29); with gallic acid (1:0875) (and numerous other phenolic acids) see (30).]

$\bar{C}$  with conc. aq.  $NH_4OH$  first dissolves then ppts. a heavy oil of butyrylchloral-ammonia (17); cryst. m.p.  $62^\circ$  (see also above for its reaction with KCN).

[ $\bar{C}$  with excess dry  $NH_4OAc$  on moderate hgt for several hrs, then pouring into aq., gives (18)  $\alpha, \beta$ -trichloro-*n*-butyraldimine, cryst from  $C_6H_6$ , m.p.  $169-170^\circ$  (31),  $164-165^\circ$  (18); observe that this m.p. is notably close to that of the condensation prod. of butyrylchloral (3:5910) with acetamide, and that latter is readily formed from  $NH_4OAc$  by dry hgt.; this matter, however, seems to have received no further attention.]

$\bar{C}$  with aq.  $NH_2OH.HCl$  on hgt. readily yields (32)  $\alpha, \beta$ -trichloro-*n*-butyraldoxime (first separating as an oil), cryst. from lgr, m.p.  $65^\circ$  (32)

The reaction of  $\bar{C}$  with arylhydrazines is of special interest and has been extensively studied. With phenylhydrazine the reaction is extremely vigorous (33) (34) and unless carefully controlled (35) may become almost explosively violent yielding only tar. With nuclear-substituted phenylhydrazines, however, the reaction is milder, and their study has shown that all arylhydrazines react in the same general pattern although this comprises several different courses according to the solvent used. The pattern will be illustrated here only by the case of 2,4-dichlorophenylhydrazine (see below); for details of the analogous reaction of  $\bar{C}$  with phenylhydrazine (33) (34), *o*-, *m*-, and *p*-tolylhydrazines (34), 2,5-dichlorophenylhydrazine (35) (36), 3,5-dichlorophenylhydrazine (35), 2,4,5-trichlorophenylhydrazine (36), 2,4,6-trichlorophenylhydrazine (36), *p*-bromophenylhydrazine (34), 2,4-dibromophenylhydrazine (37), 4,5-dibromophenylhydrazine (35), and 2,4,6-tribromophenylhydrazine (35) see indic. refs.

[The reactn. of  $\bar{C}$  (1 mole) with 2,4-dichlorophenylhydrazine hydrochloride (1 mole) first gives the expected butyrylchloral 2,4-dichlorophenylhydrazone (A) which, however, cannot be isolated because of immediate further reaction in two different modes according to the solvent employed. In dil aq.  $HCl$  contg.  $NaOAc$  (A) loses  $HCl$  in two different ways leading on one hand to  $\alpha, \beta$ -dichloroacetaldehyde 2,4-dichlorophenylhydrazone (B), long yel. pr. from alc. or  $AcOH$ , m.p.  $112^\circ$  (34), and on the other (simultaneously and with rearr. of unsatd. linkages) to the crimson 1-(2,4-dichlorobenzeneazo)-2,3-dichlorobutene-1 (C) (in most instances the last is not isolatable in pure form although it has been in the case (37) of  $\bar{C}$  with 2,4-dibromophenylhydrazine), in  $MeOH$ ,  $EtOH$ , or  $AcOH$ , however, the two  $\alpha$ -chlorine atoms of the initial arylhydrazone (A) undergo hydrolysis with consequent formn. of  $\beta$ -chloro- $\alpha$ -keto-*n*-butyraldehyde 2,4-dichlorophenylhydrazone (D), pale yel. pr. from alc., m.p.  $129^\circ$  (33)]

[This last type of epl. (D) can be caused to undergo two further important types of reaction: e.g., (D) with further 2,4-dichlorophenylhydrazine in  $MeOH$  soln. not only undergoes conventional condensation of its  $\alpha$ -keto grouping but also has the  $\beta$ -chlorine atom replaced by methoxyl so that the product obt'd is  $\beta$ -methoxy- $\alpha$ -keto-*n*-butyraldehyde bis-(2,4-dichlorophenyl)oxazone (E), bright yel. pr. from pyridine or  $C_6H_6$ , m.p.  $196^\circ$  dec. (33) (this reaction occurs so readily in  $MeOH$  that from  $\bar{C}$  + 2,4-dichlorophenylhydrazine hydrochloride both (D) and (E) are formed and may be separated by fractional crystn.); on the other hand, (D) with alc.  $NaOEt$  on hgt. loses  $HCl$  and ring-closes (38) to 1-(2,4-dichlorophenyl)-4-hydroxy-5-methylpyrazole (F), colorless cryst. from boilg. alc., m.p.  $144^\circ$  (35) (this type of reactn. comprises a general synthesis of 4-hydroxypyrazoles).]

Na isopropylate, gives (85% yield (3) (14), 80% yield (16)) 4-chlorophenyl-phenyl-carbinol (4-chlorobenzohydrol) [Beil. VI-680, VI<sub>1</sub>-(327)], m.p. 67.5° (3) (14), 62° (7), accompanied by a little (14% (3) (14))  $\alpha,\alpha'$ -diphenyl- $\alpha,\alpha'$ -bis-(4-chlorophenyl)ethylene glycol (*sym*-4,4'-dichlorobenzopinacol) [Beil. VI<sub>1</sub>-(523)], m.p. 179° (3) (14). —  $\bar{C}$  with Zn + AcOH yields 4-chlorobenzohydryl acetate (12) or a mixt. (7) of 4-chlorobenzohydrol (above) + the corresp. pinacol (see below).]

[ $\bar{C}$  with Mg + MgI<sub>2</sub> in ether + C<sub>6</sub>H<sub>6</sub> or  $\bar{C}$  in very dil. alc. soln. in sunlight (7) gives (94% yield (13)) *sym*-4,4'-dichlorobenzopinacol, m.p. 172-178° (see above). —  $\bar{C}$  with Zn dust + H<sub>2</sub>SO<sub>4</sub> in nq. AcOH yields (12) *sym*-4,4'-dichloro- $\alpha$ -benzopinacolone (*sym*-4,4'-dichlorotetraphenylethylene oxide) [Beil. XVII<sub>1</sub>-(45)], ndls. from AcOH, m.p. 220° dec. (12). — For oxidn.-reductn. potential of  $\bar{C}$  see (35)]

[ $\bar{C}$  with conc. H<sub>1</sub> + red P in AcOH refluxed 14 hrs. gives (7) 4-chlorodiphenylmethane [Beil. V-590, V<sub>1</sub>-(278), V<sub>2</sub>-(500)], b.p. 298° at 742.5 mm. (7).]

[ $\bar{C}$  with diphenylmethyl sodium (benzohydryl-sodium) followed by aq. gives (18) corresp. tertiary alc., viz., benzohydryl-*p*-chlorophenyl-phenyl-carbinol, m.p. 176-178° (18), which with acetyl chloride loses H<sub>2</sub>O to give 4-chlorotetraphenylethylene [Beil. V<sub>1</sub>-(376), V<sub>2</sub>-(679)], m.p. 166-167° (18). —  $\bar{C}$  with MeMgI in dry ether yields (19) *p*-chlorophenyl-phenyl-methyl-carbinol which on loss of aq. by htg. as directed gives (66% overall yield)  $\alpha$ -(4-chlorophenyl)- $\alpha$ -phenylethylene, b.p. 164° at 16 mm. (19); note that this prod. with

$\text{Br}_2$  does not add halogen but rather evolves  $\text{HBr}$  yielding (20) both solid (m.p. 94–95°) and liq. stereoisomers of  $\beta$ -(4-chlorophenyl)- $\beta$ -phenylvinyl bromide. —  $\bar{\text{C}}$  with  $\beta$ -(4-chlorophenyl)- $\beta$ -phenylvinyl  $\text{MgBr}$  as directed (23) gives 1,4-di-(*p*-chlorophenyl)-1,4-diphenylbutadiene-1,3, yellowish green ndls. from amyl alc., m.p. 230° (23). —  $\bar{\text{C}}$  with triphenylmethyl  $\text{MgBr}$  in ether +  $\text{C}_6\text{H}_6$ , followed by dil.  $\text{AcOH}$ , gives (21) 78% yield *sym*-4,4-dichlorohenzopinacol (see above) + 80% yield triphenylmethyl peroxide.]

[ $\bar{\text{C}}$  with ethyl bromoacetate +  $\text{Zn}$  in dry  $\text{C}_6\text{H}_6$  gives (yields: 79% (22), 67% (24)) ethyl  $\beta$ -(4-chlorophenyl)- $\beta$ -hydroxy- $\beta$ -phenyl-propionate, m.p. 79–80.5° (22), 69° (24); this prod. on htg. with 85% formic acid gives (66% yield (24)) ethyl  $\beta$ -(4-chlorophenyl)cinnamate, h.p. 210–212° at 13 mm. (24), or on hydrolysis gives (22)  $\beta$ -(4-chlorophenyl)- $\beta$ -hydroxy- $\beta$ -phenylpropionic acid, m.p. 188.5–189° dec. (22).]

$\bar{\text{C}}$  with  $\text{PCl}_5$  at 150° gives (yields: 90% (25) (27), 88% (26) (8))  $\alpha,\alpha$ -4-trichlorodiphenylmethane (4-chlorohenzophenone dichloride) [Beil. V-592,  $\text{V}_1$ -(279)], h.p. 191–193° at 13 mm. (8), 189–194° at 12 mm. (25).  $D_4^{20} = 1.302$  (25),  $n_D^{20} = 1.6110$  (25); this prod. with  $\text{Zn}$  dust refluxed in dry ether for 1 hr. gives (12% yield (25))  $\alpha,\beta$ -di-(*p*-chlorophenyl)- $\alpha,\beta$ -di(phenyl)ethylenc, ndls. from alc., m.p. 202–203° (25).

$\bar{\text{C}}$  fused with  $\text{KOH}/\text{NaOH}$  gives (28) benzoic acid (66%) + *p*-chlorobenzoic acid (3:4940) (18%) + a little *p*-hydroxybenzoic acid (1:0340). —  $\bar{\text{C}}$  with 10% aq.  $\text{NaOH}$  in pres. of  $\text{Cu}$  under press. at 190° yields (29) 4-hydroxybenzophenone (1:1560).

[ $\bar{\text{C}}$  with  $\text{NH}_3$  in pres. of  $\text{Cu}$  cpds. at 170–300° under press. gives (30) 4-aminobenzophenone [Beil. XIV-81,  $\text{XIV}_1$ -(388)], lfts. from dil. alc., m.p. 123–124°. —  $\bar{\text{C}}$  condensed with  $\text{NaNH.C}_6\text{H}_5$  as directed (31) yields 4-anilinoenzophenoneanil, m.p. 56° (for other amines and use of products as antioxidants see (31)); note, however, that by a closely similar method (36) *p*-chlorobenzophenoneanil, m.p. 64–64.5°, can also be ohtd.]

$\bar{\text{C}}$  on dinitration with abs.  $\text{HNO}_3$  gives (32) a mixt. contg. 4-chloro-3,3'-dinitrobenzophenone, cryst. from toluene, m.p. 166°, 4-chloro-3,2'-dinitrobenzophenone, cryst. from alc., m.p. 123.5°, and 4-chloro-3,4'-dinitrobenzophenone, m.p. 136–136.5°.

⑥ 4-Chlorobenzophenone oxime: This prod. is known in two stereoisomeric forms: the higher-melting isomer, m.p. 155–156° (6) (corresp. acetate, m.p. 147–148° (6), corresp. benzyl ether, m.p. 74–75° (6)), which on Beckmann rearr. (6) (34) with  $\text{PCl}_5$ , with conc.  $\text{H}_2\text{SO}_4$  at 100°, or with  $\text{AcOH}/\text{Ac}_2\text{O}/\text{HCl}$  yields 4-chlorobenzanilide, is in the light of modern views on *trans* interchange regarded as the *syn*-(*p*-chlorophenyl) stereomer; the lower-melting isomer, m.p. 95° (6) (corresp. acetate, m.p. 105–106° (6), corresp. benzyl ether, m.p. 98–99° (6)), which on Beckmann rearr. with  $\text{PCl}_5$  yields benz-*p*-chloroanilide, is now regarded as the *trans*-(*p*-chlorophenyl) stereomer. (A mixt. of these two stereoisomeric oximes contg. 56% high-melting form + 44% low-melting form (33) is ohtd. from  $\bar{\text{C}}$  with  $\text{NH}_2\text{OH.HCl}$  + pyridine in abs. alc. (33) or from  $\bar{\text{C}}$  +  $\text{NH}_2\text{OH.HCl}$  + dil. alc.  $\text{KOH}$  (6); the two isomers are separated by means of their different solubilities in alc. (6) (34). — Note that the lower-melting isomer is itself converted to the higher-melting form by htg. 3 hrs. at 100° (6) and also (in part) during Beckmann rearr.]

⑦ 4-Chlorobenzophenone phenylhydrazone: cryst. from ether/ $\text{AcOH}$ , m.p. 106° (34). [From  $\bar{\text{C}}$  with phenylhydrazine or phenylhydrazine acetate in alc. as directed (34).]

— 4-Chlorobenzophenone *p*-nitrophenylhydrazone: unreported.

⑧ 4-Chlorobenzophenone 2,4-dinitrophenylhydrazone: m.p. 184–185° (Heilbron).

3:1915 DI-(TRICHLOROMETHYL)  
CARBONATE  
(Triphosgene, perchlorodimethyl  
carbonate, hexachlorodimethyl  
carbonate)

Beil. III - 17

III<sub>1</sub>-(8)

III<sub>2</sub>-(16)

M.P. 78-79° (1)

79° (2) (3) (4)

B.P. 203° at 760 mm., sl. dec. (3)

124° at 50 mm. (3)

117° at 36 mm. (2)

105° at 22 mm. (2)

Cryst. from anhydrous ether (1) (2) or pet. eth. (4). — Disagreeable penetrating odor; attacks mucous membrane.

$\bar{\text{C}}$  on distn. dissociates slightly into phosgene (3:5000) and diphosgene (trichloromethyl chloroformate) (3:5515) (4) (5); solid  $\bar{\text{C}}$  when mixed with powdered charcoal and heated to just above m.p. rapidly decomposes to phosgene (3:5000) (5).

[For prepn. of  $\bar{\text{C}}$  from dimethyl carbonate (1:3016) by chlorination in sunlight see (1); from methyl chloroformate (3:5075) by chlorination see (2) ]

$\bar{\text{C}}$  on treatment at 20° for 1 hr. with NaI in acetone evolves CO and separates iodine to 84% of amt. expressed by the reactn.  $\text{Cl}_3\text{C.O.CO.O.CCl}_3 + 6\text{NaI} \rightarrow 3\text{CO} + 3\text{I}_2 + 6\text{NaCl}$  (6).

$\bar{\text{C}}$  with most reagents behaves like phosgene; e.g.,  $\bar{\text{C}}$  with alcohols gives ultimately dialkyl carbonates (7);  $\bar{\text{C}}$  with aniline in ether (7) or aq. (2) gives *N,N*-diphenylurea, m.p. 233° (7);  $\bar{\text{C}}$  with phenol + aq. NaOH gives (90% yield (7)) diphenyl carbonate (1:2335) cryst. from alc., m.p. 77.5-78° (7).

[For use of  $\bar{\text{C}}$  in prepn. of acid chlorides of carboxylic or sulfonic acids see (8); similarly  $\bar{\text{C}}$  htd. with anhydrous NaOAc yields  $\text{Ac}_2\text{O}$  (9) ]

78.0-79.5°	(3)	315° u.c.	(5) (6)
78.5°	(4)		

Colorless cryst. from alc.; 100 pts. 90% alc. dis. in cold 11.91 pts.  $\bar{C}$ , on boilg. 19.87 pts.  $\bar{C}$  (8). —  $\bar{C}$  is eas. sol. ether,  $CHCl_3$ , or  $CS_2$ ; less so in alc. or  $C_6H_6$ .

PREPARATION OF  $\bar{C}$ 

[For prepn. of  $\bar{C}$  from 1,1,1-trichloro-2,2-diphenylethane (3:1420) by splitting out 1 HCl on distn. (9) cf. (19) (6), or with alc. KOH (2) (1) (for study of rate see (11)), or alc. NaOEt (1) see indic. refs.; from *unsym.*-diphenylethane [Beil. V-605, V<sub>1</sub>-(285), V<sub>2</sub>-(509)] with  $Cl_2$  at 100-150° in quartz flask in light for 10 hrs followed by distn. at ord. press. (16% yield) see (3); from *unsym.*-diphenylethylene [Beil. V-639, V<sub>1</sub>-(368), V<sub>2</sub>-(543)] with  $Cl_2$  followed by distn. see (12).]

[For formn. of  $\bar{C}$  from  $\alpha,\alpha$ -dichloro- $\beta,\beta$ -diphenylethylene sulfide ( $Cl_2C-CH(C_6H_5)_2$ ) by

htg. at 100° for 2 hrs. (or for shorter time at 160°), or by boilg. with MeOH, or htg. with Zn see (13); from  $\alpha,\alpha$ -dichloro- $\beta,\beta$ -diphenylethyl *p*-tolyl sulfone with  $PCl_5$  at 200° for 2 hrs. see (4); for formn. of  $\bar{C}$  during condensation of chloral (3:5210) with  $C_6H_6 + AlCl_3$  in  $CS_2$  see (10) (6).]

CHEMICAL BEHAVIOR OF  $\bar{C}$ 

Reduction. [ $\bar{C}$  on reduction with conc. HI + P at 170-210° gives (7) *unsym.*-diphenylethane [Beil. V-605, V<sub>1</sub>-(285), V<sub>2</sub>-(509)] and bibenzyl (1:7149).]

Addition of halogens.  $\bar{C}$  with  $Cl_2$  in dry  $CHCl_3$  adds 1 mole halogen giving (8) (5) 1,1,1,2-tetrachloro-2,2-diphenylethane, m.p. 35° (6). —  $\bar{C}$  with excess  $Br_2$  htd. on aq. bath until excess reagt. evaporates gives (6) 1,2-dibromo-1,1-dichloro-2,2-diphenylethane, cryst. from alc., m.p. 120.0-120.5° (6).

Behavior with alkalis. [ $\bar{C}$  with aq. NaOH at 150°, or with alc. NaOH in s.t. at 100°, is substantially unaffected within 24 hrs. (3); however,  $\bar{C}$  with alc. KOH in stainless-steel bomb at 150° for 24 hrs. gives (73% yield (3)) diphenylacetic acid (1:0765), m.p. 147-148° cor. (3) cf. (1). — Note also that, although  $\bar{C}$  with dry NaOMe in  $C_6H_6$  does not react even in s.t. at 180° for 36 hrs. yet  $\bar{C}$  with dry NaOMe (2 moles) on direct distn. gives diphenylacetylene (tolane) and other products (15).]

[Note also that  $\bar{C}$  with Na phenolate at 225° for 24 hrs. gives (3)  $\alpha$ -hydroxy- $\alpha,\alpha$ -diphenylacetaldehyde diphenylacetal (benzaldehyde diphenylacetal), m.p. 111.5°-112° (3).]

Behavior with  $H_2SO_4$  or  $HNO_3$ . With  $H_2SO_4$ .  $\bar{C}$  with conc.  $H_2SO_4$  on warming first becomes yellow, then dark green, later violet, and ultimately brownish red. (5) (6).

With  $HNO_3$ .  $\bar{C}$  on addition to 12 pts. ice-cold fuming  $HNO_3$  and subsequently pouring onto ice gives (14) 1,1-dichloro-2,2-bis-(*p*-nitrophenyl)ethylene, yellowish ndis. from hot alc., m.p. 172° (14); note also that from the mother liquors of recrystn. there can also be obtd. some 4,4'-dinitrobenzophenone, m.p. 153-159°, resulting from some simultaneous oxidn. (14).

Colorless shining lfts. (from alc.) with camphoraceous odor. Eas. sol. ether,  $C_6H_6$ ,  $CHCl_3$ , or  $CCl_4$ .

[For prepn. of  $\bar{C}$  (100% yield (1)) from the solid stereoisomer (3:0870) of 1,2,3,4-tetrachlorobutadiene-1,3 see (1); for formn. of  $\bar{C}$  from 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) by actn. of u.v. light see (1).] [Note that octachlorobutane (3:2000) has also been reported in same reactn.] [For formn. of  $\bar{C}$  together with its liquid stereoisomer (3:9046) by actn. of  $Cl_2$  upon the high-boilg. fraction obtd in the prepn. of trichloroethylene (3:5170) from 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) see (1).]

$\bar{C}$  in alc. refluxed with Zn/Cu couple for 1 hr. yields (1) the solid stereoisomer of 1,2,3,4-tetrachlorobutadiene-1,3 (3:0870), m.p.  $50^\circ$  (1).

3:1945 (1) Müller, Hüther, *Ber.* 64, 559-600 (1931); *C.A.* 25, 3956-3957 (1931).

### 3:1960 PIPERONYLOYL CHLORIDE

(3,4-Methylenedioxy-  
benzoyl chloride)

$C_8H_6O_3Cl$

Beil. XIX - 270

XIX<sub>1</sub>—

M.P.  $80^\circ$  (1) (2)

B.P.  $155^\circ$  at 25 mm. (2)  
 $140-141^\circ$  at 8 mm. (1)

[For prepn. of  $\bar{C}$  from piperonylic acid (1:0865) with excess  $SOCl_2$  at  $100^\circ$  (1) or in  $C_6H_6$  (90-95% yield (4)), or with  $PCl_5$  (2), see indic. refs. — Note, however, that at higher temps. the dioxymethylene group is also attacked: e.g., piperonylic acid htd. in a s.t. with  $SOCl_2$  at  $180-200^\circ$  for 8 hrs. (1) or refluxed 3 hrs. with 3 moles  $PCl_5$  (1) yields  $\mu,\mu$ -dichloropiperonyl chloride (Beil. XIX-272, XIX<sub>1</sub>-(743)), b.p.  $140-150^\circ$  at 12 mm. (1).]

$\bar{C}$  with diazomethane yields (3) piperonyl diazomethyl ketone which with ammonia yields (3) homopiperonylamide, m.p.  $173^\circ$ ;  $\bar{C}$  with ethyl sodio-acetoacetate in dry ether, followed by hydrolysis (as specified (4)) of the acetyl group, yields ethyl piperonylacetate, m.p.  $42.5^\circ$  (4).]

$\bar{C}$  on hydrolysis with aq. yields piperonylic acid (1:0865), m.p.  $228^\circ$ .

① Piperonylamide [Beil. XIX-270]: this. from alc., m.p.  $169^\circ$ .

② Piperonylanilide [*N*-phenyl-piperonylamide]: cryst. from dil. alc., m.p.  $146-147^\circ$  cor. (5). [From  $\bar{C}$  + 2 moles aniline in  $C_6H_6$  (5).]

③ Piperonylo-*p*-toluidide: cryst. from dil. alc., m.p.  $149-149.5^\circ$  cor. (5). [Similarly using *p*-toluidine (5).]

④ Piperonylo- $\alpha$ -naphthalide: cryst. from dil. alc., m.p.  $192-193^\circ$  cor. (5). [Similarly using  $\alpha$ -naphthylamine (5).]

⑤ Piperonylo- $\beta$ -naphthalide: cryst. from dil. alc., m.p.  $156.5-157^\circ$  cor. (5). [Similarly using  $\beta$ -naphthylamine (5).]

 $C_{10}H_7Cl_3$ 

Beil. V - 544

V<sub>1</sub>—V<sub>2</sub>—

M.P. 82-83° (1)

81° (2)

80.5° (1)

(See text.)

Pr. from ether + alc. — The behavior of  $\bar{C}$  on fusion is characteristic: if the fused  $\bar{C}$  in a m.p. tube is allowed to cool to 68° and then withdrawn, it immediately solidifies to a translucent mass which on swift reimmersion into the bath shows m.p. 66-67° but if left for a few seconds in the air suddenly becomes opaque forming a cylinder of m.p. 82-83°, retracted from the wall of the capillary m.p. tube. This change (although slower) also occurs in the translucent form if cooled below 66° (1).

[For prepn. of  $\bar{C}$  from 1-chloronaphthalene tetrachloride [Beil. V-493] with alc. NaOEt (61.6% yield (1)) (2) (3) see indic. refs.; from 1,3-dichloronaphthol-2 (3:1990) by distn. with  $PCl_5$  see (2); from sodium 1,2,3-trichloronaphthalenesulfonate-7 (1) by hydrolysis with superhdt. steam see (1).]

[ $\bar{C}$  treated with  $ClSO_3H$  in  $CS_2$  and reacta. prod. conv. to sodium salt as directed (1) gives mixt. of sodium 1,2,3-trichloronaphthalenesulfonate-5 (corresp. sulfonyl chloride, m.p. 131°, corresp. sulfonamide, m.p. 249°) and sodium 1,2,3-trichloronaphthalenesulfonate-7 (corresp. sulfonyl chloride, m.p. 157°, corresp. sulfonamide, m.p. 245°) (1).]

[ $\bar{C}$  with 7 pts. fuming  $H_2SO_4$  (10%  $SO_3$ ) shaken 15 min. at 100° yields (1) 1,2,3-trichloronaphthalene-5,7-disulfonic acid (corresp. bis-(sulfonyl chloride), m.p. 184° (1)).]

**3:2170  $\gamma$ -CHLOROCROTONIC ACID**

(4-Chlorohuten-2-oic  
acid-1) $C_4H_5O_2Cl$ 

Beil. II-418

M.P. 83° (1)

82° (2)

81-82° (3) (4)

B.P. 117-118° at 13 mm. (5)

White cryst., eas. sol. ether or AcOH, can be recrystallized from pet. ether (1) or from hot aq. (5). —  $\bar{C}$  distills under reduced press. without decomposition (5). — Note that m.p. 76.7-77.5° first reported (5) was later (2) found to be erroneous and same sample had actually m.p. 81-82° (2).

Note that, although  $\bar{C}$  is capable of existing in two geometrically isomeric forms, only this one is known; collateral evidence (but not actual proof) indicates that  $\bar{C}$  probably represents the *trans* stereoisomer.

[For prepn. of  $\bar{C}$  from ethyl  $\gamma$ -chlorocrotonate (3:8657) by hydrolysis with  $\text{Ba}(\text{OH})_2$  below  $0^\circ$  (60% yield (1) (6)) (4), or less advantageously with 30% aq. KOH in alc. soln. at  $-15^\circ$  (40% yield (1)) (5) (note that  $\gamma$ -chlorovinylacetic acid, m.p.  $10^\circ$  (1), is often obtd. (1) (4) as by-prod.); for formn. of  $\bar{C}$  from  $\beta$ - $\gamma$ -dichloro-*n*-butyric acid [Beil. II-280] with KOH (poor yield (5)), from *trans*- $\gamma$ -hydroxycrotonic acid [Beil. III-376] with  $\text{SOCl}_2$  in pyridine (2), or from methyl  $\alpha$ -chloro- $\alpha$ -vinylacetate by hydrolysis (3) (7) (presumably as a result of allylic transposition of  $\alpha$ -chloro- $\alpha$ -vinylacetic acid under the influence of alkali) see indic. refs.]

$\bar{C}$  dissolved in excess aq. 1 *N* NaOH and shaken with  $\text{H}_2$  in pres. of Pd/activated carbon is readily dehalogenated giving (95% yield (1)) crotonic acid (1:0425); with sufficient  $\text{H}_2$  this prod. ultimately reduces to *n*-butyric acid (1:1035).

[ $\bar{C}$  by cat. hydroxylation with  $\text{BaClO}_3$ /osmic acid gives (yields: 75% (6), 78% (9)) *threo*- $\gamma$ -chloro- $\alpha,\beta$ -dihydroxy-*n*-butyric acid, m.p.  $100^\circ$  (9); this prod. with silver oxide as directed replaces Cl by OH giving (59% yield (6)) *d,l*-threonic acid, m.p.  $98^\circ$  (6).]

$\bar{C}$  adds  $\text{Br}_2$  (1 mole) yielding (3)  $\gamma$ -chloro- $\alpha,\beta$ -dibromo-*n*-butyric acid, cryst. from cyclohexane, m.p.  $119$ - $120^\circ$  (3)

$\bar{C}$  with NaI in dry acetone ppts. NaCl and gives (86% yield (1))  $\gamma$ -iodocrotonic acid, yel. ndls. from lgr., m.p.  $108$ - $108.5^\circ$  (1).

[ $\bar{C}$  on neutralization with  $\text{NH}_4\text{OH}$  and htg. with  $(\text{NH}_4)_2\text{SO}_3$  at  $50^\circ$  for 12 hrs. gives (4)  $\gamma$ -sulfocrotonic acid, very hygroscopic cryst., m.p.  $94$ - $96^\circ$ .]

The acid chloride corresponding to  $\bar{C}$  is unreported.

— Methyl  $\gamma$ -chlorocrotonate: unreported.

— Ethyl  $\gamma$ -chlorocrotonate: b.p.  $191$ - $193^\circ$  at 760 mm. (5) (see 3:8657).

—  $\gamma$ -Chlorocrotonamide: cryst. from hot aq., m.p.  $135.5$ - $136^\circ$  (8),  $130$ - $132^\circ$  (5).

[Reported only by partial hydrolysis of  $\gamma$ -chlorocrotononitrile (5) (8).]

—  $\gamma$ -Chlorocrotonanilide: unreported.

Long colorless ndls from alc.; volatile with steam; sublimes readily. — Almost insol. cold alc., apprec. sol. boilg. alc.; eas. sol. ether,  $\text{C}_6\text{H}_6$ ,  $\text{CHCl}_3$ ,  $\text{CCl}_4$ , or  $\text{CS}_2$ ; spar. sol. conc.  $\text{HNO}_3$ .

[For prepn. of  $\bar{\text{C}}$  from nonachlorobenzophenone-*o*-carboxylic acid [o-(pentachlorobenzoyl)-tetrachlorobenzoic acid] [Beil. X<sub>1</sub>-(358)] by btg with 10 pts conc.  $\text{H}_2\text{SO}_4$  at 200-250° for ½ hr. (simplest prepn. of pure  $\bar{\text{C}}$ ) see (12); for formn. of  $\bar{\text{C}}$  from 2,3,4,5,6-pentachloroacetophenone (6) or 2,3,4,5,6-pentachlorobenzophenone (11) by  $\text{KOH}/\text{NaOH}$  fusion see indic. refs., from 2,3,4,5,6-pentachlorobenzaldehyde (3:4892) (2) by htg. with 50% aq.  $\text{KOH}$  5 hrs at 100° (88% yield) see (2).]

[For prepn. of  $\bar{\text{C}}$  from 2,3,5,6-tetrachloroaniline (7) via diazotization and use of  $\text{Cu}_2\text{Cl}_2$  reactn. see (7), from 2,3,5-trichloro-*p*-phenylenediamine via tetrazotization in  $\text{AcOH}$  with nitrosylsulfuric acid and use of  $\text{Cu}_2\text{Cl}_2$  reactn. (80% yield) see (3).]

[For formn. of  $\bar{\text{C}}$  from benzene with  $\text{Cl}_2$  (7), or  $\text{Cl}_2$  + cat. (20), or  $\text{Cl}_2$  in pres. of  $\text{I}_2$  (18), or  $\text{AlCl}_3$  (19) see indic. refs.; from chlorobenzene with  $\text{Cl}_2$  +  $\text{Cu}$  at 200° see (21); from 1,3,5-trichlorobenzene (3:1400) with  $\text{Cl}_2$  +  $\text{Al}/\text{Hg}$  see (17); from all three tetrachlorobenzenes with  $\text{Cl}_2$  +  $\text{Al}/\text{Hg}$  see (17); from 1,2,4,5-tetrachlorobenzene (3:4115) in  $\text{SOCl}_2$  or  $\text{CCl}_4$  with  $\text{SO}_2\text{Cl}_2$  +  $\text{AlCl}_3$  +  $\text{S}_2\text{Cl}_2$  see (8) (note that under these circumstances *p*-dichlorobenzene (3:0980) gives a mixt. of tetra and hexachlorobenzenes (8) (22)); from lower chlorinated derivs. of benzene by btg. with  $\text{FeCl}_3$  see (5); from diphenyl sulfone with  $\text{Cl}_2$  in sunlight followed by treat. with alc.  $\text{KOH}$  see (13) (23); from tetrachlorobenzyl chloride with  $\text{Cl}_2$  see (16); from acet-*N*-nitro-2,3,5,6-tetrachloroaniline on htg. in toluene or from parent base on attempted acetylation see (15); from trichloroethylene (3:5170) at 700° see (9); from iodopentachlorobenzene with  $\text{MeOH}/\text{NaOH}$  see (11).]

[For formn. of  $\bar{\text{C}}$  from various chlorine addition products derived from *o*-dichlorobenzene (3:6055) (4), *m*-dichlorobenzene (3:5960) (4), *p*-dichlorobenzene (3:0980) (4), 1,2,4,5-tetrachlorobenzene (3:4115) (24), and even  $\bar{\text{C}}$  itself (25) see indic. refs.]

[ $\bar{\text{C}}$  with liq.  $\text{Cl}_2$  in s.t. in sunlight adds 2  $\text{Cl}_2$  with considerable sluggishness yielding (26) (25) a mixt. of two stereoisomeric nonachlorocyclohexenes.]

[ $\bar{\text{C}}$  with fuming  $\text{H}_2\text{SO}_4$  gives on protracted btg. (27) a red dyestuff, sol. in alk. with deep red color.]

[ $\bar{\text{C}}$  with  $N/2$   $\text{NaOMe}$  in  $\text{MeOH}$  in s.t. at 160° for 7½ hrs. gives (7) 2,3,5,6-tetrachlorophenol, m.p. 115° (7) (benzoate, m.p. 136° (28)), accompanied by a small amt. 2,3,4,5-tetrachlorophenol, itself not obt'd. pure but yielding (28) a benzoate of m.p. 110° (28). — [For further study of actn. of  $\text{MeOH}/\text{NaOH}$  on  $\bar{\text{C}}$  see (29) (30).]

$\bar{\text{C}}$  on nitration, e.g., with 7-8 wt. pts.  $\text{HNO}_3$  ( $D = 1.52$ ) at 100° for 1 hr. (7), gives (7) (9) (18) (31) pentachloronitrobenzene [Beil. V-247], ndls. from alc., tbls. from  $\text{CS}_2$ , m.p. 146° (9) (18) (31), 143° (7); note that since  $\bar{\text{C}}$  is spar. sol. in conc.  $\text{HNO}_3$  any unchanged material may separate with the crude prod. (31). — [This pentachloronitrobenzene with

N/10 NaOMe in MeOH boiled for 8 hrs. loses NO<sub>2</sub> instead of Cl yielding (31) methyl pentachlorophenyl ether (pentachloroanisole), m.p. 104-105° (31); cf. also under pentachlorophenol (3:4850).]

### 3:2295 PENTACHLOROBENZOYL CHLORIDE

C<sub>7</sub>OCl<sub>6</sub>

Beil. S.N. 938

M.P. 87° (1)

Colorless tbs. from hot alc.

[For prepn. of  $\bar{C}$  from *unsym.*-tetrachlorophthalyl (di)chloride (3,3,4,5,6,7-hexachlorophthalide) [Beil. XVIII<sub>1</sub>-(484)] on htg. nt 300° in pres. of Cl<sub>2</sub> see (1).]

$\bar{C}$  during protracted htg. loses CO yielding (1) hexachlorobenzene (3:4939) (this type of decompn. is generally facilitated by AlCl<sub>3</sub> although in this case this aspect has not been reported).

$\bar{C}$  with MeOH on refluxing for 30 hrs. gives (1) methyl pentachlorobenzoate m.p. 97° (1); note that esterification is slow and that  $\bar{C}$  can be recrystallized from EtOH without change.

$\bar{C}$  on hydrolysis with alc. KOH, followed by acidification, yields (1) pentachlorobenzoic acid (3:4910).

3:2295 (1) Kirpal, Kunze, *Ber.* 62, 2104-2105 (1929).

### 3:2300 TRICHLOROPARALDEHYDE (Chloroacetaldehyde trimer; 2,4,6-tris-(chloromethyl)- trioxane-1,3,5)

C<sub>6</sub>H<sub>3</sub>O<sub>3</sub>Cl<sub>3</sub>Beil. XIX - 386  
XIX<sub>1</sub>-(807)

M.P. 87-87.5° cor. (1)

B.P. 142-144° at 10 mm. (2)  
140° at 10 mm. (1)

Colorless ndis. from ether; insol. aq., spar. sol. cold alc., eas. sol. hot alc. or in ether.

[For prepn. of  $\bar{C}$  from chloroacetaldehyde (3:7212) (or its hydrate) with  $\frac{1}{2}$  vol. cold conc.  $H_2SO_4$  see (1) (3) (4).]

$\bar{C}$  on distn. at ord. press. (1) (2) (3) (4) depolymerizes to monomeric chloroacetaldehyde (3:7212), b.p.  $85^\circ$ .

3:2300 (1) Natterer, *Monatsh.* **3**, 459-464 (1882). (2) Späth, *Monatsh.* **36**, 6-7 (1915). (3) Hellerich, Speidel, *Ber.* **54**, 2634-2635 (1921). (4) Lespieau, *Bull. soc. chim.* (4) **43**, 200-201 (1928).

### 3:2325 1,2,7-TRICHLORONAPHTHALENE

$C_{10}H_5Cl_3$

Beil. V - 545

$V_1$ -(263)

$V_2$ —

M.P.  $88^\circ$  also  $84^\circ$  (1) (2)

(See Text.)

$\bar{C}$  shows the double m.p. behavior indicated also for several of its isomers, e.g., 1,2,3-isomer (3:2125), 1,2,5-isomer (3:1930), 1,3,8-isomer (3:2420), 1,4,6-isomer (3:1625).

[For prepn. of  $\bar{C}$  from 1-chloro-7-sulfonaphthylamine-2 [Beil. XIV-765] via diazotization and use of  $Cu_2Cl_2$  reactn. see (1) (2); from 1,2-dichloronaphthalenesulfonyl chloride-2 [Beil. XI-184] (2) (3), from 1-chloro-7-nitronaphthalenesulfonyl chloride-2 [Beil. XI-188] (4), from 2-chloro-1-nitronaphthalenesulfonyl chloride-2 [Beil. XI-189] (5) (2), or from 1-chloronaphthalene-2,7-bis-(sulfonyl chloride) [Beil. XI-217] (2), each with  $PCl_5$  as directed, see indic. refs.]

$\bar{C}$  treated with  $ClSO_3H$  in  $CS_2$  and reactn. prod. conv. to sodium salt as directed (1) yields sodium 1,2,7-trichloronaphthalenesulfonate-X (corresp. sulfonyl chloride, m.p.  $176^\circ$  (1)).]

3:2325 (1) Turner, Wynne, *J. Chem. Soc.* **1941**, 247, 252. (2) Armstrong, Wynne, *Chem. News* **71**, 253-254 (1895). (3) Armstrong, Wynne, *Chem. News* **59**, 189 (1889). (4) Cleve, *Chem. Ztg.* **17**, 398 (1893). (5) Cleve, *Ber.* **25**, 2486-2487 (1892).

### 3:2340 2,5-DICHLOROBENZOPHENONE

(2,5-Dichlorophenyl phenyl ketone)

$C_{13}H_9OCl_2$  Beil. S.N. 652

M.P.  $88^\circ$  (1) (3)

$85-86^\circ$  (2)

Cryst. (from alc. (1)). —  $\bar{C}$  does not form a  $NaHSO_3$  epd. (1).

[For prepn. (20% yield (1)) from *p*-dichlorobenzene (3:0980) +  $BzCl$  (3:6240) +  $AlCl_3$  see (1) (2).]

$\bar{C}$  fused for 3 hrs. at  $200^\circ$  with a mixt. of  $KOH$  +  $NaOH$  gives (3) *p*-dichlorobenzene (3:0980) (65% yield (3)) and  $BzOH$  (1:0715) (91% yield (3)).

$\bar{C}$  on oxidn. with  $KMnO_4$  solu. yields (1) 2,5-dichlorobenzoic ac. (3:4340), m.p.  $150^\circ$  (1).

⊕ 2,5-Dichlorobenzophenone oxime: from  $\bar{C}$  in alc. on htg. with  $NH_2OH.HCl$  +  $BaCO_3$  for 3 days (10% yield (1)); m.p.  $135^\circ$  (on rapid htg.),  $207^\circ$  (on slow htg.) (1). [This

oxime upon Beckmann rearr. with 10 pts. conc.  $\text{H}_2\text{SO}_4$  at  $100^\circ$  for 1 hr. gives benz-2,4-dichloroanilide, m.p.  $122^\circ$  (1).]

3:2310 (1) de Crauw, *Rec. trav. chim.* 50, 767-768 (1931). (2) Ganzmüller, *J. prakt. Chem.* 138, 311-312 (1933). (3) Lock, Rödiger, *Ber.* 72, 869 (1939).

3:2360 2,3,5,5,6-HEXACHLORO-CYCLOHEXENE-2-DIONE-1,4

 $\text{C}_6\text{O}_2\text{Cl}_6$ 

Beil. VII-574  
VII<sub>1</sub>—

M.P.  $89^\circ$  (1)  
 $86-87^\circ$  (2)

B.P.  $275-285^\circ$  dec. (1)  
 $182-185^\circ$  at 45-50 mm. (1)

Cryst. (from ether/pet. ether). — Lachrymatory odor. — Eas. volatile with steam; on distn. at atm. press. dec. into chloranil (3:4978) and  $\text{Cl}_2$ . — Eas. sol. ether,  $\text{CHCl}_3$ ; fairly eas. sol. alc.,  $\text{C}_6\text{H}_6$ , lgr.; insol. aq.

[For prepn. from chloranil (3:4978) by treatment with  $\text{MnO}_2$  + conc.  $\text{HCl}$  in s.t. for 10 hrs. at  $180^\circ$  see (1); from *p*-aminophenol hydrochloride in  $\text{AcOH}$  on treatment with  $\text{Cl}_2$  see (1).]

[For use of  $\bar{\text{C}}$  as fungicide see (3).]

$\bar{\text{C}}$  with  $\text{KI}$  in  $\text{AcOH}$  yields (1) chloranil (3:4978). —  $\bar{\text{C}}$  on reduction with  $\text{SnCl}_2$  yields (1) tetrachlorohydroquinone (3:4941).

$\bar{\text{C}}$  on shaking with 10% aq.  $\text{NaOH}$  slowly dissolves with decompn. into dichloromaleic acid, trichloroethylene, and  $\text{HCl}$  (1).

① 3,5,5,6,6-Pentachlorocyclohexanetrione-1,2,4-anil-2 [Beil. XII-212]: in alm. 100% yield from  $\bar{\text{C}}$  (1 pt.) in  $\text{AcOH}$  (5 pts.) htd.  $\frac{1}{2}-\frac{3}{4}$  hr. at  $100^\circ$  with aniline (1 pt.), then cooling; red cryst., m.p.  $144^\circ$  (1). [This prod. is stable to conc.  $\text{HCl}$  but on stdg. with 6-8 pts. 10% aq.  $\text{NaOH}$  reacts suddenly with evoln. of ht. and odor of carbilamine; after dilution and filtration, acidification of the filtrate ppts. 1-phenyl-3,5,6-trichloropyridone-4-carboxylic acid-2 [Beil. XXII-298], m.p.  $245^\circ$  dec. (1)]

3:2375 3,5-DICHLOROPHTHALIC ANHYDRIDE

 $\text{C}_8\text{H}_2\text{O}_3\text{Cl}_2$ 

Beil. XVII-483  
XVII<sub>1</sub>—

M.P.  $89^\circ$  (1) (2)

[See also 3,5-dichlorophthalic acid (3:4580).]

Ndls. from lgr.; eas. sol. ether,  $\text{C}_6\text{H}_6$ ,  $\text{CHCl}_3$ .

[For prepn. from 3,5-dichlorophthalic acid (3:4580) by htg. AcCl (1), see indic. refs.; from 3,5-disulfophthalic acid (2) with  $\text{SOCl}_2$  at  $180^\circ$  see (2)]

$\bar{C}$  htd. with resorcinol + a drop of conc.  $H_2SO_4$ , then dislvd. in alk. and diluted, gives brilliant greenish fluorescence (1).

$\bar{C}$  with hydroquinone (1:1590) +  $AlCl_3$  +  $NnCl$  htd. at 200-220° for 40 min. gives (3) 5,7-dichloro-1,4-dihydroxyanthraquinone (5,7-dichloroquinizarin), red ndls. from xylene, m.p. 231-232° (3).]

$\bar{C}$  with steam passed over cat. at 380-420° loses  $CO_2$  presumably yielding (4) 2,4-dichlorobenzoic acid (3:4560) and/or 3,5-dichlorobenzoic acid (3:4810).]

$\bar{C}$  on melting and treatment with dry  $NH_3$  gas yields (1) 3,5-dichlorophthalimide [Beil. XXI-501], yel. ndls. from hot nle., m.p. 208° (1);  $\bar{C}$  on htg. with 1 mole aniline until evolv. of gas stops gives (1) 3,5-dichlorophthalanil [Beil. XXI-501], yel. ndls. from nle., m.p. 150.0-150.5° (1).

$\bar{C}$  is insol. in cold aq. but hydrolyzes on boilg;  $\bar{C}$  on sapon. with standard alk. (Sap. Eq. = 108.5) followed by acidifn. yields 3,5-dichlorophthalic acid (3:4810) q.v.

3:2375 (1) Crossley, LeSueur, *J. Chem. Soc.* 81, 1536-1537 (1902). (2) Waldmann, Schwenk, *Ann.* 457, 293-294 (1931). (3) Waldmann, *J. prakt. Chem.* (2) 130, 99-100 (1931). (4) Jaeger (to Selden Co.), U.S. 1,004,516, June 26, 1931, *Cent.* 1931, II 3047.

3:2395 *unsym.-o-PHTHALYL*  
**DICHLORIDE**  
(*unsym.-o*-Phthaloyl dichloride;  
3,3-dichlorophthalide)

$C_8H_4O_2Cl_2$

Beil. IX - 895  
XVII<sub>1</sub>-(102)

[See also *sym.-o-phthalyl dichloride* (3:6900).]

M.P. 89° (1)  
88-89° (2)  
88.5° (3) (5)  
87-89° (4)  
84° (6)

$D_4^{20} = 1.3320$  (6)  
 $D_4^{20} = 1.351$  (5)

Prisms from  $C_6H_6$  (2), cryst. from pet. eth. (b.p. 20-50°) (4). —  $\bar{C}$  is much less reactive but far more lachrymatory (7) than *sym.-o*-phthalyl dichloride (3:6900). — The m.p. of  $\bar{C}$  is not sharp because of beginning of conversion to *sym.* isomer (4) (5), and  $\bar{C}$  shows progressive change of density when kept at 90° for 1 hr (5) —  $\bar{C}$  on distillation is converted to the *sym.* isomer and therefore shows b.p. of the latter; this change is accelerated by presence of  $AlCl_3$  or  $SnCl_4$  (1) (2) or by  $HCl$  —  $\bar{C}$  should therefore be preserved in a desiccator over soda-lime (2). — For f.p./compn. diagram of  $\bar{C}$  with its *sym.* isomer see (3); the eutectic has m.p. +8° and conts 23%  $\bar{C}$ .

[For prepn. of  $\bar{C}$  from *sym.-o*-phthalyl dichloride by htg with  $AlCl_3$  at 100° for 8-10 hrs. (72% yield) see (4).]

$\bar{C}$  in anhydrous formic acid reacts below 40° evolving  $HCl$  +  $CO$  (7) (the *sym.* isomer reacts much more readily, even below 25° (7)).

$\bar{C}$  on shaking at 0° with 10 vols. 7% aq.  $NH_4OH$  followed by acidification yields (1) (7) *o*-cyanobenzoic acid [Beil. IX-814, IX<sub>1</sub>-(365)], m.p. 190° dec., converted by htg. to phthalimide, m.p. 228.5° u.c. [Exactly this same result is obtd. with the *sym.* isomer.]

[For studies of rate of reactn. of  $\bar{C}$  with  $MeOH$  or with aniline see (2) (8).]

[For differentiation of  $\bar{C}$  from its *sym.* isomer by use of piperidinium *N*-piperidyldithiocarbamate (from piperidine + aq. +  $CS_2$ ) see (6) (7).]

### 3:2635 7,8-DICHLORONAPHTHOL-1

 $C_{10}H_6OCl_2$ 

Beil. VI - 613

 VI<sub>1</sub>—

 VI<sub>2</sub>—

M.P. 95° (1) (2)

Ndls. from alc. (1) (2); rough more sol. in lgr. than isomeric 6,7-dichloronaphthol-1 (3:4315) (3).

[For prepn. from  $\beta$ -(3,4-dichlorobenzal)propionic ac. [Beil. IX-614] by distn. see (1) (2) (3);  $\bar{C}$  is separated from the larger proportion of 6,7-dichloronaphthol-1 (3:4315) by its greater soly. in lgr. (3).]

$\bar{C}$  in alk. soln. coupled with diazotized naphthionic acid (1-aminonaphthalenesulfonic acid-4) gives a dark violet color which upon acidification turns bluish cherry-red (3). [Dif. from 6,7-dichloronaphthol-1 (3:4315) q.v.]

⑦ 7,8-Dichloro-1-naphthyl acetate: cryst. from dil. alc., m.p. 87-88° (1) (2)

3:2635 (1) Armstrong, Wynne, *Chem. News* **71**, 253 (1895). (2) Armstrong, Wynne, *Proc. Chem. Soc.* **11**, 78-79 (1893); *Ber.* **29**, Referate 223-224 (1896). (3) Erdmann, Schwechten, *Ann.* **275**, 286 (1893).

### 3:2637 3,5-DICHLORO-2-HYDROXY-BENZALDEHYDE (3,5-Dichlorosalicylaldehyde)

 $C_7H_4O_2Cl_2$ 

Beil. VIII - 54

 VIII<sub>1</sub>—

M.P. 95-96° (1)

95° (2) (3)

94-95° (4)

Pale yel. scales from AcOH; insol. aq., sol. in usual org. solvents.

[For prepn. of  $\bar{C}$  from *o*-hydroxybenzaldehyde (salicylaldehyde) (1:0205) in AcOH or  $CHCl_3$  with  $Cl_2$  (2moles) (yields: 90% (3), 70% (4)) (1) see indic. refs.; for formn. from 2,4-dichlorophenol (3:0560) with hexamethylenetetramine in glycerol +  $H_3BO_3$  with  $H_2SO_4$  as directed (7% yield) see (1).]

[For study of bactericidal props. of  $\bar{C}$  see (9).]

$\bar{C}$  is sol. in dil. aq. alk. or  $NH_4OH$  yielding yel. solns.;  $\bar{C}$  is stable toward dil. aq. acids or even hot conc.  $HCl$  but with conc.  $H_2SO_4$  or  $HNO_3$  dec. on warming (2).

$\bar{C}$  in dil. aq.  $NaOH$  oxidized with dil. (3%)  $H_2O_2$  as directed yields (1) 3,5-dichloro-1,2-dihydroxybenzene (3,5-dichlorocatechol) (3:3525), pr. from cold aq., m.p. 83-84° (1)]

[ $\bar{C}$  with  $Ac_2O$  +  $NaOAc$  (Perkin condensation) yields (5) (6) 6,8-dichlorocoumarin,

cryst. from  $C_6H_6$ , m p.  $160^\circ$  (5),  $157^\circ$  (6) (this prod. on reduction with Na/Hg gives (6)  $\gamma$ -(3,5-dichloro-2-hydroxyphenyl)propionic acid (3,5-dichloromelilotic acid), m.p.  $122^\circ$  (6), on soln. in aq. alk. and boilg. with  $HgO$  or  $Hg(OAc)_2$  yields (7) 3,5-dichloro-2-hydroxycinnamic acid (3,5-dichloro-*o*-coumaric acid), cryst. from dil. alc., dec.  $242^\circ$  (7), or on oxidn. with  $KMnO_4$  gives alm. quant. yield (5) of 3,5-dichlorosalicylic acid (3:4935), m p.  $214^\circ$  (5)) —  $\bar{C}$  with  $\omega$ -(phenylacetyl)acetophenone (1,4-diphenylbutanedione-1,3) in abs. alc. with a little piperidine 7-11 hrs. at  $100^\circ$  condenses giving (16% yield (8)) 6,8-dichloro-3-phenylcoumarin, colorless ndls. from AcOH, m p.  $193-195^\circ$  (8).]

$\bar{C}$  with  $EtMgBr$  yields corresp. ter. alc., viz., 3,5-dichloro-2-hydroxyphenyl-ethylcarbinol, which at 16 mm. press. loses aq. at  $140^\circ$  giving (80% yield (4)) 2,4-dichloro-6-propenylphenol, m p.  $46-47^\circ$  (4).]

- ③ 3,5-Dichloro-2-hydroxybenzaldehyde (3,5-dichlorosalicylaldehyde): colorless ndls. from alc./aq. (4:1) (3), m.p.  $193-196^\circ$  (4),  $193^\circ$  (2). [From  $\bar{C}$  +  $NH_2OH.HCl$  in alc. on htg. 1 hr. and pouring into aq. (alm. quant. yield) (4).] [This oxime with  $Ac_2O$  on boilg. 3 hrs. gives alm. quant. yield (4) of 3,5-dichloro-2-acetoxymethylbenzotrile, colorless ndls. from alc., m p.  $78^\circ$  (4).]
- ④ 3,5-Dichloro-2-hydroxybenzaldehyde phenylhydrazone: pale yel. tpls. from alc., m p.  $153^\circ$  (4). [From  $\bar{C}$  in alc. with phenylhydrazine on shaking 10 min. (4).]
- ⑤ 3,5-Dichloro-2-hydroxybenzaldehyde semicarbazone: alm. colorless ndls. from AcOH, m p.  $227^\circ$  dec. (4). [From  $\bar{C}$  in AcOH with semicarbazide  $HCl$  in alm. quant. yield after  $\frac{1}{2}$  hr. boilg. (4).]

3:2637 (1) Dakln, *Am. Chem. J.* 42, 488-489 (1909). (2) Duff, *J. Chem. Soc.* 1911, 547-549. (3) Biltz, *Stepf. Ber.* 37, 4027-4031 (1904). (4) Clausen, *Tietze, Ann.* 449, 100 (1926). 3:2638 2,6-DICHLORO-3,5-DIMETHYL-  
PHENOL  
(2,6-Dichloro-*m*-5-xyleneol)

$C_8H_6OCl_2$  Beil. S.N. 529

M.P.  $95-96^\circ$  (1)

(See also text.)

Cryst. from pet. ether. — Exs. sol.  $CHCl_3$ ,  $CCl_4$ .

[For prepn. of  $\bar{C}$  from 3,5-dimethylphenol (*m*-5-xyleneol) (1:1455) with  $SO_2Cl_2$  (2 moles) in  $CHCl_3$  see (1); note, however, that structure there assigned is 2,4-dichloro-3,5-dimethylphenol (3:2182) q.v.]

The nitration of  $\bar{C}$  has not been reported, and the expected 4-nitro-2,6-dichloro-3,5-dimethylphenol is unknown.

— 2,6-Dichloro-3,5-dimethylphenyl acetate: unreported.

— 2,6-Dichloro-3,5-dimethylphenyl benzoate: unreported.

3:2638 (1) *Lesser, Gad, Ber.* 56, 975 (1923).

## 3:2640 2-CHLOROPHENYLACETIC

ACID

(o-Chloro- $\alpha$ -toluic acid) $C_8H_7O_2Cl$ 

Beil. IX - 447

IX-1(78)

95-96°	(2)
95°	(3) (4)
94-95°	(2)
94°	(6)
92°	(5)

Colorless ndls. from aq. [For study of ioniz. const. of  $\bar{C}$  see (1) (6) (9) (10) (13); for fate in animal body see (3); for studies of bacteriostatic props. see (11) (12).]

[For prepn. of  $\bar{C}$  from o-chlorobenzyl chloride (3:6400) via conversion to o-Cl.C<sub>6</sub>H<sub>4</sub>.CH<sub>2</sub>MgCl and subsequent carbonation with CO<sub>2</sub> see (2); from o-chlorophenylacetamide (see below) with nitrous acid see (3) (4) (6); from 2-phenyl-4-(2-chlorobenzal)oxazolone-5 (the azlactone from o-chlorobenzaldehyde + N-benzoylglycine + Ac<sub>2</sub>O (5)) [Beil. XXVII-298]] on boilg. with aq. NaOH and afterward treated with H<sub>2</sub>O<sub>2</sub> see (5).]

[For reactns. of closely related o-Cl.C<sub>6</sub>H<sub>4</sub>.CH<sub>2</sub>COOMgCl with large excess of isopropyl MgCl or C<sub>6</sub>H<sub>5</sub>MgBr yielding o-chlorophenylmalonic acid, cryst. from alc., m.p. 139° (7), see (7) (8).]

[For condens. of  $\bar{C}$  with pyrene-3-aldehyde (14) or with N-ethylcarbazole-3-aldehyde (15) in prepn. of intermediates for dyes or pharmaceuticals see indic. refs.]

[ $\bar{C}$  with PCl<sub>5</sub> yields (3) 2-chlorophenylacetyl chloride, b.p. 110-121° at 12 mm., 118-120° at 10 mm.; this prod. with aminoacetic acid (glycine) in dil. aq. alk. gives (35% yield (3)) o-chlorophenylacetaminacetic acid (o-chlorophenylaceturic acid), cryst. from hot aq., m.p. 134-135° (3).]

[ $\bar{C}$  converted to Pb salt, latter dried at 110° and distilled, yields (16) 2,2'-dichlorodibenzyl ketone, ndls. from alc., m.p. 102° (16) (oxime, m.p. 112° (16), semicarbazone, m.p. 149° (16)).] [For soly. of many other salts see (4).]

— Methyl 2-chlorophenylacetate: oil, b.p. 125-128° at 23 mm. (4). [From  $\bar{C}$  in MeOH with HCl gas (4); also from o-Cl.C<sub>6</sub>H<sub>4</sub>.CH<sub>2</sub>MgCl with methyl chloroformate in ether (2); alkaline hydrolysis gives (2)  $\bar{C}$ .]

— Ethyl 2-chlorophenylacetate: oil, h.p. 134° at 23 mm. (4). [From  $\bar{C}$  in EtOH with HCl gas (4).]

Ⓒ 2-Chlorophenylacetamide: lfts. from aq., m.p. 175° (4), 172-175° (3). [From 2-chlorophenylacetoneitrile (o-chlorobenzyl cyanide) by partial hydrol. with H<sub>2</sub>SO<sub>4</sub> (4) (3); actn. of HNO<sub>2</sub> yields  $\bar{C}$  (see above).]

Ⓒ (2-Chlorophenylacet)anilide: white ndls. from alc., m.p. 138.5° (4). [From  $\bar{C}$  + 1 mole aniline on htg. at 180-190° for 1/2 hr. (4).]

Ⓒ (2-Chlorophenylacet)-m-chloroanilide: white ndls. from dil. alc., m.p. 154° cor. (17). [From  $\bar{C}$  + m-chloroaniline (1 mole) on htg. at 180-190° for 2 hrs. (17); also from o-chlorobenzyl m-chlorophenyl ketoxime by Beckmann rearr. with PCl<sub>5</sub> in ether (17).]

Ⓒ (2-Chlorophenylacet)-p-toluidide: white ndls. from dil. alc., m.p. 169.5° (4). [From  $\bar{C}$  on htg. with 1 mole p-toluidine as for the anilide (above) (4).]

Ⓒ (2-Chlorophenylacet)phenylhydrazide: white lfts. from C<sub>6</sub>H<sub>6</sub>, m.p. 175° (4). [From  $\bar{C}$  on htg. with 1 mole phenylhydrazine (as above) (4).]

3:2649 (1) Dippy, Williams, *J. Chem. Soc.* 1934, 1888-1892. (2) Austin, Johnson, *J. Am. Chem. Soc.* 54, 657 (1932). (3) Cerecedo, Sherwin, *J. Biol. Chem.* 58, 220-222 (1923/24). (4) Mehner, *J. prakt. Chem.* (2) 62, 554-560 (1900). (5) Mauthner, *J. prakt. Chem.* (2) 95, 61 (1917). (6)

removes the aq. and yields (5) anhydrous  $\bar{C}$  (for conv. of the "hemihydrate" to anhydrous  $\bar{C}$  by use of  $\text{CaO}$ ,  $\text{CaCl}_2$ ,  $\text{MgCl}_2$  see (12)); note, however, that anhydrous  $\bar{C}$  on stdg. in air is converted to the "hemihydrate" in less than 30 min. (11). —  $\bar{C}$  readily sublimates even at room temp. and by repeated sublimation yields (18) anhydrous form.

$\bar{C}$  has hypnotic, sedative, local anesthetic, and antiseptic characteristics and finds extensive use in medicine and in preservation of biological solns.; it has been used in treatment of nausea and seasickness, e.g., German "Nautissan" or (together with caffeine) as the British "Motherhill's Seasick Remedy" (10).

$\bar{C}$  is also employed as a modifier for cellulose acetate (13) (14) (15) (16) or cellulose ethers (17).

[For detn. of  $\bar{C}$  by complete hydrolysis with bot  $\text{MeOH/KOH}$  and subsequent detn. of chlorine by either volumetric or gravimetric methods see (3) (19).]

[For prepn. of  $\bar{C}$  from acetone (1:5400) +  $\text{CHCl}_3$  (3:5050) by addn. of dry powdered  $\text{KOH}$  (0.5 mole) below  $0^\circ$  (5) or  $2-3^\circ$  (4) or  $\text{KOH}$  in alc. as directed (11) (yields: 25% (11), 23% (5)) (2) (4) see indic. refs.; note that use of  $\text{NaOH}$  lowers the yield (5) and that  $\text{Ca(OH)}_2$  (11),  $\text{Zn(OH)}_2$  (5), or  $\text{Al(OH)}_3$  (5) yields no  $\bar{C}$ ; note also that the crude prod. contains some diacetone alcohol (1:6423) which is best removed by treatment with aq. (11) since otherwise it appears to form with  $\bar{C}$  a const.-boilg. mixt.

[For prepn. of  $\bar{C}$  from trichloroacetyl chloride (3:5420) with  $\text{MeMgI}$  in ether (4) or from ethyl trichloroacetate (3:5950) with  $\text{MeMgBr}$  in ether (20) see indic. refs.]

[ $\bar{C}$  with granulated  $\text{Zn}$  + conc.  $\text{HCl}$  (in pres. of a little ether) is reduced (21) to *tert*-butyl alc. (1:0140), m.p.  $25^\circ$ , but  $\bar{C}$  in 70% alc. warmed with  $\text{Zn}$  dust for 5 hrs. gives (4% yield (22)) 1,1-dichloro-2-methylpropene-1 (3:5300) + 1-chloro-2-methylpropene-1 (3:7120) + isobutylene (23). —  $\bar{C}$  with granulated  $\text{Zn}$  in boilg.  $\text{AcOH}$  yields (21) *tert*-butyl acetate (1:3057).]

[ $\bar{C}$  with  $\text{Na/Hg}$  in moist ether (21), or with aq. in s.t. at  $180^\circ$  for 3 hrs. (24), or  $\bar{C}$  with aq. alc.  $\text{KOH}$  (25) undergoes hydroly. of its  $-\text{CCl}_3$  group yielding  $\alpha$ -hydroxy-isobutyric acid (1:0431), m.p.  $79^\circ$ .]

Anhydrous  $\bar{C}$  in dry ether poured onto a lower layer of colorless fuchsin-aldehyde reagent (Schiff's soln.) gives a purple color (26), but this behavior is not shown by the "hemihydrate." —  $\bar{C}$  also reduces  $\text{NH}_4\text{OH/AgNO}_3$  soln. slowly in the cold (2).

[ $\bar{C}$  with cold 10% aq.  $\text{KOH}$  is claimed (27) cf. (29) to yield traces of  $\alpha$ -chloroisobutyric acid (3:0235) or carbon monoxide + acetone (28), while  $\bar{C}$  with solid  $\text{KOH}$  gives (27) methacrylic acid [Beil. II-421, II<sub>2</sub>-(398)], and  $\bar{C}$  in  $\text{MeOH}$  with alk. or tertiary org. bases, or mineral acids, yields (29) methyl methacrylate [Beil. II<sub>2</sub>-(398)].]

$\bar{C}$  with conc.  $\text{H}_2\text{SO}_4$  (10 wt. pts.) evolves  $\text{CO} + \text{CO}_2 + \text{HCl}$  (25) (26); the  $\text{CO}$  presumably results from the usual action of  $\text{H}_2\text{SO}_4$  on some  $\alpha$ -hydroxy-isobutyric acid (1:0431) first formed by hydrolysis; for the other reactions see (25).

[ $\bar{C}$  with  $\text{PCl}_5$  at  $100^\circ$  is claimed (30) (31) (21) to yield both *bis*-( $\beta,\beta,\beta$ -trichloro-*tert*-butyl) ether [Beil. I-383, I<sub>1</sub>-(193)], b.p.  $156^\circ$  (30), and 1,1,1,2-tetrachloro-2-methylpropane (3:4725), m.p. and b.p. both at  $167^\circ$  (30), but later workers (26) could obtain no reaction at all between  $\bar{C}$  and  $\text{PCl}_5$ . —  $\bar{C}$  with  $\text{PBr}_5$  at  $60^\circ$  (not above because of dissociation of  $\text{PBr}_5$ ) gives (32) cf. (21) 2,3-dibromo-1,1,1-trichloro-2-methylpropane, b.p.  $243^\circ$  (32).]

$\bar{C}$  with  $\text{P}_2\text{O}_5$  in dimethylaniline (1) or quinoline (50) btd. at  $200^\circ$  under ord. press. gives (yield: 30-43% (50), 15% (33)) 1,1,1-trichloro-2-methylpropene-2 (3:5605), b.p.  $132^\circ$ , + 57% yield of its synionic isomer 1,1,3-trichloro-2-methylpropene-1 (3:5025), h.p.  $45-46^\circ$ , accompanied by some  $\alpha$ -chloroisobutyric acid (3:0235) cf. (50).

[Various reactions of  $\bar{C}$  have been employed in prepn. of pharmaceutical prods.:  $\bar{C}$  with adipic anhydride (see text of 1:0775) at  $160-180^\circ$  for 8 hrs. (35), or  $\bar{C}$  with adipic acid (1:0775) +  $\text{SOCl}_2$  grad. htd. to  $150-160^\circ$  (36), gives  $\beta,\beta,\beta$ -trichloro-*tert*-butyl hydrogea

adipate, cryst. from pct. ether, m.p. 70° (35). —  $\bar{C}$  with 5-ethyl-5-phenyl-barbituric acid ("Luminal") does not (37) show evidence of molecular cpd. formn. but forms a eutectic, m.p. 70.4°, contg. 90%  $\bar{C}$ . —  $\bar{C}$  with 2,3-dimethyl-1-phenylpyrazolone-5 ("Antipyrine") does not (38) form a molecular cpd. but gives a eutectic contg. 60 mole %  $\bar{C}$ . —  $\bar{C}$  with 2,3-dimethyl-4-dimethylamino-1-phenylpyrazolone-5 ("Pyramidone") gives (39) a molecular cpd., m.p. 61–63°. —  $\bar{C}$  with chloral (3:5210) or chloral hydrate (3:1270) gives (40) a molecular cpd., m.p. 65°. — See also above (paragraph 4) and below (under  $\bar{C}$ 's).]

[For reactn. of  $\bar{C}$  +  $AlCl_3$  (in Friedel-Crafts sense) with benzene, toluene, and *p*-xylene see (31); for reactn. of  $\bar{C}$  with ethyl sodio-acetoacetate see (25)]

[ $\bar{C}$  with aniline in alc. KOH gives according to conditions (41) either  $\beta$  (or  $\alpha$ )-anilinoisobutyranilide [Beil. XII-558], cryst. from alc., m.p. 155–157° (41), or  $\beta$ -anilinoisobutyric acid [Beil. XII-497], cryst. from alc., m.p. 185° (41). — For study of reactions of  $\bar{C}$  with *p*-ethoxyaniline (*p*-phenetidine) + alc. KOH see (42); of  $\bar{C}$  with *o*-phenylenediamine + alc. KOH see (41)]

② Carbylamine test:  $\bar{C}$  with aniline + aq. alk. on warming gives characteristic odor of phenyl isocyanide (phenyl carbylamine).

③ Iodoform reaction:  $\bar{C}$  in aq. soln. (1/200) treated with aq. NaOH +  $I_2/KI$  soln gives yel. ppt. of iodoform (m.p. 119°) with its characteristic odor.

—  $\beta,\beta,\beta$ -Trichloro-*ter*-butyl acetate: oil, b.p. 191° (21), 190–191° (4), 151–152° at 237 mm (43). [From  $\bar{C}$  (1 pt.) with  $Ac_2O$  (2 pts.) + anhyd. NaOAc (1 pt.) refluxed 2 hrs (85% yield (43)), or from  $\bar{C}$  (1 mole) with  $AcCl$  (1 mole) under reflux (37% yield (21)).] — [Note that this ester, although unaffected by 10% aq. NaOH at 100° for 20 min. (dif. from  $\bar{C}$  which is hydrolyzed), is rapidly saponified by boilg. with 3–4 vols. conc.  $HNO_3$  for a few minutes, and upon dilution with aq. ppts.  $\bar{C}$  (43)]

④  $\beta,\beta,\beta$ -Trichloro-*ter*-butyl benzoate: cryst. from alc. upon addn. of aq., m.p. 34–35° (44) (45). [From  $\bar{C}$  with  $BzCl$  at 100° until evoln. of  $HCl$  stops (6 hrs.) (44) (45), or from  $\bar{C}$  + benzoic acid (1:0715) in pres. of  $ZnCl_2$  (45)] — [Note that this ester on boilg. with conc.  $HNO_3$  is not hydrolyzed (dif. from esters of  $\bar{C}$  with aliphatic acids, e.g., acetate (above)), but nitrated (46) yielding mainly  $\beta,\beta,\beta$ -trichloro-*ter*-butyl *m*-nitrobenzoate (see below).]

⑤  $\beta,\beta,\beta$ -Trichloro-*ter*-butyl *o*-nitrobenzoate: pl. from alc., m.p. 91° (46) (47) [From  $\bar{C}$  with *o*-nitrobenzoyl chloride on warming (46) (47).]

⑥  $\beta,\beta,\beta$ -Trichloro-*ter*-butyl *m*-nitrobenzoate: pl. from alc., m.p. 87° (46) (47). [From  $\bar{C}$  with *m*-nitrobenzoyl chloride on warming (46) (47), or from  $\beta,\beta,\beta$ -trichloro-*ter*-butyl benzoate (above) by nitration with excess conc.  $HNO_3$  below 50° (46) (47)]

⑦  $\beta,\beta,\beta$ -Trichloro-*ter*-butyl *p*-nitrobenzoate: ndls. from alc., m.p. 145° (46) (47). [From  $\bar{C}$  with *p*-nitrobenzoyl chloride on warming (46) (47).]

⑧  $\beta,\beta,\beta$ -Trichloro-*ter*-butyl 3,5-dinitrobenzoate: unreported.

—  $\beta,\beta,\beta$ -Trichloro-*ter*-butyl carbamate: pl. from  $C_6H_6$ , m.p. 102° (48) (49). [From  $\bar{C}$  with Na in  $C_6H_6$  at room temp. for 4 hrs., followed by conversion of the presumably resultant metal alcoholate with phosgene (3:5000) in toluene to  $\beta,\beta,\beta$ -trichloro-*ter*-butyl chloroformate (not isolated), and reaction of the latter in the  $C_6H_6$ /toluene soln. with dry  $NH_3$  gas (55% yield (48)) (49); note that earlier attempts (26) to obtain a metal alcoholate in toluene had led to serious explosions (cf. alkali metals with  $CHCl_3$ ) (3:5050).]

—  $\beta,\beta,\beta$ -Trichloro-*ter*-butyl *N*-phenylcarbamate: ndls. from  $C_6H_6$ , m.p. 118° (48). [From  $\bar{C}$  as in the preceding case except that aniline was used in place of  $NH_3$  in last step; yield is poor (48)]

—  $\beta,\beta,\beta$ -Trichloro-*ter*-butyl *N*-( $\alpha$ -naphthyl)carbamate: unreported.

### 3:2690 2-CHLORORESORCINOL

 $\text{C}_6\text{H}_4\text{O}_2\text{Cl}$ 

Beil. S.N. 554

 M.P.  $97\text{--}98^\circ$  u.c. (1)

 $04^\circ$  (2)

[See also 4-chlororesorcinol (3:3100) and 5-chlororesorcinol (3:3530).]

Colorless cryst. purified by sublimation.

[For prepn. of  $\bar{\text{C}}$  from 2,4-dihydroxy-5-nitrobenzoic acid (5-nitro- $\beta$ -resorcylic acid) [Beil. X-382, X<sub>1</sub>-(179)] via chlorination with  $\text{SO}_2\text{Cl}_2$  in AcOH to 3-chloro-2,4-dihydroxy-5-nitrobenzoic acid, reduction of the latter with  $\text{SnCl}_2/\text{HCl}$  in AcOH to 3-chloro-2,4-dihydroxy-5-aminobenzoic acid, with final removal of the amino group by diazotization and use of alk.  $\text{SnCl}_2$ , see (1).]

( $\bar{\text{C}}$  is formed in small amt. together with 4-chlororesorcinol (3:3100) from resorcinol (1:1530) by actn. of *N,N*-dichlorourea (2).]

[Note that attempts (3) cf. (1) to prepare  $\bar{\text{C}}$  from 2-aminoresorcinol [Beil. XIII-782] by diazotization and use of Sandmeyer reactn. have failed because the actn. of nitrous acid yields 4-nitroso-2-diazo-resorcinol.]

[The prod., m.p.  $89^\circ$ , b.p.  $255\text{--}256^\circ$ , obtained (4) from resorcinol (1:1530) with  $\text{SO}_2\text{Cl}_2$  in ether may have contained  $\bar{\text{C}}$ .]

### 3:2700 2,3,4,6-(or 2,3,5,6-) TETRACHLORO-BENZALDEHYDE

 $\text{C}_7\text{H}_2\text{OCl}_4$ 

Beil. VII —

 VII<sub>1</sub>-(134)

 M.P.  $97\text{--}98^\circ$  (1)

Ndls. from pet. ether. — Eas. sol. ether,  $\text{C}_6\text{H}_6$ , or  $\text{CHCl}_3$ ; spar. sol. alc. or pet. ether; insol. aq

[For prepn. of  $\bar{\text{C}}$  from 2,3,4,6-tetrachlorobenzal (di)chloride (3:6980) by hydrolysis with conc.  $\text{H}_2\text{SO}_4$  at  $96^\circ$  see (1)]

$\bar{C}$  with  $\text{NaHSO}_3$  forms the corresp. addn. cpd.; spar. sol. cold aq. (1); for use in sepn. of  $\bar{C}$  from 2,3,4,5-tetrachlorobenzaldehyde (3:3140) see (2).

[For use of  $\bar{C}$  in prepn. of dyes of the triphenylmethane series see (3).]

3:2700 (1) Cassella and Co., Ger. 290,209, Feb. 8, 1916; *Cent.* 1916, I 396-397; not in *C.A.* (2) Chem. 3:2705 5-CHLORO-3,4-DIMETHYLPHENOL  
(6-Chloro-*o*-4-xlenol)

M.P. 98° (1) (2)

Ndls. from lt. pet. — Volatile with steam.

[For prepn. of  $\bar{C}$  from 5-chloro-3,4-dimethylaniline (6-chloro-*o*-4-xylidine) (1) via diazotization and hydrolysis (yield not stated) see (1); from 6-amino-5-chloro-3,4-dimethylphenol (6-chloro-5-amino-*o*-4-xlenol) (2) via diazotization and elimination of original amino group using  $\text{Cu}_2\text{Cl}_2$  reaction (unusual) (yield not stated) see (2).]

$\bar{C}$  with  $\text{Cl}_2$  in  $\text{CHCl}_3$  gives (1) 2,5,6-trichloro-3,4-dimethylphenol (3:4747), m.p. 182.5°.

The nitration of  $\bar{C}$  has not been reported, and neither of the two possible mononitro derivs. nor the corresp. dinitro deriv. is known.

$\bar{C}$  in alk. soln. couples with benzenediazonium chloride giving (2) the corresp. azo cpd., red ndls. from alc., m.p. 143° (2).

— 5-Chloro-3,4-dimethylphenyl acetate: unreported.

Ⓐ 5-Chloro-3,4-dimethylphenyl benzoate: m.p. 42° (1).

3:2705 (1) Hinkel, *J. Chem. Soc.* 125, 1853 (1924). (2) Hinkel, Ayling, Bevan, *J. Chem. Soc.* 1928, 2532.

3:2710 2,3,4,5-TETRACHLOROTOLUENE

M.P. 98.1° cor. (1)

97-98° (2) (3)

Ndls. from  $\text{MeOH}$ .

[For prepn. of  $\bar{C}$  from 3,4,5-trichloro-2-aminotoluene (3) or from 2,4,5-trichloro-3-aminotoluene [Beil. XII-872] (2) (3) via diazotization and use of  $\text{Cu}_2\text{Cl}_2$  reactn. see indic. refs.; from 3,4,5-trichlorotoluene (3:0580) with  $\text{Cl}_2$  in pres. of  $\text{Al/Hg}$  (2) (3) or with  $\text{SO}_2\text{Cl}_2$  +  $\text{AlCl}_3$  +  $\text{S}$  (35% yield (1)) see indic. refs.]

$\bar{C}$  at b.p. with  $\text{Cl}_2$  yields (4) 2,3,4,5-tetrachlorobenzal (di)chloride (3:9397).]

$\bar{C}$  on nitration with 6 pts. of a mixt. of 2 pts.  $\text{HNO}_3$  ( $D = 1.48$ ) + 4 pts.  $\text{H}_2\text{SO}_4$  ( $D = 1.84$ ) at 105° for  $\frac{1}{2}$  hr. (1) yields 2,3,4,5-tetrachloro-6-nitrotoluene, m.p. 159.6° cor. (1), 159° (3).

3:2710 (1) Silberrad, *J. Chem. Soc.* 127, 2682-5, 1280, 1285 (1904). (3) Cohen, Dakin, *J. Fabrik Griesheim-Elektron*, Brit. 251,511, May 1926, II 2355.

## 3:2725 4-CHLOROPHTHALIC ANHYDRIDE

 $C_8H_5O_3Cl$ Beil. XVII - 483  
XVII<sub>1</sub>-(253)

M.P. 98.5° (1)	B.P. 294.5° cor. at 720 mm. (6)
98° (2) (3) (4) (13)	297° (3)
97° (5)	291-295° (3)
96-97° (6)	286-290° (4)
95° (7) (8)	287° at 750 mm. (2)
90-94° (3)	

[See also 4-chlorophthalic acid (3:4390).]

Cryst. from  $CCl_4$  (5) (4), from  $Ac_2O$  (2), from ether, or from alc. (For crystallographic consts. see (2)) — Eas. sol. alc., ether,  $CHCl_3$ ; less sol.  $CS_2$ ; spar. sol. lgr.

[For use of  $\bar{C}$  with glycerol or ethylene glycol in prepn. of glyptal type resins see (26).]

[For prepn. of  $\bar{C}$  from 4-chlorophthalic acid (3:4390) by htg. or sublimation (6) (7) (8) (1) (9) or by htg. with  $AcCl$  (2) see indic. refs; from  $NaHA$  with conc.  $H_2SO_4$  at 100° see (10); from phthalic anhydride (1:0725) with  $Cl_2$  in pres. of Fe or Fe salts at 160-260° see (11) (note that crude  $\bar{C}$  obt'd. by chlorination methods or from 4-chlorophthalic acid obt'd. by chlorination methods may cont. dichlorophthalic anhydrides from which  $\bar{C}$  is separable by its greater soly. in toluene (4)); from 4-nitrophthalic anhydride [Beil. XVII-486, XVII<sub>1</sub>-(256)] with  $Cl_2$  at 240° see (12)]

[ $\bar{C}$  with  $Cl_2$  in fume  $H_2SO_4$  in pres. of  $I_2$  gives (13) mixt. contg much 3,4-dichlorophthalic anhydride (3:3695), m.p. 120-121°, b.p. 329°, and little 4,5-dichlorophthalic anhydride (3:4830), m.p. 187°.]

[ $\bar{C}$  with  $SOCl_2 + ZnCl_2$  in s.t. at 210° yields (27) 4-chlorophthalyl (di)chloride [Beil. IX-817], b.p. 275-276° (6).]

[ $\bar{C}$  in MeOH sat'd. with dry  $HCl$  yields (6) dimethyl 4-chlorophthalate, ndls. from lgr., m.p. 38° (5), m.p. 37° (6), b.p. 186-187° at 32 mm. (5);  $\bar{C}$  in EtOH similarly gives (6) diethyl 4-chlorophthalate, b.p. 173-174° at 16 mm. (14), 300-305° (6)]

$\bar{C}$  fused and treated with dry  $NH_3$  gas (6) or  $\bar{C}$  ltd. with urea (28) yields 4-chlorophthalimide [Beil. XXI-503, XXI<sub>1</sub>-(391)], m.p. 210-211° (6) (3). (Ring opening of this prod. with  $NaOCl$  yields (9) 3 pts. 4-chloro-2-aminobenzoic acid (4-chloroanthranilic acid) [Beil. XIV-365, XIV<sub>1</sub>-(518)], m.p. 235-236° (9), and 1 pt. 5-chloro-2-aminobenzoic acid as "anhydride," m.p. 178-179° (9)] [For use of 4-chlorophthalimide in prepn. of pigments of phthalocyanine type see (28).]

[ $\bar{C}$  fused with aminoacetonitrile hydrochloride or sulfate yields (15) 4-chlorophthalimidoacetamide, ndls. from hot aq., m.p. 211° (15);  $\bar{C}$  ltd. with methylenaminoacetonitrile until evoln. of  $CH_2O$  ceases yields (15) 4-chlorophthalimidoacetonitrile, ndls. from dil. AcOH, m.p. 146.5° (15);  $\bar{C}$  ltd. with glycine yields (15) 4-chlorophthalimidoacetic acid, yel. pl. from hot aq. or dil. alc., m.p. 205° (15)]

[ $\bar{C}$  with 2 moles phenol ltd. with  $ZnCl_2$  at 115-130° for 48 hrs. as directed (2) gives 76% yield phenol (di)chlorophthalcin, m.p. 214-233°, and prob. a mixt. of isomers;  $\bar{C}$  with resorcinol ltd. with trace conc.  $H_2SO_4$  yields (6) a prod. behaving as dichlorofluorescein. — Note, however, that  $\bar{C}$  with hydroquinone (1:1590) +  $AlCl_3$  +  $NaCl$  ltd. at 200-220°

(4) or  $\bar{C}$  with *p*-chlorophenol (3:0475) + fuming  $H_2SO_4 + H_3BO_3$  htd. 20 hrs. at 175-195° gives (95% yield (4)) 6-chloro-1,4-dihydroxyanthraquinone (6-chloroquinizarin), thls. from toluene, m.p. 188° (diacetate, m.p. 213°, dimethyl ether, m.p. 168.5° (4)).]

[ $\bar{C}$  with  $C_6H_5^- + AlCl_3$  yields (6) (3) 4-chloro-2-(benzoyl)benzoic acid [Beil. X-750, X<sub>1</sub>-(356)], cryst. from xylene, m.p. 180.5° (3), from  $C_6H_6$ , m.p. 170° (6) (this on ring closure with conc.  $H_2SO_4$  at 160-170° for 10 min. gives 2-chloroanthraquinone (3:4922), m.p. 204° (3). —  $\bar{C}$  with chlorobenzene (3:7903) +  $AlCl_3$  yields (3) (17) 4-chloro-2-(*p*-chlorobenzoyl)benzoic acid [Beil. X<sub>1</sub>-(357)], cryst. from xylene, m.p. 195.5° (3) (this on ring closure as above gives (3) 2,6-dichloroanthraquinone [Beil. VII-788, VII<sub>1</sub>-(413)], m.p. 278° (3)]. — For similar condensations of  $\bar{C} + AlCl_3$  with *p*-dichlorobenzene see (3), with bromobenzene see (18), with naphthalene see (25) (19); with toluene see (19) (20), with perylene see (21) (22), with 2,2'-dinaphthyl see (23).]

[For use of  $\bar{C}$  in prepn. of pigments of the phthalocyanine type see (24) (28).]

$\bar{C}$  on warming with aq. readily hydrolyzes;  $\bar{C}$  on saponification with standard alk. (Sap. Eq. = 91.3) followed by acidification yields 4-chlorophthalic acid (3:4390) q.v.

[See also  $\alpha$ -chloroisocrotonic acid (3:1615).]

Ndls. from aq. (4) (20) or pet. eth. (8). —  $\bar{C}$  is sol. in 47.1 pts. aq. at 19° (13); 100 pts. satd. aq. soln. at 12.5° cont. 1.97 pts.  $\bar{C}$  (9). —  $\bar{C}$  is less (9) (5) volatile with steam than the isomeric  $\alpha$ -chloroisocrotonic acid (3:1615). — Eas. sol. alc. or ether (10). — Readily sublimates (10). — Note that the m.p. of mixts. of  $\bar{C}$  with  $\beta$ -chlorocrotonic acid (3:2625) is depressed far below either (4).

[For thermal anal. of system  $\bar{C}$  + 2,6-dimethylpyrone see (12); with conc.  $H_2SO_4$  see (14).]

Preparation. \* For prepn. of  $\bar{C}$  from  $\alpha,\alpha,\beta$ -trichloro-*n*-butyric acid (3:1280) [itself readily obtd. from  $\alpha,\alpha,\beta$ -trichloro-*n*-butyraldehyde (butylchloral) (3:5910) by oxidn. with  $HNO_3$ ] by removal of two halogen atoms with Zn dust + aq. (83% yield on initial butylchloral hydrate (3)) (10), or with Zn + HCl (15), see indic. refs.; from the higher-melting form of  $\alpha,\beta$ -dichloro-*n*-butyric acid ("isocrotonic acid dichloride") (3:1903) by splitting out HCl with alc. KOH see (17) (18); from the lower-melting form of  $\alpha,\beta$ -dichloro-*n*-butyric acid ("crotonic acid dichloride") (3:1375) by splitting out HCl with excess aq. NaOH (5) (18) or with pyridine at 100° for 3 hrs. (4) or with 1%  $Am_3N$  refluxed at 160–180° for 16 hrs. (85% yield (28)) (note, however, that with NaOH the yield is low and much of the isomeric  $\alpha$ -chloroisocrotonic acid (3:1615) is formed); from  $\alpha$ -chloro- $\beta$ -hydroxy-*n*-butyric acid [Beil. III-309, 310] by elimination of  $H_2O$  with warm 80%  $H_2SO_4$  see (17) ]

[For prepn. of  $\bar{C}$  from  $\alpha,\alpha,\beta$ -trichloro-*n*-butyraldehyde (butylchloral) (3:5910) by simultaneous oxidn. and elimination of HCl with aq.  $K_4Fe(CN)_6$  (yield 44.3% (3)) (19) see indic. refs.]

[For formn. of  $\bar{C}$  from crotonic acid (1:0425) by actn. of  $Cl_2$  and distillation of product see (20); from  $\alpha$ -chloroisocrotonic acid (3:1615) by hgt. in s.t. at 150–160° for 12 hrs. (21), with pyridine HCl in pyridine 7 days at room temp (4), or to small extent even on steam distn. (22) see indic. refs.; from the methyl, ethyl, or *n*-propyl esters of  $\alpha$ -chloro- $\alpha$ -vinylacetic acid or from  $\alpha$ -chloro- $\alpha$ -vinylacetonitrile (or amide) on hydrolysis with alkali (note shift of double bond from  $\beta,\gamma$  to  $\alpha,\beta$  position) see (11); from ethyl  $\alpha$ -chlorocrotonate (3:8523) by hydrolysis with conc. HCl see (23).]

Chemical behavior. [ $\bar{C}$  on reduction with Na/Hg is dehalogenated yielding (10) crotonic acid (1:0425), m.p. 72°; note, however, that  $\bar{C}$  does not readily absorb  $H_2$  even in pres. of Pt black (11).]

$\bar{C}$  with  $Cl_2$  in  $CS_2$  adds 1 mole halogen yielding (24)  $\alpha,\alpha,\beta$ -trichloro-*n*-butyric acid (3:1280), m.p. 59.5–60°. —  $\bar{C}$  adds  $Br_2$  readily (15) yielding (10)  $\alpha,\beta$ -dibromo- $\alpha$ -chloro-*n*-butyric acid [Beil. II-286], m.p. 92° (10).

$\bar{C}$  with fuming HCl in s.t. at 100° for 5 hrs. adds 1 HCl to double bond yielding (17) (18) the higher-melting  $\alpha,\beta$ -dichloro-*n*-butyric acid (3:1903), m.p. 78°.

$\bar{C}$  behaves as a monobasic acid; dissociation const. at 25° is  $7.2 \times 10^{-4}$  (25); Neut. Eq. 120.5.

[Salts:  $NH_4\bar{A}$ , lfts. or hexag. tbs., sublimable (10);  $Na\bar{A}$  (10);  $K\bar{A}$ , lfts. from alc. in which it is spar. sol. (1 pt.  $K\bar{A}$  in 736.4 pts. 99% alc. at 16.5° (5)) (use in sepn. of  $\bar{C}$  from the isomeric  $\alpha$ -chloroisocrotonic acid (3:1615) (4) (18) (17));  $Ag\bar{A}$ , ndls., spar. sol. aq. (10) (17);  $Ca\bar{A}_2$ , pr. spar. sol. cold aq. (10) (17);  $Ba\bar{A}_2$ , more sol. aq. than  $Ca\bar{A}_2$  (10) (17);  $Cu\bar{A}_2$ , blue ndls., converted by warm aq. to a basic salt (10);  $Pb\bar{A}_2 \cdot H_2O$  (10).]

[ $\bar{C}$  with NaOEt is unchanged even at 215° (20), but  $\bar{C}$  with 10 N KOH at 190–200° decomposes with formn. of AcOH (1:1010), oxalic acid (1:0445),  $CO_2$  +  $H_2$  + other prods. (20) ]

[For study of rate of reactn. of  $\bar{C}$  with  $K_2AsO_3$  see (2) ]

[ $\bar{C}$  with  $PCl_5$  on warming gives (10)  $\alpha$ -chlorocrotonoyl chloride, liq. with sharp odor, b.p. 112° (10).]

— Methyl  $\alpha$ -chlorocrotonate: b.p. 161–162° (see 3:5870). [For study of rate of esterification of  $\bar{C}$  with MeOH see (26) (27).]

— Ethyl  $\alpha$ -chlorocrotonate: b.p. 176° (see 3:8523).

①  $\alpha$ -Chlorocrotonamide: lftn., spar. sol. cold aq., eas. sol. alc.; m.p. 113.5° (8), 111.5–112.5° (11), 107° (10). [From  $\alpha$ -chlorocrotonyl chloride (above) (10) or ethyl  $\alpha$ -chlorocrotonate (11) with conc. aq.  $NH_4OH$ ; also by other routes such as from  $\alpha,\alpha,\beta$ -trichloro-*n*-butyraldehyde (3:5910) with  $NH_4OH + KCN$  (93% yield (8)).]

—  $\alpha$ -Chlorocrotonanilide: unreported.

—  $\alpha$ -Chlorocroton- $\alpha$ -naphthalide: unreported.

[See also 2,3-dichlorohydroquinone (3:4220).]

Yel. ndls. from aq. (2) or alc. (1). —  $\bar{C}$  has characteristic quinone odor.

[For prepn. of  $\bar{C}$  from 2,3-dichlorohydroquinone (3:4220) by oxidn. with  $MnO_2$  +  $\Delta$ ,  $H_2SO_4$  (yields: 88% (1), 60% (3)) (4), or with  $CrO_2/ArOH$  (2) see indic. refs.; for formn. of  $\bar{C}$  from *p*-benzoquinone (1:9025) in  $HCl$  or  $H_3PO_4$  with  $Cl_2$  see (5).]

[For study of oxidn.-reductn. potential of system  $\bar{C}$  + 2,3-dichlorohydroquinone (3:4220) see (1) (5).]

[ $\bar{C}$  with butadiene-1,3 gives an adduct which upon oxidn. yields (7) 2,3-dichloronaphthoquinone-1,4 (3:4857); similarly  $\bar{C}$  with 2,3-dimethylbutadiene-1,3 gives an adduct which upon oxidn. yields (7) 2,3-dichloro-6,7-dimethylnaphthoquinone-1,4.]

[For use of  $\bar{C}$  as accelerator for vulcanization of rubber see (5).]

[ $\bar{C}$  in alc. with *p*-nitrosodimethylaniline gives (60% yield (9)) corresp. nitrone; for condens. of  $\bar{C}$  with other nitroso epds. and use of prods. as dye intermediates see (10).]

[ $\bar{C}$  in  $CHCl_3$  with  $Cl_2$  is not attacked at low temps., but at ord. temp. yields (4) tetrachloro-*p*-benzoquinone (chloranil) (3:4978).]

$\bar{C}$  on reductn. (presumably with  $SO_2$  +  $H_2O$ ) yields 2,3-dichlorohydroquinone (3:4220) q.v.

## 3:3045 4-CHLORONAPHTHOL-2

 $C_{10}H_7OCl$ 

Beil. S.N. 538

M.P. 104° (1)  
103-104° (2)  
102-103° (2)  
100° (4)

Ndls. from lgr. or 30% aq. alc.

[For prepn of  $\bar{C}$  from 1,4-dichloronaphthol-2 (3:3840) by partial reduction with  $SnCl_2$  in  $AcOH/HCl$  at 100° in a.t. for 8 hrs (74% yield (2)) (1) see indic. refs., from 4-chloronaphthol-2-sulfonic acid-1 (2) (see also under 3:3840) by hydrolysis of the sulfonic acid group (91% yield) see (2); from 4-chloronaphthalene-1,2-diazo-oxide (itself obtd. in 95% yield (3) from 4-chloro-2-nitronaphthylamine-1 with  $HNO_2$ ) on boilg. with  $Al$  powder in  $EtOH$  for 19 hrs. (84% yield (4)) or (less advantageously) with  $Na_2SnO_2$  (4) see indic. refs.]

$Na\bar{A}$  is spar. sol. in cold aq 10%  $NaOH$  (4).

[ $\bar{C}$  with alc.  $NaOH + CHCl_3$  (3:5050) undergoes Reimer-Tiemann reaction giving (but in very small yield (2)) 4-chloro-2-hydroxynaphthaldehyde-1, m.p. 118° (2).]

$\bar{C}$  (in alk. soln.) with diazotized aniline gives (4) 4-chloro-1-benzeneazonnaphthol-2, or-red ndls. from acetone, or crimson ndls. from chlorobenzene, m.p. 165° (4) (note that after fusion and resolidification this prod. has m.p. 151° but after a second resolidification (at about 155°) remelts on slow htg. at 165° (4)). [For use of  $\bar{C}$  in prepn. of azo dyes by coupling with o-hydroxydiazonium salts see (5).]

— 4-Chloro-2-naphthyl methyl ether: pl. from lt. petroleum, m.p. 44-45° (4). [From  $\bar{C}$  with  $Me_2SO_4 + aq. NaOH$  (3)]

⊙ 4-Chloro-2-naphthyl acetate: pl. from aq.  $MeOH$  or lt. petroleum, m.p. 58-59° (2), 56° (4) [From  $\bar{C}$  with excess  $Ac_2O$  refluxed 30 min. (90-100% yield (2)).]

⊙ 4-Chloro-2-naphthyl benzoate: ndls. from alc., m.p. 83-84° (2).

3:3045 (1) Fries, Schimmelschmidt, *Ann.* 484, 293 (1930). (2) Burton, *J. Chem. Soc.* 1945, 280-283. (3) Hodgson, Birtwell, *J. Chem. Soc.* 1943, 322. (4) Hodgson, Birtwell, *J. Chem. Soc.* 1943, 463-469. (5) Herzberg, Wunderlich (to I.G.), *Ger.* 459,889, May 18, 1928; *Cent.* 1928, II 395; not in *C.A.*

3:3070 3,4-DICHLOROBENZOPHENONE  
(3,4-Dichlorophenyl phenyl ketone) $C_{13}H_9OCl_2$  Beil. S.N. 652

M.P. 104-105° (1)  
102-103° (2) (3)

Cryst. (from alc. (1)).

[For prepn. (79.5% yield) from *o*-dichlorobenzene (3:6055) + BzOH (1:0715) + AlCl<sub>3</sub> see (1); for prepn. from *o*-dichlorobenzene (3:6055) + BzCl (3:6240) + AlCl<sub>3</sub> see (2) (3).]

⑥ 3,4-Dichlorobenzophenone oxime: m.p. 153–154° (1). [This oxime upon Beckmann rearr. with H<sub>2</sub>SO<sub>4</sub> gives (1) 3,4-dichlorobenzanilide which can be hydrolyzed to 3,4-dichlorobenzoic ac. (3:4925), m.p. 207–208° (1), and aniline]

3:3070 (1) Newton, Groggins, *Ind. Eng. Chem.* 27, 1398 (1935). (2) Böeseken, *Rec.* 27, 15 (1905). (3) Kraay, *Rec. trav. chim.* 49, 1085 (1930).

### 3:3100 4-CHLORORESORCINOL

C<sub>6</sub>H<sub>4</sub>O<sub>2</sub>Cl

Beil. VI —

VI<sub>1</sub>—

VI<sub>2</sub>-(818)

M.P. 105° (1) (10)

102° (2)

B.P. 259.5° (2)

255–256° (4)

147° at 18 mm. (1)

The nature of the cpd., m.p. 89°, and formerly (3) thought to be  $\bar{C}$ , is still in doubt, cf. (1).  $\bar{C}$  is very sol. in nq. and *not* volatile with steam (1); eas. sol. aq., alc., ether, C<sub>6</sub>H<sub>6</sub>, and CS<sub>2</sub> (4).

[For prepn. of  $\bar{C}$  from resorcinol (1:1530) by actn. of SO<sub>2</sub>Cl<sub>2</sub> in ether (95% yield (1)) see (1) (4).]

$\bar{C}$  with FeCl<sub>3</sub> gives a blue-violet soln. becoming brown on warming (4).

$\bar{C}$  reduces NH<sub>4</sub>OH/AgNO<sub>3</sub> on warming (4).

$\bar{C}$  on further chlorination with SO<sub>2</sub>Cl<sub>2</sub> (no details) gives (96% yield (1)) of 4,6-dichlororesorcinol (3:3380).

$\bar{C}$  (10 g.) refluxed with KHCO<sub>3</sub> (40 g.) in nq. (50 ml.) for 1½ hrs. gives (76% yield (5)) of 5-chloro-2,4-dihydroxybenzoic acid (6), cryst. from hot aq., m.p. 224–225° cor. (6), 215–216° (Maquenne bloc) after drying at 100–105° (5) (6).

$\bar{C}$  in AcOH treated with xanthrol (1:5205) yields 4-chloro-2-(?)-xanthidylresorcinol, cryst. from C<sub>6</sub>H<sub>6</sub>, m.p. 215° (7).

[For studies on prepn. of alkyl ethers of 4-chlororesorcinol for use as antiseptics and germicides see (8); for use of  $\bar{C}$  in prepn. of purpurin (1,2,4-trihydroxyanthraquinone) by reaction with phthalic anhydride, H<sub>2</sub>SO<sub>4</sub> + H<sub>3</sub>BO<sub>3</sub>, see (9) ]

[For coupling of  $\bar{C}$  with diazotized aniline, *p*-nitroaniline, or *p*-toluidine see (11).]

⑥ 4-Chlororesorcinol diacetate: m.p. 46–47° (10).

⑥ 4-Chlororesorcinol dihenzoate: m.p. 66° (10).

## 3:3130 2-CHLOROHYDROQUINONE

Beil. VI - 849

VI<sub>1</sub>-(417)VI<sub>2</sub>-(844)

M.P. 106°	(1) (2) (12)	B.P. 263°	(1) (2)
105.5° cor.	(3)		
104°	(4) (5)		
103°	(6)		
102°	(7)		
101-102°	(8)		

[See also 2-chlorobenzoquinone-1,4 (3:1100).]

Colorless lfts from  $\text{CHCl}_3$  in which  $\bar{\text{C}}$  is eas. sol. hot but spar. sol. cold. — Very eas. sol. aq., alc., or ether; sol. in warm  $\text{C}_6\text{H}_6$  (dif. from hydroquinone (1:1590) and use in sepn. from latter (1)). — Not sublimable (5)

[For prepn. of  $\bar{\text{C}}$  from 2-chlorobenzoquinone-1,4 (3:1100) by reductn. with aq.  $\text{SO}_2$  (2) (9) see indic. refs. (note, however, that in dil. aq.  $\text{NaOH}$  under  $\text{N}_2$  both reductn. and sulfonation occur (10)); from benzoquinone-1,4 (1:9025) with conc.  $\text{HCl}$  (11) (2) or in  $\text{CHCl}_3$  with  $\text{HCl}$  gas (100% yield (12)) (2); from sodium benzoquinonesulfonate (5) with conc.  $\text{HCl}$  below 20° (55% yield (5)) in  $\text{CO}_2$  see indic. refs.; from *p*-benzoquinone dichloride (2,3-dichlorocyclohexen-5-dione-1,4) [Beil. VII-573] by reductn. with  $\text{SnCl}_2 + \text{HCl}$  at 0° see (4); from hydroquinone (1:1590) in  $\text{CCl}_4$  with  $\text{Cl}_2$  see (13).]

[ $\bar{\text{C}}$  is used as a photographic developer under name "Adurol" (for identification of  $\bar{\text{C}}$  in developers see (1));  $\bar{\text{C}}$  forms an addn. cpd. (14) with 2 moles *p*-(methylamino)phenol also used as developer under name Chloranol; for use of  $\bar{\text{C}}$  as vulcanization accelerator see (15); for use of  $\bar{\text{C}}$  as antioxidant (16) and as gum inhibitor in cracked gasoline (17) or in aq. emulsion as insecticidal spray (18) see indic. refs.; for study of bactericidal actn. see (19).]

$\bar{\text{C}}$  on oxidn. with  $\text{NaClO}_3 + \text{H}_2\text{SO}_4 + \text{V}_2\text{O}_5$  in  $\text{AcOH}$  (92% yield (20)), with  $\text{K}_2\text{Cr}_2\text{O}_7 + \text{H}_2\text{SO}_4$  (yield: 89% (21), 84% (8)) (2), with  $\text{MnO}_2 + \text{dil. H}_2\text{SO}_4$  (56% yield (8)), or with  $\text{PbO}_2$  in  $\text{C}_6\text{H}_6$  (22) gives 2-chlorobenzoquinone-1,4 (3:1100). [For studies of oxidn.-reductn. potential of this system and also for the intermediate quinhydrone see under the quinone (3:1100).]

[For reactn. of  $\bar{\text{C}}$  with phthalic anhydride + conc.  $\text{H}_2\text{SO}_4$  at 130-135° see (2); for reactn. of  $\bar{\text{C}}$  with naphthalene-1,2-dicarboxylic acid anhydride (23) or with naphthalene-2,3-dicarboxylic acid anhydride (24) each fused with  $\text{AlCl}_3 + \text{NaCl}$  see indic. refs.]

$\bar{\text{C}}$  in  $\text{AcOH}$  with xanthinol (1:5205) yields (25) 2-chloro-3-xanthidrylhydroquinone, cryst. from  $\text{C}_6\text{H}_6$ , m p 236-237° (25).

$\bar{\text{C}}$  gives no effervescence with aq. 10%  $\text{Na}_2\text{CO}_3$  but soln. darkens on stdg. (1);  $\bar{\text{C}}$  with aq. 5%  $\text{AgNO}_3$  scarcely reduces in cold but does so rapidly on warming (1);  $\bar{\text{C}}$  with 10% aq.  $\text{FeCl}_3$  gives red-brown color in cold and on boilg. pronounced quinone-like odor (1).

① 2-Chlorohydroquinone diacetate: pr. from dil. alc., m p. 99° (1) (26), 72° (2), 71-72° (27), 70.5° cor. (3) [from  $\bar{\text{C}}$  with  $\text{Ac}_2\text{O}$  (2) or  $\text{AcCl}$  (26)] [Note that a monoacetate, m p. 62° (28) has been reported, but the reason for the wide divergence in the m p.'s reported for the diacetate has not been explained.]

② 2-Chlorohydroquinone dibenzoate: fine woolly ndls. from mixt. of alc. + ether, m p. 130° (2). [From  $\bar{\text{C}}$  on refluxing with  $\text{BzCl}$  (2)]

**3:3140 2,3,4,5-TETRACHLORO-BENZALDEHYDE**

$C_7H_2OCl_4$  Beil. S.N. 635

M.P. 106-106.5° (1)

[For prepn. of  $\bar{C}$  from 2,3,4,5-tetrachlorobenzal (di)chloride (3:9397) by hydrolysis (presumably with strong  $H_2SO_4$ ) see (1).]

$\bar{C}$  with  $NaHSO_3$  forms the corresp. addn. cpd. which may be used as means of sepn. of  $\bar{C}$  from 2,3,5,6-tetrachlorobenzaldehyde (3:2700).

[For use of  $\bar{C}$  in prepn. of dyestuffs see (1).]

**3:3140** (1) Chem. Fabrik Griesheim-Elektron, Brit. 251,511, May 27, 1926; *Cent.* 1926, II 2355; [*C.A.* 21, 1361 (1927)]; French 603,650, April 20, 1926; *Cent.* 1926, II 2355; not in *C.A.*

**3:3145 6-CHLORONAPHTHO-QUINONE-1,4**

$C_{10}H_6O_2Cl$  Beil. S.N. 674

M.P. 106-107° (1)

[For prepn. of  $\bar{C}$  from benzoquinone-1,4 (1:9025) by addition of 2-chlorobutadiene-1,3 ("Chloroprene") (3:7080) and subsequent oxidation of the resulting Diels-Alder type adduct see (2); for formn. of  $\bar{C}$  by oxidation of various dichloronaphthalenes see (1).]

**3:3145** (1) Kozlov, Talybov, *J. Gen. Chem.* 9, 1827-1836 (1939); *C.A.* 34, 4067 (1940). (2) Carothers, Collins (to du Pont Co.), U.S. 1,967,862, July 24, 1934; *Cent.* 1936, I 2209; *C.A.* 28, 5994-5995 (1934).

**3:3155 1,1,2,3,4,4-HEXACHLORO-BUTANE**

$C_4H_2Cl_6$  Beil. S.N. 10

M.P. 107° (1) (2)

[For isolation of  $\bar{C}$  from the high-boilg. fraction resulting in the preparation of trichloroethylene (3:5170) from 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) see (1) (2); long refluxing (20 days) of freshly distilled samples of the latter compound also yields (1)  $\bar{C}$ .]

$\bar{C}$  on boilg. with alc.  $Ca(OH)_2$  or with alk. at room temp. loses 2 HCl yielding (1) the liquid stereoisomer (3:6150) of 1,2,3,4-tetrachlorobutadiene-1,3. [The solid stereoisomer (3:0870) was not obtained from  $\bar{C}$  (1).]

**3:3155** (1) Müller, Hüther, *Ber.* 64, 589-600 (1931); *C.A.* 25, 3956-3957 (1931). (2) Ghigli, *Ann. chim. applicata* 28, 363-368 (1938); *Cent.* 1939, I 86; *C.A.* 33, 6792 (1939).

nitronaphthalene [Beil. V-553, V<sub>1</sub>-(264)] with Cl<sub>2</sub> (together with other products) (17) (2) see indic. refs.]

[C̄ in CHCl<sub>3</sub> soln. satd. with Cl<sub>2</sub> gives (25) both 1,5-dichloronaphthalene tetrachloride, m.p. 84°, and a trichloronaphthalene dichloride, m.p. 94° (separated by spar. soly. of latter in MeOH).]

[C̄ on mononitration yields (10) 1,5-dichloro-8-nitronaphthalene [Beil. V-556], yel. pr. from AcOH, m.p. 142° (10) (17) (23); note that the isomeric 1,5-dichloro-3-nitronaphthalene, m.p. 132°, has been reported indirectly (23) (12).]

[C̄ on monosulfonation (18) (13) gives chiefly 1,5-dichloronaphthalenesulfonic acid-3 [Beil. XI-183, XI<sub>1</sub>-(41)] (corresp. sulfonyl chloride, m.p. 143° (13), corresp. sulfonamide, m.p. 204° (24)) accompanied by a smaller amt. 1,5-dichloronaphthalenesulfonic acid-2 [Beil. XI-181] (corresp. sulfonyl chloride, m.p. 125° (13)).]

[C̄ with picric acid yields a cpd. C̄.PkOH, m.p. 87° (10).]

[C̄ on oxidn. with CrO<sub>3</sub>/AcOH yields (19) 3-chlorophthalic acid (3:4820) but on oxidn. with dil. HNO<sub>3</sub> yields (20) a nitro-chloro-phthalic acid.] [C̄ on cat. vapor-phase oxidn. (21) gives 80% yield 3-chlorophthalic anhydride (3:3900) + 20% phthalic anhydride (1:0725).]

3:3220 PARA- $\alpha$ -CHLORO-ISOBUTYRALDEHYDE  
(2,4,6-tris-( $\alpha$ -Chloroisopropyl)-trioxane-1,3,5)

M.P. 107° (1) (2)

Odorless tasteless ndls. (from distn. with steam); pr. (from ether); insol. aq.; sol. alc., ether, pet. ether. — Sublimes above m.p.

[For prepn. from  $\alpha$ -chloroisobutyraldehyde (3:7235) by shaking with 1/2 vol. conc. H<sub>2</sub>SO<sub>4</sub> see (1) (2).]

3:3220 (1) Brochet, *Ann. chim.* (7) 10, 357-359 (1897). (2) Brochet, *Bull. soc. chim.* (3) 7, 643-644 (1892).

## 3:3250 2,4-DICHLORONAPHTHOL-1

 $C_{10}H_6OCl_2$ 

Beil. VI - 612

VI<sub>1</sub>-(308)VI<sub>2</sub>-(582)

M.P. 107-108° (2) (3)

106-107° (1) (5)

Ndls. (from dil. alc. or lgr.); from AcOH  $\bar{C}$  separates in pr. with 1 mole of AcOH rapidly lost at 40-50° (1). —  $\bar{C}$  is volatile with steam; eas. sol. nbs. alc. ether or  $C_6H_6$ . —  $\bar{C}$  on htg. to 180° decomposes with loss of HCl.

[For prepn. from  $\beta$ -naphthol (1:1500) (1) (2) or 4-chloronaphthol-1 (3:3720) (4) by chlorination see (1) (2) (3); from naphthalene 1,2,3,4-tetrachloride (3:4750) by oxidn. with  $CrO_2$  in AcOH see (5); for other methods see Beil. VI-612]

$\bar{C}$  dissolves in NaOH or  $Na_2CO_3$  but on warming (or even long stdg. in cold) yields (6) ultramarine flocks which impart to ether a violet, and to benzene a deep blue violet, color (6). [Same result obtd. with  $K_3Fe(CN)_6$  but not with pyridine (6).]

$\bar{C}$  on bofl. with dil.  $HNO_3$  is oxidized (1) to phthalic ac. (1:0820); but with  $CrO_2$  in AcOH yields 2-chloronaphthoquinone-1,4 (3:3580), volatile with steam, golden-yel. ndls. from aq., alc., or AcOH, m.p. 116° (1).

$\bar{C}$  is not affected by Sn + alc. HCl (3), or Na/Hg (3), but on htg. in AcOH with conc. HI ( $D = 1.7$ ) for 10 hrs. gives (3)  $\alpha$ -naphthol (1:1500).

$\bar{C}$  dislvd. in 20 pts. 15% aq. KOH and shaken with 4 pts.  $(CH_3)_2SO_4$  gives (94% yield (3)) of the methyl ether, methyl 2,4-dichloro-1-naphthyl ether, colorless ndls. from alc., m.p. 58° (3).

② 2,4-Dichloro-1-naphthyl acetate: from  $\bar{C}$  by htg. with AcCl (2); ndls. (from alc.), m.p. 74-76° (2).

3:3250 (1) Cleve, *Ber.* 21, 891-893 (1885) (2) Zincke, *Ber.* 21, 1035-1036 (1888). (3) Franzen, *Stübke, J. prakt. Chem.* (2) 103, 354-385 (1921/22). (4) Reverdin, Kauffmann, *Ber.* 28, 3053 (1895). (5) Helbig, *Ber.* 28, 506 (1895). (6) Willstätter, Schuler, *Ber.* 61, 370 (1928).

## 3:3275 6-CHLORO-2-METHYL-BENZOIC ACID

 $C_8H_7O_2Cl$ 

Beil. S.N. 941

M.P. 108° (1)

102° (2)

[91.5° (3)]

Long slender colorless ndls. from hot aq. (2) or from HCl (1).

[For prepn. of  $\bar{C}$  from 6-chloro-2-methylbenzamide (see below) (itself obtd. from 6-chloro-2-methylbenzonitrile, m.p. 82-83° (2)) by actn. of nitrous acid see (2); from 6-amino-2-methylbenzoic acid (1) via diazotization and use of  $Cu_2Cl_2$  reactn. see (1) (3).]

$\bar{C}$  on htg. with aniline,  $K_2CO_3$ , and copper powder yields (1) 3-methyldiphenylamine-carboxylic acid-2, cryst. from 50% alc., m.p. 145° dec. (1).

[ $\bar{C}$  melted and treated with  $Br_2$  evolves  $HBr$ , and the prod. on warming with dil. NaOH yields (3) 3-chloro- $\alpha$ -hydroxyphthalide, colorless pl. from dil. alc., m.p. 138° (3)]

— 6-Chloro-2-methylbenzamide: scales from boflg. aq., m.p. 167° (2). [Prepd. indirectly as above.]

3:3275 (1) Gleu, Nitzsche, *J. prakt. Chem.* (2) 153, 213 (1939). (2) Kenner, Witham, *J. Chem. Soc.* 119, 1458 (1921). (3) Levy, Stephen, *J. Chem. Soc.* 1930, 2788.

3:3295 3,4-DICHLORONAPHTHOL-2

$C_{10}H_8OCl_2$  Beil. VI —  
VI<sub>1</sub> —  
VI<sub>2</sub>-(004)

M.P. 108° (1) (2).

Small colorless ndls. from lgr. Sol. in cold  $K_2CO_3$  soln. (2).

[For prepn. from  $\beta$ -naphthol (1:1540) via 1-nitrosonaphthol-2, chlorination with  $SO_2Cl_2$  in tetrachloroethane to 1-nitroso-3,4-dichloronaphthol-2, reduction to 1-amino-3,4-dichloronaphthol-2 and thence via diazo reaction to  $\bar{C}$  see (1); for prepn. from 1,3,4-trichloronaphthol-2 by reduction with  $FeSO_4 + NaOH$  see (2).]

$\bar{C}$ . treated with 1 mole  $HNO_2$  yields 1-nitroso-3,4-dichloronaphthol-2, golden-yel. cryst. from AcOH, m.p. not given (1).

3:3295 (1) Marschall, *Bull. soc. chim.* (4) 43, 1367 (1928). (2) Herzberg, Spengler, Schmidt (to I.G.), Ger. 431,165, June 30, 1926; *Cent.* 1926, II 1196.

3:3298 1,1,1-TRICHLORO-2,2-bis-(p-CHLOROPHENYL)ETHANE  
("DDT", "p,p-DDT")

Beil. S.N. 479

M.P. 108.5-109 (20)

108-109° (1) cor. (27) (29)

108° (2) (28)

107-108° cor. (3)

106-107° (17)

105-106° (5)

105° (6)

[See also 1,1-dichloro-2,2-bis-(p-chlorophenyl)ethane, "DDD" (3:3320).]

Note that  $\bar{C}$  is the remarkable insecticide to which so much publicity is currently being given. Despite the general fanfare the amount of real scientific data which has been released at this writing is small, although very rapid publication is inevitable in the near future. No attempt can be made in this text to cover the utilization of  $\bar{C}$ , but attention is drawn to two bibliographies (7) (8) containing respectively 174 and 418 references, although most of these are to general and nontechnical reports. For an extensive review of chemistry of  $\bar{C}$  see (30).

[For patents on utilization of "DDT" as insecticide see (9) (10). — For studies of toxicology and pharmacology of "DDT" see (11) (12) (13) (14). — Note that  $\bar{C}$  is by rabbits in part excreted as di-(p-chlorophenyl)acetic acid (3:4612), m.p. 166-166.5° u.e. (24).]

Colorless cryst. from 95% alc. —  $\bar{C}$  is spar. sol. in 95% alc.; viz., 0.8 wt. % at 0°, 3.9 wt. % at 48° (3); spar. sol. pet. ether of b.p. 30-60° (3);  $\bar{C}$  is moderately sol. in  $CCl_4$ , ether, or  $CHCl_3$  (3); eas. sol. in pyridine, dioxane,  $C_6H_6$ , or acetone (3); for data and graph of wt. % solubility/temp. over range 0-48° see (3) cf. (25); for soly. of  $\bar{C}$  in kerosenes see (31). [For detn. of  $\bar{C}$  in technical samples, i.e., in pres. of "DDD" (3:3320), by recrystn. from satd. alc. soln. of "DDT" see (26).]

Note that technical  $\bar{C}$  may contain some of the isomeric 1,1,1-trichloro-2-(*p*-chlorophenyl)-2-(*o*-chlorophenyl)ethane (3:1820) and/or polymers of chloral (3:5210); in fact, technical  $\bar{C}$  of setting point  $88^\circ$  contains about 70%  $\bar{C}$  accompanied by 18% of the *o-p* isomer + 6% of the *o,o'* isomer (25). — For extensive report on the compn. of technical grade  $\bar{C}$  see (29).

[For optical crystallographic props. of  $\bar{C}$  see (28).]

### PREPARATION OF $\bar{C}$

$\bar{C}$  is universally prepd. by condensation of chloral or chloral hydrate with chlorobenzene.

From chloral hydrate. [For prepn. of  $\bar{C}$  from chloral hydrate (3:1270) with chlorobenzene (3:7903) + fuming  $H_2SO_4$  (8–10%  $SO_3$ ) (70% yield (2) (4)) or  $ClSO_3H$  (77% yield (32)) see indic. refs.]

From chloral. [For prepn. of  $\bar{C}$  from anhydrous chloral (3:5210) with chlorobenzene (3:7903) + conc.  $H_2SO_4$  see (6) (15) (16).]

### CHEMICAL BEHAVIOR OF $\bar{C}$

Reduction of  $\bar{C}$ .  $\bar{C}$  on reduction with  $Na/alc.$  gives up all its chlorine quant. detn. of which comprises a method for the quant. detn. of  $\bar{C}$  (14)

[ $\bar{C}$  on hydrogenation with  $H_2$  +  $Pd/CaCO_3$  in various solvents on slight warming gives according to conditions (18) various products of bimolecular reduction; these include 2,2,3,3-tetrachloro-1,1,4,4-tetra-(*p*-chlorophenyl)butane, cryst. from  $AcOEt$ , m.p.  $271.5^\circ$  (28% yield (18)), both higher-melting ( $229^\circ$ ) and lower-melting ( $174^\circ$ ) stereoisomers of 2,3-dichloro-1,1,4,4-tetra-(*p*-chlorophenyl)butene-2 (former 36% yield, latter in traces) (18), and perhaps other products; for much further study of these reaction products see the original references (18)]

[ $\bar{C}$  on electrolytic reduction in alc.  $HCl$  soln. gives (13% yield (10)) at the cathode 1,1,4,4-tetra-(*p*-chlorophenyl)butyne-2, pr. from  $AcOEt$ , m.p.  $174^\circ$  (19); note that this prod. on oxdn. with  $CrO_3/AcOH$  gives (91% yield (19)) 4,4'-dichlorobenzophenone (3:4270), m.p.  $145^\circ$ .]

Oxidation of  $\bar{C}$ . Attempts to oxidize  $\bar{C}$  with  $CrO_3/AcOH$  have given (5) no identifiable products.

Dehydrochlorination of  $\bar{C}$ .  $\bar{C}$  with alc. ions can be caused to split out 1  $HCl$  yielding 1,1-dichloro-2,2-bis-(*p*-chlorophenyl)ethylene (21) (for study of rate see (20))

$\bar{C}$  with alc. 10–20 min. (21) (for study of rate see (20)) gives (27) 81% (5) 1,1-dichloro-bis-(*p*-chlorophenyl)ethylene (3:2438) [for use of this reaction by detn. of ionized chlorine as means for detn. of  $\bar{C}$  in spray deposit see (21)]

$\bar{C}$  with excess  $Ba(OH)_2 \cdot 8H_2O$  in ethylene glycol refluxed 10–12 hrs. gives (33% yield (24)) di-(*p*-chlorophenyl)acetic acid (3:4612), m.p.  $166$ – $166.5^\circ$  u.c.; this results by initial loss of  $HCl$  as above and further degradation.

$\bar{C}$  in the pres. of minute amts. (e.g., 0.01%) of  $FeCl_3$  or  $AlCl_3$  at  $110$ – $120^\circ$  loses  $HCl$  giving (22) cf. (34) 1,1-dichloro-2,2-bis-(*p*-chlorophenyl)ethylene (3:2438). (See also below under behavior of  $\bar{C}$  with  $AlCl_3$  +  $C_6H_6$ .)

### SUBSTITUTION REACTIONS OF $\bar{C}$

Bromination. No study of the behavior of  $\bar{C}$  toward  $Br_2$  appears yet to have been reported.

Chlorination.  $\bar{C}$  in  $CCl_4$  soln. with  $Cl_2$  + trace of  $PCl_5$  in light at b.p. of mixture for 3 hrs. gives (73% yield (5)) 1,2,2,2-tetrachloro-1,1-bis-(*p*-chlorophenyl)ethane (3:2477), m.p.  $91$ – $92^\circ$  (5).

Nitration.  $\bar{C}$  on introduction of two nitro groups (no details) gives (6) n prod., ndls. from nlc., m.p. 148.0-148.3° (29), which is presumably 1,1,1-trichloro-1,2-bis-(4-chloro-2-nitrophenyl)ethane; note that this dinitro compd. has same m.p. as corresp. dinitro deriv. from "o,p-DDT" (3:1820) but m.p. of a mixt. of the two is depressed (29).

$\bar{C}$  on tetranitration with a mixt. (1:1 by volume) of fuming  $HNO_3$  and conc.  $H_2SO_4$  at 100° for 1 hr. gives (23) 1,1,1-trichloro-2,2-bis-(4-chloro-3,5-dinitrophenyl)ethane, m.p. 223.5-224.5° cor. (23). — [Note that similar tetranitration of "DDD" (1,1-dichloro-2,2-bis-(p-chlorophenyl)ethane (3:3320) gives (23) 1,1-dichloro-2,2-bis-(4-chloro-3,5-dinitrophenyl)ethane, m.p. 224.5-225.5° cor. (23); similar tetranitration of the o-p isomer of "DDT" (viz., 1,1,1-trichloro-2-(o-chlorophenyl)ethane) (3:1820) gives a prod., m.p. 229.5-230° cor. (23). — For color reactions of these tetranitro derivs. with MeOH/NaOMe and its use in detn. of  $\bar{C}$  see (23) (33).]

Behavior with  $AlCl_3 + C_6H_6$ .  $\bar{C}$  with anhydrous  $AlCl_3$  (1 mole) in large excess of  $C_6H_6$  reacts at room temp. evolving 2 moles HCl and giving (10%) yield (1) 1,1,2,2-tetraphenylethane [Beil. V-739,  $V_1$ -(371),  $V_2$ -(673)], m.p. 211°. [Note that the mechanism of this surprising result has not yet been explained; that by similar treatment the same tetraphenylethane is also obtd. in 25% yield from 1,1-dichloro-2,2-bis-(p-chlorophenyl)ethane (3:3320), in 10% yield from 1,1,1-trichloro-2,2-diphenylethane (3:1420), and from the o-p isomer of "DDT" (viz., 1,1,1-trichloro-2-(o-chlorophenyl)-2-(p-chlorophenyl)ethane) (3:1820), but not at all from 1,1-dichloro-2,2-bis-(p-chlorophenyl)ethylene (3:2438); and that if chlorobenzene is substituted for  $C_6H_6$  no tetraphenylethane results from any of them (1).]

Colorless (12) or pale greenish-yellow (7) (8) cryst. from hexane +  $AcCl$  (1), dry ether (9), lgr. (7) (8), or dry  $C_6H_6$  + pet. ether (12) (17). — Ord.  $\bar{C}$  frequently conts. two kinds of crystals, white and yellow, both melting at 110-112° (13). —  $\bar{C}$  from  $CCl_4$  cryst. with

1 mole solvent;  $\bar{C}$  from acetone cryst. with  $\frac{1}{2}$  mole solvent; in both cases solvent is lost at 92° but not readily in air at ord. temp. (24). — [For study of x-ray crystallography of  $\bar{C}$  see (25).] — Note that  $\bar{C}$  cannot be recrystd. from MeOH or EtOH without more or less complete conversion to the corresp. trityl ethers (see also below under behavior of  $\bar{C}$  with alcohols).

$\bar{C}$  may be stored satisfactorily in ord. screw-top bottles, provided they are well sealed with paraffin (7) — On long exposure to moist air, however,  $\bar{C}$  is hydrolyzed (see also below) to triphenylcarbinol (1:5985), m.p. 161–162°; for f.p./compn. diagram of system  $\bar{C}$  + triphenylcarbinol, eutectic, m.p. 100°, contg. 90%  $\bar{C}$ , see (26). — Samples of partially hydrolyzed  $\bar{C}$  may be purified by recrystn. from  $\frac{1}{2}$  wt. of  $C_6H_6$  contg. 5–25% acetyl chloride, the latter reconverting the triphenylcarbinol to  $\bar{C}$  (7).

$\bar{C}$  is eas. sol. in ether,  $C_6H_6$  (100 g.  $C_6H_6$  dis. 85.8 g.  $\bar{C}$  at 25° (35)),  $CCl_4$ ,  $CHCl_3$ , or  $CS_2$ , but is much less sol. in pet. ether (19). — Solns. of  $\bar{C}$  in acetyl chloride (27) (29), benzoyl chloride (27), hot 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (27) (28), dichloroethylene (28), nitrobenzene (27),  $SOCl_2$  (27),  $SO_2Cl_2$  (29) are yellow; for study of effect of temp. see (27) — Solns. of  $\bar{C}$  in liq.  $SO_2$  are also yellow (29) and conduct electric current (30) (31) (32); for study of molecular weight of  $\bar{C}$  in liq.  $SO_2$  see (33). —  $\bar{C}$  is very sparingly sol. in liq.  $NH_3$  but soln. conducts elect. current (34).

[The protracted arguments on the constitution of  $\bar{C}$  and of trityl derivatives in general (controversy over carbonium and quinonoid forms, etc.) cannot be detailed within the scope of this book; however, for leading references since 1920 see (36) (37) (38) (39) (40) (41) (42) (43) (44) (45); for earlier references see Beil. V-700]

### PREPARATION OF $\bar{C}$

The two best-studied preparations of  $\bar{C}$  are those from triphenylcarbinol (1:5985) with  $AcCl$  (3:7065) in  $C_6H_6$  (93–95% yield (12)) and from  $CCl_4$  (3:5100) with  $C_6H_6$  +  $AlCl_3$  (84–86% yield on  $AlCl_3$  used (7) (8)). Note, however, that many other methods have also been used as recorded below.

From triphenylcarbinol (1:5985). [For prepn. of  $\bar{C}$  from triphenylcarbinol with  $AcCl$  (3:7065) directly (79% yield (16)) or in  $C_6H_6$  soln. (93–95% yield (12)); with oxalyl (dichloride) (3:5060) (47); with  $HCl$  gas in dry  $C_6H_6$  (48) (for study of equilibrium see (49)) contg.  $CaCl_2$  (9) or in dioxane at 50° for 22 hrs. (86% yield (14)); with conc.  $HCl$  in  $AcOH$  (79% yield (50)) or in  $C_6H_6$  +  $ZnCl_2$  (85% yield (51)); with  $PCl_5$  directly (52) or in lgr. (53) or in  $C_6H_6$  (29) or in  $C_6H_6$  +  $ZnCl_2$  (90% yield (51)); with  $PCl_5$  +  $ZnCl_2$  in  $C_6H_6$  (92% yield (51)); with  $SOCl_2$  in  $C_6H_6$  (97% yield (51)); with  $SiCl_4$  in  $C_6H_6$  or lgr. at 40° (54), or with  $COCl_2$  (3:5000) in  $C_6H_6$  +  $CaCl_2$  (5) see indic. refs.]

From other triphenylcarbinol derivatives. [For prepn. of  $\bar{C}$  from K triphenylcarbinolate with  $COCl_2$  (3:5000) in toluene (5); from triphenylmethoxy— $MgBr$ ,  $(C_6H_5)_3C-OMgBr$  (from benzophenone +  $C_6H_5MgBr$ ), with  $AcCl$  in  $C_6H_6$  (37% yield (55)) or with  $COCl_2$  in toluene (14% yield (55)); from triphenylcarbinol ethyl ether (see also below) with  $AlCl_3$  in  $CS_2$  (56) or with  $AcCl$  (46) (57) see indic. refs.]

From various other trityl derivatives and relatives. [For prepn. of  $\bar{C}$  from  $\alpha$ -bromotriphenylmethane (trityl bromide) with  $AgCl$  in  $C_6H_6$  in s.t. at 200° for several days (50% yield (57)); from  $\alpha$ -aminotriphenylmethane (tritylamine) [Beil. XII-1343, XII-(557)] with  $NH_4Cl$  in liq.  $NH_3$  (34), from triphenylmethylphosphinic acid  $[(C_6H_5)_3C(PO)(OH)]$  with  $PCl_5$  (3 moles) at 70° (91% yield (20)); from triphenylmethane (1:7220) with  $PCl_5$  at 160° for 2 hrs. (65% yield (58)) or with  $NOCl$  at 150° (59) see indic. refs.]

[For prepn. of  $\bar{C}$  from triphenylacetyl chloride [Beil. IX-713, IX-(309)] by loss of  $CO$  on htc. at 120–150° (60) or at 170–180° (61); from bis-(triphenylmethyl) peroxide [Beil.

VI-716, VI<sub>1</sub>-(350)] with Cl<sub>2</sub> + a little I<sub>2</sub> in boilg. CCl<sub>4</sub> soln. for 3 hrs. (40% yield (23)) see indic. refs.]

From benzene with various polyhalogenated methanes. [For prepn. of  $\bar{C}$  from C<sub>6</sub>H<sub>6</sub> (1:7400) with CCl<sub>4</sub> (3:5100) in pres. of AlCl<sub>3</sub> (84-86% yield on AlCl<sub>3</sub> used (7) (8); 70-85% yield (18)) cf. (62) (63) (64) in CS<sub>2</sub> (97% yield (19)) see indic. refs.; for use of FeCl<sub>3</sub> (31% yield against 77% with AlCl<sub>3</sub> under otherwise same conditions (10) cf. (65)) see indic. refs.]

[For prepn. of  $\bar{C}$  from C<sub>6</sub>H<sub>6</sub> (1:7400) with CHCl<sub>3</sub> (3:5050) + AlCl<sub>3</sub> at 50° see (22).]

[For formn. of  $\bar{C}$  from C<sub>6</sub>H<sub>6</sub> with dichloro-difluoro-methane ("Freon") + AlCl<sub>3</sub> see (66).]

From various chlorotoluenes. [For formn. of  $\bar{C}$  from benzotrichloride (3:6540) with C<sub>6</sub>H<sub>6</sub> in pres. of metallic U (67), Ti (68), Ce (69), or Cr (21) see indic. refs.; from benzal (di)chloride (3:6327) with C<sub>6</sub>H<sub>6</sub> + AlCl<sub>3</sub> see (22).]

From various chlorodiphenylmethanes. [For formn. of  $\bar{C}$  from  $\alpha$ -chlorodiphenylmethane (benzohydril chloride) (3:0060) (22) or from  $\alpha,\alpha$ -dichlorodiphenylmethane (benzophenone chloride) (3:6960) (70) with C<sub>6</sub>H<sub>6</sub> + AlCl<sub>3</sub> see indic. refs.]

From other miscellaneous sources. [For formn. of  $\bar{C}$  from pentaphenylethane [Beil. V-755, V<sub>1</sub>-(386), V<sub>2</sub>-(711)] with PCl<sub>5</sub> at 170° for 2 hrs. or refluxed in C<sub>6</sub>H<sub>6</sub> (58), or (together with other products) with HCl at 150° (71) or on evapn. of soln. in SO<sub>2</sub>Cl<sub>2</sub> (72).]

## CHEMICAL BEHAVIOR OF $\bar{C}$

Pyrolysis of  $\bar{C}$ .  $\bar{C}$  on htg. at 200° (52) (73) or 250° (53) or at 160° in pres. of P<sub>2</sub>O<sub>5</sub> (74) loses HCl and yields both triphenylmethane (1:7220), m.p. 92°, and 9-phenylfluorene [Beil. V-720, V<sub>1</sub>-(355), V<sub>2</sub>-(630)], m.p. 147-148°; note that 9-phenylfluorene is also formed from  $\bar{C}$  in various other reactions such as with POCl<sub>3</sub> on distn. (23) or with  $\frac{1}{10}$  wt. of mossy zinc refluxed in C<sub>6</sub>H<sub>6</sub> for 5 hrs. (75).

Reduction of  $\bar{C}$ .  $\bar{C}$  is reduced to triphenylmethane by many different types of reducing agent [e.g.,  $\bar{C}$  in anhydrous formic acid (1:1005) at 100° evolves CO<sub>2</sub> + HCl and gives (yield: 79% in 30 min., 90% in 2 hrs. (4)) triphenylmethane (1:7220);  $\bar{C}$  in EtOH treated with conc. H<sub>2</sub>SO<sub>4</sub> at 70-80° gives (76) (17) triphenylmethane accompanied by acetaldehyde (1:0100);  $\bar{C}$  is reduced by diethyl ether in the presence of AlCl<sub>3</sub> (56) (77), FeCl<sub>3</sub> (65), or ZnCl<sub>2</sub> (78) to triphenylmethane (1:7220), acetaldehyde (1:0100) and ethyl chloride (3:7015) also being formed; other reagents which effect reduction of  $\bar{C}$  to triphenylmethane (1:7220) include hydrazobenzene in boiling C<sub>6</sub>H<sub>6</sub> (79), cyclohexadiene-1,3 (dihydrobenzene) + HgCl<sub>2</sub> (80); Zn + AcOH (50) (reaction here is complex, and various other prods. may be formed according to conditions), and dry H<sub>2</sub>S at 150° (81)].

Oxidation of  $\bar{C}$ .  $\bar{C}$  is not readily oxidized:  $\bar{C}$  with silver oxide in dry C<sub>6</sub>H<sub>6</sub> or ether gives (78) a little fuchson, (C<sub>6</sub>H<sub>5</sub>)<sub>2</sub>=C<sub>6</sub>H<sub>4</sub>=O [Beil. VII-520, VII<sub>1</sub>-(290)], m.p. 168°, together with other amorphous products difficult to purify; note, however, that  $\bar{C}$  in alcohol-free acetone with KMnO<sub>4</sub> in same solvent instantly reduces the KMnO<sub>4</sub> and gives (100% yield (85)) triphenylcarbinol (1:5985).

Hydrolysis of  $\bar{C}$ .  $\bar{C}$  with aq. hydrolyzes to triphenylcarbinol (1:5985) + HCl: e.g.,  $\bar{C}$  on shaking with aq. at ord. temp. is 85% hydrolyzed in 48 hrs. (26) cf. (82) (83) (in this connection note m.p./compn. diagram (26) of  $\bar{C}$  + triphenylcarbinol);  $\bar{C}$  with boilg. aq. rapidly and completely yields only triphenylcarbinol.

[For study of hydrolysis of  $\bar{C}$  by aq. in acetone (84), in dioxane (14), or by aq. HCl (35) see indic. refs.]

$\bar{C}$  dissolves in cold conc. H<sub>2</sub>SO<sub>4</sub> yielding (86) (48) (87) a golden-yellow soln. with evolution of HCl (88) (86) (48) and formn. of triphenylcarbinyl hydrogen sulfate; dilution of this soln. with aq. ppts. (99% yield (86) (48)) triphenylcarbinol (1:5985).

$\bar{C}$  dissolves in phenol with deep brown color; on dilution of the freshly prepd. soln. with aq. it becomes colorless and both HCl and triphenylcarbinol are detectable; if, however, the phenol soln. has stood for some time prior to dilution some *p*-tritylphenol [Beil. VI-731, VI<sub>1</sub>-(364)], m.p. 282°, is also formed (89) (see also below under behavior of  $\bar{C}$  with phenols).]

## BEHAVIOR OF $\bar{C}$ WITH OTHER INORGANIC REACTANTS

### WITH SALTS OF VARIOUS INORGANIC ACIDS

#### With Salts of Hydrogen Peroxide

$\bar{C}$  in acetone with 30%  $H_2O_2$  in freezing mixt. treated with 50% KOH gives (90) trityl hydroperoxide,  $(C_6H_5)_3C-O-OH$  (isolated as its addn. cpd. with pyridine hydrochloride, viz.,  $(C_6H_5)_3C-O-OH \cdot C_5H_5N \cdot HCl$ , cryst. from alc., m.p. 133° dec.), accompanied by some triphenylcarbinol (1:5985).]

$\bar{C}$  in  $C_6H_6$  with aq.  $Na_2O_2$  as directed (91) gives (5-11% yield) bis-trityl peroxide,  $(C_6H_5)_3C-O-O-C(C_6H_5)_3$ , cryst. from hot  $CS_2$ , m.p. 185-186°, accompanied by much triphenylcarbinol; the bis-trityl peroxide is also obtainable from the trityl hydroperoxide (above) by reaction with  $\bar{C}$  in  $C_6H_6$  on addn. of aq. alk. (90).]

#### With Salts of Halogen Hydrides

With alkali or alkaline-earth salts.  $\bar{C}$  with alkali fluorides seems not to have been studied; note, however, that trityl fluoride, cryst. from  $CCl_4$ , m.p. 104° (6), has been prepd. by other means, viz., from triphenylcarbinol with HF (6) or with acetyl fluoride (85).]

$\bar{C}$  with anhydrous  $CaBr_2$  in  $C_6H_6$  at room temp. for 5-6 hrs. (92) or  $\bar{C}$  with HBr in  $C_6H_6$  at room temp. for 20 hrs. (92) is largely converted to trityl bromide [Beil. V-704, V<sub>1</sub>-(348), V<sub>2</sub>-(617)], m.p. 152°.]

[For study of rate of reaction of  $\bar{C}$  with KI in dry acetone at 0° see (93); note, however, that, although trityl iodide [Beil. V-706], m.p. 132°, is doubtless formed, yet more or less sepn. of  $I_2$  and formn. of triphenylmethyl (or its reaction prods.) occurs also.]

With metal chlorides.  $\bar{C}$  with many metallic chlorides forms double salts [e.g.,  $\bar{C}$  with  $AlCl_3$  forms (19) (87) a cpd.,  $\bar{C} \cdot AlCl_3$ , dark-yellow very hygroscopic cryst. from nitrobenzene +  $CS_2$ , dec. abt. 122-125°;  $\bar{C}$  in nitrobenzene with  $SnCl_4$  gives on addn. of dry  $CS_2$  or.-yel. cryst. of a cpd.,  $\bar{C} \cdot SnCl_4$  (30) (57) (87) (94);  $\bar{C}$  with  $SbCl_5$  gives (57) a cpd.,  $\bar{C} \cdot SbCl_5$ , red cryst.;  $\bar{C}$  with  $BCl_3$  gives a cpd.,  $\bar{C} \cdot BCl_3$  (6), etc.].

#### With Salts of Hydrogen Sulfide

$\bar{C}$  with alc. NaSH (from alc. NaOEt sdd. with  $H_2S$ ) (81) cf. (95) (96), or  $\bar{C}$  with KSF in  $C_6H_6$  (96), gives triphenylthiocarbinol [Beil. VI<sub>1</sub>-(352)], cryst. from abs. alc. or alc. +  $CHCl_3$ , m.p. 107° (81) (95) —  $\bar{C}$  with alc.  $Na_2S$  as directed gives (21% yield (95)) bis-trityl sulfide, m.p. 182° dec. — Note also that bis-trityl disulfide, cryst. from  $C_6H_6$  + pet. ether, m.p. 157° dec. (95) [Beil. VI<sub>1</sub>-(353)], is also known but prepd. indirectly (81) (95) (96).]

#### With Other Salts of Inorganic Acids

$\bar{C}$  with  $Ag_2SO_4$  in liq.  $SO_2$  (23),  $C_6H_6$  (97), or at 120-130° for 15-20 min. (98) cf. (48) gives di-trityl sulfate [Beil. VI-717, VI<sub>1</sub>-(351)]. —  $\bar{C}$  with  $AgClO_4$  in nitrobenzene +  $C_6H_6$  gives (99) trityl perchlorate [Beil. VI-717, VI<sub>1</sub>-(351)]. —  $\bar{C}$  with  $AgCrO_4$  in  $C_6H_6$  gives (48) cf. (100) di-trityl chromate [Beil. VI-717; note that this salt is also obtd. from  $\bar{C}$  with  $CrO_3$  in  $C_6H_6$  or  $CCl_4$  (101).]

[ $\bar{C}$  with  $\text{NaN}_3$  in  $\text{C}_6\text{H}_6$  refluxed 20 hrs. gives (100% yield (102)) trityl azide [Beil. V-708, V<sub>1</sub>-(349), V<sub>2</sub>-(618)], colorless cryst., m.p. 64° (102), 65° (103). — For study of reaction of  $\bar{C}$  with silver hyponitrite and decompn. of the transient trityl hyponitrite see (104)]

#### WITH METAL OXIDES

[ $\bar{C}$  with  $\text{HgO}$  in dry  $\text{C}_6\text{H}_6$ , ether,  $\text{CS}_2$ , or  $\text{CHCl}_3$  as directed (78) cf. (105) (106) gives (50–85% yield (78)) di-trityl oxide, cryst. from xylene, m.p. 237–238° (106), 235–237° (78) (105). — Note that  $\bar{C}$  with  $\text{Ag}_2\text{O}$  in  $\text{C}_6\text{H}_6$  undergoes oxidation (cf. above); note that  $\bar{C}$  with  $\text{CrO}_3$  in  $\text{C}_6\text{H}_6$  or  $\text{CCl}_4$  gives (101) di-trityl chromate [Beil. VI-717].]

#### WITH METALS

With alkali metals (or their amalgams). [ $\bar{C}$  in dry ether with 1%  $\text{Na}/\text{Hg}$  on shaking at room temp. (2) (8) (107) (108) (109) or  $\bar{C}$  with  $\text{Na}$  in liq.  $\text{NH}_3$  (112) gives tritylsodium (sodium triphenylmethyl) [Beil. XVI<sub>1</sub>-(589)].  $\bar{C}$  with  $\text{K}$  in liq.  $\text{NH}_3$  gives (112) tritylpotassium. —  $\bar{C}$  in dry ether with excess  $\text{Li}/\text{Hg}$ ,  $\text{Rb}/\text{Hg}$ , or  $\text{Cs}/\text{Hg}$  in absence of air gives (113) corresp. trityllithium, tritylrubidium, or tritylcesium. — For behavior of  $\bar{C}$  with calcium in liq.  $\text{NH}_3$  see (112). — In this connection note that  $\bar{C}$  in dry ether,  $\text{C}_6\text{H}_6$ , or  $\text{CS}_2$  in absence of air and under  $\text{CO}_2$  with molecular  $\text{Ag}$  (91) cf. (117),  $\text{Hg}$  (91),  $\text{Zn}$  (91) (114) (115), or  $\bar{C}$  with  $\text{Cu}$  bronze in  $\text{C}_6\text{H}_6$  +  $\text{EtOAc}$  (116) or in s.t. at 80–110° in dark (117) gives triphenylmethyl (trityl); note also that  $\bar{C}$  with  $\text{Zn}$  +  $\text{AcOH}$  in the cold gives (50) triphenylmethane (1:7220) + trityl, but the same mixture if heated gives triphenylmethane + 1-benzohydril-4-tritylbenzene [Beil. V-761], m.p. 231° (118), 230° cor. (110), the latter under certain conditions attaining as high as 70% (50) (118).]

With  $\text{Zn}$ . [ $\bar{C}$  with  $\frac{1}{10}$  wt. of mossy zinc refluxed in  $\text{C}_6\text{H}_6$  for 5 hrs. gives (75) 9-phenylfluorene (see also above under pyrolysis of  $\bar{C}$ ). — For behavior of  $\bar{C}$  with  $\text{Zn}$  in  $\text{EtOAc}$  see (120).]

With  $\text{Mg}$  (in dry ether).  $\bar{C}$  with  $\text{Mg}$  in dry ether in the pres. of  $\text{I}_2$  as directed gives (96% yield (13)) cf. (121) of corresp.  $\text{R}-\text{Mg}-\text{Cl}$  cpd., viz., trityl- $\text{Mg}-\text{Cl}$  [Beil. XVI-942, XVI<sub>1</sub>-(556)]. — [The former controversy as to whether this can exist in a more reactive quinonoid structure ( $\alpha$ ) or a relatively less reactive carbonium ( $\beta$ ) structure cannot be reported here (for references see above Beilstein citation), nor can space be taken for a full account of its reactions.] — Note, however, that this  $\text{RMgCl}$  cpd. with  $\text{CO}_2$  gives (yields: 91% (2), 87.5% (121)) (122) (59) triphenylacetic acid [Beil. IX-712, IX<sub>1</sub>-(309)], m.p. 264–265° dec. (122); for study of adverse influence of triphenylcarbinol or of benzaldehyde see (121).]

#### WITH NITROGENOUS INORGANIC REACTANTS

[ $\bar{C}$  dislvd. in  $\text{C}_6\text{H}_6$  and satd. with dry  $\text{NH}_3$  gas (123) (124) repeatedly (125), or  $\bar{C}$  in naphthalene with dry  $\text{NH}_3$  gas at 130° (126), gives (45% yield (126)) tritylamine (triphenylmethyl-amine) [Beil. XII-1343, XII<sub>1</sub>-(557)], pr. from abs. alc., m.p. 102° (126), 103–104° (124), 105° (127) (corresp.  $\text{B.HCl}$ , spar. sol. aq., m.p. 244° (127)).]

[ $\bar{C}$  with  $\text{NH}_2\text{OH}$  (from  $\text{NH}_2\text{OH.HCl}$  in  $\text{MeOH}/\text{NaOMe}$ ) in  $\text{C}_6\text{H}_6$  gives (73–75% yield (3)) (128) cf. (129) *N*-tritylhydroxylamine [Beil. XV-33, XV<sub>1</sub>-(11)], pr. from  $\text{C}_6\text{H}_5/\text{pet. ether}$ , m.p. 130–135° (3), 124–135° u.c. (128); for study of rearr. of this prod. see (129). — For study of *N*-methyl ether of this prod., viz., *N*-trityl-*N*-methylhydroxylamine (similarly prepd. from  $\bar{C}$  with *N*-methylhydroxylamine) see (130) (131); for study of the isomeric *O*-methyl ether, viz., *N*-trityl-*O*-methylhydroxylamine (from  $\bar{C}$  with methoxyamine), see (132).]

[ $\bar{C}$  with hydrazine hydrate (2 moles) in alc. at ord. temp. (232) or in dry ether under reflux (233) or in dry pyridine at 45–50° (234) gives (63% yield (234)) *N,N'*-di-tritylhydrazine]

zinc ( $\alpha, \alpha'$ -hydrazotriphenylmethane) [Beil. XV-582, XV<sub>1</sub>-(184)], m.p. 212° (234), 219-220° dec. (235), often accompanied (232) (233) by some *N*-tritylhydrazine [Beil. XV-591, XV<sub>1</sub>-(184)]

## BEHAVIOR OF $\bar{C}$ WITH ORGANIC REACTANTS

### WITH ORGANIC HYDROXY OR MERCAPTO COMPOUNDS

#### With Alcohols

$\bar{C}$  with alcohols gives the corresp. ethers of triphenylcarbinol. With the lower monohydric alcs this conversion can occur merely on solution and warming, but higher alcs. usually require htg., use of metal alcoholate, use of an acid acceptor (pyridine), etc.

With methyl alcohol.  $\bar{C}$  with MeOH (1:6120) in  $C_6H_6$  for 10 min. (133), or  $\bar{C}$  with MeOH/NaOMe refluxed 4 hrs. (134), gives (55% yield (134)) triphenylcarbinyl methyl ether ( $\alpha$ -methoxytriphenylmethane), cryst. from MeOH, m.p. 83.5-84° (133), 82.5-83° (134), 82.6-82.9° (134) (136), 82° (64); note, however, that this product exists in dimorphous forms; the lower-melting form just mentioned sometimes (134) (135) changes to a higher-melting form, m.p. 96.0-96.5° (134) (135); note also that the m.p. of this methyl ether is close to that of the ethyl ether (see below) but that a mixed m.p. of the two is depressed (136). — [For studies of hydrolysis of the methyl trityl ether to triphenylmethane (1:7220) and formaldehyde (1:0145) see (134) (136); for prepn. of its addn. cpd., m.p. 90-91°, with PhOH see (138)]

With ethyl alcohol.  $\bar{C}$  with abs. EtOH (1:6130) on warming (1) (4) (5) (52) or even shaking 1 min. nt ord. temp. (139), or  $\bar{C}$  with nbs. EtOH/NaOEt (9) (56) (134) (139), gives (yields: 83% (138), 50% (134)) triphenylcarbinyl ethyl ether ( $\alpha$ -ethoxytriphenylmethane), cryst. from nbs. alc., ether, or pet. ether, m.p. 84° (5), 83° (1) (9), 81.2-81.8° (134), 81.3° (56), 81° (4). — Note that the m.p. of this prod. is almost identical with that of triphenylcarbinyl methyl ether (above) but that a mixed m.p. of the two is depressed (137). — [For study of pyrolysis of this ethyl trityl ether yielding triphenylmethane (1:7220) and acetaldehyde see (134) (136); for study of its cleavage with AcCl (3:7065) (57) (46), with AlCl<sub>3</sub> in CS<sub>2</sub> (56), or with EtOH/HCl (26) see indic. refs.; for conversion with boilg. anhydrous formic acid to triphenylmethane (1:7220) see (4).]

With other monohydric alcs.  $\bar{C}$  with *n*-PrOH (1:6150) in dry pyridine nt room temp. for 20 hrs. (140), or  $\bar{C}$  with *n*-PrOH/NaO *n*-Pr refluxed 4 hrs. (134), gives (10% yield (134)) trityl *n*-propyl ether, cryst. from *n*-PrOH/pet. ether, m.p. 55° (140), 50.5-52.5° (134). —  $\bar{C}$  with isopropyl alc. (1:6135) in dry pyridine nt room temp. for 20 hrs. (140) or  $\bar{C}$  with isopropyl alc./Na isopropylate under reflux gives (50% yield (134)) trityl isopropyl ether, m.p. 113° (140), 112.9-113.8° (134), 111.7° (56). —  $\bar{C}$  with *n*-BuOH (1:6180) + sodium *n*-butylate gives (40% yield (134)) trityl *n*-butyl ether, oil, b.p. 196-199° nt 5 mm. (134). — For prepn. of corresp. trityl ethers from *sec*-butyl alc. (1:6155) (134), isobutyl alc. (1:6165) (134), isomyl alc. (1:6200) (134), cetyl alc. (1:5915) (140), allyl alc. (1:6145) (140), benzyl alc. (1:6450) (134), cyclohexanol (1:6415) (140), see indic. refs.]

[For prepn. of corresp. trityl ethers from *l*-menthol (1:5940) (152) (153) (154), *d*-borneol (1:5990) (152) (153), or cholesterol (1:5975) (152) see indic. refs.]

[Note, however, that  $\bar{C}$  with K triphenylcarbinolate does not give the expected prod. but rather (96) *p*-hydroxytriphenylcarbinol in the form of its anhydride fuchsone; the expected ditrityl ether has been obtd. from  $\bar{C}$  by action of HgO (see above).]

With various important substituted monohydric alcohols.  $\bar{C}$  with  $\beta$ -methoxyethanol (methyl "cellosolve") (1:6405) in pyridine gives (80-85% yield (141)) trityl  $\beta$ -methoxyethyl ether, m.p. 105.5-106.0° u.c. (141), 104° (142). —  $\bar{C}$  with  $\beta$ -ethoxyethanol ("cellosolve") (1:6410) in pyridine nt 100° for 5 hrs. gives (92% yield (141)) trityl  $\beta$ -ethoxyethyl

ether, m.p. 79.0-79.5° u.c. (141), 77-78° (143). —  $\bar{C}$  with  $\beta$ -isopropoxyethyl alc. (isopropyl "cellosolve") (1:6413) in pyridine gives (50-60% yield (141)) trityl  $\beta$ -isopropoxyethyl ether, m.p. 71.0-71.5° u.c. (141). —  $\bar{C}$  with  $\beta$ -benzyloxyethyl alc. (benzyl "cellosolve") (1:6533) in pyridine gives (50-70% yield (141)) trityl  $\beta$ -benzyloxyethyl ether, m.p. 76-77° u.c. (141). —  $\bar{C}$  with  $\beta$ -phenoxyethyl alc. (phenyl "cellosolve") (1:6518) in pyridine gives (75-85% yield (141)) trityl  $\beta$ -phenoxyethyl ether, m.p. 123.5-124.0° u.c. (141).]

[ $\bar{C}$  with  $\beta$ -( $\beta$ -methoxyethoxy)ethyl alc. (methyl "carbitol") (1:6458) in pyridine gives (55-60% yield (141)) trityl  $\beta$ -( $\beta$ -methoxyethoxy)ethyl ether, m.p. 58-59° u.c. (141). — Note that the trityl ethers of  $\beta$ -( $\beta$ -ethoxyethoxy)ethyl alc. ("carbitol") (1:6470) and of  $\beta$ -( $\beta$ -n-butoxyethoxy)ethyl alc. (butyl "carbitol") (1:6517) are unreported.]

With various polyhydric alcohols. (For  $\bar{C}$  with carbohydrates see separate section below.)

[ $\bar{C}$  with ethylene glycol (1:6465) in pyridine may according to conditions (141) give either or both of the two possible ethers, viz., ethylene glycol monotrityl ether, m.p. 105-105.5° u.c. (141), 104.5-105.5° (141), 102-103° (143), 98-100° (140) (corresp. benzoyl deriv. m.p. 58.5-59.5° (144); corresp. *p*-nitrobenzoyl deriv., m.p. 155-156° (144)), and/or ethylene glycol ditrityl ether, m.p. 190° u.c. (145), 187-188° u.c. (141), 185-186° (140)]

[ $\bar{C}$  with propylene glycol (propanediol-1,2) (1:6455) in pyridine gives (146) propylene glycol ditrityl ether, m.p. 176.5-177.0° u.c. (146).]

[ $\bar{C}$  (2 moles) with diethylene glycol (1:6525) in pyridine gives (60-70% yield (141)) diethylene glycol ditrityl ether, m.p. 157.5-158.0° u.c. (141); note that corresp. diethylene glycol monotrityl ether has m.p. 112.5-113.5° u.c. (141).]

[ $\bar{C}$  (2 moles) with triethylene glycol (1:6538) in pyridine gives (45-60% yield (141)) triethylene glycol ditrityl ether, m.p. 142.0-142.5° u.c. (141); note that this prod. is dimorphous, and an unstable form, m.p. 130.5-131.5° u.c., sometimes obt'd. can be converted to the stable higher-melting form by htg. at 125° or by grinding in acetone (141).]

[ $\bar{C}$  with glycerol (1:6540) may give mono-, di-, or tritryl ethers acc. to conditions; glycerol  $\alpha$ -monotrityl ether, m.p. 93-94° (147), 92-94° (140), but also sometimes in another form of m.p. 108-110° (147) (148), 109-110° (149); glycerol  $\alpha,\alpha'$ -ditrityl ether, m.p. 174-177° (150), 174-176° cor. (151), 170-171° (140); glycerol  $\alpha,\alpha',\beta$ -tris-trityl ether, m.p. 196-197° (147) (150). — Note that the relationships of these three ethers are subtle; e.g., the monoether at 180-190° is converted (147) into the  $\alpha,\alpha'$ -diether; the latter in turn at 260° gives (147) the triether.]

[ $\bar{C}$  (4 moles) with pentaerythritol (1:5850) in pyridine gives (145) a tetratrityl ether m.p. above 350°.]

With carbohydrates and their relatives.  $\bar{C}$  has recently been much employed as a tritylating agent for compounds of the carbohydrate group. This use started from the original (erroneous) impression that  $\bar{C}$  etherified hydroxyl groups only if the latter were primary. However, although  $\bar{C}$  does in general react preferentially with such primary hydroxyls, and this reaction has been proposed (155) as a means for the detection of primary alcs. in the presence of secondary and/or tertiary alcohols, yet such primary tritylation is *not* specific. Abundant evidence is already available (156) (157) (158) (159) that secondary hydroxyl groups undergo tritylation. Although the scope of this book cannot be extended to a detailed treatment of the use of  $\bar{C}$  as tritylating agent in the carbohydrate group, yet a few brief citations may be of service as leading references.

With various tetrahydric alcohols. [For behavior of  $\bar{C}$  with *meso*-erythritol (1:5825) and pentaerythritol (1:5850) see (145).]

With various pentahydric alcohols and pentoses. [For behavior of  $\bar{C}$  with adonitol, arabit, xylitol, fucitol, rhamnitol, and epirhamnitol see (145); with arabinose, ribose, and xylose see (160); with various derivatives of these see (158) (167) (168).]

type (104)) accompanied by a trace of a cryptophenol, presumably 2-trityl-4-methylphenol, m.p. 182° (185) (190), also nhtd. (64% yield (190)) from  $\bar{C}$  with sodium *p*-cresolate in excess *p*-cresol at 130–140° for 3 hrs.]

*With other phenols.* [For further examples of nuclear tritylation of phenols by use of  $\bar{C}$  with isochavihetol and isoeugenol see (196) cf. (26); with 2-hydroxynaphthoquinone-1,4 see (197). — For formn. of di-trityl ethers from pyrocatechol (1:1520) (140) or from hydroquinone (1:1590) (108) see indie. refs.]

*With thiophenols.*  $\bar{C}$  with thiophenol on hgt. (109) or in  $C_6H_6$  soln. on refluxing  $\frac{1}{2}$  hr. (180) (179), or  $\bar{C}$  with  $NaSC_6H_5$  in ether at ord. temp. for 18 hrs. (200) (201), gives (yield alm. quant. (109) (200), 96% (180)) trityl phenyl sulfide, m.p. 106.5° (180), 106° (201), 105–106° (199) (200), 105° (179); this prod. on oxidn. with  $CrO_3/AcOH$  gives (199) the corresp. sulfoxide, m.p. 163°, but is unaffected by  $H_2O_2$  (199) [for corresp. sulfone, m.p. 175–176° (210), see below under reaction of  $\bar{C}$  with salts of organic acids (sodium benzene-sulfinate)].

[For corresp. sulfides from  $\bar{C}$  with *o*-thiocresol, *p*-thiocresol,  $\alpha$ -thionaphthol,  $\beta$ -thionaphthol, 2,4-dinitrothiophenol see (201).]

*With enols or enolates.* [For examples of reaction of  $\bar{C}$  with the enol form of diphenylacetaldehyde (202), methyl diphenylacetate (202), or with stilbenediol *bis*-MgI cpd. (203) see indie. refs.]

#### BEHAVIOR OF $\bar{C}$ WITH ETHERS

$\bar{C}$  with various aliphatic ethers in the pres. of suitable catalysts yields triphenylmethane and an aldehyde [e.g.,  $\bar{C}$  with diethyl ether in the pres. of  $AlCl_3$  (56) (77),  $FeCl_3$  (65), or  $ZnCl_2$  (78) gives triphenylmethane and acetaldehyde; although the latter is lost by polymerization the method is standard (77) for prepn. of triphenylmethane (1:7220)].

[Note, however, that with aromatic ethers nuclear tritylation occurs: e.g.,  $\bar{C}$  with anisole (1:7445) +  $SnCl_4$  at 100–110° for 1 hr. gives (45% yield (204)) 4-tritylanisole; m.p. 200.5° (204).]

#### BEHAVIOR OF $\bar{C}$ WITH ORGANIC ACIDS

(For salts of organic acids see below.)

$\bar{C}$  with  $AcOH$  even at 13° (133) (146) cf. (50) is in equilibrium with trityl acetate (see below) +  $HCl$ . —  $\bar{C}$  with thiolacetic acid ( $CH_3COSH$ ) gives trityl thiolacetate [Beil. VI-721, VI<sub>1</sub>-(353)], m.p. 138° (179). —  $\bar{C}$  with thiolbenzoic acid ( $C_6H_5COSH$ ) in toluene gives (85% yield (180)) trityl thiolbenzoate [Beil. IX-422, IX<sub>1</sub>-(170)], m.p. 187.5–188° (180). —  $\bar{C}$  with free thiocyanic acid in  $C_6H_6$  gives (97% yield (180)) trityl thiocyanate, m.p. 139° (180) (see also below).

#### BEHAVIOR OF $\bar{C}$ WITH SALTS OF ORGANIC ACIDS

$\bar{C}$  with salts of organic acids normally reacts to yield the corresp. trityl esters.

$\bar{C}$  with  $AgOAc$  in dry ether or  $C_6H_6$  on shaking at room temp. (57) or in  $C_6H_6$  refluxed 2 hrs. (46), or  $\bar{C}$  shaken with  $NH_4OAc$  in  $C_6H_6$  at ord. temp. (205), gives trityl acetate, cryst. from  $AcOEt$  + lgr., m.p. 87–88° (46) (57). —  $\bar{C}$  with  $AgOBz$  in  $C_6H_6$  at 60° for 4 hrs. gives (96) trityl benzoate, m.p. 165–166° (96). — Note that in analogous fashion  $\bar{C}$  might be expected to react with silver salts of *p*-nitrobenzoic and 3,5-dinitrobenzoic acids to give corresp. esters, but these are unreported.

[ $\bar{C}$  with excess dry  $Ag_2CO_3$  in dry  $C_6H_6$  shaken 24 hrs. gives (60–80% yield (106)) (105) ditrityl carbonate, cryst. from xylene, m.p. 209° dec. (106), 205–210° (105); this prod. on hgt. in xylene in pres. of  $Cu$  pdr. decomposes (106) (105) into  $CO_2$  and ditrityl ether, m.p. 237–238° (106) (see also above under  $\bar{C}$  with  $HgO$ ).]

[ $\bar{C}$  with excess  $Hg(CN)_2$  at 150–170° for 1 hr. gives (alm. 100% yield (53)) on extraction

with  $C_6H_6$  (53) (206) (207) trityl cyanide (triphenylacetoneitrile) [Beil. IX-714, IX<sub>1</sub>-(309)], pr. from AcOH, m.p. 129° (208), 127.5° (53) ]

[ $\bar{C}$  with mercury fulminate in dry  $C_6H_6$  under cooling gives (85% yield (208)) trityl cyanide oxide,  $(C_6H_5)_3CNO$ , ndls. from alc., m.p. 153-154° (208) ]

[ $\bar{C}$  with KSCN in dry  $C_6H_6$  shaken at room temp. for 2 days gives (209) trityl thiocyanate [Beil. VI-721], m.p. 137° (209) (see also above under  $\bar{C}$  with organic acids (HSCN)).]

[ $\bar{C}$  with sodium benzenesulfinate in dry ether gives (210) trityl phenyl sulfone [Beil. VI-721], lfts. from ether, m.p. 175-176° (210); note that corresp. sulfoxide (see above under behavior of  $\bar{C}$  with thiophenol) has m.p. 163°. — Similarly,  $\bar{C}$  with sodium *p*-toluenesulfinate in dry  $C_6H_6$  gives (179) trityl *p*-tolyl sulfone [Beil. VI-(353)], m.p. 173° (179).]

### BEHAVIOR OF $\bar{C}$ WITH ORGANOMETALLIC COMPOUNDS

This topic cannot be fully expanded within the scope of this book, but the following examples will serve as leading references.

With organo-alkali compounds. [ $\bar{C}$  with Li *n*-butyl in pet. ether for 9 days gives (26% yield (211)) 1,1,1-triphenylpentaoe, m.p. 153-154° (211) —  $\bar{C}$  with Li  $C_6H_5$  gives (212) free trityl isolated in form of (20% yield) ditrityl peroxide ]

[ $\bar{C}$  with Na *n*-butyl or Na trityl in liq.  $NH_3$  + toluene (112) or  $\bar{C}$  with Na trityl in dry ether (108) gives free trityl. —  $\bar{C}$  with Na + tetraphenylethylene as directed gives (213) pentaphenylethyl ]

With  $RMgX$  compounds.  $\bar{C}$  with  $MeMgBr$  (214) or  $\bar{C}$  with  $MeMgI$  (215) gives no gas (216) cf. (217) (218) but couples giving (yields: 95% (214), 70% (215)) 1,1,1-triphenylethane ( $\alpha$ -methyltriphenylmethane) [Beil. V-709, V<sub>1</sub>-(350)], cryst. from alc., m.p. 94-95° (214) (215), 94.8-95.0° (15); note that this prod. is also obtd. from  $MeMgBr$  with trityl acetate (61% yield (219)) or from K trityl with  $MeI$  in liq.  $NH_3$  (85-94% yield (220)).]

[ $\bar{C}$  with  $EtMgBr$  in dry ether reacts rapidly and quant. (221) yielding (215) not only the expected 1,1,1-triphenylpropane [Beil. V-712], m.p. 51° (215), but also (215) triphenylmethane (1:7220) and ethylene ]

[ $\bar{C}$  with *n*- $PrMgBr$  in dry ether gives (215) not only 1,1,1-triphenylbutane, m.p. 79° (215), but also considerable triphenylmethane (1:7220). —  $\bar{C}$  with *iso*- $PrMgBr$  in dry ether gives (215) not only 1,1,1-triphenyl-2-methylpropane, b.p. 233-234° at 21 mm. (215), but also much triphenylmethane (1:7220).]

[ $\bar{C}$  with  $C_6H_5MgBr$  in dry ether or  $C_6H_6$  gives a small yield (25-30% (222), 10-12% (139), 5-10% (215) (223)) tetraphenylmethane [Beil. V-738, V<sub>1</sub>-(371), V<sub>2</sub>-(672)], m.p. 281-282° (224) (225), b.p. 431° at 760 mm. (225), but the principal product (yield: 50-77% (222), 47.4% (226)) is 4-benzohydrylbiphenyl (*p*-phenyltetraphenylmethane) [Beil. V-738, V<sub>2</sub>-(672)], m.p. 111° (226), 112-113° (116); for explanation and study of this reaction see (222) — Note that  $\bar{C}$  with  $C_6H_5MgI$  behaves differently giving (227) cf. (179) triphenylmethyl and biphenyl (1:7175) ]

[ $\bar{C}$  in  $C_6H_6$  with benzyl  $MgCl$  in dry ether gives (100% yield (215)) (228) 1,1,1,2-tetraphenylethane [Beil. V-740, V<sub>1</sub>-(372), V<sub>2</sub>-(674)], m.p. 144° (215), 143.5-143.7° (15). —  $\bar{C}$  with benzohydryl bromide +  $Mg$  in dry ether (215) cf. (230) (or better trityl  $MgBr$  + benzohydryl bromide (229) cf. (230)) gives (90% yield (229)) pentaphenylethane [Beil. V-755, V<sub>1</sub>-(386), V<sub>2</sub>-(711)], m.p. in air 166-178° (229), in  $N_2$  182-185° (229). —  $\bar{C}$  with trityl  $MgCl$  gives (230) free trityl.]

[For behavior of  $\bar{C}$  with phenylacetylenyl  $MgBr$  giving trityl-phenylacetylene or with acetylene-*bis*- $MgBr$  giving di-tritylacetylene (hexaphenylbutyne-2) see (231).]

BEHAVIOR OF  $\bar{C}$  WITH (ORGANIC) AMINES

(For  $\bar{C}$  with  $NH_3$ ,  $NH_2OH$ ,  $NH_2NH_2$ , etc., see above under  $\bar{C}$  with inorganic nitrogen compds; for  $\bar{C}$  with arylhydrazines see below.)

 $\bar{C}$  with Primary Amines

[ $\bar{C}$  with  $MeNH_2$  in  $C_6H_6$  in pres. of  $NaOMe$  gives (125) trityl-*N*-methylaniline [Beil. XII-1344, XII<sub>1</sub>-(557)], m.p. 73° (125) (236) (corresp.  $\bar{B} \cdot HCl$ , m.p. 216° (125)).]

With aromatic *prim.* amines.  $\bar{C}$  in  $C_6H_6$  with aniline in alc. refluxed 15 min. gives (80% yield (228)) (57) *N*-tritylaniline [Beil. XII-1344, XII<sub>1</sub>-(557)], cryst. from alc / ether, m.p. 149–150° (57), 148–149° (237), 146° (228) [note that this prod. with  $\frac{1}{2}$  its wt.  $ZnCl_2$  at 160° for 15 min. rearranges (228) to *p*-tritylaniline [Beil. XII-1348], ndls. from toluene or alc., m.p. 256° cor. (225), 249° (228); note also that  $\bar{C}$  is claimed to form with aniline an addn. epd., m.p. 189–190° (34)].

[ $\bar{C}$  in  $C_6H_6$  with *o*-toluidine in alc. refluxed 15 min. gives (228) *N*-trityl-*o*-toluidine, m.p. 142.5° (228), 142° (237) (238), 140–142° (57); this prod. with  $ZnCl_2$  at 160° for 15 min. rearranges (82% yield (189)) (228) to 4-trityl-2-methylaniline, m.p. 216° (228), 215° (189) (not to  $\alpha$ -(2-amino)- $\beta,\beta,\beta$ -triphenylethane as originally supposed (228) cf. (189)). —  $\bar{C}$  with *m*-toluidine directly has not been studied nor has the other expected product, viz., *N*-trityl-*m*-toluidine, nor its rearr. prod., been reported. —  $\bar{C}$  in  $C_6H_6$  with *p*-toluidine in alc. refluxed 15 min. gives (228) *N*-trityl-*p*-toluidine [Beil. XII-1344], m.p. 180° (228), 177–178° (85), 177° (238), 176° (237): this product with  $ZnCl_2$  at 190° for 30 min. does not (228) rearrange.]

[ $\bar{C}$  with *p*-aminobiphenyl (*p*-xenylamine) in  $C_6H_6$  on htg. gives (82% yield (239)) *N*-trityl-*p*-xenylamine, pr. from  $C_6H_6$ , m.p. 179.5–180.5° (239); note that this prod. does not rearrange.]

 $\bar{C}$  with Secondary Amines

With aliphatic *sec.* amines. [ $\bar{C}$  with  $Me_2NH$  in  $C_6H_6$  gives (65% yield (240)) trityl-dimethyl-amine, cryst. from aba. alc., m.p. 95–97° (240), 97° (236).]

With aromatic *sec.* amines. [ $\bar{C}$  with diphenylamine might first be expected to give *N*-trityl-diphenylamine, ndls. from toluene, m.p. 172° (241), which has actually been prepd. by other means (241) (242) (243); however,  $\bar{C}$  with diphenylamine (244) in hot  $C_6H_6$  (243) or pyridine (165) or the above *N*-trityl-diphenylamine with diphenylamine  $HCl$  in  $C_6H_6$  or in hot  $AcOH$  directly (243) gives the rearr. prod., viz., 4-trityl-diphenylamine (4-anilino-tetraphenylmethane), m.p. 242° (243) (244), 240° (165). — For use of these and related prods. as antioxidants see (244) (245). — For analogous behavior of  $\bar{C}$  with di-*p*-tolylamine, di-*p*-amylamine, and di-(*p*-dimethylaminophenyl)amine see (243).]

[For behavior of  $\bar{C}$  with *N,N*-diphenyl-*p*-phenylenediamine yielding a blue meriquinoid salt, m.p. 182–183°, see (246) (247) (248); with indole and with 2-methylindole giving *N*-trityl derivs. see (196).]

With heterocyclic *sec.* amines. [ $\bar{C}$  with piperidine in  $C_6H_6$  yields (179) *N*-tritylpiperidine, ndls. from alc., m.p. 153° (179).]

 $\bar{C}$  with Tertiary Amines

With aliphatic *ter*-amines. [ $\bar{C}$  with  $Me_3N$  in acetonitrile +  $CHCl_3$  at room temp. ppts. a prod., m.p. 190–195° dec. (249), of compn.  $2(C_6H_5)_3COH \cdot (CH_3)_3N \cdot HCl$  from which extraction with aq. leaves triphenylcarbinol (1:5985), m.p. 161°, or from which extraction with  $C_6H_6$  leaves the trimethylamine  $HCl$ . — For analogous behavior of  $\bar{C}$  with  $Et_3N$  see (249) ]

With aromatic *ter*-amines.  $\bar{C}$  with 3 wts. dimethylaniline at 100–115° for 8 hrs. gives (42% yield (250)) 4-trityldimethylaniline (4-dimethylamino-tetraphenylmethane), cryst. from alc., m.p. 204–205° (250), 208° (251).]

With heterocyclic *ter*-amines.  $\bar{C}$  with pyridine does not give a simple quaternary salt; however,  $\bar{C}$  with pyridine in nitromethane +  $CHCl_3$  (249) or in EtOAc (249), or  $\bar{C}$  in dry pyridine with exactly 1 mole  $H_2O$  (84) (252) (165), gives a definite prod., cryst. from acetone (249) or  $CHCl_3$  (42), m.p. 176° (42), 174° (34) (253) (165), 172–174° (84), 170–175° (249); this prod. is formulated as ether  $(C_6H_5)_3C.OH \cdot C_5H_5N.HCl$  (249) or as  $(C_6H_5)_3CCl \cdot C_5H_5N.H_2O$  (84) (252) (42).]

#### BEHAVIOR OF $\bar{C}$ WITH ARYLHYDRAZINES

With monoaryldiazines.  $\bar{C}$  with phenylhydrazine (2 moles) in dry ether at room temp. gives (90% yield (254)) *N*-trityl-*N*-phenylhydrazine [Beil. XV-581, XVI-(184)], cryst. from boilg. abs. alc., m.p. 136–137° (254), 148° (255). [Note that this prod. is easily oxidized (dehydrogenated), e.g. with nitrous oxides (100% yield (254), 86% (256)) or  $Br_2/aq.$  (100% yield (257)) giving tritylazobenzene  $(C_6H_5)_3C-N=N-C_6H_5$  [Beil. XVI-85], m.p. 113–114° (254), 110° (255), 110–112° (256) (for study of thermal decompn. of this prod. see (258)).]

$\bar{C}$  with *p*-nitrophenylhydrazine in a large vol.  $C_6H_6$  gives (257) cf. (256) *N*-trityl-*N*-(*p*-nitrophenyl)hydrazine, m.p. 170° (250).]

With diaryldiazines.  $\bar{C}$  with *N,N*-(unsym.)-diphenylhydrazine (2 moles) in  $C_6H_6$  refluxed 20 min. gives (259) *N'*-trityl-*N,N*-diphenylhydrazine, m.p. 136–137° (259). —  $\bar{C}$  with *N,N'*-diphenylhydrazine (hydrazobenzene) (2 moles) in dry ether under  $CO_2$  refluxed 16 hrs. gives (259) *N'*-trityl-*N,N*-diphenylhydrazine, m.p. 107° (259) (in this connection recall also that  $\bar{C}$  with hydrazobenzene in boilg.  $C_6H_6$  is in part reduced (79) to triphenylmethane)]

#### BEHAVIOR OF $\bar{C}$ WITH AMIDES

$\bar{C}$  (2 moles) with urea (1 mole) in dry pyridine at 100° gives (165) cf. (179) *N,N'*-ditritylurea, cryst. from alc. with 2 EtOH not lost on air drying, m.p. 245° (165); note that *N*-tritylurea (prepd. indirectly (124)) has m.p. 234–235° dec. (124). —  $\bar{C}$  (1 mole) + thiourea in pyridine at 100° for 1 hr. gives (165) cf. (179) *N*-tritylthiourea, cryst. from  $C_6H_6$ , m.p. 222° dec. (165), 217° (179).]

#### BEHAVIOR OF $\bar{C}$ WITH HYDRAZIDES

$\bar{C}$  with free semicarbazide ( $NH_2CONH.NH_2$ ) in pyridine at 0° gives (88% yield (260)) 1-tritylsemicarbazide, cryst. from abs. alc. with 1 EtOH, m.p. 186–188° dec.; the solvate alc. is lost in vac. at 110° after 6 hrs. and m.p. rises to 190–192° (260).]

$\bar{C}$  with primary hydrazides (acylhydrazine) in general reacts to give *N*-trityl-*N*-acylhydrazines which upon suitable dehydrogenation give *N*-trityl-*N*-acyl-azo compounds; the topic cannot here be expanded but for many examples see (260) (261).]

① Triphenylmethane (1:7220): lfts. from alc. [From  $\bar{C}$  in anhydrous formic acid (1:1005) at 100° for 2 hrs. in 90% yield (4).]

② Triphenylcarbinol (1:5985): cryst. from  $C_6H_6$  or alc., m.p. 161–162°. [From  $\bar{C}$  on boilg. with aq.]

③ Trityl methyl ether: cryst. from MeOH, m.p. 82–83°. (See text above under behavior of  $\bar{C}$  with alcohols.)

④ Trityl ethyl ether: cryst. from EtOH, m.p. 83–84°. (See text above under behavior of  $\bar{C}$  with alcohols.)

© *N*-Tritylphthalimide: tbls. from alc., m.p. 172° (179). [From  $\bar{C}$  with K phthalimide at 200° (179).]

## 3:3432 CHLOROMALEIC ACID

 $C_4H_3O_4Cl$ 

Beil. II-752

II<sub>1</sub>—II<sub>2</sub>-(G46)

M.P. 115° (1) (2)

114–115° (3) (4)

[108° after sintering at 95° (5) (6)]

[See also chlorofumaric acid (3:4853).]

Cryst. from AcOH/CHCl<sub>3</sub>, ether/CHCl<sub>3</sub>, ether/pet. ether, or ether alone. — Eas. sol. alc, ether, AcOH; spar. sol. CHCl<sub>3</sub> or C<sub>6</sub>H<sub>6</sub>; insol. pet. ether.

[For prepn. of  $\bar{C}$  from *meso*- $\alpha,\alpha'$ -dichlorosuccinic acid (3:4930) with NaOAc/dil. AcOH on boilg. (5) (1), or from its neutral sodium salt in aq. soln. on boilg.  $\frac{1}{2}$  hr. (4), see indic. refs.; from chloromaleic anhydride (3:0280) by hydrolysis with aq. and subsequent evapn. see (4) (5) (6) (7); from 3,5,5,5-tetrachloro-4-ketopenten-2-oic acid-1 ("  $\beta$ -(trichloroacetyl)- $\beta$ -chloroacrylic acid ") [Beil. III-733] on 24 hr. stdg. at room temp. of its soln. in excess 10% aq. Na<sub>2</sub>CO<sub>3</sub> see (6); from chloromaleonitrile (b.p. 185° at 753 mm., 71.0–71.5° at 10 mm.,  $D_4^{20} = 1.2293$ ,  $n_D^{20} = 1.48944$  (9)) by hydrol. see (9).]

$\bar{C}$  on htg. at 180° loses H<sub>2</sub>O yielding (6) chloromaleic anhydride (3:0280).

$\bar{C}$  although unchanged by conc. HCl at ord. temp. for as long as 10 days (4) is by repeated evapn. with conc. HCl (7) isomerized to chlorofumaric acid (3:4853).

$\bar{C}$  in aq. soln. with Zn filings is dehalogenated yielding (4) fumaric acid (1:0895);  $\bar{C}$  (as Na<sub>2</sub>X) in aq. soln. with 1% Na/Hg gives (4) mainly succinic acid (1:0530) accompanied by some fumaric acid (1:0895).

$\bar{C}$  readily reduces aq. KMnO<sub>4</sub>.

[ $\bar{C}$  readily combines with Br<sub>2</sub> if heated in s.t. to 100° (7).]

$\bar{C}$  behaves normally as a dibasic acid: e.g., titration with standard dil. aq. alk. gives Neut. Eq. 75.3; for study of electrometric titration see (1).

[Salts: KH<sub>2</sub>A, eas. sol. aq. (dif. from corresp. salt of chlorofumaric acid (3:4853)), e.g., 100 g. of its satd. aq. soln. at 15° cont. 29.2 g. of KH<sub>2</sub>A (7); for crystallographic data see (7).]

—  $\text{NaH}\bar{\text{A}}\cdot 3\text{H}_2\text{O}$ , eas. sol. aq. (7). —  $\text{Ag}_2\bar{\text{A}}$ , insol. aq. (7). —  $\text{Ba}\bar{\text{A}}\cdot 2\text{H}_2\text{O}$  (4) (5) (6), spar. sol. aq. —  $\text{Ca}\bar{\text{A}}\cdot 4\text{H}_2\text{O}$  (4). —  $\text{Sr}\bar{\text{A}}\cdot 4\frac{1}{2}\text{H}_2\text{O}$ , spar. sol. cold aq. (5). —  $\text{Ph}\bar{\text{A}}$ , insol. aq. (4).]

[ $\bar{\text{C}}$  on stdg. at ord. temp. with slight excess 0.76 *N* aq. KOH gives chlorine ion only  $\frac{1}{40}$  as rapidly (4) as the isomeric chlorofumaric acid (3:4853).]

The acid chloride corresp. to  $\bar{\text{C}}$ , viz., chloromaleyl (di)chloride (3:6158) q.v., has been reported only by indirect means.

— Dimethyl chloromaleate: oil (see 3:9351).

— Diethyl chloromaleate: oil (see 3:6697).

⑧ Chloromaleanil [*N*-phenyl-chloromaleimide]: ndls. from hoilg. alc., m.p. 170° (8). [From aniline salt of  $\bar{\text{C}}$  (or of chlorofumaric acid) on htg. for a few minutes at 170–180° (8); note that this prod. on htg. with aniline yields (8)  $\alpha$ -anilinosuccinanil [Beil. XXI-554, XXI-432]], yel. cryst. from acetone +  $\text{C}_6\text{H}_6$ , m.p. 232° (8), and that a little of this latter cpd. which may accompany the former is readily removed from it by washing with warm  $\text{C}_6\text{H}_6$  (8).]

⑨ Chloromaleic *p*-chloroanil [*N*-(*p*-chlorophenyl)chloromaleimide]: pl. from hot alc., m.p. 175° (8). [From *p*-chloroaniline salt of  $\bar{\text{C}}$  on htg. for a few minutes at 170–180° (8).]

⑩ Chloromaleic *p*-bromoanil [*N*-(*p*-bromophenyl)chloromaleimide]: microcrystn. powder from hoilg. alc., m.p. 190° (8). [From *p*-bromoaniline salt of  $\bar{\text{C}}$  on htg. for a few minutes at 170–180° (8).]

Cryst. from benzene.

[For prepn of  $\bar{C}$  from 3,5-dimethylphenol (*m*-5-xyleneol = *sym*-*m*-xyleneol) (1:1455) with  $SO_2Cl_2$  (1 mole) in  $CHCl_3$  (1) or with  $Cl_2$  in AcOH (66% yield (2)) or from crude coal-tar fraction consisting mainly of 3,5-dimethylphenol with  $Cl_2$  or  $SO_2Cl_2$  (5) see indic. refs. (note that some 2-chloro-3,5-dimethylphenol (6-chloro-*m*-5-xyleneol) (3:0844) is formed as a by-product (1) (5); also that 3,5-dimethylphenol in AcOH on complete saturation

[Note that, in addition to its ordinary use to designate  $\bar{C}$  specifically, the term "chloralide" is also used generically to denote a class of compounds formed by condensation of chloral (3:5210) with  $\alpha$ -hydroxy acids.]

Cryst. from alc. or ether; eas. sublimable; insol. aq.; eas. sol. hot but spar. sol. cold alc.; eas. sol. ether; cas. sol. in 80% AcOH (dif. and sepn. from metachloral (1)). — For crystallographic studies see (10).

Note that m.p. of  $\bar{C}$  is almost identical with that of  $\alpha$ -parachloral, m.p. 116°, but that mixed m.p. of the two is depressed as low as 85–90° (2);  $\beta$ -parachloral, however, has m.p. 152° (2).

[For prepn. of  $\bar{C}$  from chloral (3:5210) or chloral hydrate (3:1270) with conc. or fuming  $H_2SO_4$  (yields: 61% (11), 44–51% (4) both based on chloral hydrate) see (11) (4) (8) (12) (6); for formn. of  $\bar{C}$  from chloral hydrate with  $H_2SO_4$  as a by-product (abt. 2% (2)) in prepn. of  $\alpha$ - and  $\beta$ -parachloral + metachloral, or from chloral by warming with  $AlCl_3$  (1), see indic. refs.; for formn. of  $\bar{C}$  from chloral with  $ClSO_3H$  as by-prod. of prepa. of octachlorodiethyl ether (3:0738) see (3); for formn. of  $\bar{C}$  from chloral (excess) with  $\beta,\beta$ -trichloro- $\alpha$ -hydroxypropionic acid (trichlorolactic acid) [Beil. III-286, III<sub>1</sub>-(111), III<sub>2</sub>-(210)] in s.t. at 150–160° see (4) (13) cf. (17).]

[ $\bar{C}$  on reduction with Zn + HCl in alc. soln. gives according to conditions very small amts. of  $\beta,\beta$ -dichloroacrylic acid (3:1875) (14) (15) (16),  $\beta$ -chloroacrylic acid (3:2240) (11), and acetaldehyde (1:0100) (15) (16).] — [ $\bar{C}$  is unaffected by boilg.  $HNO_3$  (8).]

[ $\bar{C}$  with  $PCl_5$  in s.t. at 270–290° for several days gives (18) (9) 5-chloro-2,5-bis-(trichloromethyl)dioxolane-1,3-dio-4 ("trichlorolactic acid-tetrachloroethylidene ether-ester") [Beil. XIX-105], oil, b.p. 276° (18),  $D_4^{20} = 1.7426$  (18).]

$\bar{C}$  with boilg. alkalis undergoes hydrolytic cleavage yielding (4) (12) (6) (7) chloroform (3:5050) and salts of formic acid (1:1005).

[ $\bar{C}$  with abs. EtOH in s.t. at 140–150° gives (16) (4) chloral ethylalcoholate (3:0860) and ethyl  $\beta,\beta,\beta$ -trichlorolactate [Beil. III-287, III<sub>1</sub>-(111), III<sub>2</sub>-(210)], m.p. 66–67°.]

3:3520 2,4,6-TRICHLORO-3-HYDROXYBENZALDEHYDE

$C_7H_3O_2Cl_3$

Beil. VIII-61  
VIII<sub>1</sub>—

M.P. 115.5–116.5° (1)  
115–116° (6)  
114° (2)  
113° (3)

Colorless cryst. from 50% AcOH;  $\bar{C}$  seps. with AcOH of crystn. but this immediately effervesces in air. —  $\bar{C}$  has pronounced sternutatory props. and on moist skin produces painful blisters (2).

[For prepn. of  $\bar{C}$  from *m*-hydroxybenzaldehyde (1:0055) in AcOH with excess  $Cl_2$  see (1) (2).]

[For condens. of  $\bar{C}$  with 2,4-dichlorophenol (3:0560) see (4), with 2,4-dihydroxybenzoic acid (1:0843) and use of prod. as dye intermediate see (5).]

$\bar{C}$  in 50% aq. KOH warmed for 4 hrs. at 60-70° gives (89.9% yield (3)) 2,4,6-trichlorophenol (3:1573).

$Na\bar{A}$ , pure yel. ndls., spar. sol. aq (2).

$\bar{C}$  in  $Na_2CO_3$  soln. with  $Me_2SO_4$  yields 2,4,6-trichloro-3-methoxybenzaldehyde, ndls. from alc., m.p. 76° (2); on very slow oxidn. with alk.  $KMnO_4$ , this prod. yields 2,4,6-trichloro-3-methoxybenzoic acid, m.p. 109° (2)

② 2,4,6-Trichloro-3-hydroxybenzaldehyde: ndls. from dil. alc., m.p. 174° (2), 170° (6). [This with boilg.  $Ac_2O$  yields 2,4,6-trichloro-3-acetoxybenzonitrile, lfts. from dil. AcOH, m.p. 82-83° (6).]

③ 2,4,6-Trichloro-3-hydroxybenzaldehyde *p*-nitrophenylhydrazone: yel.-or. ndls., m.p. 272-273° dec (2) [From  $\bar{C}$  in alc. with *p*-nitrophenylhydrazine + 1 drop aq. (2).]

### 3:3523 2,3,4,5-TETRACHLOROPHENOL

$C_6H_2OCl_4$  Beil. S.N. 522

M.P. 116-117° (1)

116° (2) (3)

[For prepn. of  $\bar{C}$  from 2,3,4,5-tetrachloroaniline [Beil. XII-630, XII<sub>1</sub>-(313)] via diazotization and reaction with aq. (65% yield) see (1); from 2-amino-3,4,5,6-tetrachlorophenol [Beil. XII-386] (3) via diazotization and elimination of diazo group with alc. see (3); for formn. of  $\bar{C}$  from pentachlorobenzene (3:2290) with *N*/2 MeOH/ $NaOMe$  at 180° in s.t. for 7½ hrs. as by-prod. of the isomeric 2,3,5,6-tetrachlorophenol (3:3460) see (4).]

$\bar{C}$  in aq. behaves as an acid,  $K_{nt} 25^\circ = 1.1 \times 10^{-7}$ , and can be titrated with *N*/10 aq. NaOH (1), Neut. Eq. = 232.

— 2,3,4,5-Tetrachlorophenol methyl ether (2,3,4,5-tetrachloroanisole): m.p. 83° (3). [Reported only by indirect means (4).]

— 2,3,4,5-Tetrachlorophenol ethyl ether (2,3,4,5-tetrachlorophenetole): unreported.

— 2,3,4,5-Tetrachlorophenyl acetate: unreported.

③ 2,3,4,5-Tetrachlorophenyl benzoate: m.p. 110° (4) (5). [Note that this prod. depresses m.p. of corresp. benzoate from the isomeric 2,3,4,6-tetrachlorophenol (3:1687) (5).]

— 2,3,4,5-Tetrachlorophenyl *N*-phenylcarbamate: unreported.

3:3525 4,5-DICHLOROCATECHOL  
(4,5-Dichloropyrocatechol)

$C_6H_4O_2Cl_2$  Beil. VI - 783  
VI<sub>1</sub>-(389)  
VI<sub>2</sub>—

M.P. 116-117° (1)  
105-106° (2) (3)  
(See text)

Colorless pr. from  $CHCl_3 + CS_2$  (1); ndls. from  $C_6H_6 +$  pet. ether (2). —  $\bar{C}$  is eas. sol. in cold aq. from which it crystallizes as a hemihydrate (1) (it is possible that the m.p. of 105-106° observed by some workers may have been due to formn. of this prod.). —  $\bar{C}$  cryst. from AcOH with 1 mole of solvent, viz.,  $\bar{C} \cdot AcOH$  (1).

[For prepn. of  $\bar{C}$  from pyrocatechol (1:520) with  $SO_2Cl_2$  (2 moles) or from 4-chloropyrocatechol (3:2470) with  $SO_2Cl_2$  (1 mole) see (2).]

[ $\bar{C}$  with silver oxide in dry ether gives (1) 4,5-dichlorobenzoquinone-1,2 [Beil. VII<sub>1</sub>-(338)], m.p. 94°; note, however, that  $\bar{C}$  with this prod. forms a corresp. quinhydrone, dec. abt. 85°.]

[ $\bar{C}$  with  $Cl_2$  in AcOH gives (1) 3,4,5-trichloropyrocatechol (3:3448) cryst. from aq. as monohydrate, m.p. abt. 106-109° (1), 104-105° (4), 115° (5).]

[ $\bar{C}$  with  $PCl_5$  gives (2) 1,2,4,5-tetrachlorobenzene (3:4115).]

$\bar{C}$  with  $N/10$  aq. KOH titrates (1) as a monobasic acid, i.e., Neut. Eq. = 89.5. —  $\bar{C}$  with aq.  $FeCl_3$  gives blue-green coloration becoming red on addn. of aq.  $Na_2CO_3$  (1).

$\bar{C}$  does not (5) condense with xanthydrol (1:5205) in AcOH (dif. from 4-chloropyrocatechol (3:2470)).

— 4,5-Dichloropyrocatechol diacetate: unreported.

⊙ 4,5-Dichloropyrocatechol dibenzoate [Beil. IX<sub>1</sub>-(72)]; m.p. 140.0-140.5° (1).

— 4,5-Dichloropyrocatechol 1-methyl ether (4,5-dichloroguaiacol) [Beil. VII-783]: ndls. from pet. ether, m.p. 71-72° (7). [Prepd. indirectly (7).]

— 4,5-Dichloropyrocatechol dimethyl ether (4,5-dichloroveratrole) [Beil. VII-783]: ndls. from alc., m.p. 85.5-86.5° (7). [From the preceding monomethyl ether with MeI + aq. KOH (7).]

Yel. ndls with pungent quinone odor from dil. alc. or dil. AcOH. — Volatile with steam. — Eas. sol. alc.,  $\text{C}_6\text{H}_6$ ; spar. sol. ether.

[For prepn. of  $\bar{C}$  from naphthoquinone-1,4 ( $\alpha$ -naphthoquinone) (1:9040) by conversion with  $\text{Cl}_2$  in AcOH to 2,3-dichloro-1,4-diketo-1,2,3,4-tetrahydronaphthalene ("  $\alpha$ -naphtho-

quinone dichloride") [Beil. VII-702] and subsequent elimination of 1 HCl with NaOAc/AcOH see (4) cf. (7); from  $\alpha$ -naphthol (1:1500) by conversion with Cl<sub>2</sub> in AcOH to 2,2,4-trichloro-1-keto-1,2-dihydronaphthalene [Beil. VII-387] and subsequent hydrolysis (with rearr.) in boilg. dil. alc. or dil. AcOH see (5).]

[For prepn. of  $\bar{C}$  from 1,3-dichloronaphthalene (3:1310) by oxidn. with CrO<sub>3</sub>/AcOH see (8); from 2,4-dichloronaphthol-1 (3:3250) by oxidn. with CrO<sub>3</sub>/AcOH or HNO<sub>3</sub>/AcOH see (5) (9); from 2-chloro-1,2-diaminonaphthalene (2-chloronaphthylenediamine-1,2) by oxidn. with 2% alk. KMnO<sub>4</sub> see (2); from 2-chloronaphthol-1-sulfonic acid-4 by oxidn. with MnO<sub>2</sub> in boilg. 50% H<sub>2</sub>SO<sub>4</sub> see (1); from 2,4-dinitronaphthol [Beil. VI-617, VI<sub>1</sub>-(308)] by oxidn. with NaOCl in HCl soln. (3) or HCl + KClO<sub>3</sub> (10) see indic. refs.; from sodium salt of 4-(*p*-sulfohenzeneazo)naphthol-1 ("Orange I") [Beil. XVI-275, XVI<sub>1</sub>-(296)] by oxidn. with NaOCl in HCl soln. see (3).]

[ $\bar{C}$  on reduction might be expected to give 2-chloro-1,4-dihydroxynaphthalene [Beil. VI-975], m.p. 116-117°; note, however, that this reaction has not actually been reported and that this prod. is also obtained by SO<sub>2</sub> reduction of 3-chloronaphthoquinone-1,2 (3:4704). — For study of oxidn.-reductn. potential of  $\bar{C}$  see (7).]

[ $\bar{C}$  with Cl<sub>2</sub> in AcOH gives (4) (5) 2,3-dichloronaphthoquinone-1,4 (3:4857).]

[ $\bar{C}$  in boilg. alc. with aq. NaN<sub>3</sub> splits out NaCl giving (90% yield (11)) 2-azidonaphthoquinone-1,4, long yel. pr. from alc., m.p. 118° dec.]

$\bar{C}$  with aniline on htg. (5) (6) in alc. soln. (8) (9) gives 3-chloro-2-anilino-naphthoquinone-1,4 [Beil. XIV-168, XIV<sub>1</sub>-(434)], red ndls., m.p. 207-208° (10), 207° (8), 202-203° (9) (6).

$\bar{C}$  like many other quinones is able to form Diels-Alder type adducts with many conjugated dienes [e.g.,  $\bar{C}$  with 2,3-dimethylbutadiene-1,3 (1:8050) gives an adduct which with aq. 5% NaOH and a little Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> at 70° reduces (with loss of halogen) to 2,3-dimethyl-1,4-dihydronaphthoquinone which in turn upon oxidn. with air at 0° gives (12) 2,3-dimethylanthraquinone [Beil. VII-815, VII<sub>1</sub>-(425)], yel. ndls. from alc. or AcOH, m.p. 210° (13), 209° (14), 208-209° (15), 208° (16), 205-206° (17); note also that this 2,3-dimethylanthraquinone is also obtd. (18) from the initial adduct with pyridine in absence of nir, or (18) from  $\bar{C}$  + 2,3-dimethylbutadiene-1,3 (1:8050) at 100-105° under press. — For behavior of  $\bar{C}$  with 2-methylbutadiene-1,3 (isoprene) (1:8020) and with butadiene-1,3 see (18).]

— 2-Chloronaphthoquinone-1,4-oxime-4 (2-chloro-4-nitrosonaphthol-1) [Beil. VII-729]; ndls. from alc., m.p. 200° dec. (8). [From  $\bar{C}$  with NH<sub>2</sub>OH.HCl in alc. on warming (8).]

— 2-Chloronaphthoquinone-1,4-(*p*-nitrophenylhydrazine-4) = 4-(*p*-nitrobenzeneazo)-2-chloronaphthol-1: m.p. 274° dec. (1). [From  $\bar{C}$  with *p*-nitrophenylhydrazine (1); also from 2-chloronaphthol-1 (3:1490) in alk. soln. on coupling with diazotized *p*-nitroaniline (1).]

IX<sub>1</sub>-(228)), m.p. 129° (5)]

[For prepn. of  $\bar{C}$  from *O*-carbomethoxybenzoic acid (2) with  $SOCl_2$  see (2); for prepn. of  $\bar{C}$  from  $\alpha$ -chlorodiphenylacetyl chloride (3:0885) by hydrolysis (even in moist air) see (8)]

$\bar{C}$  on reduction with  $TiCl_3$  in boil. AcOH gives (8) diphenylacetic acid (1:0765), m.p. 148°.

$\bar{C}$  (or its sodium salt) htd. under reduced press. at 125° for 10 hrs. gives (80-90% yield (9)) benzilide (Beil. XIX-187, XIX<sub>1</sub>-(700)), ndIs. from alc., m.p. 196° (10), 194° (11) (5), 103° (12), 192-193.5° (9) [the structure of this prod is disputed, but it is either 2,2,5,5-tetraphenyl-3,6-diketodioxane-1,4 or tetraphenyldiglycolic acid anhydride].

$\bar{C}$  with nq. KSH (or NaSH) does not (21) give the expected  $\alpha$ -mercaptodiphenylacetic acid (diphenylthioglycolic acid) (thiobenzoic acid) [Beil. XI<sub>1</sub>-(154)], but rather (apparently because of alkalmty of the soln) gives (13)  $\alpha$ -methoxydiphenylacetic acid (benzoic acid *O*-methyl ether) [Beil. XI<sub>1</sub>-(152)], m.p. 100° (13); note that various compounds prepd by a wide

variety of methods but all supposed to have this structure have been reported with m.p.'s as follows: 99-100° (14), 102° (15), 106° (16), 107° (17), 111-112° (18), 120-121° (9); note also that the corresp. methyl ester, viz., methyl  $\alpha$ -methoxydiphenylacetate, oil, b.p. 199-200° at 27 mm., has been prepd. (19) from  $\alpha$ -bromodiphenylacetate, oil, b.p. 199-200° from ether, m.p. 114-115° (20) (8), (13)  $\alpha$ -ethoxydiphenylacetic acid [Beil. XI<sub>1</sub>-(152)], viz., ethyl  $\alpha$ -ethoxydiphenylacetate, appears to be unreported]

$\bar{C}$  with  $Nn$  phenolate might be expected to give  $\alpha$ -phenoxydiphenylacetic acid, but neither this reaction nor the expected prod. is reported. — However,  $\bar{C}$  with thiophenol in  $C_6H_6$  refluxed 2 hrs evolves  $HCl$  and gives (22)  $\alpha$ -thiophenoxydiphenylacetic acid, but from 50%  $AcOH$ , m.p. 126-128° (22)

[ $\bar{C}$  with  $C_6H_5$  +  $AlCl_3$  gives normal Friedel-Crafts type reaction giving (25% yield (3)) triphenylacetic acid [Beil. IX-712, IX<sub>1</sub>-(309)], m.p. 265°.]

$\bar{C}$  with various amines or amino compds splits out  $HCl$  giving the corresp.  $\alpha$ -aminodiphenylacetic acid derivatives (e.g.,  $\bar{C}$  with  $NH_3$  gives (13)  $\alpha$ -aminodiphenylacetic acid, m.p. 180° (13); for other cases see (13)).

$\bar{C}$  with benzhydrazide in  $C_6H_6$  splits out  $HCl$  and yields (8)  $\alpha$ -benzhydrazido-diphenylacetic acid, m.p. 167-168° (8).

$\bar{C}$  with excess  $SOCl_2$  on warming does *not* give the expected  $\alpha$ -chlorodiphenylacetyl chloride (3:0885), m.p. 50°, but rather (5)  $\alpha$ -chlorodiphenylacetic acid anhydride, m.p. 120° (5).

$\bar{C}$  in pyridine on htg. at 100° (23) evolves  $CO_2$  presumably yielding benzoydryl chloride ( $\alpha$ -chlorodiphenylmethane) (3:0060) as its quaternary salt with pyridine.

— Methyl  $\alpha$ -chlorodiphenylacetate: oil, b.p. 196° at 16 mm. (4). [From  $\bar{C}$  in dioxane soln. with dimethoxyethane (100% yield) (4); note also that this ester with  $Cu$  bronze refluxed in  $C_6H_6$  for 5 hrs. then evaporated in air gives (4) the peroxide, m.p. 151-152°, of dimethyl tetraphenylsuccinate.]

— Ethyl  $\alpha$ -chlorodiphenylacetate: cryst. from nlc., m.p. 43-44° (24) (6), b.p. 185° at 14 mm. (24). [From  $\bar{C}$  with  $EtOH + dry HCl$  (10) best in pres. of  $C_6H_6$  as directed (90% yield (25)), or from  $\alpha$ -chlorodiphenylacetyl chloride (3:0885) with  $EtOH$  (6), or from ethyl benzilate (1:2086) with  $PCl_5$  (6).]

—  $\alpha$ -Chlorodiphenylacetamide: m.p. 115° (6), 111-113° (26). [From  $\alpha$ -chlorodiphenylacetyl chloride (3:0885) in ether with  $NH_3$  gas (6) (13).]

—  $\alpha$ -Chlorodiphenylacetanilide: m.p. 88°. [See text of  $\alpha$ -chlorodiphenylacetyl chloride (3:0885).]

### 3:3634 DICHLOROMALEIC ACID

$\text{C}_2\text{H}_2\text{O}_4\text{Cl}_2$  Beil. II - 753  
II<sub>1</sub>—  
II<sub>2</sub>—

M.P. 119-120° (1)

118.5-119° (2)

118-119° (3)

116° (4)

[See also dichloromaleic anhydride (3:3635) and dichloromaleyl (di)chloride (3:6197).]

Ndls. from lgr./ether. — Eas. sol. aq.; sol. alc., AcOH; insol.  $\text{C}_6\text{H}_6$ ,  $\text{CHCl}_3$ ,  $\text{CS}_2$ . — Note that  $\bar{\text{C}}$  on hgt. very readily loses  $\text{H}_2\text{O}$  and is converted to dichloromaleic anhydride (3:3635); the m.p.'s observed for  $\bar{\text{C}}$  are probably actually those of its anhydride.

Note also that, although the structure corresp. to  $\bar{\text{C}}$  should be capable of existing also in the geometrically isomeric *trans* configuration, no such dichlorofumaric acid or its derivatives has ever been reported.

[For prepn. of  $\bar{\text{C}}$  from furfural (1:0185) in conc.  $\text{HCl}$  soln. with  $\text{Cl}_2$  (30% yield) see (5); from dichloromaleinaldehyde-acid ("mucochloric acid") [Beil. III-727] by oxidn. with fumg.  $\text{HNO}_3$  on stdg. at ord. temp. for several days (100% yield (4)) (2) see indic. refs.; from  $\alpha,\beta$ -dichloro- $\beta$ -(trichloroacetyl)acrylic acid ("perchloro- $\beta$ -acetylacrylic acid") [Beil. III-733] by hydrolytic cleavage with aq.  $\text{NaOH}$  (chloroform is also formed) see (3); from hexachlorocyclohexen-1-dione-3,6 [Beil. VII-574] by hydrolytic cleavage with 10% aq.  $\text{NaOH}$  (trichloroethylene (3:5170) is also formed) see (1); from hexachlorocyclohexen-1-dione-3,5 ("hexachlororesorcinol") (3:3470) (6) or from 2,2,3,4,6,6-heptachlorohexen-3-one-5-acid-1 [Beil. III-735, III<sub>1</sub>-(255)] (6) with large excess dil. aq.  $\text{Ca}(\text{OCl})_2$  see indic. refs.]

[For formn. of  $\bar{\text{C}}$  from 3,4-dichlorofuroic acid [Beil. XVIII-282] by oxidn. with boilg. dil.  $\text{HNO}_3$  (7) or from 3,4,5-trichlorofuroic acid [Beil. XVIII-283] by oxidn. with hot dil.  $\text{HNO}_3$  or cold  $\text{Br}_2/\text{aq.}$  (7) see indic. refs.; from pyrrole with aq.  $\text{NaOCl}$  (other prods. are also formed) see (8).]

$\bar{C}$  behaves normally as a dibasic acid: e.g.,  $\bar{C}$  on titration with standard dil. aq. alk. gives Neut. Eq. 92.5 (2).

[Salts: for  $Li\bar{A}$ ,  $Na_2\bar{A} \cdot H_2O$ ,  $NaH\bar{A} \cdot H_2O$ ,  $K_2\bar{A} \cdot 2H_2O$ ,  $K\bar{A} \cdot H_2O$ ,  $Cu\bar{A} \cdot H_2O$ ,  $Pb\bar{A} \cdot H_2O$ ,  $Ni\bar{A} \cdot 2H_2O$  see (4). —  $Ba\bar{A} \cdot 2\frac{1}{2}H_2O$  (3). —  $Ag_2\bar{A}$ , white ndls. which explode on htg. (3) (8) (9).]

— Dimethyl dichloromaleate: oil, b.p. 225° (9). [From dichloromaleic anhydride (3:3635) in MeOH with HCl gas on boilg. (9). — This prod. with aniloe at 100° yields (4) dimethyl  $\alpha,\beta$ -dianilinomaleate, cryst. from alc., m.p. 172° (4).]

— Diethyl dichloromaleate: unreported.

— Dichloromaleinimide [Beil. XXI-401]: ndls. from aq., m.p. 179° (10). [From dichloromaleic anhydride (3:3635) with urea on htg. at 110-115° (10).]

— *N*-Phenyldichloromaleinimide (dichloromalecanil) [Beil. XXI-402]: colorless lfts. from MeOH, m.p. 263°. [Reported only by indirect means.]

— Dichloromaleic dianilide: see under text of dichloromaleyl (di)chloride (3:6197).

### 3:3695 3,4-DICHLOROPHTHALIC ANHYDRIDE

 $C_8H_2O_3Cl_2$ 

Beil. XVII - 483

 $XVII_1$ -(253)

M.P. 120-121° cor. (1)  
120-121° (2)

[See also 3,4-dichlorophthalic acid (3:4880).]

TbIs. from  $CCl_4$ ; sol. in  $C_6H_6$ , toluene,  $CHCl_3$ .

[For prepn. of  $\bar{C}$  from 3,4-dichlorophthalic acid (3:4880) by protracted hgt. at 220° see (2); for formn. of  $\bar{C}$  (together with other isomers) from phthalic anhydride (1:0725) with  $Cl_2$  at 240° in pres. of Fe or Fe salts (3), from phthalic anhydride or 3-chlorophthalic

anhydride (3:3900) with  $\text{Cl}_2$  in fuming  $\text{H}_2\text{SO}_4$  in pres. of  $\text{I}_2$  (4) (1), [see indic. refs.] [For sepn. of  $\bar{\text{C}}$  from isomeric dichlorophthalic anhydrides by means of salts of corresp. acids see (4) (1) (18); by means of differential hydrolysis with  $\text{H}_2\text{SO}_4$  (prods. with no  $\alpha$ -chlorine such as 4,5-dichlorophthalic anhydride require  $\text{H}_2\text{SO}_4$  of 98-100% concn.; those with one  $\alpha$ -chlorine such as  $\bar{\text{C}}$  hydrolyze with 56-95%  $\text{H}_2\text{SO}_4$ ; those with two  $\alpha$ -chlorines such as 3,6-dichloro- or 3,4,5,6-tetrachlorophthalic anhydrides hydrolyze at  $\text{H}_2\text{SO}_4$  concns. of less than 50%) see (5).]

$\bar{\text{C}}$  dislvd. in abs. alc. yields one of the two known acid esters, viz., 3,4-dichloro-2-carbethoxybenzoic acid, pr. from dil. alc., m.p.  $164^\circ$  (6); see also under 3,4-dichlorophthalic acid (3:4880).

[ $\bar{\text{C}}$  with  $\text{PCl}_5$  htd. in a.t. at  $200^\circ$  for 6 hrs. gives exclusively (6) *pseudo*-3,4-dichlorophthaloyl dichloride (3,3,6,7-tetrachlorophthalide), ndls. from  $\text{C}_6\text{H}_6$ , m.p.  $123^\circ$  (6) (this prod. shaken with abs. alc. susp. of  $\text{CaCO}_3$  for 10 hrs. yields (6) 6,7-dichloro-3,3-diethoxyphthalide, pr. from pet. ether., m.p.  $79^\circ$  (6), which depresses m.p. of normal diethyl 3,4-dichlorophthalate, m.p.  $80^\circ$  (6) to  $60^\circ$ ).]

$\bar{\text{C}}$  with 1 mole  $\text{NH}_2\text{OH}\cdot\text{HCl} + \text{Na}_2\text{CO}_3$  in aq. as directed (2) yields 3,4-dichlorophthalylhydroxylamine (*N*-hydroxy-3,4-dichlorophthalimide) [Beil. XXI-504], ndls. from  $\text{MeOH}$ , m.p.  $218-219^\circ$  (2),  $216-219^\circ$  (7) (this prod. with boilg. aq.  $\text{Na}_2\text{CO}_3$  yields (2) (7) a mixt. of 3,4-dichloro-2-aminobenzoic acid (3,4-dichloroanthranilic acid) [Beil. XIV-367, XIV-549] and 5,6-dichloro-2-aminobenzoic acid (5,6-dichloroanthranilic acid) [Beil. XIV-368]).]

[ $\bar{\text{C}}$  with steam passed over cat. at  $380-420^\circ$  loses  $\text{CO}_2$  presumably yielding (8) 2,2-dichlorobenzoic acid (3:4650) and/or 3,4-dichlorobenzoic acid (3:4925).]

[ $\bar{\text{C}}$  with hydroquinone (1:1500) +  $\text{H}_3\text{BO}_3$  htd. at  $100^\circ$  and afterward treated with hot conc.  $\text{H}_2\text{SO}_4$  (9), or  $\bar{\text{C}}$  with  $\text{AlCl}_3 + \text{NaCl}$  htd. at  $200-220^\circ$  for 45 min. (10), or  $\bar{\text{C}}$  with *p*-chlorophenol (3:0475) htd. with fuming  $\text{H}_2\text{SO}_4 + \text{H}_3\text{BO}_3$  (11), gives 5,6-dichloro-1,4-dihydroxyanthraquinone (5,6-dichloroquinizarin) [Beil. VIII-715], red. ndls. from  $\text{AcOH}$ , m.p.  $230^\circ$  (10),  $208^\circ$  (9) (diacetate, m.p.  $179^\circ$  (10),  $140^\circ$  (9)).]

[For study of behavior of  $\bar{\text{C}}$  with *o*-chlorotoluene +  $\text{AlCl}_3$  see (12); for use of  $\bar{\text{C}}$  with dibenzanthrone derivs. in prepn. of vat dyes see (13); for reactn. with *p*-cresol see (16).]

$\bar{\text{C}}$  on fusion with urea yields (14) 3,4-dichlorophthalimide, m.p.  $348-351^\circ$  (14) (for use in prepn. of pigments of phthalocyanine type see (14) (15)).]

$\bar{\text{C}}$  (1 pt.) dislvd. in 5 pts. boilg.  $\text{AcOH}$  and treated with 1 pt. aniline gives on cooling 97% yield 3,4-dichlorophthalanil [Beil. XXI-(391)], cryst. from  $\text{AcOH}$ , m.p.  $181-181.5^\circ$  cor. (1), ndls. from alc., m.p.  $179-180^\circ$  (17) [note, however, that on protracted htg. with excess aniline one of the two nuclear halogens also reacts, e.g.,  $\bar{\text{C}}$  (1 pt.) boiled with 3 pts. aniline for 10 hrs. gives 4-chloro-3-anilinophthalanil, cryst. from alc., m.p.  $159.5-160^\circ$  cor. (1); note also that under certain conditions both halogens can be removed, e.g., 3,4-dichlorophthalanil (above) on refluxing 6 hrs. with aniline + anhydrous  $\text{Na}_2\text{CO}_3 + \text{Cu}$  gives (10% yield (17)) 3-anilinophthalanil, or.-yel. pr., m.p.  $144.5-145^\circ$  (17).]

$\bar{\text{C}}$  on saponification with standard alk. (Sap. Eq. = 108.5), followed by acidification, yields 3,4-dichlorophthalic acid (3:4880) q.v.

I 2533; 1930, I 1303. (13) Imperial Chem. Ind., Ltd., Shaw, Thomson, Brit. 383,624, Dec. 15, 1931; *Cent.* 1933, I 1358. (14) Imperial Chem. ### 3:3720 4-CHLORONAPHTHOL-1

 $C_{10}H_7OCl$ 

Beil. VI - 611

 VI<sub>1</sub>-(308)

 VI<sub>2</sub>-(582)

M.P. 120-121°	(1)
120-120.5°	(2)
120°	(3)
116-117°	(4) (26)
116°	(5)

Ndls. from dil. alc. or from  $CHCl_3$ . — Very eas. sol. org. solv. — Sublimes in ndls. — Volatile with steam but less so than 2-chloronaphthol-1 (3:1490) (use in sepn. from latter (5)).

[For prepn. of  $\bar{C}$  from bis-(4-chloronaphthyl-1) carbonate (itself obtd. from bis-( $\alpha$ -naphthyl) carbonate in AcOH with  $Cl_2$  in pres. of  $SbCl_5$  (5)) by hydrolysis with alc. KOH see (5); from 4-chloronaphthyl-1 *p*-toluenesulfonate (itself obtd. from  $\alpha$ -naphthyl *p*-toluenesulfonate in  $CCl_4$  with  $Cl_2$  + cat. (7)) by hydrolysis see (7); from  $\alpha$ -naphthol (1:1500) with  $SO_2Cl_2$  in  $CHCl_3$  as directed (yields: 20-60% (1), 42% (5), 27-33% (8)) (26) (the isomeric 2-chloronaphthol-1 (3:1490) is also formed) see indic. refs.; from 1,4-dichloronaphthalene (3:1655) by htg. with MeOH/KOH in copper-lined autoclave 20 hrs. at 190-200° see (9); from 4-chloronaphthol-1-sulfonic acid-8 (10) (3) by hydrolysis (10) or reductive cleavage with Na/Hg (3) of the  $-SO_3H$  group see indic. refs.; from 4-chloro-1-hydroxynaphthoic acid-2 (Beil. XI-(146)) by htg. in naphthalene or nitrobenzene in pres. of aniline (yield 81-89%) see (2); from 4-chloronaphthyl-1 MgBr in ether by oxidn. with dry  $O_2$  see (4).]

$\bar{C}$  with  $Cl_2$  in AcOH yields (4) 2,4-dichloronaphthol-1 (3:3250), m.p. 106° (4);  $\bar{C}$  with 1 mole  $Br_2$  in AcOH gives alm. quant. yield (11) 2-bromo-4-chloronaphthol-1; ndls., m.p. 96° (11).

[ $\bar{C}$  with 0.5 mole  $SCl_2$  in  $CHCl_3$  gives (79% yield (12)) bis-(4-chloro-1-hydroxynaphthyl-2) sulfide, colorless ndls. from hot alc., m.p. 172° dec. (12); for reactn. of  $\bar{C}$  with 2-hydroxynaphthalene-1-sulfonyl bromide (13) (14), or with  $SCl_2$  +  $\beta$ -naphthol (15), see indic. refs.]

[ $\bar{C}$  undergoes many condensations with various types of cpds., e.g., for condensation of  $\bar{C}$  with formaldehyde (16) (17), with 2,6-bis-(hydroxymethyl)-4-methylphenol (18), and use of prods. as mothproofing cpds. see indic. refs.; for condensation of  $\bar{C}$  with naphthalene-2,3-dicarboxylic acid anhydride [Beil. XVII-(266)] see (19); for condensation of  $\bar{C}$  with maleic acid (1:0450) or with ethyl acetoacetate (1:1710) or with ethyl methylacetoacetate (1:1712) using  $H_2SO_4$  or  $P_2O_5$  yielding naphthapyrone derivs. see (8); for condens. of  $\bar{C}$  with 2,3-dichloronaphthoquinone-1,4 (3:4357) for use in prepn. of vat dyes see (21).]

[ $\bar{C}$  with maleic anhydride (1:0625) +  $AlCl_3$  + NaCl htd.  $\frac{1}{2}$  hr. at 210-220° gives (13% yield (20)) 10-chloro-1-hydroxyanthraquinone-4,9, dark red ndls. from  $C_6H_6$ , m.p. 205-206°; similarly  $\bar{C}$  with citraconic anhydride (1:1135) yields (20) both 10-chloro-1-hydroxy-2-methyl- and 10-chloro-1-hydroxy-3-methylanthraquinone-4,9.]

[ $\bar{C}$  with 2,4-dinitrotoluene forms a mol. cpd., m.p.  $65^{\circ}$  (22);  $\bar{C}$  with 2,4-dinitroanisole forms a mol. cpd. (22); for use of these as fungicides see (22); for use of  $\bar{C}$  as disinfectant see (23).]

$\bar{C}$  with  $\text{KOH}$  in  $\text{CHCl}_3$  (5) forms an unstable mol. cpd.,  $\bar{C}.\text{KOH}$ , or. ndls., m.p.  $171^{\circ}$  (5),  $170-171^{\circ}$  (4) (1).

$\bar{C}$  with  $\text{FeCl}_3$  or  $\text{Cu}(\text{OCl})_2$  in neutral soln. gives blue ppt. (5) (4).

$\bar{C}$  in alc. (10 pts.) treated with conc.  $\text{HCl}$  (5 pts.) and then with  $\text{NaNO}_2$  (0.4 pt.) yields (2) 4-chloronaphthoquinone-1,2-oxime-2 [Beil. VII<sub>1</sub>- (385)], purified via the beautifully crystg. dif. sol. red sodium salt, from which  $\text{HCl}$  ppts. the free oxime, pale yel. ndls., m.p.  $157^{\circ}$  (2).

① 4-Chloro-1-naphthyl acetate: cryst. from lgr., m.p.  $44^{\circ}$  (4) (26). [From  $\bar{C}$  with  $\text{AcCl}$  (2).] [For Fries rearr. of this acetate to 4-chloro-1-hydroxy-2-naphthyl methyl ketone see (24).]

— 4-Chloro-1-naphthyl benzoate: ndls. from nlc., m.p.  $100-101^{\circ}$  (25). [Reported only by indirect means (25).]

 $121^{\circ}$  (2)  
 $120.5^{\circ}$  (3)  
 $120^{\circ}$  (4) (5) (6)  
 (9) (14) (17)  
 $120-121^{\circ}$  (7) (8)  
 $119^{\circ}$  (12)

[See also 2,6-dichlorohydroquinone (3:4600).]

Yellow cryst. from  $\text{C}_6\text{H}_6$  or lgr.; yellow pr. from nlc. or  $\text{AcOH}$ . —  $\bar{C}$  is somewhat sol. boulg. aq. or cold alc.; cas. sol. hot alc.; sol.  $\text{CHCl}_3$ . — Sublimes far below m.p.; volatile

with steam. —  $\bar{C}$  turns skin reddish brown. [For study of photochem. decompn. of alc. soln. see (43)]

[For prepn. of  $\bar{C}$  from 2,6-dichlorohydroquinone (3:4600) with  $\text{CrO}_3$  (7) or with excess aq.  $\text{FeCl}_3$  soln. on warming (9) see indic. refs.; from 2,4,6-trichlorophenol (3:1673) on oxidn. with  $\text{CrO}_3$  in  $\text{AcOH}$  at 30–40° (yields: 69% (3), 27% (10)) (2), with cold fumg.  $\text{HNO}_3$  (25% yield (11)) (6), with mixt. of fumg.  $\text{HNO}_3$  + conc.  $\text{H}_2\text{SO}_4$  (12), with  $\text{PbO}_2$  in  $\text{AcOH}$  or in  $\text{C}_6\text{H}_6$  (10) or in alc. with  $\text{HNO}_2$  (13) (14) cf. (10), see indic. refs. (note that in addn. to  $\bar{C}$  the crude oxidn. prod. contains also 2-chloro-6-(2',4',6'-trichlorophenoxy)-benzoquinone-1,4, m.p. 134–135° (10), and 2,6-bis-(2',4',6'-trichlorophenoxy)benzoquinone-1,4, m.p. 245° (10), which resemble  $\bar{C}$  in appearance, composition, and behavior); from 2,6-dichloro-4-fluorophenol (8) or its dimethyl ether (8) or from 2,6-dichloro-4-bromophenol (11) with ice-cold  $\text{HNO}_2$  ( $D = 1.5$ ) see indic. refs.; from 2,6-dichloro-4-nitrophenol [Beil. VI-241, VI-122)] on htg. above its m.p. (125°) (15) or in small amt. with mixt. of fumg.  $\text{HNO}_3$  + fumg.  $\text{H}_2\text{SO}_4$  at ord. temp. (16); from 2,6-dichloro-4-aminophenol [Beil. XIII-512, XIII-183)] by oxidn. with  $\text{K}_2\text{Cr}_2\text{O}_7$  +  $\text{H}_2\text{SO}_4$  (90% yield (1)) (17) see indic. refs.; from 3,5-dichloro-4-aminophenol [Beil. XIII-513] similarly see (18); from 2,6-dichloro-*p*-phenylenediamine [Beil. XIII-118, XIII-37)] by oxidn. with dichromate see (19) (10); from 2,6-dichloro-4-bromophenol bromide (4) or from "2,4,6-trichlorophenol bromide" (2,4,6-trichloro-6-bromocyclohexadiene-1,4-one-3) [Beil. VII-145] (5) with cold fumg.  $\text{HNO}_3$  see indic. refs.; from 2,6-dichlorobenzoquinone-1,4-(2,4-dinitroanil)-4 [Beil. XII-754] on hydrolysis with dil.  $\text{H}_2\text{SO}_4$  in a.t. at 200° see (20).]

[For study of bactericidal value of  $\bar{C}$  see (21); for use as vulcanization accelerator see (22); for condensation with  $\beta$ -naphthylamine and use of prods. as intermediates in prepn. of sulfur dyes see (23); for condensation with various amines to yield corresp. mono- and diarylaminoquinones see (24); for condensation with various aminophenols and use of prods. in prepn. of oxazine dyes see (25); for condensation of  $\bar{C}$  with  $\alpha$ -aminoaryl mercaptans and use in prepn. of vat dyes see (26); for reactn. with  $\text{Na}_2\text{S}_2\text{O}_3$  +  $\text{AcOH}$  in prepn. of sulfur dyes see (40)]

$\bar{C}$  on reductn. with aq.  $\text{SO}_2$  gives (80% yield (3)) (27) (1) 2,6-dichlorohydroquinone (3:4600) (note, however, that  $\bar{C}$  in dil. aq.  $\text{NaOH}$  under  $\text{N}_2$  with  $\text{SO}_2$  is in part reduced to 2,6-dichlorohydroquinone (3:4600) and in part sulfonated to mono- and disulfonic acids of  $\bar{C}$  (28)). — [For studies of the oxidn.-reductn. potential of system  $\bar{C}$  + 2,6-dichlorohydroquinone see (3) (29) (30) (42).] — [ $\bar{C}$  forms with 2,6-dichlorohydroquinone the corresp. quinoxaline, brown prismatic ncls, m.p. 135° (31), but does so less readily than the benzoquinone-1,4/hydroquinone system (3); note that this same quinoxaline is obtd. (36) from  $\bar{C}$  + ord. hydroquinone (36).]

[ $\bar{C}$  in  $\text{CHCl}_3$  at low temp. does not react with  $\text{Cl}_2$  but at ord. temps. gives (22) tetrachlorobenzoquinone-1,4 (chloranil) (3:4978). —  $\bar{C}$  in  $\text{AcOH}$  at 15–20° gives (11) with 2 moles  $\text{Br}_2$  2,6-dichloro-3,5-dibromobenzoquinone-1,4 [Beil. VII-612], m.p. 291° (11), accompanied by a little 2,5-dichloro-3,6-dibromobenzoquinone-1,4 [Beil. VII-612], m.p. 292° (11); but  $\bar{C}$  in boilg.  $\text{AcOH}$  with 2 moles  $\text{Br}_2$  gives exclusively the latter (11) cf. (19) (33).]

[ $\bar{C}$  with conc.  $\text{HCl}$  gives on boilg. (34) both 2,3,5-trichlorobenzoquinone-1,4 (3:4672) and 2,3,5,6-tetrachlorobenzoquinone-1,4 (chloranil) (3:4978).]

[ $\bar{C}$  in cold alc. treated dropwise with 10% alc.  $\text{KOH}$  gives first a green soln. turning to brownish red and pptg. in poor yield (2) a potassium salt of 2-chloro-3,6-dihydroxybenzoquinone-1,4 [Beil. VIII-378];  $\bar{C}$  in satd. alc. soln. at 50–60° with conc.  $\text{NH}_4\text{OH}$  gives a purple soln. grad. turning brownish red and pptg. (20–25% yield (2)) 2-chloro-3,6-dihydroxybenzoquinone-1,4-diamide [Beil. VIII-370], bronze-colored lfts. from  $\text{AcOH}$ , subliming at 258–260° without melting]

[ $\bar{C}$  (1 pt.) in alc. (15–20 pts.) + conc.  $\text{HCl}$  (0.3–0.4 pts.) treated with aniline (0.25 pt.)

yields mainly (35) 2,6-dichloro-3-anilino-1,4-benzoquinone (3:4600) accompanied by small amts. of 2-chloro-3,6-dianilino-1,4-benzoquinone (see below);  $\bar{C}$  in either alc. or AcOH with excess aniline yields (35) 2-chloro-3,6-dianilino-1,4-benzoquinone (3:4600).] — [Note that  $\bar{C}$  with sulfanilic acid behaves similarly: e.g.,  $\bar{C}$  with 2 moles sulfanilic acid in aq. (best in pres. of NaOAc) yields (37) 2-chloro-3,6-bis-(p-sulfanilino)-1,4-benzoquinone (3:4600); in aq. alc., however, 2,6-dichloro-3-(p-sulfanilino)-1,4-benzoquinone is also formed (37).]

[ $\bar{C}$  with  $NH_2OH.HCl$  in alc. yields (38) 2,6-dichlorobenzoquinone-1,4-monoxime-4, pale yel. lfts. from dil. alc., m.p.  $140^\circ$  (38), which with cold conc.  $HNO_3$  oxidizes to 2,6-dichloro-4-nitrophenol [Beil. VI-241], colorless ndls. from aq., lfts. from AcOH, thls. from ether, m.p.  $125^\circ$  dec.; note that no dioxime can be formed.]

[ $\bar{C}$  with semicarbazide  $HCl$  in cold dil. alc. gives (39) 2,6-dichlorobenzoquinone-1,4-semicarbazone-4, in red or yel. forms acc. to conditions, but both of m.p.  $219^\circ$  dec. (39); note that no bis-semicarbazone can be formed.]

[ $\bar{C}$  with 20% soln. of triphenylphosphine in  $CHCl_3$  gives an orange-red, red, or brown color (41) (also shown by trichlorobenzoquinone and by chloranil); for other limitations and details see (41).]

3:3780 4-CHLORO-3-HYDROXYBENZ-  
ALDEHYDE

$C_7H_5O_2Cl$  Beil. S.N. 746

M.P.  $121^\circ$  (1) (2)

Colorless ndls. (1).

[For prepn. of  $\bar{C}$  from *m*-hydroxybenzaldehyde (1:0055) via 4-nitro-3-hydroxybenzaldehyde, reduction to amino cpd., and use of appropriate diazo reactn. see (1).]

$\bar{C}$  in 50% AcOH mononitrated as specified (2) gives mainly 4-chloro-2-nitro-3-hydroxybenzaldehyde, spar. sol. in hot  $\text{CHCl}_3$ , colorless pr. from AcOH, m.p.  $175^\circ$  (2) (3). [Note that this statement takes account of a very important correction (3).] [This 4-chloro-2-nitro-3-hydroxybenzaldehyde yields the following derivs.: *p*-nitrophenylhydrazone, deep maroon ndls. from hot AcOH, m.p.  $275\text{--}276^\circ$  dec.; semicarbazone, lt. or. ndls. from alc., m.p.  $265\text{--}266^\circ$  dec. (2) ]

$\bar{C}$  in aq. contg.  $\text{NaHCO}_3$  treated with  $(\text{CH}_3)_2\text{SO}_4$  yields (1) 4-chloro-3-methoxybenzaldehyde, m.p.  $52^\circ$  (1). [This prod. depresses m.p. of corresp. methyl ether of the isomeric 2-chloro-3-hydroxybenzaldehyde (3:4085), m.p.  $56\text{--}57^\circ$  (1); on keeping it acquires a beautiful silver-gray color (1); it yields an oxime, colorless ndls., m.p.  $98\text{--}99^\circ$ , and a *p*-nitrophenylhydrazone, old-gold ndls., m.p.  $251^\circ$  (1).]

④ 4-Chloro-3-hydroxybenzaldehyde: colorless ndls. of hydrate, dec.  $106\text{--}110^\circ$  from dil. alc.; anhydrous oxime, m.p.  $126^\circ$  (1).

— 4-Chloro-3-hydroxybenzaldehyde phenylhydrazone: unrecorded.

④ 4-Chloro-3-hydroxybenzaldehyde *p*-nitrophenylhydrazone: violet-red ndls. from dil. alc., m.p.  $226\text{--}227^\circ$  (1).

— 4-Chloro-3-hydroxybenzaldehyde 2,4-dinitrophenylhydrazone: unrecorded.

④ 4-Chloro-3-hydroxybenzaldehyde semicarbazone: pale yel. ndls., m.p.  $238\text{--}239^\circ$  (1).

3:3780 (1) Hodgson, Beard, *J. Chem. Soc.* 1926, 150-154. (2) Hodgson, Beard, *J. Chem. Soc.* 1926, 2033-2034. (3) Hodgson, Beard, *J. Chem. Soc.* 1927, 2377-2378.

### 3:3810 7-CHLORONAPHTHOL-1

 $\text{C}_{10}\text{H}_7\text{OCl}$ 

Beil. VI - 612

 $\text{VI}_1\text{—}$ 
 $\text{VI}_2\text{—}$ 

M.P.  $123^\circ$  (1)

Ndls. from aq. or  $\text{CS}_2$ ; spar. sol. aq. —  $\bar{C}$  has odor suggesting that of iodoform.

[For prepn. of  $\bar{C}$  from  $\gamma$ -(*p*-chlorophenyl)paraconic acid [Beil. XVIII-421] by distn. see (1) ]

$\bar{C}$  dis. in aq. alk. from which it is reprecipitated by  $\text{CO}_2$ ; the alk. soln. of  $\bar{C}$  couples with diazonium salts yielding azo dyestuffs (1).

$\bar{C}$  with aq.  $\text{FeCl}_3$  gives a yellowish white ppt. which on stdg. assumes a pronounced violet color (1)

$\bar{C}$  (1 mole) with  $\text{P}(\text{KOH})$  (1 mole) in  $\text{CHCl}_3$  yields an addn. cpd.,  $\bar{C} \cdot \text{P}(\text{KOH})$ , or.-red. ndls. from hot  $\text{CHCl}_3$ , m.p.  $139^\circ$  (1).

— 7-Chloro-1-naphthyl acetate: oil.

3:3810 (1) Erdmann, Kirchhoff, *Ann.* 247, 374-375 (1885).

### 3:3840 1,4-DICHLORONAPHTHOL-2

 $\text{C}_{10}\text{H}_6\text{OCl}_2$ 

Beil. VI - 650

 $\text{VI}_1\text{—}$ 
 $\text{VI}_2\text{—}$ 

M.P.  $123\text{--}124^\circ$  (1)

$122\text{--}123^\circ$  (2)

$121^\circ$  (3)

Ndls. from lgr; eas. sol. alc., ether, or AcOH.

[For prepn. of  $\bar{C}$  from 1,1-dichloro-2-keto-1,2-dihydronaphthalene, m.p.  $54^\circ$  (2),  $48\text{--}50^\circ$

(3) (itself prepd. from naphthol-2 (1:1540) in AcOH + NaOAc soln. with Cl<sub>2</sub> (2) (3)), by shaking with satd. soln. of HCl gas in AcOH for 2-3 min. (2) (3) see indic. refs.; from 1,1,3,4-tetrachloro-2-keto-1,2,3,4-tetrahydronaphthalene [Beil. VII-371] by partial reduction with SnCl<sub>2</sub> in AcOH (poor yield) see (1); from 1-chloronaphthol-2 (3:1700) with SO<sub>2</sub>Cl<sub>2</sub> at ord. temp. (4) (note that this prepn. undoubtedly involves intermediate formn. of 1,1-dichloro-2-keto-1,2-dihydroonaphthalene (above) (2)) see indic. refs.; from 1,4,5-trichloronaphthol-2 [Beil. VI-650] by partial reduction with Na/Hg see (4).]

$\bar{C}$  in AcOH with Cl<sub>2</sub> gives (1) 1,1,4-trichloro-2-keto-1,2-dihydronaphthalene [Beil. VII-386], m.p. 86-87°, together with other oily by-products.]

$\bar{C}$  with SnCl<sub>2</sub>/AcOH/HCl in s.t. at 100° for 8 hrs. gives (72% yield (2)) (3) 4-chloronaphthol-2 (3:3045), m.p. 103-104°.

$\bar{C}$  in AcOH mixed with conc. HNO<sub>3</sub> (*D* = 1.42) and cautiously warmed until the liq. shows intense red color, then poured into nq., yields (1) 4-chloro-3-nitronaphthoquinone-1,2 [Beil. VII-724], red ndls. from AcOH, m.p. 184° (1).

$\bar{C}$  with aq. alc. Na<sub>2</sub>SO<sub>3</sub> boiled 72 hrs. gives in poor yield (2) 4-chloronaphthol-2-sulfonic acid-1, cryst. from aq. with  $\frac{1}{2}$  H<sub>2</sub>O (not lost at 100° in vac.); note that this prod. on hydrolysis with H<sub>2</sub>SO<sub>4</sub> gives (91% yield (2)) 4-chloronaphthol-2 (3:3045), m.p. 103-104°.

⑤ 1,4-Dichloro-2-naphthyl acetate: m.p. 90-91° (1). [From  $\bar{C}$  with AcCl (1).]

3:3840-3:3860 (2) Burton, *J. Chem. Soc.* 1945, 280-283. (1930). (4) Armstrong, Rossiter, *Chem.*

### 3:3860 3,3'-DICHLOROBENZOPHENONE (Di-(*m*-chlorophenyl) ketone)

Beil. S.N. 652

M.P. 123.8-124.9° (1) B.P. 160-166° at 2 mm. (1)

[For prepn. of  $\bar{C}$  from *m*-chlorobromobenzene [Beil. V-209, V<sub>1</sub>-(115), V<sub>2</sub>-(161)] (2) via conversion to *m*-chlorophenyl MgBr (cf. (3)) and reaction with *m*-chlorobenzonitrile [Beil. IX-339] (4), followed by hydrolysis (77% yield), see (1).]

⑥ 3,3'-Dichlorobenzophenone 2,4-dinitrophenylhydrazone: m.p. 235-238° (1).

## 3:3900 3-CHLOROPHTHALIC ANHYDRIDE

 $C_8H_5O_3Cl$ Beil. XVII - 482  
XVII<sub>1</sub>—

M.P. 126°	(1)
124.5-125.5°	(2)
123°	(3)
122°	(4) (5)

[See also 3-chlorophthalic acid (3:4820).]

[For prepn. of  $\bar{C}$  from 3-chlorophthalic acid (3:4820) by distn. see (4) (2); from 3-nitrophthalic anhydride [Beil. XVII-486, XVII<sub>1</sub>-(256)] by htg. with  $PCl_3$  in s.t. 6 hrs. at 175° (5) or 9 hrs. at 220° (60% yield (1)) or with  $Cl_2$  at 240° (6) see indic. refs.; from phthalic anhydride (1:0725) with  $Cl_2$  at 240° in pres. of Fe or Fe salts see (7).]

$\bar{C}$  with  $Cl_2$  in fuming  $H_2SO_4$  in pres. of  $I_2$  gives (8) a mixt. contg. 3 pts. 3,6-dichlorophthalic anhydride (3:4860), m.p. 194° cor., and 1 pt. 3,4-dichlorophthalic anhydride (3:3695), m.p. 120-121°, b.p. 320°.]

[The neutral dimethyl and diethyl esters corresp. to  $\bar{C}$  are unreported; ethyl hydrogen 3-chlorophthalate has m.p. 118-119° (3).]

$\bar{C}$  with  $PCl_5$  (3) or with  $SOCl_2$  +  $ZnCl_2$  in s.t. at 200-240° (9) yields 3-chlorophthaloyl (di)chloride, b.p. 169-171° at 10 mm. (3).]

$\bar{C}$  with urea on fusion at 170° gives (3) 3-chlorophthalimide, cryst. from AcOH, m.p. 233° (3), 236° (15). —  $\bar{C}$  with 1 mole aniline htd. at 200-220° until no more steam is evolved (14) or  $\bar{C}$  with 1 mole aniline in boilg. AcOH (14) gives quant. yield 3-chlorophthalanil (N-phenyl-3-chlorophthalimide), pale cream-colored ndls. from AcOH, m.p. 189-190° (14);  $\bar{C}$  similarly treated with p-toluidine gives (80-90% yield (14)) N-(p-tolyl)-3-chlorophthalimide, colorless ndls. from AcOH, m.p. 160.5° (14).

$\bar{C}$  with pyrocatechol (1:1520) +  $AlCl_3$  + NaCl htd. at 130-138° gives (10) an intermediate prod. (presumably 3-chloro-2-(o,m-dihydroxybenzoyl)benzoic acid), yel. cryst. from AcOH, m.p. 187° (10), which with conc.  $H_2SO_4$  yields (10) 8-chloro-1,2-dihydroxyanthraquinone (5-chlorohystazarin), yel. cryst. from pyridine, m.p. 187° (diacetate, m.p. 193° (10)). —  $\bar{C}$  with hydroquinone (1:1590) +  $AlCl_3$  + NaCl htd. at 200-220° for 40-50 min. yields (11) 8-chloro-1,4-dihydroxyanthraquinone (5-chloroquinizarin), red cryst. from xylene, m.p. 213° (diacetate, m.p. 205°, dimethyl ether, m.p. 208° (11)).]

$\bar{C}$  with  $C_6H_4$  +  $AlCl_3$  yields (12) 6-(37)-chloro-2-(benzoyl)benzoic acid, m.p. 233.5°, which with conc.  $H_2SO_4$  for 4 hrs. at 95° gives (59% yield (12)) 1-chloroanthraquinone (3:4180), m.p. 162° (12). —  $\bar{C}$  with p-xylene +  $AlCl_3$  gives (81% yield (13)) 6-(37)-chloro-2-(2,5-dimethylbenzoyl)benzoic acid, pr. from AcOH, m.p. 215°, which on warming with 9 pts. fuming  $H_2SO_4$  (10%  $SO_3$ ) gives (96% yield (13)) 1-chloro-5,8-dimethylanthraquinone, yel. ndls. from AcOH, m.p. 186°.]

$\bar{C}$  on boilg. with dil.  $HCl$  (1) or  $\bar{C}$  on saponification with standard alk. (Sap. Eq. = 91.3) followed by acidifn. gives 3-chlorophthalic acid (3:4820) q.v.

VI<sub>1</sub>—  
VI<sub>2</sub>—

M.P. 136° u.c. (1)  
134° (2)  
132-133° (3)

Cryst. from abs. alc. — Note that from aq.  $\bar{C}$  cryst. as a trihydrate (1), but on htg. this hydrate loses aq. before melting (2); note also that  $\bar{C}$  on recrystn from toluene gives a solvated prod., m.p. 108-109° (1). [For study of crystallography of  $\bar{C}$  see (4).]

$\bar{C}$  is alm. insol. aq. or cold  $C_6H_6$ ; sol. alc. —  $\bar{C}$  readily sublimes.

[For prepn. of  $\bar{C}$  from phloroglucinol (1,3,5-trihydroxybenzene) (1:1620) with  $Cl_2$  in  $CCl_4$  (crude yield 76% (1)) or in AcOH (5) see indic. refs.; note that attempts (6) (7) to prepare  $\bar{C}$  from phloroglucinol (1:1620) with  $Cl_2$  in aq. soln. were not effective owing to further decomp. of the prod. into dichloroacetic acid (3:6208) and/or the tetrahydrate of sym.-tetrachloroacetone (3:6050) cf. (1).]

[For formn. of  $\bar{C}$  from phloroglucinol (1:1620) with  $SO_2Cl_2$  in dry ether see (3).]

[For formn. of  $\bar{C}$  from hexachlorocyclohexanetrioo-1,3,5 ("hexachlorophloroglucinol") [Beil. VII-854, VII<sub>1</sub>-(469)] by reduction with  $SnCl_2$  or KI see (7).]

$\bar{C}$  dis. in hot conc. HCl from which on cooling it separates in fine ndls.;  $\bar{C}$  with warm dil.  $HNO_3$  is decomposed with formn. of oxalic acid (1:0445);  $\bar{C}$  with conc.  $H_2SO_4$  dissolves unchanged on gentle warming, but on contd. htg. HCl is evolved and soln. turns deep sage-green (1).

$\bar{C}$  dissolves in aq. alk. but is reprecip. unchanged upon acidification; note, however, that alk. soln. of  $\bar{C}$  on stdg. in air develops a purple color (1).

[ $\bar{C}$  in AcOH added to excess  $Br_2$ /aq. undergoes ring cleavage with formn. of 1,1,3,5,5-pentabromo-1,3,5-trichloropentanedione-1,4 [Beil. I-786], colorless cryst. from pet. ether, m.p. 93-95°, to a turbid liq. becoming clear at 98° (8).]

— 2,4,6-Trichlorophloroglucinol trimethyl ether: ndls. from alc., m.p. 130-131° (9). [Prepd. indirectly (9)]

— 2,4,6-Trichlorophloroglucinol triacetate: lfts. from dil. AcOH, m.p. 167-168° (7). [From  $\bar{C}$  with large excess  $AcCl$  at 100° (7).]

### 3:4052 2,3,6-TRICHLOROHYDROQUINONE

$C_6H_3O_2Cl_3$  Beil. VI - 850  
VI<sub>1</sub>—  
VI<sub>2</sub>-(846)

M.P. 138° (1)  
136° (2)  
134° (3)  
131-132° (16)  
130-132° (13)  
130° (4)

[See also 2,3,5-trichlorobenzoquinone-1,4 (3:4672).]

Colorless shining pr. from aq. rapidly losing their luster in air (3); transparent pr. with 1 mole AcOH from AcOH but solvated AcOH readily lost in air (5).

$\tilde{C}$  at 15° is sol. in 160 pts. aq. (6);  $\tilde{C}$  is spar. sol. cold aq. but eas. sol. hot aq. in which it first melts to an oil (3);  $\tilde{C}$  is eas. sol. alc. or ether.

$\bar{C}$  readily sublimes in lfts. (4); for study of sublimation press. see (7).

[For study of heat of formn. of  $\bar{C}$  see (8); for studies of heat of combustion of  $\bar{C}$  see (5) (9).]

[For detn. of chlorine in  $\bar{C}$  by hydrogenation at elevated temp. see (10); for patent on use of  $\bar{C}$  as vulcanization accelerator see (11).]

### PREPARATION OF $\bar{C}$

From trichlorobenzoquinone. [For prepn. of  $\bar{C}$  from 2,3,5-trichlorobenzoquinone-1,4 (3:4672) by reduction with aq.  $\text{SO}_2$  (3) (4) (6) (12) in ether (1), or from "benzoquinone tetrachloride" (2,3,5,6-tetrachlorocyclohexanedione-1,4) [Beil. VII-557] with aq.  $\text{SO}_2$  (13), see indic. refs.]

From other sources. [For formn. of  $\bar{C}$  (together with other products) from 2,5-dichlorobenzoquinone-1,4 (3:4470) or from 2,6-dichlorobenzoquinone-1,4 (3:3750) with boilg. conc.  $\text{HCl}$  see (14); from  $\text{C}_6\text{H}_8$  with  $\text{KClO}_3 + \text{H}_2\text{SO}_4$  see (16).]

### CHEMICAL BEHAVIOR OF $\bar{C}$

Reduction. [ $\bar{C}$  with  $\text{Na}/\text{Hg}$  in acid soln. is hardly affected and does not (3) give hydroquinone; however, for anal. of  $\bar{C}$  by quant. detn. of chlorine with  $\text{H}_2$  at elev. temp. see (10).]

Oxidation.  $\bar{C}$  on oxidn., e.g., with  $\text{CrO}_3$  at  $0^\circ$  (5), conc.  $\text{HNO}_3$  (4) (3),  $\text{AgNO}_3$  (4), or  $\text{FeCl}_3$  (4), gives 2,3,5-trichlorobenzoquinone-1,4 (3:4672); note, however, that with insufficient oxidizing agent the corresp. quinhydrone (see below) may separate.

[For study of oxidn.-reductn. potential of system  $\bar{C} + 2,3,5$ -trichlorobenzoquinone-1,4 (3:4672) see (2) (17) (18).]

$\bar{C}$  (1 mole) with 2,3,5-trichlorobenzoquinone-1,4 (3:4672) (1 mole) in  $\text{CHCl}_3$  soln. gives on evapn. (2) (19) the corresp. quinhydrone, green-black cryst., m.p.  $114$ – $115^\circ$  (2),  $103^\circ$  (19).

[Note also that  $\bar{C}$  in aq.  $\text{KOH}$  exposed to air first turns green, then red, and finally brown (4), and this soln. on stdg. or boilg. in air gradually separates the corresp. potassium salt of chloranilic acid (3:4970) (3).]

Other reactions of  $\bar{C}$ . [ $\bar{C}$  with  $\text{PCl}_5$  (2 moles) on btg. gives (3) a mixture of pentachlorobenzene (3:2290) and hexachlorobenzene (3:4939).]

— Trichlorohydroquinone dimethyl ether (3,4,5-trichloro-1,4-dimethoxybenzene): unreported.

① Trichlorohydroquinone diethyl ether (3,4,5-trichloro-1,4-diethoxybenzene): ndls. from alc., m.p.  $68.5^\circ$  (3). [From  $\bar{C}$  with  $\text{C}_2\text{H}_5\text{I} + \text{KOH}$  in s.t. (3).]

② Trichlorohydroquinone diacetate: ndls. by sublimation, m.p.  $153^\circ$  (3). [From  $\bar{C}$  with  $\text{AcCl}$  under reflux (3).]

③ Trichlorohydroquinone dibenzoate: ndls. from  $\text{CS}_2$ , m.p.  $174^\circ$  (14). [From  $\bar{C}$  with  $\text{BzCl}$  on btg. (14).]

**3:4085 2-CHLORO-3-HYDROXYBENZ-ALDEHYDE**   $C_7H_5O_2Cl$  Beil. S.N. 745

M.P. 139.5° (1)  
139-139.5° (3)  
139° cor. (4)

Colorless cryst from dil.  $AcOH$  (1) becoming pale pink on prolonged exposure to air (1) —  $\bar{C}$  has pronounced sternutatory props. (1) (3).

[For prepn. of  $\bar{C}$  from *m*-hydroxybenzaldehyde (1:0055) +  $Cl_2$  (32.6% yield (4)) see (1) (3) (4); for indirect prepn. via 2-nitro-3-hydroxybenzaldehyde, reductn., and appropriate diazo reactns. see (1).]

$\bar{C}$  in 50%  $AcOH$  mononitrated as directed (2) by grad. addn. of  $HNO_3$  ( $D = 1.3$ ) then after a min. poured onto ice gives 100% yield of mixt. of 4-nitro and 6-nitro derivs.; extraction with aq. nt 90° dissolves the latter leaving residue of almost pure 4-nitro deriv.; from the soln. of 6-nitro isomer a little dissolved 4-nitro cpd. is distilled out with steam (2).

4-Nitro-2-chloro-3-hydroxybenzaldehyde: pale yel. ndls. from  $AcOH$ , m.p. 166° (2). [Corresp. oxime, insol. aq., yel. ndls. from alc., m.p. 170° (2); *p*-nitrophenylhydrazone, deep or. ndls. from hot  $AcOH$ , m.p. 291-295° dec. (2); semicarbazone, sulfur-yel. ndls.

from hot alc., m.p. 271–272° dec. (2); methyl ether, colorless ndls. from dil. alc. or dil. AcOH, m.p. 107° (2).]

6-Nitro-2-chloro-3-hydroxybenzaldehyde: colorless ndls. from aq., m.p. 153° (2). [Corresp. oxime, exceedingly sol. in aq. or alc., colorless ndls. from  $\text{CHCl}_3$ , m.p. 175° (2); *p*-nitrophenylhydrazone, or.-red ndls. from hot dil.  $\text{AcOH}$ , m.p. 232-233° (2); semicarbazone, pale yel. ndls. from alc., m.p. 234° dec. (2); methyl ether, colorless ndls. from  $\text{AcOH}$ , m.p. 134° (2).]

$\bar{C}$  in  $\text{CHCl}_3$  treated with  $\text{Br}_2$  in  $\text{CHCl}_3$  as directed (5) gives (86% yield (5)) 4-bromo-2-chloro-3-hydroxybenzaldehyde, cryst. from 50%  $\text{AcOH}$ , m.p.  $139\text{--}140^\circ$  cor. (5). [This deriv. depresses m.p. of  $\bar{C}$  (5).] [4,6-Dibromo-2-chloro-3-hydroxybenzaldehyde has m.p.  $104\text{--}105^\circ$  (5).]

5 with 50% KOH at 60–70° undergoes Cannizzaro reactn. giving (4) 2-chloro-3-hydroxybenzyl alc. (87% theory (4)), cryst. from toluene, m.p. 132° cor. (4), and 2-chloro-3-hydroxybenzoic acid (96% theory (4)) (3:4395), cryst. from *aq.*, m.p. 156° (4).

C in aq. 20% NaOH (1) or aq.  $\text{NaHCO}_3$  (1), treated with  $\text{Me}_2\text{SO}_4$ , yields methyl ether (2-chloro-3-methoxybenzaldehyde), volatile with steam, cryst. from dil. alc., m.p. 56–57° (1). [This ether depresses m.p. of corresp. deriv. (m.p. 52°) of the isomeric 4-chloro-3-hydroxybenzaldehyde (3:3780).] [On oxidn. with alk.  $\text{KMnO}_4$  (1) this methyl ether yields 2-chloro-3-methoxybenzoic ac., m.p. 160° (1).]

⑧ 2-Chloro-3-hydroxybenzaloxime: colorless nlds. from dil. alc., m.p. 140° (l).

— 2-Chloro-3-hydroxybenz aldehyde phenylhydrazone: unrecorded.

① 2-Chloro-3-hydroxybenzaldehyde *p*-nitrophenylhydrazone: or.-red ndls. from hot alc., m.p. 244-245° (1).

— 2-Chloro-3-hydroxybenzaldehyde 2,4-dinitrophenylhydrazone: unrecorded.

① 2-Chloro-3-hydroxybenzaldehyde semicarbazone: pale yel. nlds., m.p. 236-237° (1).

⑤ **2-Chloro-3-acetoxybenzaldehyde**: rhombic cryst. from alc., m.p. 62° (1).

⑤ 2-Chloro-3-benzoxypyridine: rhombic cryst. from alc., m.p. 88° (1).

Ndls. from ether; cryst. from  $\text{CCl}_4$ ,  $\text{CS}_2$ ,  $\text{C}_6\text{H}_6$  +  $\text{LiOH}$ , or  $\text{C}_6\text{H}_6$  (for studies on crystallographic props. see (2) (8) (5) (15)). — Insol. cold and spar. sol. hot nlc; fairly sol. cold ether,  $\text{C}_6\text{H}_6$ ,  $\text{CHCl}_3$ , or  $\text{CS}_2$  —  $\bar{\text{C}}$  has penetrating and disagreeable odor. — Sublimes easily.

[For prepn. of  $\bar{\text{C}}$  from 2,4,5-trichloroaniline [Beil. XII-627] (9) or from 2,5-dichlorophenylenediamine [Beil. XIII-118] (16) via diazotization and use of  $\text{Cu}_2\text{Cl}_2$  reactn. (64% yield (16)) see indic. refs.; from *p*-dichlorobenzene (3:0950) with  $\text{S}_2\text{Cl}_2$  +  $\text{AlCl}_3$  in  $\text{SO}_2\text{Cl}_2$  (67% yield (1)) (17) or from *o*-dichlorobenzene (3:6055) with  $\text{Cl}_2$  + cat. (18) see indic. refs.]

[For formn. of  $\bar{\text{C}}$  from  $\text{C}_6\text{H}_6$  with  $\text{Cl}_2$  in pres. of  $\text{I}_2$  (5),  $\text{Fe}$  (44% yield (13)), or  $\text{AlCl}_3$  (19), or  $\text{Cu}$  (20), or from chlorobenzene with  $\text{Cl}_2$  +  $\text{Cu}$  (20), or from *o*-dichlorobenzene (3:6055) with  $\text{Cl}_2$  + cat. (18) or  $\text{Al/Hg}$  (21), or from *m*-dichlorobenzene (3:5960) with  $\text{Cl}_2$  +  $\text{Al/Hg}$  (21) or  $\text{AlCl}_3$  (4), or from *p*-dichlorobenzene with  $\text{Cl}_2$  in pres. of  $\text{Fe}$  (39% yield (13)), see indic. refs.; from dry  $\text{C}_6\text{H}_6$  with anhyd.  $\text{AuCl}_3$  (22) or on electrol. in aq.  $\text{HCl}/\text{AcOH}$  soln. see (23); from lower chloro derivs. of  $\text{C}_6\text{H}_6$  with  $\text{FeCl}_3$  see (7); from 2,4,5-trichlorotoluene (3:2100) with  $\text{Cl}_2$  see (21); from benzaldehyde (1:0195) by hlg. with  $\text{SnCl}_4$  see (11)]

[For formn. of  $\bar{\text{C}}$  from 2,5-dichloro-4-nitroaniline on diazotization and treatment with  $\text{Cu}_2\text{Cl}_2$  see (23) (14) (note abnormal replacement of nitro group); from nitrobenzene with  $\text{SO}_2\text{Cl}_2$  +  $\text{N}_2\text{O}_4$  see (10), from resorcinol 4,6-bis-(sulfonyl chloride) or hydroquinone 2,5-

*bis*-(sulfonyl chloride) with  $\text{PCl}_5$  in s.t. at  $180^\circ$  see (12) (26); from 4,6-dichlorobenzene 1,3-*bis*-(sulfonyl chloride) (27) or from 1,3-*bis*-(methylmercapto)benzene-4,6-*bis*-(sulfonyl chloride) (28) with  $\text{SOCl}_2$  at  $170$ – $200^\circ$  see indic. refs.; from 2,5-dichlorobenzene-1,4-*bis*-(sulfonyl chloride) with  $\text{PCl}_5$  in s.t. 4 hrs. at  $180^\circ$  see (6); from 2,3,5,6-tetrachloro-*N*-nitroacetanilide (39) by refluxing in toluene or xylene (other products are also formed) see (39).]

[For behavior of  $\bar{\text{C}}$  with liq.  $\text{Cl}_2$  yielding addn. products see (29); for behavior with  $\text{NH}_3$  at elevated temps. see (30);  $\bar{\text{C}}$  with  $\text{S}_2\text{Cl}_2 + \text{AlCl}_3 + \text{SO}_2\text{Cl}_2$  yields (17) hexachlorobenzene (3:4933).]

[ $\bar{\text{C}}$  htd. with NaOMe as directed yields according to conditions (13) (31) (32) (38) 2,4,5-trichlorophenol (3:1620) or its methyl ether.]

$\bar{\text{C}}$  on mononitration, e.g., on boilg. with 5 pts.  $\text{HNO}_3$  ( $D = 1.52$ ) for  $\frac{1}{2}$  hr. (3) (13) (34), yields 1,2,4,5-tetrachloro-3-nitrobenzene [Beil. V-247], m.p.  $99$ – $100^\circ$  (33) (35),  $99^\circ$  (34) (13),  $98^\circ$  (9), some tetrachlorobenzoquinone (chloranil) (3:4978) (insol. in pet. ether) also being formed (9) (34) (13) (33). [For studies on ebem. of this mononitro cpd. see (36).]

$\bar{\text{C}}$  on dinitration by boilg. 5–6 hrs. with mixt. of 10 pts.  $\text{HNO}_3$  ( $D = 1.52$ ) + 10 pts. fuming  $\text{H}_2\text{SO}_4$  (25%  $\text{SO}_3$ ) gives (71% yield (33)) 1,2,4,5-tetrachloro-3,6-dinitrobenzene, cryst. from  $\text{C}_6\text{H}_6$  by addn. of alc., m.p.  $227$ – $228^\circ$  (33),  $232$ – $233^\circ$  (35).

$\bar{\text{C}}$  with 4 pts. chlorosulfonic acid refluxed for hr. gives (78% yield (37)) hexachlorobenzene (3:4939), m.p.  $218$ – $219^\circ$  u.c. (37).

## 3:4135 TETRACHLORORESORCINOL

 $\text{C}_6\text{H}_2\text{O}_2\text{Cl}_4$ 

Beil. VI - 820

VI<sub>1</sub>—VI<sub>2</sub>-(819)M.P.  $141^\circ$  (1) $140^\circ$  (2)

Long colorless ndls. from hot aq. — Faintly pleasant phenolic odor. [New comml. prod. (1942) in U.S.A.] — Eas. sol. alc., ether, AcOH,  $C_6H_6$ ; fairly eas. sol. hot aq.; spar. ol. cold aq.

[For prepn. from "hexachlororesorcinol" (3:3470) by reduction with  $SaCl_2$  in AcOH see (1)]

$\bar{C}$  is sol. in aq. alk. (2). —  $\bar{C}$  in aq. soln. gives with  $FeCl_3$  a blue color (2).

$\bar{C}$  in AcOH on treatment with  $Cl_2$  yields "hexachlororesorcinol" (3:3470), m.p. 115°.

⑤ Tetrachlororesorcinol diacetate: m.p. 145° (1), 144° (2). [Note that m.p. of this deriv. is close to that of  $\bar{C}$  and should be tested by method of mixed m.p.'s.]

3:4135 (1) Zincke, Fuchs, *Ber.* 25, 2689-2690 (1892). (2) Fries, Hartmann, *Ber.* 54, 199 (1921).

### 3:4140 2,4-DICHLORO-3-HYDROXYBENZ-ALDEHYDE

$C_7H_3Cl_2O_2$  Beil. S.N. 745

M.P. 141° (1)

Colorless cryst. from AcOH.  $\bar{C}$  has pronounced sternutatory props. and blisters moist skin. — [Note that the m.p. of a mixt. of  $\bar{C}$  with isomeric 2,6-dichloro-3-hydroxybenzaldehyde (3:4160), m.p. 140°, is depressed to 111° (1)]

[For prepn. of  $\bar{C}$  from 4-chloro-3-hydroxybenzaldehyde (3:3780) in AcOH with  $Cl_2$  at room temp. (100% yield) see (1)]

$\bar{C}$  (1 pt.) in AcOH (4 pts.) on nitration at 65° with 1 pt. conc.  $HNO_3$  ( $D = 1.42$ ) yields (2) 2,4-dichloro-3-hydroxy-6-nitrobenzaldehyde (2), colorless ndls. from its deep yellow soln. in AcOH or from hot aq., m.p. 107° (2) (p-nitrophenylhydrazone, or. ndls. from AcOH, m.p. 279-280° (2), semicarbazone monohydrate, yel. ndls. from dil. alc., softens 140-150° (2))

$\bar{C}$  dislvd. in boilg. 10% NaOH (2 moles) and treated with  $Me_2SO_4$  (1.3 moles) yields (1) 2,4-dichloro-3-methoxybenzaldehyde, m.p. 82° (1) (p-nitrophenylhydrazone, old-gold ndls., m.p. 258-260° (1)), which on oxidn. yields 2,4-dichloro-3-methoxybenzoic acid, colorless ndls., m.p. 163° (1)

⑤ 2,4-Dichloro-3-hydroxybenzaldehyde: fine colorless ndls. from alc., m.p. 188° (1).

⑥ 2,4-Dichloro-3-hydroxybenzaldehyde p-nitrophenylhydrazone: or.-red ndls., m.p. 277-278° dec (1)

3:4140 (1) Hodgson, Beard, *J. Chem. Soc.* 1926, 147-155. (2) Hodgson, Beard, *J. Chem. Soc.* 1926, 2030-2036.

Cryst. from hot aq.,  $C_6H_6$ , dioxane/ $C_6H_6$ , or alc. —  $\bar{C}$  is spar. sol. cold aq.; e.g.,  $\bar{C}$  is sol. at 0° in 881 pts. aq. (27); at 25°, 100 ml. satd. aq. soln. coats. 0.213 g  $\bar{C}$  (21) (= 0.0136 mole per liter (21) (28)). —  $\bar{C}$  is eas. sol. hot aq., alc., ether (26). — At 14–16°C 100 ml. satd. soln. of  $\bar{C}$  in acetone coats. 28.4 g  $\bar{C}$ , in ether 17 g  $\bar{C}$ , in EtOAc 13.2 g  $\bar{C}$ , in 75% AcOH 6.2 g  $\bar{C}$ ; in  $C_6H_6$  0.9 g  $\bar{C}$ ; in  $CCl_4$  0.6 g  $\bar{C}$ ; in  $CS_2$  0.5 g  $\bar{C}$ ; in 1 gr. 0.07 g  $\bar{C}$  (10). — For study of soly. of  $\bar{C}$  in acetone (4),  $C_6H_6$  (4) (29), heptane (29), chlorobenzene (3:7903) (30), o-chlorotoluene (3:8245) (30), or m-chlorotoluene (3:8275) (30) see indic. refs.

For study of distribution at 25° of  $\bar{C}$  between aq. + toluene (31), aq. + xylene (32), or aq. +  $CHCl_3$  (31) (32) (for use of  $CHCl_3$  in sepn. of  $\bar{C}$  from aq. suspension of 3-chlorophthalic acid (3:4820) (33)) see indic. refs.; for adsorption of  $\bar{C}$  on charcoal from its solns. in EtOH (34), acetone (4),  $C_6H_6$  (4), or aq. (35) see indic. refs.; for soly. of  $\bar{C}$  in aq. solns. of various salts (including  $Na\bar{A}$ ) see (28) (21).

$\bar{C}$  can be sublimed in vac. (12). —  $\bar{C}$  is but very slightly volatile with steam (for details see (11)). — For crystallographic data see (36) (37). — For purification of  $\bar{C}$  (by use of decolorizing carbon on soln. of  $\bar{C}$  in aq.  $Na_2CO_3$  followed by reprecipn. with 6 N HCl) see (33).

Binary systems contg.  $\bar{C}$ : for f.p./compn. data on system  $\bar{C}$  +  $H_2O$  see (39); for f.p./compn. data and diagram on system  $\bar{C}$  +  $BzOH$  (1:0715), eutectic, m.p. 91.1°, contg. about 41 wt. %  $\bar{C}$ , see (10) (41); for f.p./compn. data on systems  $\bar{C}$  + o-toluic acid (1:0690) (20) or  $\bar{C}$  + o-hydroxybenzoic acid (salicylic acid) (1:0780) (20) see indic. refs.

For f.p./compn. data and diagrams on systems  $\bar{C}$  + m-chlorobenzoic acid (3:4392) (eutectic, m.p. 110.7°, contg. 52–53 mole %  $\bar{C}$  (6) (40) (10) (15)) see indic. refs.; on system  $\bar{C}$  + p-chlorobenzoic acid (3:4940) (eutectic, m.p. 132°, contg. abt. 86 mole %  $\bar{C}$ ) see (10) (15).

For f.p./compn. data and diagrams on systems  $\bar{C}$  + o-bromobenzoic acid (41),  $\bar{C}$  + o-iodobenzoic acid (42),  $\bar{C}$  + o-nitrobenzoic acid (43),  $\bar{C}$  + m-nitrobenzoic acid (43) see indic. refs.

Ternary systems contg.  $\bar{C}$ . [For influence of addn. of benzoic acid (6) or of p-chlorobenzoic acid (3:4940) (40) to the eutectic of  $\bar{C}$  with m-chlorobenzoic acid (3:4392) see indic. refs.; for influence of addn. of  $\bar{C}$  to the eutectic of benzoic acid with m-chlorobenzoic acid see (40); for data on system  $\bar{C}$  + m-chlorobenzoic acid (3:4392) + p-chlorobenzoic acid (3:4940), eutectic, m.p. 104.9°, contg. respectively 48.3, 44.0, and 7.7 mole % of the three isomers, see (15).]

Miscellaneous. [For study of fate of  $\bar{C}$  in animal organism see (44) (45); note that contrary to earlier (45) results with dogs and rabbits conjugation with glycine to yield the expected N-(o-chlorobenzoyl)glycine (o-chlorobiphenyl acid) [Beil. IX-336], m.p. 176° (45), does (44) occur. — For study of use of  $\bar{C}$  (or its salts) as preservatives see (46); for detectn. of  $\bar{C}$  in foods see (179). — For use of  $\bar{C}$  as vulcanization regulator see (47) (48).]

Preparation. [For prepn. of  $\bar{C}$  from o-chlorotoluene (3:8245) by oxidn. with boilg. aq.  $KMnO_4$  (yields: 90% (14), 74–78% (18), 68–71% (24)) (49) (13), with nitrosulfonic acid (from fung.  $HNO_3$  + dry  $SO_2$ ) at 100° (50), with air in the pres. of various catalysts (51) (52) (53), or in aq. alk. at 260° under press. (54), see indic. refs.; for formn. of  $\bar{C}$  from o-chlorophenyl benzyl ketone by auto-oxidn. in light and air see (56); for formn. of  $\bar{C}$  from o-chlorobenzaldehyde (3:6410) by oxidn. with  $CrO_3$  (57), with alk.  $KMnO_4$  (58), or by auto-oxidn. in  $Ac_2O$  (59) see indic. refs.]

[For prepn. of  $\bar{C}$  from o-aminobenzoic acid (anthranilic acid) [Beil. XIV-312, XIV-1 (529)] via diazotization and use of  $Cu_2Cl_2$  (yields: 90% (24), 87% (178)) (preferably under  $CO_2$  (60)), or  $CuH$  (60% yield (61)), or  $Cu$  (62) see indic. refs.]

[For prepn. of  $\bar{C}$  from o-chlorobenzonitrile [Beil. IX-336] by hydrolysis with  $H_2SO_4$  (14), with dil. HCl in s.t. at 150° (63), or boilg. KOH (14) see indic. refs.; from o-chlorobenzoyl chloride (3:6640) by hydrolysis with aq. (91) or aq. alk.; from o-chlorobenzotri-

chloride (3:6880) by hydrolysis (64) (65), e.g., with aq. in s.t. at 150° (27) or by boilg. conc.  $\text{HNO}_3$  (65) see indic. refs.; from *o*-chlorobenzal (di)chloride (3:6625) with  $\text{CrO}_3$  (57) or with boilg. aq. for 20 hrs. followed by oxidn. with  $\text{KMnO}_4$  (75% yield (7)); from a mixt. of *o*-chlorobenzotrichloride + *o*-chlorobenzal (di)chloride by bydrol. with 70%  $\text{H}_2\text{SO}_4$  or 80%  $\text{AcOH}$  or 5%  $\text{NaOH}$  at 90–100° in stream of air to effect immediate oxidn. (67); from *o*-chlorobenzoyl-*o*-chlorotriphenylethane by hydrolytic cleavage with 20%  $\text{MeOH/KOH}$  5 hrs. at b.p. (8); from *o*-chlorophenylnitrolic acid by hydrolysis with boilg. aq. (19) see indic. refs.]

[For formn. of  $\bar{\text{C}}$  (together with other prods.) from benzoic acid (1:0715) with  $\text{KClO}_3$  +  $\text{HCl}$  (68), with  $\text{NaOCl}$  (6) (69), see indic. refs.]

[For formn. of  $\bar{\text{C}}$  from *o*-sulfobenzoic acid imide (saccharin) [Beil. XXVII-168, XXVII-1-(266)] with  $\text{KClO}_3$  +  $\text{HCl}$  see (9); from 3-chlorophthalic acid (3:4820) by cat. monodecarboxylation see (70); from *o*-nitrotoluene [Beil. V-318, V<sub>1</sub>-(158), V<sub>2</sub>-(243)] (71), from sodium *o*-toluenesulfonate [Beil. XI-83, XI<sub>1</sub>-(22)] (72), or from *o*-toluenesulfonyl chloride [Beil. XI-86, XI<sub>1</sub>-(23)] (71) with  $\text{SOCl}_2$  in s.t. at elevated temp. followed by treatment with aq. see indic. refs.]

Chemical behavior. [ $\bar{\text{C}}$  (as  $\text{Na}\bar{\text{A}}$ ) on reduction with  $\text{Na/Hg}$  (27) (25) (73) or  $\bar{\text{C}}$  (as  $\text{K}\bar{\text{A}}$ ) on fusion with sodium formate (74) cf. (75) is dehalogenated yielding benzoic acid (1:0715) (for study of reduction of  $\bar{\text{C}}$  with  $\text{H}_2$  +  $\text{Ni}$  in aq. alk. at ord. temp. see (76)). —  $\bar{\text{C}}$  on electrolytic reduction in alc.  $\text{H}_2\text{SO}_4$  yields (77) *o*-chlorobenzyl alc. [Beil. VI-444, VI<sub>1</sub>-(222)], ndls. from aq. alc., m.p. 72° (77)]

$\bar{\text{C}}$  behaves normally as a monobasic acid: e.g.,  $\bar{\text{C}}$  on titration with standard dil. aq. alk. gives Neut. Eq. 150.5; ionization const. at 25° is  $13.2 \times 10^{-4}$  (78) (79) cf. (80) (81) (21) (1). — [For study of acid strength of  $\bar{\text{C}}$  in various alcohols (82) (83) (84) (5) (85) (86) (22) or in acetonitrile (87) see indic. refs. — For solubility of  $\bar{\text{C}}$  in aq. solns. of various salts incl.  $\text{Na}\bar{\text{A}}$  see (28) (21). — For sepn. of  $\bar{\text{C}}$  from *p*-chlorobenzoic acid (3:4940) by use of difference in their acidic strength see (88) — For use of  $\bar{\text{C}}$  as standard in alkalimetry (89) and in iodimetry (90) see indic. refs.]

Salts of inorg. bases. [ $\text{NH}_4\bar{\text{A}}$  (91) (92) (note that this salt with benzotrichloride (3:6880) in pres. of suitable cat. yields (93) *o*-chlorobenzonitrile). — Hydroxylamine salt: m.p. 104.5° (94). —  $\text{Na}\bar{\text{A}}$  (use as preservative) (46). —  $\text{K}\bar{\text{A}} \cdot \frac{1}{2}\text{H}_2\text{O}$  (91) (forms liq. cryst. on fusion (95)). —  $\text{Ag}\bar{\text{A}}$ , scales from boilg. aq. (25) (100) (note that this salt with  $\text{I}_2$  in  $\text{C}_6\text{H}_6$  under reflux does not (96) yield phenyl *o*-chlorobenzoate, m.p. 37°, and thus differs from corresp. salt of *m*-chlorobenzoic acid (3:4392)) —  $\text{Ca}\bar{\text{A}}_2 \cdot \text{H}_2\text{O}$  (26) (97), much more sol. aq. than corresp. salts of *m*-chlorobenzoic acid (3:4392) or *p*-chlorobenzoic acid (3:4940) (97); insol. either cold or hot alc. (98); on dry distn. gives (18% yield (99)) xanthone (1:7275), m.p. 174° —  $\text{Ba}\bar{\text{A}}_2 \cdot 3\text{H}_2\text{O}$  from spont. evapn. of aq. soln. (98) (9). —  $\text{Ba}\bar{\text{A}}_2$  from hot conc. aq. soln. (25) (26) (use in sepn. of  $\bar{\text{C}}$  from isomers (40)); spar. sol. aq. (100). — Note that  $\text{Pb}\bar{\text{A}}_2$  (25) (100) and  $\text{Cu}\bar{\text{A}}_2$  (25) (100) are spar. sol. aq., while salts of  $\text{Ca}$ ,  $\text{Sr}$ ,  $\text{Mg}$ ,  $\text{Zn}$ ,  $\text{Fe}$ ,  $\text{Mn}$ ,  $\text{Co}$ ,  $\text{Ni}$ , and  $\text{Cd}$  are sol. (100). — For sepn. of  $\bar{\text{C}}$  from  $\text{BzOH}$  (1:0715) by use of  $\text{Cu}$  salts see (6)]

Salts of organic bases.  $\bar{\text{C}}$  with equiv. nmt. benzylamine in boilg.  $\text{EtOAc}$  followed by evapn. of solvent yields (101) benzylammonium *o*-chlorobenzoate, m.p. 148.4–149.4° u.c., 150.5–151.5° cor., Neut. Eq. 263.6 (note that the m.p. of this salt is but very slightly dif. from that of corresp. salt of *m*-chlorobenzoic acid (3:4392)). —  $\bar{\text{C}}$  similarly treated with  $\alpha$ -phenylethylamine yields (101)  $\alpha$ -phenylethylammonium *o*-chlorobenzoate, m.p. 128.4–129.4° u.c., 130.9–131.9° cor., Neut. Eq. 277.6 (note that m.p. of this salt, although better separated from those of the isomeric acids than the preceding case, is very close to those of the corresp. salts of *m*-methoxybenzoic acid, *p*-methoxybenzoic acid, and *o*-nitrobenzoic acid).

$\bar{C}$  (1 mole) in alc. mixed with codeine (1 mole), m.p. 155°, htd. several minutes, solvent evapd. and resulting sirup recrystd. from aq. yields (102) codeine *o*-chlorobenzoate,  $C_{15}H_{21}O_3N \cdot \bar{C}$ , m.p. 134° on "Maquenne block"; note that this value although close to that of corresp. prod. from *o*-bromobenzoic acid is widely different from that of corresp. salts of either *m*-chlorobenzoic acid (3:4392) or *p*-chlorobenzoic acid (3:4940) which are 96° and 162° respectively. —  $\bar{C}$  (1 mole) in alc. (or  $CHCl_3$ ) with strychnine (1 mole) in alc., boiled for a few minutes, then cooled, yields (103) strychnine *o*-chlorobenzoate,  $C_{21}H_{27}O_2N_2 \cdot \bar{C}$ , m.p. 170° u.c. on "Maquenne block"; note that this melting point is somewhat lower than that (185°) for the corresp. salt of *m*-chlorobenzoic acid (3:4392) and widely different from that (251°) of the corresp. salt of *p*-chlorobenzoic acid (3:4940).

[For optical data on cinchonine salt see (104); for salt (m.p. 108–110°) with phenylmercuric hydroxide see (105).]

$\bar{C}$  with alcohols gives by conventional processes the corresp. esters; for details on methyl *o*-chlorobenzoate (3:6695) and ethyl *o*-chlorobenzoate (3:6800) see these compds. — [For study of rate of esterification of  $\bar{C}$  with MeOH (106) (111) (17) (112), with EtOH (2) (17) (113), or with cyclohexanol (1:6415) (107) see indic. refs.]

$\bar{C}$  with  $P_2O_5$  in toluene boiled for 4 hrs. (108), or  $\bar{C}$  (109) or its sodium salt (110) refluxed with oxalyl (di)chloride (3:5060) in  $C_6H_6$ , yields *o*-chlorobenzoic acid anhydride, nlds. from lt. pet. (108) or nlc. (109), m.p. 79.6° (108), 78–79° (109); note that  $\bar{C}$  (2 moles) with oxalyl (di)bromide refluxed in  $C_6H_6$  similarly gives good yields (110) of the above anhydride, but that NaA with oxalyl (di)bromide can also be used (110) to give *o*-chlorobenzoyl bromide, h.p. 143–145° at 37 mm. (110).

$\bar{C}$  with  $PCl_5$  (114) (45) (115), or with  $PCl_5 + ZnCl_2$  (114), or with  $SOCl_2$  (114) (45) (116) (117), or with  $SOCl_2 +$  pyridine (118), or with *o*-chlorobenzotrichloride (3:6880) +  $ZnCl_2$  (119) yields *o*-chlorobenzoyl chloride (3:6640) q.v. for data on yields.

$\bar{C}$  with KOH or NaOH on fusion (128) (27) (25), or  $\bar{C}$  with aq. piperidine in pres. of Cu powder in s.t. at 160° for 4 hrs. (121), or  $\bar{C}$  with aq. piperidine +  $Na_2CO_3$  + amyl alc. + Cu powder refluxed 6 hrs. (124), or  $\bar{C}$  (as  $K\bar{A}$ ) with aq. NaOAc +  $Cu(OAc)_2$  in s.t. at 140–150° for 9–10 hrs. (126), or  $\bar{C}$  with aq.  $Ca(OH)_2$  + Cu cpds. at 160–170° under press. (122) gives (83% yield (126)) *o*-hydroxybenzoic acid (salicylic acid) (1:0780), accompanied in some cases (120) by substantial amounts of *m*-hydroxybenzoic acid (1:0825). — For use of alk. fusion as means of detect. of  $\bar{C}$  in wine see (123). — Note that  $\bar{C}$  with aq. KOH (even in pres. of copper) (124), or  $\bar{C}$  with aq.  $Ba(OH)_2$  in s.t. at 190–200° (125), does not yield salicylic acid or any chloride ion.

Reaction of  $\bar{C}$  with phenols.  $\bar{C}$  on suitable treatment condenses with phenols yielding *o*-aryloxybenzoic acids: e.g.,  $\bar{C}$  (as  $K\bar{A}$ ) with Na phenolate and Cu powder at 180–190° for 5 min. (127) (128), or  $\bar{C}$  (as  $K\bar{A}$ ) with phenol + Cu powder or Cu salts (129) (130), or  $\bar{C}$  (as  $K\bar{A}$ ) with anhydrous KOAc/NaOAc + Cu powder at 245–255° for 5 hrs. (126) gives (90% yield (127)) *o*-phenoxybenzoic acid [Beil. X-65,  $X_1$ -(28)], lfts. from dil. alc., m.p. 113°; note that this prod. with conc.  $H_2SO_4$  on gentle warming loses  $H_2O$  and ring-closes in quant. yield (131) to xanthone (1:7275), m.p. 174°. — [For analogous condensations of  $\bar{C}$  with *o*-cresol (1:1400) (127) (128) (60), *m*-cresol (1:1730) (127), *p*-cresol (1:1410) (127) (128),  $\alpha$ -naphthol (1:1500) (132),  $\beta$ -naphthol (1:1540) (127) (128), *o*-chlorophenol (3:5980) (133), *m*-chlorophenol (3:0255) (133), *p*-chlorophenol (3:0495) (133), *m*-nitrophenol (133), *p*-nitrophenol (133), including conv. to the corresp. xanthenes, see indic. refs.; many other analogous cases are known but cannot be included here.

Reaction of  $\bar{C}$  with amines.  $\bar{C}$  (or its salts) with primary or secondary aliphatic or aromatic amines in the pres. of  $K_2CO_3$  and Cu powder on htg. condenses with elimination of HCl (or its equivalent) to yield products of type *o*-HOOC- $C_6H_4$ -NHR; these products by ring closure through elimination of water yield in turn the corresponding acridones; the

reaction has been executed for countless cases of which only a few of the more important examples can be cited here; for the most comprehensive single survey see (134).

$\bar{C}$  (as  $K\bar{A}$ ) htd. with aq. aniline + Cu powder (134) (135), Cu salts (135), or  $\bar{C}$  htd. with aniline + Cu powder (136) or Cr powder (137), or  $\bar{C}$  htd. with aniline + anhydrous  $K_2CO_3$  + CuO (134) (38) gives (yields: 97% (134), 82-93% (38), 87% (137)) *N*-phenylanthranilic acid (diphenylamine- $\alpha$ -carboxylic acid) [Beil XIV-327, XIV<sub>1</sub>-(533)], cryst. from alc., m.p. 182-183° rap. htg (38); this prod. with conc.  $H_2SO_4$  at 100° loses aq. and ring-closes (yields 91-96% (33)) (138) (139) to acridone [Beil XXI-335, XXI<sub>1</sub>-(312)], sublimable yel. ndls., m.p. 354° cor.

[For details on analogous reaction of  $\bar{C}$  with  $\alpha$ -toluidine (134) (135) (136) (140), *m*-toluidine (134) (141), *p*-toluidine (134) (135),  $\alpha$ -naphthylamine (134) (135),  $\beta$ -naphthylamine (134) (135),  $\alpha$ -aminophenol (134),  $\alpha$ -anisidine (134), *m*-anisidine (134) (141), *p*-anisidine (142),  $\alpha$ -aminobenzoic acid (134), *m*-aminobenzoic acid (134), *p*-aminobenzoic acid (134), *p*-phenylenediamine (134), *p*-aminodimethylaniline (124), see indie. refs.; scores of other examples cannot be cited here.]

Substitution of nucleus of  $\bar{C}$ . — [ $\bar{C}$  in fuming  $H_2SO_4$  or chlorosulfonic acid + a little sulfur treated with  $Br_2$  (1 mole) at 60-70° gives (70-75% yield (143)) 5-bromo-2-chlorobenzoic acid [Beil IX-355], ndls., m.p. 165-167° (143).]

$\bar{C}$  on mononitration under various conditions, e.g.,  $\bar{C}$  (2 wt. pts) dislvd. in conc.  $H_2SO_4$  (15 wt. pts) and treated below 50° with a mixt. of  $HNO_3$  ( $D = 1.5$ ) (1 wt. pt.) in conc.  $H_2SO_4$  (2.5 wt. pts) (144) gives mainly (yields: 78.5% (144), 85% (145), 32-38% (146)) (147) (148) (14) (149) 2-chloro-5-nitrobenzoic acid [Beil IX-403], ndls. from aq., m.p. 165° (149) (14) (172), 164-165° (144) (145), 164° (146) (148), accompanied by a small amt. 2-chloro-3-nitrobenzoic acid [Beil IX-402], m.p. 185° (148), 181° (150). — [Note that both the other nitro-2-chlorobenzoic acids are known, viz., 2-chloro-4-nitrobenzoic acid [Beil IX-404], ndls. from aq., m.p. 140° (151), 139-140° (152), and 2-chloro-6-nitrobenzoic acid, m.p. 161° (151), but are prepd. by other methods.]

$\bar{C}$  on direct dinitration, e.g., with conc.  $H_2SO_4$  +  $KNO_3$  at 100° (153) (154) or at 130° (155) or  $\bar{C}$  with conc.  $H_2SO_4$  + fuming  $HNO_3$  at 130-140° (156), gives (94% yield (155)) 2-chloro-3,5-dinitrobenzoic acid [Beil IX-415], ndls. from aq., m.p. 199-200° (153) (154), 199° (156), 193.5° cor. (155) (for use of this prod. in detection of  $\bar{C}$  see (180)); this prod. is also obtd. by further nitration of 2-chloro-3-nitrobenzoic acid (above) with conc.  $H_2SO_4$  +  $KNO_3$  at 170° (157). — [Note that of the 5 other isomeric dinitro-2-chlorobenzoic acids which are possible only one is known, viz., 2-chloro-4,5-dinitrobenzoic acid, m.p. 165° cor. (158), obtd. from 2-chloro-4-nitrobenzoic acid (above) by further nitration with fuming  $HNO_3$  + conc.  $H_2SO_4$  (80% yield (158)).]

— Methyl *o*-chlorobenzoate: oil, b.p. 234°. (See 3:6695.)

— Ethyl *o*-chlorobenzoate: oil, b.p. 243°. (See 3:6800.)

① *p*-Nitrobenzyl *o*-chlorobenzoate: m.p. 106° (159). [From  $\bar{C}$  (as  $Na\bar{A}$ ) with *p*-nitrobenzyl bromide (m.p. 99°) in boilg. dil. alc. (159); note that the m.p. of this ester is almost identical with that (107°) of the corresp. prod. from *m*-chlorobenzoic acid (3:4392).]

② Phenacyl *o*-chlorobenzoate: m.p. 85.5° (160), 83° (23). [From  $\bar{C}$  (as  $Na\bar{A}$ ) with phenacyl bromide (m.p. 50°) in boilg. alc. (97% yield (23)).] — [Note that the m.p. of this prod. is only slightly lower than that (87.6°) of the corresp. prod. similarly obtd. from *p*-chlorobenzoic acid (3:4940).]

— *p*-Chlorophenacyl *o*-chlorobenzoate: unreported.

③ *p*-Bromophenacyl *o*-chlorobenzoate: m.p. 107.0° cor. (161), 106° (23) (162). [From  $\bar{C}$  (as  $Na\bar{A}$ ) with *p*-bromophenacyl bromide (m.p. 109°) in boilg. alc. (80% yield (23)).]

— *p*-Iodobenzenyl *o*-chlorobenzoate: unreported.

① *p*-Phenylphenacyl *o*-chlorobenzoate: m.p. 123° (163). [From  $\bar{O}$  (as Na $\bar{A}$ ) with *p*-phenylphenacyl bromide (m.p. 126°) in boilg. alc. (163).]

— *S*-Benzylthiuronium *o*-chlorobenzoate: unreported.

② *S*-(*p*-Chlorobenzyl)thiuronium *o*-chlorobenzoate: cryst. from dioxane, m.p. 159° cor. (164). [From  $\bar{C}$  (as Na $\bar{A}$  or K $\bar{A}$ ) in nq. with 1 equiv. of *S*-(*p*-chlorobenzyl)-thiuronium chloride, m.p. 197° (10% in nlc.) (164); note that the m.p. of this prod. is closely adjacent to that (m.p. 157° cor.) of the corresp. salt of *m*-chlorobenzoic acid (3:4392).]

③ *S*-(*p*-Bromobenzyl)thiuronium *o*-chlorobenzoate: m.p. 168° cor. (165). [From  $\bar{C}$  (as K $\bar{A}$  or Na $\bar{A}$ ) in nq. with 1 equiv. of *S*-(*p*-bromobenzyl)thiuronium bromide (m.p. 213°) in nlc. (165); note that m.p. of this prod. is only slightly higher than that (163° cor.) for the corresp. prod. from *p*-chlorobenzoic acid (3:4940).]

④ *o*-Chlorobenzamide: cryst. from alc. or alc./ether, m.p. 142.4° cor. (166), 142° (167), 141° (14), 140.5° (91), 139° (25). [From  $\bar{C}$  by refluxing with AcOH + (NH<sub>4</sub>)<sub>2</sub>CO<sub>3</sub> (37–39% yield (167)), from *o*-chlorobenzoyl chloride (3:6640) with conc. aq. NH<sub>4</sub>OH (166) (14) (01) (25), or from ethyl *o*-chlorobenzoate (3:6800) with conc. aq. NH<sub>4</sub>OH (25).] — [Note that *o*-chlorobenzamido on htg. with AlCl<sub>3</sub>.NaCl (large excess) gives (93% yield (168)) *o*-chlorobenzonitrile [Beil. IX-330], m.p. 43–44° (168), 42–43° (169), b.p. 232° (169).]

⑤ *o*-Chlorobenzhydrazide: ndls. from alc., m.p. 117–118° (170), 109–110° (171). [From ethyl *o*-chlorobenzoate (3:6800) q.v. with hydrazine hydrate (170) (171); for use as reagt. for identification of aldehydes and ketones see (170).]

— *N*-(*o*-Chlorobenzoyl) *N*-phenylhydrazide: unreported.

⑥ *o*-Chlorobenzanilide: ndls. from alc. or pet. ether; m.p. 114° (172) (173) (174), 117–118° (175) (176). — [From *o*-chlorobenzoyl chloride (3:6640) with excess aniline (25) (172) in pres. of a tertiary amine (80% yield (174)); also from oxime of *o*-chlorobenzophenone (3:0715) by Beckmann rearr. (175) (173) (176).] — [Note that this prod. must not be confused with benz-*o*-chloroanilide, m.p. 99–100°.]

⑦ *o*-Chlorobenz-*p*-toluidide: cryst. from dil. alc., m.p. 131° (177). [From *o*-chlorobenzoyl chloride (3:6640) with *p*-toluidine (177).]

— *o*-Chlorobenz- $\alpha$ -naphthalide: unreported.

— *o*-Chlorobenz- $\beta$ -naphthalide: unreported.

3:4155 5,8-DICHLORONAPHTHOL-2

$C_{10}H_6OCl_2$

Beil. S.N. 538

M.P. 141-142° (1)

[For prepn. from 5,8-dichloro-2-aminonaphthalene by hgt. with dil.  $H_2SO_4$  for 8 hrs. at 195-205° under pressure see (1) (2).]

— 5,8-Dichloro-2-naphthyl methyl ether: m.p. 74° (2).

3:4155 (1) Soc. Chem. Ind., Basel, Swiss 202,854, May 1, 1939; *Cent.* 1939, II 3196. (2) Goldstein, Viaud, *Helv. Chim. Acta*, 27, 883-888 (1944); C.A. 39, 926 (1945).

**3:4160 2,6-DICHLORO-3-HYDROXYBENZ-  
ALDEHYDE**

M.P. 142-142.2° (1)  
140.5° cor. (2) (3)  
140° (4)

Colorless cryst. from hot aq —  $\bar{C}$  has pronounced sternutatory properties and also attacks moist skin producing painful blisters. — [ $\bar{C}$  when mixed with 2-chloro-3-hydroxybenzaldehyde (3:4085), m.p. 139.5° (4), depresses m.p. to 116° (4)]

[For prepn. of  $\bar{C}$  from *m*-hydroxybenzaldehyde (1:0055) with  $Cl_2$  (2 moles) in AcOH soln. (yields: 51.5% (2) cf (3), 38% (4)) (1) (other prods. also being formed) see indic. refs; from 2-chloro-3-hydroxybenzaldehyde (3:4085) with  $Cl_2$  (1 mole) in AcOH see (4); from 6-chloro-3-hydroxybenzaldehyde (3:3350) with  $Cl_2$  (1 mole) in AcOH ( $\bar{C}$  is main prod (5) but 4,6-dichloro-3-hydroxybenzaldehyde (3:3952) is also formed (4) (5)) see indic. refs]

[For condens. of  $\bar{C}$  with *p*-chlorophenol (3:0475) and use of prod. as mothproofing agent see (6); for condens. of  $\bar{C}$  with 2,4-dihydroxybenzoic acid (1:0843) (7) or with *o*-cresotinic acid (2-hydroxy-3-methylbenzoic acid) (8) and use of products as dye intermediates see indic. refs]

$\bar{C}$  in 50% aq KOH at 60-70° first ppts. yel. K salt of  $\bar{C}$  which grad. dissolves and is replaced by a colorless cryst. ppt.; after atdg. 4 hrs. acidification with dil.  $H_2SO_4$  gives (93.8% yield (2)) 2,4-dichlorophenol (3:0560), m.p. 42° (2).

$\bar{C}$  in AcOH with  $Br_2$  gives (70% yield (3)) 4-bromo-2,6-dichloro-3-hydroxybenzaldehyde, cryst. from  $C_6H_6$  + lgr, m.p. 104-105° (3) (methyl ether, m.p. 82°, oxime, m.p. 193° cor. (3)).

$\bar{C}$  (1 pt.) in AcOH (4 pts) on nitration with 1 pt. conc.  $HNO_3$  ( $D = 1.42$ ) at 65° yields (4) 2,6-dichloro-3-hydroxy-4-nitrobenzaldehyde, bright yel. ndls. from AcOH or pl. from aq, m.p. 80° (4) (Ag salt, crimson ndls. from hot aq; oxime, deep yel. ndls. from dil. alc., m.p. 195°; *p*-nitrophenylhydrazone, deep red ndls. from hot AcOH, m.p. 279-280° dec.; semicarbazone, light-yel. lfts. from hot alc, m.p. 255-256° (4)).

$\bar{C}$  dislvd. in hot aq.  $NaHCO_3$  and treated with  $Me_2SO_4$  for 15 min. yields (4) (3) the corresp. methyl ether, viz., 2,6-dichloro-3-methoxybenzaldehyde, m.p. 103-104° (3), 102° (4) (*p*-nitrophenylhydrazone, old-gold ndls., m.p. 214-215° (4)); this methyl ether upon oxidn. with alk.  $KMnO_4$  gives (4) 2,6-dichloro-3-methoxybenzoic acid, ndls. from dil. alc, m.p. 149.5° (4).

① 2,6-Dichloro-3-hydroxybenzaldehyde oxime: ndls. from dil. alc., m.p. 174-175° (4).

② 2,6-Dichloro-3-hydroxybenzaldehyde *p*-nitrophenylhydrazone: deep or.-red. ndls., m.p. 205-206° (4).

(4)  
 Ⓢ (See also *cis*-1,2-dichloro-1,2-diphenylethylene (3:1380).)  
 alc.]

Ⓢ Colorless tbs. from alc;  $\bar{\text{C}}$  is much less sol. in alc. than its *cis* isomer (3:1380); 100 pts.  $\bar{\text{C}}$  alc. at  $24.4^\circ$  dis. 0.71 pt.  $\bar{\text{C}}$ , but soly. of  $\bar{\text{C}}$  is diminished by pres. of its stereoisomer (10). —  $\bar{\text{C}}$  (like its isomer) is very sol. ether.

Note that  $\bar{\text{C}}$  (the higher-melting tolane dichloride) has now been shown (4) to have the *trans* configuration, many earlier reports to the contrary notwithstanding.

Note also that  $\bar{\text{C}}$  with 1,1,2,2-tetrachloro-1,2-diphenylethane (tolane tetrachloride) (3:4496) gives an isomorphous mixt. (2), formerly erroneously regarded as an individual cpd. designated as "ditolane hexachloride."

### PREPARATION OF $\bar{\text{C}}$

Note that in all processes (below) for prepn. of  $\bar{\text{C}}$  more or less of the lower-melting (*cis*) stereoisomer is always formed.

## FROM DINUCLEAR INITIAL MATERIALS

From diphenylacetylene (tolane). [For prepn. of  $\bar{C}$  from tolane [Beil. V-656, V<sub>1</sub>-(319), V<sub>2</sub>-(568)] with Cl<sub>2</sub> in CHCl<sub>3</sub> see (7).]

From trans-1,2-diphenylethylene (stilbene). [For prepn. of  $\bar{C}$  from stilbene (1:7250) with PCl<sub>5</sub> (2 moles) in POCl<sub>3</sub> at 170° see (12).]

From 1,1,2,2-tetrachloro-1,2-diphenylethane (tolane tetrachloride). [For prepn. of  $\bar{C}$  from tolane tetrachloride (3:4496) by removal of two adjacent chlorine atoms by use of Zn dust in EtOH (1) (6) (7) (10), Zn dust in AmOH (6), Fe powder in boilg. AcOH (14) (6) (note that in this method ratio of  $\bar{C}$  to lower m.p. stereomer is 1:5 (6)), or by use of excess conc. (2 N) MeMgCl (11), or with H<sub>2</sub> + hydrazine hydrate in MeOH/KOH at b.p. for 1½ hrs. (3) see indic. refs.]

From benzoin. [For formn. of  $\bar{C}$  from benzoin (1:5210) with PCl<sub>5</sub> at 0° (much benzoyl-phenyl-dichloromethane ("chlorohenzil") [Beil. VII-436, VII<sub>1</sub>-(234)] also being formed) see (20).]

## FROM MONONUCLEAR INITIAL MATERIALS

From henzotrichloride. [For prepn. of  $\bar{C}$  from henzotrichloride (3:6540) with Cu powder (yield of total mixed stereoisomers 68% (15), 23 5% (16) (17)), by action of excess conc. (2 N) MeMgCl (yield total mixed stereoisomers 22% (11)), by action of hydrazine hydrate + Pd in MeOH/KOH (35% yield (3)), or for formn. of  $\bar{C}$  (together with other products) by pyrolysis over hot Pt (18) see indic. refs.]

From benzal (di)chloride. [For formn. of  $\bar{C}$  (together with other prods.) from benzal (di)chloride (3:6327) by pyrolysis over hot Pt see (18).]

## FROM MISCELLANEOUS SOURCES

[For formn. of  $\bar{C}$  from CnC<sub>2</sub> with satd. soln. of Cl<sub>2</sub> in C<sub>6</sub>H<sub>6</sub> see (13); from benzoyl-pbenyl-diazomethane (azibenzil) [Beil. VII<sub>1</sub>-(395), XXIV-208] with oxalyl (di)chloride (3:5060) in C<sub>6</sub>H<sub>6</sub> (38.5% yield  $\bar{C}$ ) see (9); from 1,1,2-trichloro-1,2-diphenylethanes [Beil. V-601] by elimination of HCl with alc. KOH see (19); for formn. of  $\bar{C}$  from its lower-melting stereoisomer (3:1380) by distn. (about 32% conversion to  $\bar{C}$  (10)) (12) (6) see indic. refs.]

CHEMICAL BEHAVIOR OF  $\bar{C}$ 

$\bar{C}$  on htg is partially transformed (6) (12) to the lower-melting isomer (3:1380); on distn. conversion is about 68% (10).

Reduction of  $\bar{C}$ .  $\bar{C}$  with conc. H<sub>2</sub> and red P in s.t. at 170° for 20 hrs. gives (16) (20) bibenzyl (1:7149), m.p. 52°.

Elimination of 2 chlorine atoms.  $\bar{C}$  with Na/Hg in alc. (1) (16), or  $\bar{C}$  with Zn dust in boilg. alc. (7) (10), or  $\bar{C}$  with alc. KOH in s.t. at 180° (12) gives diphenylacetylene (tolane) [Beil. V-656, V<sub>1</sub>-(319), V<sub>2</sub>-(568)], m.p. 60°.

Addn. of halogens.  $\bar{C}$  with Cl<sub>2</sub> in C<sub>6</sub>H<sub>6</sub> soln. yields (13) 1,1,2,2-tetrachloro-1,2-diphenylethane (tolane tetrachloride) (3:4496). —  $\bar{C}$  does not (12) add Br<sub>2</sub>, and the expected prod. 1,2-dibromo-1,2-dichloro-1,2-diphenylethane is unreported from any other source.

Nitration of  $\bar{C}$ . The nitration of  $\bar{C}$  has never been studied, and neither mono nor dinitro derivs. are reported from any other source.

142-143°	(13) (22)	

Colorless lfts. from alc; eas. sol. ether, acetone, AcOH,  $CHCl_3$ ,  $CS_2$  — [For f.p./compn. data on systems  $\bar{C}$  + benzophenone (1:5150) and  $\bar{C}$  + diphenylamine see (12).]

[For prepn. of  $\bar{C}$  from *p*-chlorobenzoic acid (3:4940) + chlorobenzene (3:7903) +  $AlCl_3$  (82% yield (1)) or from *p*-chlorobenzoyl chloride (3:6550) + chlorobenzene (3:7903) +  $AlCl_3$  in  $CS_2$  in direct sunlight (yields: 90% (17), 75-80% (2), 36% (9)) (37) (some isomeric 2,4'-dichlorobenzophenone (3:1565) also being formed) see indic. refs.; from chlorobenzene (3:7903) +  $AlCl_3$  +  $CO_2$  at 80-150° and 10 atm. press. (*p*-chlorobenzoic acid is main prod.) see (18); from *p*-chlorophenyl  $MgCl$  +  $CO_2$  (together with *p*-chlorobenzoic acid) see (8).]

[For prepn. of  $\bar{C}$  from dichloro-*bis*-(*p*-chlorophenyl)methane (4,4'-dichlorobenzophenone

dichloride) (see below) by hydrolysis with boilg. dil. alc. (14) or conc.  $\text{H}_2\text{SO}_4$  (14) (15) (6) (19) see indic. refs.; from tetra-(*p*-chlorophenyl)ethylene glycol (see below) on fusioo or oo boilg. with AcOH see (20); from 4,4'-dibromobenzophenoone with  $\text{PCl}_5$  at  $150^\circ$  see (21); from 4,4'-dichloro-3-nitrobenzophenoone (see below) via reduction to amioe, diazotizatioo, and treatmeot with  $\text{SOCl}_2 + \text{NaOH}$  see (21).]

[For formn. of  $\bar{\text{C}}$  by oxidation with  $\text{CrO}_3/\text{AcOH}$  of 4,4'-dichlorobenzilic acid (2), of bis-(*p*-chlorophenyl)metbone (7), of tris-(*p*-chlorophenyl)methane (16), of 1,1,4,4-tetra-(*p*-chlorophenyl)butyne-2 (91% yield (4)), or of 1,1,4,4-tetra-(*p*-chlorophenyl)butatriene-1,2,3 (94% yield (5)) see indic. refs.; from oxido. of  $\beta,\beta$ -di-(*p*-chlorophenyl)ethanol with aq.  $\text{KMnO}_4$  see (10); from (*p,p'*-dichlorobenzohydril)pinacolooe . . . . . (p-chlorophenyl)propioophenone by oxidn. with aq.  $\text{KMnO}_4$  in NaOH + pyridine soln. see (13); from bis-(*p*-chlorophenyl)methyleneacetophenoone with  $\text{KMnO}_4$  in acetone (71% yield) see (3).]

[For formn. of  $\bar{\text{C}}$  from 1,1-di-(*p*-chlorophenyl)ethane (3:0995) (39), from 1-chloro-2,2-bis-(*p*-chlorophenyl)ethylene (3:1430) (81% yield (40)), or from 1,1-dichloro-2,2-bis-(*p*-chlorophenyl)ethylene (3:2438) (40), all by oxidn. with  $\text{CrO}_3/\text{AcOH}$ , see indic. refs.]

[ $\bar{\text{C}}$  on reduction with 3% Na/Hg in 90% alc. (20), with Al/Hg in 80% alc. (6) (11), with Zn dust + AcOH on boilg. (20), with Zn dust + alc. KOH (20) or NaOH (23), or simply with boilg. alc. KOH (24) gives (yields: 100% (23), 96% (6) (11)) di-(*p*-chlorophenyl)carbinol (4,4'-dichlorobenzhydrol) [Beil. VI-680, VI<sub>1</sub>-(327)], cryst. from alc., m.p.  $04^\circ$  (20),  $03^\circ$  (24),  $91.5^\circ$  (23),  $89-90^\circ$  (6) (11) (corresp. 3,5-dinitrobenzoate, m.p.  $174-176^\circ$  (41)); note that in some cases this main prod. is accompaied by tetra-(*p*-chlorophenyl)ethylene glycol (see below). —  $\bar{\text{C}}$  on reduction with Zn dust + AcOH + dil.  $\text{H}_2\text{SO}_4$  (25), or in alc. in bright sunlight for 5 days (20) cf. (26), gives (85% yield (20)) tetra-(*p*-chlorophenyl)ethylene glycol [Beil. VI-1058, VI<sub>1</sub>-(523)], m.p.  $180^\circ$  (6) (11),  $175^\circ$  (20) (accompanied by smaller amts. of other prods.).]

[ $\bar{\text{C}}$  with sodium phenylacetylene in dry ether gives (57% yield (3)) bis-(*p*-chlorophenyl)-ethynyl-carbiol, m.p.  $163-164^\circ$  (3);  $\bar{\text{C}}$  with diphenylmethyl sodium gives (27) bis-(*p*-chlorophenyl)-diphenylmethyl-carbinol, m.p.  $183-184^\circ$  (27);  $\bar{\text{C}}$  with  $\text{MeMgI}$  in dry ether gives (39) (19) not only some bis-(*p*-chlorophenyl)-methyl-carbinol, m.p.  $67.0-68.5^\circ$  (39), but also (68% yield (19)), by loss of  $\text{H}_2\text{O}$ , unsym.-di-(*p*-chlorophenyl)ethylene, m.p.  $91^\circ$  (3:2475);  $\bar{\text{C}}$  with  $\beta$ -(diphenylvinyl)MgBr gives (12% yield (28)) 1,1-di-(*p*-chlorophenyl)-3,3-diphenylpropen-2-ol-1, m.p.  $85^\circ$ , which on btg. at  $130-150^\circ$  loses  $\text{H}_2\text{O}$  yieldiog 1,1-di-(*p*-chlorophenyl)-3,3-diphenylpropadiene-1,2, m.p.  $93-95^\circ$  (28);  $\bar{\text{C}}$  with ethyl bromoacetate + Zn in  $\text{C}_6\text{H}_6$  gives (30% yield (28)) ethyl  $\beta,\beta$ -di-(*p*-chlorophenyl)- $\beta$ -hydroxypropionate, m.p.  $102^\circ$  (28).]

[ $\bar{\text{C}}$  with  $\text{PCl}_5$  nt  $150^\circ$  gives (17) (15) (29) dichloro-di-(*p*-chlorophenyl)metbane (4,4'-dichlorobenzophenoone dichloride), m.p.  $52-53^\circ$  (15),  $52.5^\circ$  (17).]

[ $\bar{\text{C}}$  oo fusioo with NaOH yields (7) chlorobenzene (3:7903) + *p*-chlorobenzoic acid (3:4940). —  $\bar{\text{C}}$  with 10% aq. NaOH in pres. of Cu 5 hrs. at  $190^\circ$  uoder press. yields (30) 4,4'-dihydroxybenzophenoone [Beil. VIII-317, VIII<sub>1</sub>-(641)], m.p.  $214^\circ$  (30).]

[ $\bar{\text{C}}$  with hydrazine hydrate in isopropyl alc. in s.t. at  $150-160^\circ$  for 7 hrs. gives (56% yield (42)) 4,4'-dichlorobenzophenoone hydrazone, m.p.  $91-93^\circ$ , which on Wolff-Kishner reduction gives (21% yield (42)) 4,4'-dichlorodiphenylmethane (3:1057).]

[ $\bar{\text{C}}$  with aq.  $\text{NH}_4\text{OH}$  in pres. of CuO +  $\text{NH}_4\text{NO}_3$  +  $\text{KClO}_3$  under press. at  $180^\circ$  (1) ef. (31) gives (92% yield (1)) 4,4'-diaminobenzophenoone [Beil. XIV-88, XIV<sub>1</sub>-(391)], m.p.  $245-246^\circ$  (1),  $242.5^\circ$  (31); some half reactn. prod., viz., 4-amino-4'-chlorobenzophenoone, m.p.  $185^\circ$  (1), is also formed. — For similar reactn. of  $\bar{\text{C}}$  with diethylamine leadiog to 4-chloro-4'-diethylaminobenzophenoone see (32). — For reactn. of  $\bar{\text{C}}$  with *N*-methyl- $\alpha$ -

phenylindole and use in prepn. of dyes see {33}; with ethylhutyl-*m*-toluidine see {34}; with aminoanthraquinone derivs. see {35} {36}.]

[ $\bar{C}$  on nitration with 10 wt. pts. fuming  $\text{HNO}_3$  ( $D = 1.47$ ) in cold {37} or with 5 pts. abs.  $\text{HNO}_3$  at  $0^\circ$  {2} gives (81% yield {37}) 4,4'-dichloro-3,3'-dinitrobenzophenone, cryst. from AcOH, m.p.  $132.5^\circ$  {2},  $132-133^\circ$  {38},  $120^\circ$  {37};  $\bar{C}$  on trinitration at  $130^\circ$  with 1.8 wt. pts. conc.  $\text{H}_2\text{SO}_4$  contg. 2 pts.  $\text{KNO}_3$  gives {37} 4,4'-dichloro-3,3',5-trinitrobenzophenone, cryst. from AcOH, m.p.  $140^\circ$  {37};  $\bar{C}$  on tetranitration with 10 pts. fuming  $\text{H}_2\text{SO}_4$  + 1 pt.  $\text{KNO}_3$  at  $150^\circ$  gives {37} 4,4'-dichloro-3,3',5,5'-tetranitrobenzophenone, cryst. from AcOH, m.p.  $202^\circ$  {37}.] [A mono-nitrated  $\bar{C}$ , viz., 4,4'-dichloro-3-nitrobenzophenone, ndls. from alc., m.p.  $87^\circ$  {2},  $88-89^\circ$  {38} has been obt'd. indirectly.]

④ 4,4'-Dichlorobenzophenone oxime: ndls. from alc., m.p.  $136-136.5^\circ$  {1},  $136^\circ$  {7},  $135^\circ$  {8} {9},  $134^\circ$  {5}. [From  $\bar{C}$  with excess  $\text{NH}_2\text{OH}$  in alc. at  $100^\circ$  {9}] [This prod. by Beckmann rearr. with conc.  $\text{H}_2\text{SO}_4$  yields *p*-chlorobenz-*p*-chloroanilide, m.p.  $213-213.5^\circ$  {1}.]

— 4,4'-Dichlorobenzophenone phenylhydrazone: not reported.

— 4,4'-Dichlorobenzophenone *p*-nitrophenylhydrazone: not reported.

— 4,4'-Dichlorobenzophenone 2,4-dinitrophenylhydrazone: m.p.  $238-240^\circ$  {40}.

3:4280 2-CHLORO-4-HYDROXYBENZ-  
ALDEHYDE $C_7H_5O_2Cl$  Beil. VIII - 81  
VIII<sub>1</sub>—

M.P. 147-148° (1)

146.5° (2)

Colorless ndls. from AcOH (1) or aq. (2). — Volatile with steam but much less so than the isomeric 4-chloro-2-hydroxybenzaldehyde (3:0960) (1).

[For prepn. of  $\bar{C}$  from *m*-chlorophenol (3:0255) via Reimer-Tiemann reactn. see (1); via anhyd. HCN +  $AlCl_3$  +  $C_6H_6$  (50% yield) see (2); for prepn. (alm. 100% yield (1)) from 2-chloro-4-nitrotoluene via 2-chloro-4-aminotoluene and subsequent diazo reactn. see (1).]

$\bar{C}$  does not reduce  $NH_4OH/AgNO_3$  or Fehling soln. (1).

$\bar{C}$  with aq.  $FeCl_3$  gives only a slight ppt. [dif. from 4-chloro-2-hydroxybenzaldehyde (3:0960)]; the copper and chromium salts are lighter green in color than those from that isomer (1).

$\bar{C}$  on mononitration as specified (3) yields 5-nitro-2-chloro-4-hydroxybenzaldehyde, vol. with steam, colorless ndls. from alc., m.p. 125° (3). [This product yields a phenylhydrazone, silky dark purple ndls. from alc., m.p. 166° sl. dec.; a *p*-nitrophenylhydrazone, deep or. ndls. from AcOH, m.p. 266° dec.; and a semicarbazone, light or. ndls. from dil. AcOH, m.p. 266° dec. (3).]

$\bar{C}$  on dinitration as specified (3) yields 3,5-dinitro-2-chloro-4-hydroxybenzaldehyde, not volatile with steam, pale yel. massive pr. from aq., m.p. 93° (3). [This product yields a phenylhydrazone, br.-purple ndls. from alc., m.p. 210° dec.; a *p*-nitrophenylhydrazone, red-br. ndls. from dil. AcOH, m.p. 267° dec.; and a semicarbazone, lt. br. ndls. from dil. AcOH, m.p. 192° dec. (3).]

② 2-Chloro-4-hydroxybenzaldehyde: cryst. from alc., m.p. 194° (2).

— 2-Chloro-4-hydroxybenzaldehyde phenylhydrazone: unrecorded.

③ 2-Chloro-4-hydroxybenzaldehyde *p*-nitrophenylhydrazone: dark red pl. from alc. or vermilion red cryst. from AcOH, m.p. 288° dec. (1).

— 2-Chloro-4-hydroxybenzaldehyde 2,4-dinitrophenylhydrazone: unrecorded.

④ 2-Chloro-4-hydroxybenzaldehyde semicarbazone: yel. cryst. from alc., m.p. 214° (1).

⑤ 2-Chloro-4-acetoxybenzaldehyde: colorless ndls. from dil. AcOH, m.p. 51.5° (1).

⑥ 2-Chloro-4-benzyoxybenzaldehyde: colorless ndls. from alc., m.p. 96.5° (1). [Note that this ⑥ does not give good distinction from isomeric 4-chloro-2-hydroxybenzaldehyde (3:0960) whose corresponding benzoate has m.p. 98.5° (1).]

3:4280 (1) Hodgson, Jenkinson, *J. Chem. Soc.* 1927, 1740-1742. (2) Gattermann, *Ann.* 357, 334 (1907). (3) Hodgson, Jenkinson, *J. Chem. Soc.* 1923, 2274-2275.

(15) (17)

Colorless cryst. from toluene + lt. pet. (2), from 50% AcOH (14), or from alc. (11).

[For prepn. of  $\bar{C}$  from 4,4'-diaminobiphenyl (benzidine) [Beil. XIII-214, XIII<sub>1</sub>-(58)] via tetrazotization and use of Cu powder (9), Cu<sub>2</sub>Cl<sub>2</sub> (3), or HgCl<sub>2</sub> complex (82% yield (10)), see indic. refs.; from biphenyl (1:7175) in AcOH with Cl<sub>2</sub> (41% yield (2)) (convenient for prepn. small amts  $\bar{C}$ ) see (2); from 4,4'-dinitrobiphenyl with SOCl<sub>2</sub> in s. t. for 10 hrs. at 200-210° see (7); from *p*-chloriodobenzene [Beil. V-221, V<sub>1</sub>-(119)] with Cu powder at 200-250° (82% yield) see (15).]

[For formn. of  $\bar{C}$  from chlorobenzene (3:7903) by pyrolysis see (16) (12) (for discussion of formn. during mfg. of phenol from chlorobenzene see (19)); from biphenyl (1:7175) with Cl<sub>2</sub> in pres. of SbCl<sub>5</sub> (17) or I<sub>2</sub> (13) see indic. refs.; from 4,4'-dihydroxybiphenyl (1:1640) with PCl<sub>5</sub> see (13); from 4,4'-dichlorobiphenyl-3,3'-dicarboxylic acid on htg. see (18); from 4,4'-dichloro-3,3'-diaminobiphenyl via tetrazotization and htg. with alc. see (14), from decompn. of bis-(*p*-chlorobenzoyl) peroxide on htg. see (6).]

[For manuf. of  $\bar{C}$  or mixts. of dichlorobiphenyls contg.  $\bar{C}$  from biphenyl with Cl<sub>2</sub> see (20) (21) (22) (23); for use as insecticide see (24) ]

$\bar{C}$  htd. under press. with conc. aq. NH<sub>4</sub>OH in pres. of Cu<sub>2</sub>Cl<sub>2</sub> and Ca(OH)<sub>2</sub> gives (99.5% yield (25)) 4,4'-diaminobiphenyl (benzidine);  $\bar{C}$  with aq. over Cu + silica gel at 525-600° gives (26) 4,4'-dihydroxybiphenyl (1:1640).]

$\bar{C}$  on mononitration in 15 pts. AcOH with 10 pts. HNO<sub>3</sub> (*D* = 1.46) nt 100° for ½ hr. (2), or in nitrobenzene soln. with HNO<sub>3</sub> (*D* = 1.52) as directed (2), gives alm. quant. yield of 4,4'-dichloro-2-nitrobiphenyl, cryst. from alc. or CCl<sub>4</sub>, m.p. 102° (2) (27). [This prod. does not react with piperidine (27) ]

$\bar{C}$  on dinitration by soln. in 7½ pts. HNO<sub>3</sub> (*D* = 1.52) in an ice bath gives (2) mixt. contg. 81.3% 4,4'-dichloro-2,3'-dinitrobiphenyl and 18.7% 4,4'-dichloro-2,2'-dinitrobiphenyl. By recryst. from AcOH 4,4'-dichloro-2,3'-dinitrobiphenyl is obtd. in ndls., m.p. 141-142° (2), 140° (28), which on warming with piperidine for a few seconds yields (28) 4-chloro-4'-piperidino-2,3'-dinitrobiphenyl, or. ndls. from alc., m.p. 132° (28) (note that the principal dinitration prod. of  $\bar{C}$  is the 2,3'-dinitro- $\bar{C}$  and not the 2,2'-isomer as formerly (29) supposed). — From the mother liq. of the above dinitration may be obtd. (2) the true 4,4'-dichloro-2,2'-dinitrobiphenyl, m.p. 138-139° (2); this does not react with piperidine.

$\bar{C}$  on trinitration with 10 pts. HNO<sub>3</sub> (*D* = 1.52) for 2 hrs. at 100° gives (2) (30) 4,4'-dichloro-2,3',5'-trinitrobiphenyl, ndls. from AcOH, m.p. 166-167° (2), 164-165° (30); this prod. warmed with piperidine gives 4-chloro-4'-piperidino-2,3',5'-trinitrobiphenyl, crimson pr. from AcOH, m.p. 182° (2).

$\bar{C}$  on oxida. with CrO<sub>3</sub> in AcOH yields (13) *p*-chlorobenzoic acid (3:4940), m.p. 237° (13).

## 3:4315 6,7-DICHLORONAPHTHOL-1

 $C_{10}H_6OCl_2$ 

Beil. VI-613

VI<sub>1</sub>—VI<sub>2</sub>—

M.P. 151° (1) (2)

149-150° (3)

Cryst. from  $CHCl_3$  (3).

[For prepn. from  $\beta$ -(3,4-dichlorobenzal)propionic ac. [Beil. IX-614] by distn. see (1) (2) (3);  $\bar{C}$  is sepd. from the smaller proportion of 7,8-dichloronaphthol-1 (3:2635) by the greater soly. of the latter in lgr. (3).]

$\bar{C}$  on oxidn. with  $K_2Cr_2O_7$  + dil.  $H_2SO_4$  yields (3) 4,5-dichlorophthalic ac. (3:4890), which during m.p. detn. is converted to 4,5-dichlorophthalic anhydride (3:4830), m.p. 184-185° (3).

$\bar{C}$  in alk. soln. coupled with diazotized naphthionic acid (1-aminonaphthalenesulfonic acid-4) gives a deep red-bluish color which upon acidification becomes dark yellow (3). [Dif. from 7,8-dichloronaphthol-1 (3:2635) q.v.]

Ⓔ 6,7-Dichloro-1-naphthyl acetate: ndls. from dil. alc., or compact pr. from  $CHCl_3$  lgr., m.p. 102-103° (3).

3:4315 (1) Armstrong, Wynne, *Chem. News* 71, 253 (1895). (2) Armstrong, Wynne, *Proc. Chem. Soc.* 11, 78-79 (1895); *Ber.* 29, Referate, 223-224 (1896). (3) Erdmann, Schwedten, *Ann.* 275, 286-288 (1893).

## 3:4325 3,3-DICHLORO-2,2-DIMETHYLBUTANE

 $C_6H_{12}Cl_2$ 

Beil. I - 150

I<sub>1</sub>—I<sub>2</sub>-(113)

M.P. 151-152° (1)

Colorless cryst. subliming readily even at ord. temp.

[For prepn. of  $\bar{C}$  from *ter*-butyl methyl ketone (pinacolone) (1:5425) with  $PCl_5$  at 0-5° (1) (2) (3) (4) (5) (6) (7) (9) see indic. refs. Note that  $\bar{C}$  (by loss of HCl) is always accompanied by more or less 3-chloro-2,2-dimethylbutene-3 (3:7340) and other prods.]

$\bar{C}$  on btg. with phenol + KOAc yields (8) 3-chloro-2,2-dimethylbutene-3 (3:7340).

$\bar{C}$  on btg. at 150-230° with powdered KOH (moistened with alc.) gives (65% yield (6)) (9) (2) *ter*-butylacetylene [Beil. I-256], b.p. 37.8° at 760 mm.,  $D_4^{20} = 0.6683$ ,  $n_D^{20} = 1.37257$  (3); note that use of NaOH instead of KOH gives by loss of 1 HCl only 3-chloro-2,2-dimethylbutene-3 (3:7340) and no *ter*-butylacetylene (9).

3:4325 (1) Bartlett, Rosen, *J. Am. Chem. Soc.* 64, 544 (1942). (2) Delacre, *Bull. soc. chim.* (3) 35, 343-344 (1906). (3) Favorskii, *J. Russ. Phys.-Chem. ## 3:4330 2-CHLORONAPHTHOIC ACID-1

 $C_{11}H_7O_2Cl$  Beil. IX-651  
IX<sub>1</sub>—

M.P. 152-153° (1)

151-152° (2)

151° (4)

Cryst. from  $C_6H_6$  (2). — Sol. in 1000 pts. aq. at 20° or in 126 pts. aq. at 100°; eas. sol. alc., ether (1).

[For prepn of  $\bar{C}$  from 2-hydroxynaphthoic acid-1 [Beil. X-328, X<sub>1</sub>-(144)] with  $PCl_5$  (3 moles) in s.t. at 180-190° for 8 hrs. followed by treatment with aq. see (1) (2); from 1-chloroformylnaphthyl-2-phosphonic acid dichloride [Beil. X-329] with  $PCl_5$  (2 moles) in s.t. at 180-190° followed by treatment with aq. see (1) (2); from 2-chloro-1-(chloromethyl)-naphthalene (4) by oxidn. with dil  $HNO_3$  for 15 days see (4).]

$\bar{C}$  in aq. susp. with 2% Na/Hg yields (1)  $\alpha$ -naphthoic acid (1:0785), m.p. 160° (1).

$\bar{C}$  does not esterify upon treatment in MeOH with HCl gas (3).

Salts:  $Ca\bar{A}_2 \cdot 2H_2O$ ; sol. in 150 pts. cold aq. or 75 pts. hot aq.; loses water of hydration completely at 180° (1).

⊗ Methyl 2-chloro-1-naphthoate: pr. from alc. + toluene, m.p. 50° (1) (2), b.p. 176-180° at 18.5 mm. (2). [From  $Ag\bar{A}$  with MeI in s.t. at 100° (1) or from  $\bar{C}$  with ethereal diazomethane (2).] [This ester is very resistant to hydrolysis (1) (2)]

— Ethyl 2-chloro-1-naphthoate: unreported.

— *p*-Bromophenacyl 2-chloro-1-naphthoate: unreported.

3:4330 (1) Rabe, *Ber.* 22, 394-396 (1889). (2) Bergmann, Hirschberg, *J. Chem. Soc.* 1936, 333-334. (3) Meyer, *Ber.* 23, 184 (1895). (4) Horn, Warren, *J. Chem. Soc.* 1916, 144.

## 3:4335 2,4,5-TRICHLOROPHENOXYACETIC ACID

 $C_8H_5O_3Cl_3$ 

Beil. S.N. 522

M.P. 153° (1)

Colorless cryst. from  $C_6H_6$ ; alm. insol. aq. — Neut. Eq. = 255.5.

[For prepn of  $\bar{C}$  from 2,4,5-trichlorophenol (3:1620) with chloroacetic acid (3:1370) in aq. NaOH (85% yield) see (1).]

[For use of  $\bar{C}$  as weed killer see (2); for general survey of activity of  $\bar{C}$  as plant hormone see (4) (5)]

[For prepn. of ethylene glycol bis-(2,4,5-trichlorophenoxyacetate), m.p. 140°, and its use as plasticizer see (3).]

Am. Soc. Hort. Sci. 50, 107-108 (1947), Can. J. 22, 4313 (1945).

## 3:4340 2,5-DICHLORO BENZOIC ACID

 $C_7H_4O_2Cl_2$ 

Beil. IX - 342

IX<sub>1</sub>-(141)

M.P. 155°	(1)	153°	(7) (8)	B.P. 301° (12)
154.5°	(2)	152°	(9)	
154.4°	(3)	151-152°	(10)	
154°	(4) (21)	150°	(11)	
153.5°	(5)	149-150°	(12)	
153.0-153.5°	(6)	147-148°	(13)	

Ndls. from aq. or dil. alc. — Somewhat volatile with steam. — Sol. in 1193 pts. aq. at 11° (12); in 1177 pts. at 14° (11).

[For prepn. of  $\bar{C}$  from 2,5-dichlorotoluene (3:6245) by hgt. with dil.  $HNO_3$  in s.t. at 140° (60% yield (4)) (5) (13) (2) (8) (7) or hgt. with  $KMnO_4$  (14) see indicated refs.; for prepn. of  $\bar{C}$  from 2,5-dichlorobenzaldehyde (3:1145) via Cannizzaro reactn. (84% yield (1)) see (1) (4); for prepn. (90-95% yield (9)) from 5-chloro-2-aminobenzoic acid via diazo reactn +  $CuCl$  see (9) (11); from 2,5-dichloroaniline via 2,5-dichlorobenzonitrile (m.p. 130°) and its hydrolysis with fung.  $HCl$  at 180° see (15); for prepn. of  $\bar{C}$  from benzoic acid +  $KClO_3$  +  $HCl$  see (12) (21); for still other misc. methods see Beil. IX-342, IX<sub>1</sub>-(141).]

For f.p./compn. data on mixtures of  $\bar{C}$  with *m*-chlorobenzoic acid, m.p. 154.4° (3:4392), and with 2,3-dichlorobenzoic acid, m.p. 154.4° (3:4650), see (2).

$\bar{C}$  on hgt. with 3 pts. conc.  $H_2SO_4$  + 2 pts. aq. loses  $CO_2$  at 220° yielding *p*-dichlorobenzene (3:0980) (5).

The direct nitration of  $\bar{C}$  is unrecorded. [However, 2,5-dichloro-3-nitrobenzoic acid, ndls. from  $AcOH$ , m.p. 220°, and 2,5-dichloro-6-nitrobenzoic acid [Beil. IX-404], m.p. 143-144°, have both been prepd. by oxidn. (16) of the corresp. aldehydes.]

$\bar{C}$  with  $PCl_5$  (17) or with  $SOCl_2$  (18) yields 2,5-dichlorobenzoyl chloride, h.p. 137° at 15 mm. (17), 95.3-95.5° at 1 mm. (18). [For formn. in chlorination of benzoyl chloride see (2)]

— Methyl 2,5-dichlorobenzoate: unrecorded.

— Ethyl 2,5-dichlorobenzoate: b.p. 271° cor. (12). [For study of hydrolysis see (20).]

④ 2,5-Dichlorobenzamide: woolly ndls. from aq., m.p. 155° (12).

⑤ 2,5-Dichlorobenzanilide: from 2,5-dichlorobenzoyl chloride (above) + aniline (11), pr. from  $C_6H_5$ , m.p. 240° (11).

⑥ 2,5-Dichlorobenz-3-nitroanilide: from 2,5-dichlorobenzoyl chloride (above) + *m*-nitroaniline (19), ndls. from aq.  $MeOH$ , m.p. 151-152° u.c. (19).

VII-361] on evapn. with hot 25%  $HNO_3$  see (4); from 1,6-dichloronaphthalene (3:0810) (13), 2,6-dichloronaphthalene (3:4040) (14) (6), 2,7-dichloronaphthalene (3:3445) (14), 6-chloronaphthol-2 (3:3500) (6), or 4-chloro-2-methylbenzoic acid (above) (12) on oxidn. with dil.  $HNO_3$  in s.t. as directed see indio. refs.; from the trichloride of 4-sulphthalic acid [Beil. XI-407] with  $PCl_5$  in s.t. at 220° followed by KOH hydrolysis of the 4-chlorophthalyl (di)chloride see (15); from 4-sulphthalic anhydride (16) by hgt. with  $HCl + NaClO_3$  see (16).]

$\bar{C}$  on hgt. above m.p. gives 4-chlorophthalic anhydride (3:2725).

[ $\bar{C}$  on fusion with KOH (11) or with NaOH at 165-175° (10) gives (100% yield (10)) 4-hydroxyphthalic acid [Beil. X-499, X<sub>1</sub>-(255)], m.p. 204-205°, with conv. to corresp. anhydride, m.p. 171° (note that this same prod. is also obt'd. from the isomeric 3-chlorophthalic acid (3:4820)).]

[ $\bar{C}$  htd. under press. nt 350° with aq. + cat. loses  $CO_2$  presumably yielding (17) *m*-chlorobenzoic acid (3:4392) and/or *p*-chlorobenzoic acid (3:4940).]

[ $\bar{C}$  with  $NH_3$  gas + cat. as directed (18) yields 4-chlorophthalonitrile, m.p. 130-132° (19).]

[For use of  $\bar{C}$  as softener for cellulose derivatives see (20); for reaction of  $\bar{C}$  with naphthalene +  $AlCl_3$  yielding intermediates for vat dyes see (21).]

$\bar{C}$  on hgt. with resorcinol + few drops conc.  $H_2SO_4$ , then dissolving in alk., gives fluorescein reactn. (2). —  $\bar{C}$  is unstable toward  $KMnO_4$  (2).

Salts.  $Ba\bar{A}$ ,  $Ca\bar{A}$ , dif. sol. aq.;  $Ba\bar{A} \cdot H_2\bar{A}$ , spar. sol. even in hot aq. (11) (for table of heavy metal salts see (22)).

Esters. Dimethyl 4-chlorophthalate; from  $Ag_2\bar{A}$  with MeI (15), from 4-chlorophthalyl (di)chloride (above) with MeOH (15), or from  $\bar{C}$  in MeOH with  $HCl$  gas (3); ndls. from

lgr., m.p. 38° (3), 37° (15), b.p. 186-187° at 32 mm. (3); diethyl 4-chlorophthalate; from  $\bar{C}$  in alc. with HCl gas (15) or from diethyl 4-aminophthalate via diazotization and use of  $Cu_2Cl_2$  reactn. (70% yield (5)), b.p. 300-305° (15), 185-190° at 25 mm. (5), 173-174° at 16 mm. (1).

Pr. from hot aq., 30% AcOH or  $C_6H_6$ . —  $\bar{C}$  is spar. sol. cold aq., e.g., 1 pt.  $\bar{C}$  is sol. at 0° in 2840 pts. aq. (23); 100 ml. satd. aq. soln. at 25° conts. 0.0385 g.  $\bar{C}$  (60). —  $\bar{C}$  is eas. sol. hot aq., alc., ether. — At 14-16° C 100 ml. of satd. soln. of  $\bar{C}$  in ether conts. 14 g.  $\bar{C}$ ; in  $C_6H_6$ , 0.66 g.  $\bar{C}$ ; in  $CS_2$ , 0.62 g.  $\bar{C}$ ; in  $CCl_4$ , 0.08 g.  $\bar{C}$  (8). — For study of soly. of  $\bar{C}$  in  $C_6H_6$  or *n*-heptane see (11); in chlorobenzene (3:7903), in *o*-chlorotoluene (3:8245), or in *m*-chlorotoluene (3:8275) see (10); in acetone or  $C_6H_6$  see (6); for soly. of  $\bar{C}$  in aq. solns. of various salts including NaA see (60). — For distribution coefficients of  $\bar{C}$  at 25° between aq. + toluene or between aq. and  $CHCl_3$  see (102).

$\bar{C}$  can be sublimed under reduced press. (24) (14). —  $\bar{C}$  is but very slightly volatile with steam (for details see (12)). — For study of adsorption of  $\bar{C}$  by charcoal from acetone or  $C_6H_6$  soln. see (6).

Binary systems contg.  $\bar{C}$ : [For f.p./compn. data on system  $\bar{C}$  +  $H_2O$  see (25). — For f.p./compn. data and diagram of system  $\bar{C}$  + benzoic acid (1:0715) (eutectic, m.p. 96.0° (20), 95.4° (27) (8), contg. 36 wt. %  $\bar{C}$  (27) (20) (8) (28)) see indic. refs. — For f.p./compn. data on systems  $\bar{C}$  + *m*-toluic acid (1:0705) (26),  $\bar{C}$  + *m*-hydroxybenzoic acid (1:0825) (26), see indic. refs.]

[For f.p./compo. data on system  $\bar{C}$  + *o*-chlorobenzoic acid (3:4150) (eutectic, m.p. 110.7°, cootg. 47-48 mole %  $\bar{C}$  (20) (27) (8) (19)) see indic. refs.; on system  $\bar{C}$  + *p*-chlorobenzoic acid (3:3940) (eutectic, m.p. 140.9°, cootg. 80 mole %  $\bar{C}$  (8) (19) cf. (104)) see indic. refs.; on system  $\bar{C}$  + 2,5-dichlorobenzoic acid (3:4340) (eutectic, m.p. 119.7°, cootg. 51-58 mole %  $\bar{C}$ ) see (13).]

[For f.p./compo. data on systems  $\bar{C}$  + *o*-bromobenzoic acid (28),  $\bar{C}$  + *m*-bromobenzoic acid (28),  $\bar{C}$  + *p*-bromobenzoic acid (28), *m*-iodobenzoic acid (29), *o*-nitrobenzoic acid (30), *m*-nitrobenzoic acid (30) see indic. refs.]

Ternary systems contg.  $\bar{C}$ : [For influence of addn. of benzoic acid (20) or of *p*-chlorobenzoic acid (3:4940) (27) to eutectic of  $\bar{C}$  with *o*-chlorobenzoic acid (3:4150) see indic. refs. — For influence of addn. of *o*-chlorobenzoic acid (3:4150) to eutectic of  $\bar{C}$  with benzoic acid (1:0715) see (27); for data on system  $\bar{C}$  + *o*-chlorobenzoic acid (3:4150) + *p*-chlorobenzoic acid (3:4940) see (19).]

Miscellaneous. [For study of fate of  $\bar{C}$  in animal organism see (31) cf. (102) (note that although from man  $\bar{C}$  is excreted (34) as *N*-(*m*-chlorobenzooyl)glycine (*m*-chlorohippuric acid) [Beil. IX-339], m.p. 143-144° (31), yet from dog and rabbit no evidence for this conjugation product has been found (31). — For study of use of  $\bar{C}$  as a preservative see (32). — For use of  $\bar{C}$  as vulcanization regulator see (33).]

Preparation. [For prepo. of  $\bar{C}$  from benzoic acid (1:0715) by chlorination with  $Cl_2$  (38) in pres. of  $FeCl_3$  (70% yield (8)), with  $KClO_3$  + conc.  $HCl$  (35) (36) (37) (38), with aqua regia at 100° (yield 32% (39)) (7), with  $SbCl_5$  (35) (40) (84), with  $MoO_3$  + conc.  $HCl$  in s.t. at 150° (41), with  $NaOCl$  soln. (20) (42), or with  $Ca(OCl)_2$  soln. (42) (35) (38) see indic. refs. (note that in all these cases numerous other chlorination products are also formed); from cinnamic acid (1:0735) by chlorination and oxidn. with  $Ca(OCl)_2$  soln. see (35) (38).]

[For prepo. of  $\bar{C}$  by oxidn. of *m*-chlorotoluene (3:8275) with  $K_2Cr_2O_7$  +  $H_2SO_4$  (43), with 5% aq.  $KMoO_4$  (75% yield (4)) (8), with dil.  $HNO_3$  in s.t. at 130-140° for 8 hrs. (47), or in aq. alk. at 260° under press. with air (44) see indic. refs.; from 3-chlorobiphenyl (3:8940) or from 3,3'-dichlorobiphenyl (3:0180) by oxidn. with  $CrO_3/AcOH$  in pres. of  $V_2O_5$  see (45); from *m*-chlorobenzaldehyde (3:6475) by oxidn. with alk.  $KMoO_4$  see (3).]

[For prepn. of  $\bar{C}$  from *m*-chlorobenzal (di)chloride (3:6710) by hydrolysis with aq. followed by  $KMoO_4$  oxidn. (7% yield (2)) or from its mixt. with *m*-chlorobenzotrichloride (3:6845) by hydrolysis with 70%  $H_2SO_4$  or 80%  $AcOH$  or 5%  $NaOH$  at 90-100° in stream of air to effect immediate oxidn. (46) see indic. refs.]

[For prepo. of  $\bar{C}$  from *m*-chlorobenzonitrile [Beil. IX-339], m.p. 40.5° (48), by hydrolysis with conc.  $H_2SO_4$  (3), from *N*-(*m*-chlorobenzooyl)glycine (*m*-chlorohippuric acid) by hydrolysis with  $HCl$  (35) (36), see indic. refs.]

[For prepo. of  $\bar{C}$  from *m*-aminobenzoic acid [Beil. XIV-383, XIV-1(558)] via diazotization and use of  $Cu_2Cl_2$  reacto. (74% yield (101)) (3) (4) (49); from *m,m'*-diazaminobenzoic acid (diazaminobenzoic-3,3'-dicarboxylic acid) [Beil. XVI-727] with warm conc.  $HCl$  (50) see indic. refs.]

[For formn. of  $\bar{C}$  from *m*-chloroiodobenzene [Beil. V-220, V-1(167)] by reaction with *n*-butyllithium in ether followed by carbonation with  $CO_2$  (41.5% yield (51)); from *p*-chloronitrobenzene [Beil. V-243, V-1(129), V-1(182)] with alc.  $KCN$  in s.t. at 200° (52); from 3-chlorophthalic acid (3:4820) or 4-chlorophthalic acid (3:4390) by cat. partial decarboxylation (53); from 3-chlorophthalic acid by mercuration and treatment with  $HCl$  (99) see indic. refs.]

Chemical behavior. [ $\bar{C}$  (as  $Na\bar{A}$ ) on reduction in boilg. aq. soln. with  $Na/Hg$  yields (36) (54) benzoic acid (1:0715) (for study of reduction of  $\bar{C}$  with  $H_2$  +  $Ni$  in aq. alk. at ord. temp. see (55));  $\bar{C}$  on electrolytic reduction in alc./ $H_2SO_4$  yields (56) *m*-chlorobenzyl

alcohol [Beil. VI-444], oil, b.p. 234° (56); note that  $\bar{C}$  with Ni/Al alloy (Raney nickel) in aq. alk. soln. at 90° gives (100% yield (106)) benzoic acid (1:0715), m.p. 121°.]

$\bar{C}$  behaves normally as a monobasic acid: e.g.,  $\bar{C}$  on titration with standard dil. aq. alk. gives Neut. Eq. 156.5; ionization const. at 25° is  $1.55 \times 10^{-4}$  (57),  $1.53\text{--}1.59 \times 10^{-4}$  (58),  $1.506 \times 10^{-4}$  (59) cf. (1) (60). — [For study of acid strength of  $\bar{C}$  in MeOH, EtOH, and various other alcs. see (61) (62) (63) (16) (64) (65) (17).]

Salts of inorganic bases.  $[\text{NH}_4\bar{A}]$ , m.p. 203–204° dec. (39), lfts. from acetone/pet. ether (39), powder from abs. alc. (66). — Hydroxylamine salt, ndls. from xylenc, m.p. 144° (72), 145–146° dec. (39). —  $\text{Na}\bar{A}$  (67),  $\text{K}\bar{A}$  (67) both behave as liquid cryst. on fusion. —  $\text{Ag}\bar{A}$ , insol. aq. (68) (note that this salt (1 mole) with  $\text{I}_2$  (2 equiv.) in dry  $\text{C}_6\text{H}_6$  refluxed 15–18 hrs. yields (69) phenyl *m*-chlorobenzoate, m.p. 53°, +  $\text{CO}_2$  +  $\text{AgI}$ ). —  $\text{Ca}\bar{A}_2 \cdot 3\text{H}_2\text{O}$ , sol. at 12° in 82.6 pts. aq. (68) (35). —  $\text{Ba}\bar{A}_2 \cdot 4\text{H}_2\text{O}$ , eas. sol. nq. or alc. (for use in sepn. of  $\bar{C}$  from *o*-chlorobenzoic acid (3:4150) and *p*-chlorobenzoic acid (3:4940) see (27)). —  $\text{Cd}\bar{A}_2 \cdot 2\text{H}_2\text{O}$  (71).]

Salts of organic bases. E.g.,  $\bar{C}$  with equiv. nmt. benzylamine in boilg. EtOAc followed by evapn. of solvent yields (73) benzylammonium *m*-chlorobenzoate, m.p. 146.8–147.4° u.c., 149.2–149.8° cor. (73), Neut. Eq. 263.6 (note that the m.p. of this salt is only very slightly lower than that of the corresp. salt from *o*-chlorobenzoic acid (3:4150)). —  $\bar{C}$  similarly treated with  $\alpha$ -phenylethylamine yields (73)  $\alpha$ -phenylethylammonium *m*-chlorobenzoate, m.p. 142.0–142.6° u.c., 144.7–145.3° cor. (73), Neut. Eq. 277.6 (note that the m.p. of this salt, although better separated from those of the isomeric acids than the preceding case, is very close to that for the corresp. deriv. of cinnamic acid (1:0735)).

$\bar{C}$  (1 mole) in alc. mixed with codeine (1 mole), m.p. 155°, in alc. htd. several minutes, solvent evaporated, and resulting syrup recrystallized from aq. yields (74) codeine *m*-chlorobenzoate,  $\text{C}_{18}\text{H}_{21}\text{O}_5\text{N} \cdot \bar{C}$ , m.p. 96° on "Maquenne block"; note that this m.p. although very close to that (99°) of corresp. salt from *m*-bromobenzoic acid is widely different from the corresp. salts of *o*-chlorobenzoic acid (3:4150) and *p*-chlorobenzoic acid (3:4940), which are 134° and 162° respectively. —  $\bar{C}$  (1 mole) in alc. (or  $\text{CHCl}_3$ ) with strychnine (1 mole) in alc. boiled for a few minutes then cooled yields (75) strychnine *m*-chlorobenzoate,  $\text{C}_{21}\text{H}_{22}\text{O}_5\text{N}_2 \cdot \bar{C}$ , m.p. 185° u.c. on "Maquenne block"; note that this m.p. is somewhat higher than that (170°) of the corresp. salt from *o*-chlorobenzoic acid (3:4150) and widely different from that (251°) of the corresp. salt of *p*-chlorobenzoic acid (3:4940).

$\bar{C}$  with alcohols gives by conventional procedures the corresp. esters; for details on methyl *m*-chlorobenzoate (3:6670) and on ethyl *m*-chlorobenzoate (3:6770) see these compds. — [For study of rate of esterification of  $\bar{C}$  with MeOH (76) or with cyclohexanol (77) see indic. refs.]

$\bar{C}$  with  $\text{P}_2\text{O}_5$  in toluene boiled for 4 hrs. (78) or  $\bar{C}$  with oxalyl (di)chloride (3:5060) refluxed in  $\text{C}_6\text{H}_6$  (79) cf. (80) yields *m*-chlorobenzoic acid anhydride, pl. from  $\text{C}_6\text{H}_6$  or toluene, ndls. from lt. pet. or alc., m.p. 95.5° (78), 95° (79) (note that  $\bar{C}$  (2 moles) with oxalyl (di)bromide refluxed in  $\text{C}_6\text{H}_6$  similarly gives good yields (80) of the above anhydride but  $\text{Na}\bar{A}$  with oxalyl dibromide can also be used (80) to prepare *m*-chlorobenzoyl bromide, oil, b.p. 143–147° at 40 mm. (80)).

$\bar{C}$  with  $\text{PCl}_5$  (31) (68) (3) or with  $\text{SOCl}_2$  (81) (82) or with  $\text{SOCl}_2$  + pyridine (83) gives (76% yield (31)) *m*-chlorobenzoyl chloride (3:6590), b.p. 225°.

$\bar{C}$  with  $\text{HN}_3$  in conc.  $\text{H}_2\text{SO}_4$  in trichloroethylene (3:5170) soln. at 40° gives (75% yield (107)) *m*-chloroaniline.]

$\bar{C}$  fused with KOH, subsequently acidified, yields (81) *m*-hydroxybenzoic acid (1:0825).

$\bar{C}$  on nitration with boilg. fuming  $\text{HNO}_3$  for 10 min. (70) or with abs.  $\text{HNO}_3$  at 0° or –20° (3) (21) (85) gives a mixt. of two isomeric nitro-*m*-chlorobenzoic acids; this mixt. consists mainly (92–93% (86) cf. (21)) of 3-chloro-6-nitrobenzoic acid [Beil. 1X-401],

cryst. from  $\text{HNO}_3$  ( $D = 1.1$ ) (24), ether,  $\text{C}_6\text{H}_6$ , or aq., m.p.  $139^\circ$  (85),  $137\text{--}138^\circ$  (70),  $136^\circ$  (3),  $135\text{--}136^\circ$  (24), accompanied by a little (7–8% (86)) cf. (24) 3-chloro-2-nitrobenzoic acid [Beil. IX-400], ndls. or thls. from hot aq., m.p.  $235^\circ$  (70) (85),  $233\text{--}234^\circ$  (3) (for details on sepn. of these two isomers see (3) (70) (24) (85)). — Note that the other two possible nitro-*m*-chlorobenzoic acids are known but are not found in the product from nitration of  $\bar{\text{C}}$ ; they are 3-chloro-4-nitrobenzoic acid [Beil. IX-404], m.p.  $185\text{--}186^\circ$ , and 3-chloro-5-nitrobenzoic acid [Beil. IX-403, IX<sub>1</sub>-(165)], m.p.  $147^\circ$ . — [Note also that no dinitro-3-chlorobenzoic acids have ever been reported.]

— Methyl *m*-chlorobenzoate: b.p.  $231^\circ$ , m.p.  $21^\circ$ . (See 3:6670.)

— Ethyl *m*-chlorobenzoate: b.p.  $245^\circ$ . (See 3:6770.)

① *p*-Nitrobenzyl *m*-chlorobenzoate: m.p.  $107.2^\circ$  u.c. (87). [From  $\bar{\text{C}}$  (as  $\text{Na}\bar{\text{A}}$ ) with *p*-nitrobenzyl bromide (m.p.  $99^\circ$ ) in boilg. dil. alc. (87); note that m.p. of this ester is almost identical with that ( $106^\circ$  (83)) of the corresp. ester of *o*-chlorobenzoic acid (3:4150).]

② Phenacyl *m*-chlorobenzoate: m.p.  $118^\circ$  (89),  $116.4^\circ$  (21). [From  $\bar{\text{C}}$  (as  $\text{Na}\bar{\text{A}}$ ) with phenacyl bromide (m.p.  $50^\circ$ ) in boilg. alc. (98% yield (21)).]

— *p*-Chlorophenacyl *m*-chlorobenzoate: unreported.

③ *p*-Bromophenacyl *m*-chlorobenzoate: m.p.  $117.2^\circ$  (21),  $116^\circ$  (90). [From  $\bar{\text{C}}$  (as  $\text{Na}\bar{\text{A}}$ ) with *p*-bromophenacyl bromide (m.p.  $109^\circ$ ) in boilg. alc. (21).]

— *p*-Iodophenacyl *m*-chlorobenzoate: unreported.

④ *p*-Phenylphenacyl *m*-chlorobenzoate: m.p.  $154^\circ$  u.c. (91). [From  $\bar{\text{C}}$  (as  $\text{Na}\bar{\text{A}}$ ) with *p*-phenylphenacyl bromide (m.p.  $126^\circ$ ) in boilg. alc. (91); note that the m.p. of this deriv. is only slightly lower than that ( $160^\circ$  u.c. (91)) of the corresp. ester of *p*-chlorobenzoic acid (3:4940); note also that, since this ester has almost the same m.p. as the original  $\bar{\text{C}}$ , care must be taken to show that the supposed ester is insol. in aq.  $\text{Na}_2\text{CO}_3$  (dif. and sepn. from  $\bar{\text{C}}$ ); note finally that the m.p. of a mixt. of  $\bar{\text{C}}$  with this ester is depressed to  $130\text{--}132^\circ$  (91).]

⑤ *S*-Benzylthiuronium *m*-chlorobenzoate: cryst. from alc., m.p.  $155^\circ$  cor. (92). [From  $\text{Na}\bar{\text{A}}$  or  $\text{K}\bar{\text{A}}$  in dil. alc. with slight excess *S*-benzylthiuronium chloride soln. (15% in hot alc.) (92).]

⑥ *S*-(*p*-Chlorobenzyl)thiuronium *m*-chlorobenzoate: cryst. from dioxane, m.p.  $157^\circ$  cor. (93). [From  $\text{Na}\bar{\text{A}}$  or  $\text{K}\bar{\text{A}}$  in aq. with 1 equiv. of *S*-(*p*-chlorobenzyl)thiuronium chloride, m.p.  $197^\circ$  (10% in alc.) (93); note that the m.p. of this prod. is closely adjacent to that (m.p.  $159^\circ$  cor. (93)) of the corresp. salt of *o*-chlorobenzoic acid (3:4150), and is also almost identical with that of the original  $\bar{\text{C}}$ .]

⑦ *S*-(*p*-Bromobenzyl)thiuronium *m*-chlorobenzoate: m.p.  $150^\circ$  cor. (94). [From  $\text{Na}\bar{\text{A}}$  or  $\text{K}\bar{\text{A}}$  in aq. with 1 equiv. of *S*-(*p*-bromobenzyl)thiuronium bromide, m.p.  $213^\circ$ , in alc. (94).]

⑧ *m*-Chlorobenzamide: cryst. from hot aq. or alc., m.p.  $135^\circ$  (100),  $134.5^\circ$  cor. (3),  $134^\circ$  u.c. (95),  $132\text{--}133^\circ$  (70). [From *o*-chlorobenzoyl chloride (3:6590) with conc. aq.  $\text{NH}_4\text{OH}$  (68) (70) or from  $\bar{\text{C}}$  by refluxing with  $\text{AcOH} + (\text{NH}_4)_2\text{CO}_3$  (46–50% yield (100)); note that this amide gives on fusion with  $\text{HgO}$  a mercuric deriv., m.p.  $245^\circ$  u.c. (95).]

⑨ *m*-Chlorobenzhydrazide: ndls. from aq. or alc., m.p.  $158^\circ$  (96),  $157\text{--}158^\circ$  (97). [From ethyl *m*-chlorobenzoate (3:6770) with hydrazine hydrate in abs. alc. on 8-hr. reflux. (yield: 97% (96), 87% (97)).] — [For use of *m*-chlorobenzhydrazide as general reagent for identification of aldehydes and ketones see (97).]

— *N'*-(*m*-Chlorobenzoyl)-*N*-phenylhydrazide: unreported.

— *m*-Chlorobenzanilide: *cryst. from alc.*, m.p. 122–125° (98). [Prepn. reported but only by indirect means (98).] — [Note that the isomeric *benz-m-chloroanilide* [Beil. XII-605] has m.p. 118°.]

— *m*-Chlorobenzo-*p*-toluidide: unreported.

— *m*-Chlorobenzo- $\alpha$ -naphthalide: unreported.

— *m*-Chlorobenzo- $\beta$ -naphthalide: unreported.

**3:4395 2-CHLORO-3-HYDROXYBENZOIC ACID**

$C_7H_5O_3Cl$

Beil. X - 142

X<sub>1</sub>—

M.P. 157.5-158.5° (1)  
 156.5-157.5° (1)  
 150-157° (2) (5)  
 156° (3)  
 155.0-155.5° u.c. (10)

Colorless lfts. from aq. or  $C_6H_6$ . [Ioniz. const. at 25° =  $1.40 \times 10^{-3}$  (5).]

[For prepn. of  $\bar{C}$  from 2-chloro-3-hydroxybenzaldehyde (3:4085) with 5-6 pts. 50% KOH at 60-70° (Cannizzaro reactn.) (96% yield) see (3); from ethyl 2-chloro-3-hydroxybenzoate (see below) by hydrolysis with 35% KOH see (1) (2) cf. (4); for formn. from *m*-hydroxybenzoic acid (1:0825) with  $Cl_2$  in MeOH (6) (44% yield (10)) or AcOH (1) (together with some of the isomeric 6-chloro-3-hydroxybenzoic acid (3:4720)) see indic. refs; for prepn. of  $\bar{C}$  from 2-amino-3-hydroxybenzoic acid (1) via diazotization and use of  $Cu_2Cl_2$  reactn. see (1).]

Salts:  $Ag\bar{A}$ , cryst. ppt. (2).

$\bar{C}$  in aq. soln. gives with  $FeCl_3$  a violet-red color.

[ $\bar{C}$  with formalin (1:0145) + conc. HCl + HCl gas at room temp. gives (87% yield (10)) 7-chloro-6-hydroxyphthalide, m.p. 290° cor. (10).]

— Methyl 2-chloro-3-hydroxybenzoate: pr. with 1  $H_2O$  from dil. alc., m.p. 70-71° (2); anhydrous form, m.p. 62-65° (2). [From  $\bar{C}$  in MeOH with  $H_2SO_4$  (2).] — [This ester with MeI + MeOH/KOH in s.t. at 130° for several hours gives methyl 2-chloro-3-methoxybenzoate, anhydrous ndls. from dil. alc., m.p. 41-42° (2).]

— Ethyl 2-chloro-3-hydroxybenzoate: white ndls. with 1  $H_2O$  from dil. alc., m.p. 53° (2); above m.p. loses aq. giving viscous oil (2). [From ethyl *m*-hydroxybenzoate (1:1471) with  $SO_2Cl_2$  (together with the isomeric ethyl 6-chloro-3-hydroxybenzoate (2) (4)).] — [This anhydrous ester with AcCl yields ethyl 2-chloro-3-acetoxybenzoate, ndls. from dil. alc., m.p. 48-49° (2).]

— 2-Chloro-3-methoxybenzoic acid: colorless ndls. from aq., m.p. 161.5° (7), 160° (8) (9). [Prepd. indirectly from 2-chloro-3-methoxybenzaldehyde by oxidn. with  $KMnO_4$  (7) (8).]

— 2-Chloro-3-acetoxybenzoic acid: cryst. from aq. or  $C_6H_6$ , m.p. 152.5–153° u.c.  
(10). [From  $\bar{C}$  +  $Ac_2O$  +  $K_2CO_3$  (10)]

3:4400 3,5-DICHLORO-4-HYDROXYBENZ-  
ALDEHYDE

$C_7H_4O_2Cl_2$  Beil. VIII - 81  
VIII—

M.P. 158–159° cor. (1)  
156° (2) (3)

Colorless odorless ndls. from dil alc or from  $CHCl_3$ , fairly eas. sol. alc., ether, AcOH; more dif. sol.  $C_6H_6$ , lgr.,  $CHCl_3$

[For prepn. of  $\bar{C}$  from *p*-hydroxybenzaldehyde (1:0060) in 5 pts. AcOH at 100° (2) (4) or in  $CHCl_3$  with cooling (1) with  $Cl_2$  see indic. refs.; from corresp. methyl ether (3,5-dichloro-4-methoxybenzaldehyde) with boulg. conc. HI see (3)]

$\bar{C}$  in *N* KOH with  $H_2O_2$  yields (4) 2,6-dichlorohydroquinone (3:4600).

[The methyl ether of  $\bar{C}$  (see above) has been obtd. indirectly (3) from *p*-methoxybenzaldehyde (*p*-anisaldehyde) (1.0240) by chlorination with large excess (9 moles)  $SO_2Cl_2$ ; bright red cryst. from alc., m.p. 61.5° (3); on oxidn. with  $CrO_3$  this prod. gives (80% yield (3)) 3,5-dichloro-*p*-methoxybenzoic acid [Beil. X-177], m.p. 202.0–202.5° (3)]

① 3,5-Dichloro-4-hydroxybenzaldehyde: colorless ndls. from dil. alc., m.p. 185° (2). [From  $\bar{C}$  in moderately conc. NaOH (3 moles) with  $NH_2OH \cdot HCl$  ( $1\frac{1}{2}$  moles), subsequently acidified with AcOH (2).] — [This oxime on boulg. with  $Ac_2O$  for 2 hrs. yields (2) 3,5-dichloro-4-acetoxybenzonitrile, colorless cryst. from dil. alc., m.p. 93° (2).]

② 3,5-Dichloro-4-hydroxybenzaldehyde semicarbazone: greenish yel. ndls. from AcOH, m.p. 236–237° cor. dec. (1) [From  $\bar{C}$  in hot AcOH (50 pts.) by addn. of conc. aq. soln. of semicarbazide hydrochloride, followed by  $\frac{1}{2}$  hr. htg. (1)]

3:4400 (1) Biltz, *Ber.* 37, 4033–4034 (1904). (2) von Auwers, Reis, *Ber.* 29, 2356–2358 (1896). (3) Durrans, *J. Chem. Soc.* 123, 1426 (1923). (4) Dakin, *Am. Chem. J.* 42, 490–491 (1900).

3:4410 *cis*-1,2,3,4,5,6-HEXACHLORO-  
CYCLOHEXANE  
( $\alpha$ -Benzenehexachloride)

$C_6H_4Cl_6$  Beil. V - 23  
V<sub>1</sub>-(8)  
V<sub>7</sub>-(11)

M.P. 168.2° (1)  
158° (2)  
157° cor. (3) (21)

[See also  $\beta$ -benzenehexachloride (3:4920).]

Nine stereoisomeric configurations of benzenehexachloride are possible (cf. (1)) and four are known;  $\bar{C}$  (contrary to earlier opinion (5)) is now thought (but not unequivocally proved) to have the *cis* configuration; the  $\beta$ -isomer has been shown to have the *trans* configuration; the configurations of the  $\gamma$ -isomer, m.p. 112–113° (2), and the  $\delta$ -isomer, m.p. 129–132° (2), are unknown.

$\bar{C}$  cryst. from 80% AcOH (3) or from alc. —  $\bar{C}$  is volatile with steam (dif. and separation from  $\beta$ -isomer). —  $\bar{C}$  is insol. aq. hut sol. in 22.8 pts.  $\text{CHCl}_3$  at 15.25°; in 15.4 pts.  $\text{C}_6\text{H}_6$  at 18.25° (5). —  $\bar{C}$  forms with the  $\beta$ -isomer a eutectic (m.p. 155.5°) contg. 79.7%  $\bar{C}$  (2).

[For manuf. of ordinary benzenehexachloride (mixt. of stereoisomers) from  $\text{C}_6\text{H}_6$  (1:7400) +  $\text{Cl}_2$  in pres. of light (6) (7) (8), X-radiation (9), or conc.  $\text{H}_2\text{SO}_4$  (10) see indic. refs.; for study of prepn. of  $\bar{C}$  (together with other stereoisomers) from  $\text{C}_6\text{H}_6$  with  $\text{Cl}_2$  in pres. of 1% aq. NaOH see (3) (2) (28), in gas phase (11) (12), in pres. of ethylene in the dark (13), in pres. of  $\text{NCl}_3$  in the dark (14) or in light (15), in pres. of light (16) (17) (18) (19) (20).] [For use of  $\bar{C}$  as insecticide see (27); note, however, that insecticidal props. are thought to be due to  $\gamma$ -isomer (29).]

$\bar{C}$  on htg. above its m.p. loses HCl and yields (3) (21) 1,2,4-trichlorobenzene (3:6420).  $\bar{C}$  on htg. with aq. in s.t. at 200° (19), on boilg. with MeOH/KOH (2), EtOH/KOH (2) (3) (19) (20) (22), alc. KCN (19), or pyridine (2), or on htg. with quinoline at 105–110° (2) yields mainly 1,2,4-trichlorobenzene (3:6420) together with other prods.; e.g.,  $\bar{C}$  on boilg. with excess 10% alc. KOH for  $\frac{3}{2}$  hr. (2) or  $\bar{C}$  boiled with 10 pts. pyridine for 1 hr. (2) gives (yield: 75–86% (2)) 1,2,4-trichlorobenzene (3:6420).

$\bar{C}$  reacts very vigorously with boilg. aniline (19), hut the prods. have not been detd. [ $\bar{C}$  stood in s.t. with 3 pts. liq.  $\text{Cl}_2$  for 11 days yields (23)  $\alpha$ -nonachlorocyclohexane, cryst. from alc., m.p. 95–96° (23) (24).]

$\bar{C}$  in alc. boiled with Zn dust yields (25) benzene (1:7400).

$\bar{C}$  is very inert to most other reagents: e.g.,  $\bar{C}$  can be recrystallized unchanged from fuming  $\text{HNO}_3$  (3), is unattacked by fuming  $\text{H}_2\text{SO}_4$  (19), is unattacked by  $\text{CrO}_3$  (3), is only slightly affected by aq.  $\text{KMnO}_4$  even on boilg. (3), and is unaffected by conc. aq.  $\text{NH}_4\text{OH}$  (3), boilg. alc.  $\text{AgNO}_3$  (3), or  $\text{AgOAc}$  (26).

### 3:4420 4,8-DICHLORONAPHTHOL-2

$\text{C}_{10}\text{H}_6\text{OCl}_2$  Beil. VI —  
VI<sub>1</sub>—  
VI<sub>2</sub>-(604)

M.P. 158–159° (1).

Colorless ndls. from alc. — sol. in NaOH.

[For prepn. from 4,8-dichloronaphthylamine-2 via diazo reaction see (1).]

[For use in prepn. of azo dyestuffs see (2) ]

$\bar{C}$  on suitable methylation yields methyl ether, viz., methyl 2,4-dichloro- $\beta$ -naphthyl ether, colorless ndls., m.p. 93° (1).

3:4420 (1) Friedländer, Karamessinis, Schenk, *Ber.* 55, 48-49 (1922). (2) Herzberg, Wunderlich (to I.G.), Ger. 459,989, May 18, 1928; *Cent.* 1928, II 395.

3:4430 2-CHLORO-4-HYDROXYBENZOIC ACID   $C_7H_5O_3Cl$  Beil. S.N. 1069

M.P. 159° (1)

Colorless ndls. from aq.

[For prepn. of  $\bar{C}$  from 2-chloro-4-methoxybenzoic acid (see below) by cleavage with conc. HI ( $D = 1.7$ ) see (1).]

[The corresp. methyl ether, viz., 2-chloro-4-methoxybenzoic acid (2-chloro-*p*-anisic acid), m.p. 208° (2) (3), has been obtd. indirectly from 2-chloro-4-methoxybenzaldehyde [Beil. VIII-51] (2) or from 2-chloro-4-methoxytoluene [Beil. VI-402] (3) by  $KMnO_4$  oxidn. (2) (3).]

3:4435 3-CHLORO-2-METHYLBENZOIC ACID   $C_9H_7O_2Cl$  Beil. IX-407  
IX<sub>1</sub>—

M.P. 159° (1)

156° (2)

154° (3)

Colorless ndls from alc; eas. sol. alc.

[For prepn. of  $\bar{C}$  from 3-chloro-2-methylbenzonitrile, m.p. 19° (1), by refluxing with 20% aq. KOH for 5 hrs (98% yield) see (1); from 3-chloro-1,2-dimethylbenzene (3:8645) on oxidn. with boilg<sup>o</sup> dil.  $HNO_3$  ( $D = 1.20$ ) see (3); from 2-methylbenzoic acid (*o*-toluic acid) (1:0690) in  $CHCl_3$  in pres. of Fe with  $Cl_2$  (4) or in AcOH with  $Cl_2$  (2) see indic. refs.]

Salts:  $Ca\bar{A}_2 \cdot 2H_2O$ , spar. sol. hot aq. (3).

$\bar{C}$  on oxidn with  $KMnO_4$  gives (3) 3-chlorophthalic acid (3:4820)

3:4435 (1) Noeltig, *Ber.* 37, 1025-1026 (1904). (2) Claus, Bayer, *Ann.* 274, 310-311 (1893). (3) Krüger, *Ber.* 18, 1758 (1885). (4) Claus, Stapelberg, *Ann.* 274, 311 (1893).

3:4444 3,5,6-TRICHLORO-2-HYDROXYHYDROQUINONE   $C_6H_2O_3Cl_3$  Beil. VI-1089  
VI<sub>1</sub>—  
VI<sub>2</sub>—(1072)

M.P. 160° (1)

Ndls. from  $C_6H_6$  —  $\bar{C}$  cryst. from  $C_6H_6$  or AcOH in solvated form.  $\bar{C}$  is eas. sol. alc., ether; spar. sol. pet. ether.

[For prepn. of  $\bar{C}$  from 3,5,6-trichloro-2-hydroxybenzoquinone-1,4 [Beil. VIII-238] by reduction with aq.  $SO_2$  see (1).]

$\bar{C}$  dis. in aq. yielding colorless soln. which on htg. develops violet color;  $\bar{C}$  with aq. alk. gives deep green color changing to brown (1).

— 3,5,6-Trichloro-2-hydroxyhydroquinone trimethyl ether: unreported.

— 3,5,6-Trichloro-2-hydroxyhydroquinone triethyl ether: unreported.

— 3,5,6-Trichloro-2-hydroxyhydroquinone triacetate: ndls. from lgr./ $C_6H_6$ , m p.  $171^\circ$  (1). [From  $\bar{C}$  with  $Ac_2O + NaOAc$  on htg. (1).]

3:4444 (1) Zincke, Schaum, *Ber.* 27, 557-558 (1894).

3:4450 OCTACHLOROPROPANE  
(Perchloropropane)

$C_3Cl_8$

Beil. I - 108

I<sub>1</sub>- (35)

I<sub>2</sub>-

M.P.  $160^\circ?$  (1) B.P.  $268-269^\circ$  at 734 mm. (1)

White extraordinarily pliable (2) crystals, difficult to filter with suction (because of their high vapor pressure (3)) and best purified by fractional distn. (3) or slow sublimation in vac. (2). — Very sol. in alc., ether, or lgr. (1).

[For prepn. of  $\bar{C}$  (100% yield (3)) from 1,1,1,2,2,3,3-heptachloropropane (3:0200) by conversion with MeOH/KOH by loss of HCl to 1,1,1,2,3,3-hexachloropropene-2 (3:6370) and subsequent treatment with  $Cl_2$  below  $50^\circ$  in sunlight see (3) (2).] [For formn. from 1,2,3-trichloropropane (3:5840) or from isobutyl chloride (3:7135) with excess  $ICl_3$  at  $200^\circ$  see (1).]

$\bar{C}$  on htg. at  $300^\circ$  (1) or on htg. with  $AlCl_3$  (2) splits quantitatively (2) into  $CCl_4$  (3:5100) + tetrachloroethylene (3:5460).

[For fluorination of  $\bar{C}$  see (3) (4); for use of  $\bar{C} + Zn$  for production of smoke see (5) (6)]

3:4470 2,5-DICHLOROBENZOQUINONE-1,4  
(p-Dichlorobenzoquinone)

$C_6H_2O_2Cl_2$

Beil. VII - 632

VII- (346)

M.P.  $161-162^\circ$  (1)  
 $160.4-161.4^\circ$  (2)  
 $161^\circ$  u.c. (3)  
 $161^\circ$  (4) (17) (28)  
 $159^\circ$  (5) (10)  
 $158.5^\circ$  (6)  
 $158-161^\circ$  (7)

[See also 2,5-dichlorohydroquinone (3:4690).]

Dark yellow cryst. from alc. or  $C_6H_6$ ; insol. aq.; alm. insol. cold dil. alc., eas. sol. hot lgr. abs. alc.; fairly eas. sol. ether or  $CHCl_3$ . — Volatile with steam; sublimes in vacuum.

[For prepn. of  $\bar{C}$  from 2,5-dichlorohydroquinone (3:4690) by oxidn. with  $K_2Cr_2O_7$  or

$\text{Na}_2\text{Cr}_2\text{O}_7$  + dil.  $\text{H}_2\text{SO}_4$  (2) (4) (6) (8) (9) or with conc.  $\text{HNO}_3$  at ord. temp (5) see indic. refs.; from 2,5-dichlorohydroquinone dimethyl ether with fuming  $\text{HNO}_3$  in the cold see (1); from 2-chlorobenzoquinone-1,4 (3:1100) via conversion with  $\text{HCl}$  to 2,5-dichlorohydroquinone (3:4690) and subsequent oxidn. of latter see (5) (17); from 2,5-dichloroaniline [Beil. XII-625, XII-311] with  $\text{CrO}_3$  (5) or from 2,5-dichloro-*p*-phenylenediamine [Beil. XIII-118] with  $\text{CrO}_3$  (10) or  $\text{K}_2\text{Cr}_2\text{O}_7$  + dil.  $\text{H}_2\text{SO}_4$  (28) see indic. refs.; for formn. of  $\bar{C}$  from benzoquinone-1,4 (1:9025) in  $\text{CCl}_4$  with  $\text{ICl}$  on gentle warming. see (3); from benzene with  $\text{ClO}_2$  see (11), from copper salt of quinic acid [Beil. X-535, XI-(270)] by oxidn. with  $\text{MnO}_2$  +  $\text{NaCl}$  +  $\text{H}_2\text{SO}_4$  see (12) ]

[For study of oxidn.-reductn. potential of system  $\bar{C}$  + 2,5-dichlorohydroquinone (3:4690) see (6) (13) (14).] — [For use as vulcanization accelerator see (15); for use in prepn of curdoid dyes see (16), for study of bactericidal actn. see (18).]

$\bar{C}$  is sol in conc.  $\text{H}_2\text{SO}_4$  with greenish-yellow color, in dimethylaniline with deep blue color (10),  $\bar{C}$  is sol in dil. aq. alk. with brown color and decomposition (11) (12).]

$\bar{C}$  with  $\text{KCN}$  in 85%  $\text{MeOH}$  gives (20) a ruby-red soln. with red fluorescence;  $\bar{C}$  with diphenylketene in ether + pet. eth. gives a compound, m.p. 180-192° dec. (21) ]

$\bar{C}$  in aq. reduces with  $\text{SO}_2$  (12) to 2,5-dichlorohydroquinone (3:4690) q.v. (note that the intermediate quinhydrone, dark violet pr. or greenish-black ndls. with 2  $\text{H}_2\text{O}$  (12), crystal water lost over  $\text{H}_2\text{SO}_4$  or on warming giving yellow anhydrous form, m.p. 140-145° (22), is known), however,  $\bar{C}$  in dil. aq.  $\text{NaOH}$  (under  $\text{N}_2$ ) treated with  $\text{SO}_2$  is in part reduced to 2,5-dichlorohydroquinone (3:4690) and in part sulfonated to mono- and disulfonic acids of  $\bar{C}$  (23).

$\bar{C}$  in  $\text{CHCl}_3$  at low temps. does not react with  $\text{Cl}_2$ ; at ord. temps., however, yields tetrachlorobenzoquinone-1,4 (chloranil) (3:4978) (24). —  $\bar{C}$  in  $\text{AcOH}$  at 70-80° with 2 moles  $\text{Br}_2$  gives (alm. quant. yield (4)) (25) (9) 2,5-dichloro-3,6-dibromobenzoquinone-1,4 [Beil. VII-642], golden-brown tbls. from  $\text{C}_6\text{H}_6$ , m.p. 292° (4).]

$\bar{C}$  with conc.  $\text{HCl}$  gives no boilg. (5) 2,3,5-trichlorobenzoquinone-1,4 (3:4672), but some tetrachlorobenzoquinone (chloranil) (3:4978) is also formed.]

$\bar{C}$  (1 pt.) in  $\text{Ac}_2\text{O}$  (5 pts.) +  $\text{AcOH}$  (5 pts.) loses color on boilg. with  $\text{Zn}$  dust (1) and yields (by reductive acylation) 2,5-dichlorohydroquinone diacetate, cryst. from alc., m.p. 141° (1)

$\bar{C}$  (1 pt.) in hot  $\text{AcOH}$  (40 pts.) + conc.  $\text{HCl}$  (0.4-0.5 pt.) treated with aniline (0.4-0.5 pt.) yields mainly (26) 2,5-dichloro-3-anilinobenzoquinone-1,4 [Beil. XIV-137], blue lts., m.p. 180° (26), and 2,5-dichlorohydroquinone (3:4690) accompanied by small amts. of 2,5-dichloro-3,6-dianilinobenzoquinone-1,4 (see below);  $\bar{C}$  htd. with excess aniline yields (26) 2,5-dichloro-3,6-dianilinobenzoquinone-1,4 [Beil. XIV-144], yel.-br. tbls. from  $\text{C}_6\text{H}_6$ , m.p. 290° (26), and 2,5-dichlorohydroquinone (3:4690).

$\bar{C}$  in  $\text{C}_6\text{H}_6$  + alc. warmed with slightly more than 1 mole  $\text{NH}_2\text{OH} \cdot \text{HCl}$  yields (5) (27) 2,5-dichlorobenzoquinone-1,4 monoxime (2,5-dichloro-4-nitrosophenol) [Beil. VII-633], pale yel. cryst. from  $\text{C}_6\text{H}_6$ , m.p. 155-160° (8) (purified by conv. with  $\text{Ac}_2\text{O}$  +  $\text{NaOAc}$  to its acetate, yel. pr. from  $\text{C}_6\text{H}_6$ , m.p. 149° (8), and subsequent hydrolysis with  $\text{NaOH}$ ). —  $\bar{C}$  in alc. with excess  $\text{NH}_2\text{OH} \cdot \text{HCl}$  yields (27) 2,5-dichlorobenzoquinone-1,4 dioxime, grayish yel. cryst. from  $\text{C}_6\text{H}_6$ , m.p. not stated (27) ]

[See also 2-chloroanthraquinone (3:4922).]

Yellow ndls. from  $C_6H_6$ , toluene, or alc.; eas. sol.  $C_6H_6$ , toluene, AcOH, nitrobenzene, or AmOH on htg.; spar. sol. alc. or lgr.

[For f.p./compn. data and diagram of system  $\bar{C}$  + 2-chloroanthraquinone (3:4922) (eutectic, m.p. 143.9-144.2°, contg. about 25%  $\bar{C}$ ) see (14).]

[For use in coloring oils, fats, and waxes see (19);  $\bar{C}$  is very widely used as intermed. in prepn. of many dyestuffs, but no general summary can be given here although selected examples occur in the following text.]

[For prepn. of  $\bar{C}$  from potassium salt of anthraquinonesulfonic acid-1 [Beil. XI-335, XI<sub>1</sub>-(81)] by htg with strong HCl + NaClO<sub>3</sub> (yields: 97-98% (3), 95% (4)) at 100° (3) (4) (10) (6) (8) (for use of this method in detn. of mixt. of anthraquinone- $\alpha$ - and  $\beta$ -sulfonic acids or their salts by f.p./compn. curve of resultant mixt. of  $\bar{C}$  + 2-chloroanthraquinone (3:4922) see (4)) or by actn of Cl<sub>2</sub> at 100° (20) see indic. refs.; from anthraquinonesulfonic acid-1 (0) or its Na salt (15) in dil. HCl on exposure to light see indic. refs.; from anthraquinonecarboxylic acid-1 with HCl + KClO<sub>3</sub> in s.t. at 200° for 12 hrs. see (22); from Na salt of anthracenesulfonic acid-1 [Beil. XI-194, XI<sub>1</sub>-(44)] with HCl + NaClO<sub>3</sub> at 100° see (21); from 1-chloroanthraquinonesulfonic acid-5 by electrolysis of alk. soln. see (23); from K salt of anthraquinonesulfonic acid-1 (see above) (24) or from anthraquinonesulfonyl chloride-1 (5) by btg. in s.t. with SOCl<sub>2</sub>, or from 1-anthraquinonylarsinic acid by 10 hrs. reflux with SOCl<sub>2</sub> (67), see indic. refs.]

[For prepn. of  $\bar{C}$  from 2-benzoyl-3- (or 6)-chlorobenzoic acid by ring closure with conc. H<sub>2</sub>SO<sub>4</sub> see (7) (25).]

[For prepn. of  $\bar{C}$  from 1-aminoanthraquinone (see below) via diazotization and use of Cu<sub>2</sub>Cl<sub>2</sub> reactn. see (26); from 1-nitroanthraquinone [Beil. VII-791, VII<sub>1</sub>-(415)] with Cl<sub>2</sub> in trichlorobenzene soln. at 160-165° see (27); from 1-hydroxyanthraquinone [Beil. VIII-338, VIII<sub>1</sub>-(650)] with PCl<sub>5</sub> in boilg. nitrobenzene see (28).]

[ $\bar{C}$  on htg. with conc.  $H_2SO_4$  at 200–205° for 9 hrs. reart. (29) to 2-chloroanthraquinone (3:4922).]

[ $\bar{C}$  on reductn. with Zn dust + conc. aq.  $NH_4OH$  under reflux yields (30) 1-chloroanthracene [Beil. VI-(324)], colorless lfts. from AcOH, m.p. 81–82° (2), 79° (30). —  $\bar{C}$  on reductn. with hydrazine hydrate in MeOH/KOH at 10 atm. and 135° for 1½ hrs. in pres. of Pd/CaCO<sub>3</sub> followed by access of air to the prod. gives (57% yield (31)) anthraquinone (14905). —  $\bar{C}$  on reductn. with Al powder + conc.  $H_2SO_4$  (32) (33) (3) (34) yields 1-chloroanthrone-9, yel. ndls. from  $CHCl_3$  + lt. pet., m.p. 115° (32), 114° (6);  $\bar{C}$  on reductn. with Sn + HCl in AcOH contg. PtCl<sub>4</sub>, however, gives the isomeric 4-chloroanthrone-9, yel. ndls. from  $CHCl_3$  + lt. pet., m.p. 118° (32) (note that although these two isomeric chloroanthrones have the same m.p. yet each depresses the m.p. of the other (32) and the earlier prod. of m.p. 106° (33) may have been a mixture). — For studies of oxidn.-reductn. potential of  $\bar{C}$  see (12) (17).]

[ $\bar{C}$  with MeOH/KOH at 80° yields (35) 1-methoxyanthraquinone [Beil. VII-37, VII-1-(651)], m.p. 169.5° —  $\bar{C}$  with 2-hydroxyanthraquinone + NaOAc + Cu powder in boilg. nitrobenzene gives (36) 1,2'-dianthraquinonyl ether [Beil. VIII-343], but m.p. is not reported. —  $\bar{C}$  with K xanthate + Cu powder boiled for 24 hrs. in AcOH or  $\bar{C}$  with alk. trithiocarbonate in boilg. nitrobenzene (41) gives (64% yield (37)) 2,3-bis(methoxynonyl) sulfide, red pr. from pyridine, m.p. 215° (37) (for disulfide see below). —  $\bar{C}$  with thiosalicylic acid (2-mercaptobenzoic acid) + solid KOH htd. in AcOH at 15° for 7 hrs. gives (66% yield (38)) S-(1-anthraquinonyl)thiosalicylic acid [Beil. X-10, 10-11] thls. from alc., m.p. 261° cor. (38); this prod. on htg. with  $PCl_5$  in nitrobenzene gives (98% yield (39)) 3,4-phthalylthioanthrone [Beil. XVII-(250)], or-red lfts., m.p. 340° cor. (39).]

[ $\bar{C}$  with NaOH + glycerol htd. at 120° is claimed (39) to yield anthraquinone (14905). —  $\bar{C}$  on htd. with Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> (42) yields 1-mercaptanthraquinone [Beil. XII-1, m.p. 187° (42)]; this prod. on oxidn. by air (43) readily yields 2,1'-dianthraquinonyl disulfide, m.p. 359° (45), also obt'd from  $\bar{C}$  with Na<sub>2</sub>S + S in boilg. alc. (46) (43) (47); from  $\bar{C}$  + K thiobenzoate in boilg. AcOH (50% yield (48)). —  $\bar{C}$  with  $H_2S_2O_8$  in alc. at 80° gives (17) 1-chloro-2-mercaptanthraquinone, or-red lfts. from AcOH, m.p. 220° in alc. (49) also di-(1-anthraquinonyl) disulfide.]

[ $\bar{C}$  with conc. aq.  $NH_4OH$  in pres. of Cu salts under press. at elevated temp. gives (50) (57) in alm. quant. yield 1-aminoanthraquinone [Beil. XIV-477, XIV-1-(651)], m.p. 212°. — Considerable analogies combinations of  $\bar{C}$  with various amines cannot be included here; however, note that  $\bar{C}$  with 1-aminoanthraquinone + NaOAc + CuCl<sub>2</sub> htd. in nitrobenzene yields (52) cf. (51) di-(1-anthraquinonyl) ether (for amplification of this topic see (54)). —  $\bar{C}$  with hydrazine hydrate + pyridine for 1½ hrs. gives (55% yield (56)) 1-hydrazinoanthraquinone [Beil. XI-(106)] cf. (57) lfts. from xylene, m.p. 225° cor. (54). — For reart. of  $\bar{C}$  with  $NH_4OH$  see (1).]

[For condens. of  $\bar{C}$  with 1-aminonaphthalene (53) or with 1-aminobenzene (54) as dyes for colorless azo dyes see indie. refs.; for condens. of  $\bar{C}$  with 1-aminobenzene in pres. of  $AlCl_3$  for prod. of triazoles see (55).]

[ $\bar{C}$  with Cu powder + 2,2'-bipyridine or in boilg. nitrobenzene yields (56) 2,2'-bis(methoxynonyl) disulfide, m.p. 215° (37) (for disulfide see below). —  $\bar{C}$  with 1-aminoanthraquinone + NaOAc + CuCl<sub>2</sub> htd. in nitrobenzene yields (52) cf. (51) di-(1-anthraquinonyl) ether (for amplification of this topic see (54)). —  $\bar{C}$  with 1-aminoanthraquinone + NaOAc + CuCl<sub>2</sub> htd. in nitrobenzene yields (52) cf. (51) di-(1-anthraquinonyl) ether (for amplification of this topic see (54)). —  $\bar{C}$  with 1-aminoanthraquinone + NaOAc + CuCl<sub>2</sub> htd. in nitrobenzene yields (52) cf. (51) di-(1-anthraquinonyl) ether (for amplification of this topic see (54)).]

185° (57), 180–182° (58); a mixt. of this prod. with corresp. prod. (m.p. 193°) from 2-chloroanthraquinone (3:4922) has m.p. 152–160° (58).]

[For formn. of addn. cpds. of  $\bar{C}$  with  $SbCl_5$  in  $CHCl_3$  see (16) (18); for formn. of 1-anthraquinonylpyridinium chloride from  $\bar{C}$  +  $AlCl_3$  in pyridine see (59).]

[ $\bar{C}$  on mononitration by soln. in 10 wt. pts. conc.  $H_2SO_4$  and addn. of  $HNO_3/H_2SO_4$  as directed (61) (62) gives (30% yield (61)) 1-chloro-4-nitroanthraquinone [Beil. VII-792, VII-415], cryst. from  $AcOH$ , m.p. 260–261° (63), 259° (61); note that 1-chloro-2-nitroanthraquinone (prepared by indirect means) has m.p. 257–258° (63). — For study of kinetics of nitration of  $\bar{C}$  see (64).]

[ $\bar{C}$  on monosulfonation, e.g., with fuming  $H_2SO_4$  (20%  $SO_3$ ) at 160° for 4 hrs. (65) (66), yields a mixt. of about equal parts of two monosulfonic acids eas. separable via their sodium salts; viz., 1-chloroanthraquinonesulfonic acid-6 (Na salt less sol. boilg. aq., corresp. sulfonyl chloride, pale yel. pr. from lgr., m.p. 207–208° dec.) and 1-chloroanthraquinonesulfonic acid-7 (Na salt more sol. boilg. aq., corresp. sulfonyl chloride, lemon-yel. pl. from  $C_6H_6$ , m.p. 200–201° dec.); the m.p. of mixts. of the two sulfonyl chlorides is depressed below 180° (65). —  $\bar{C}$  on sulfonation in the pres. of Hg salts but otherwise as above yields, however, a different result as the principal prod. is 1-chloroanthraquinonesulfonic acid-5 (corresp. sulfonyl chloride, yel. pl. from toluene, m.p. 243–244° dec. (65) (66)), accompanied by 1-chloroanthraquinonedisulfonic acid-4,5.

3:4485 2,3,5-TRICHLOROBENZOIC  
ACID

$C_7H_3O_2Cl_3$  Beil. IX - 345  
IX<sub>1</sub>—

M.P. 163° (1)  
162° (2) (3)

Ndis. from hot aq. (2). — Not volatile with steam. — Very spar. sol. cold aq. but sol. in org solv.

[For prepn. of  $\bar{C}$  from 2,3,5-trichlorotoluene (3:0010) by oxidn with 20%  $HNO_3$  in s.t. at 140° see (2); from 2,3,5-trichlorobenzaldehyde (3:1060) by oxidn. with  $KMnO_4$  see (3), for prepn. from corresp. nitrile by hydrolysis see (1).]

$\bar{C}$  on soln. in warm fuming  $HNO_3$  readily yields a mononitro cpd, 2,3,5-trichloro- $\alpha$ -nitrobenzoic acid, cryst. from alc, m.p. 158° (1).

$\bar{C}$  with excess  $PCl_5$  yields (1) 2,3,5-trichlorobenzoyl chloride, cryst. from EtOAc, m.p. 36° (1).

— Methyl 2,3,5-trichlorobenzoate: unrecorded.

— Ethyl 2,3,5-trichlorobenzoate: oil. (From  $\bar{C}$  + alc. +  $HCl$  (1).)

② 2,3,5-Trichlorobenzamide: from 2,3,5-trichlorobenzoyl chloride +  $(NH_4)_2CO_3$ ; ndis. from dil. AcOH, m.p. 204-205° (1).

— 2,3,5-Trichlorobenzanilide: unrecorded.

162° (5) (6)  
161-162° (7)  
161.5° (8)  
161° (9)

Colorless cryst. from AcOH, pct. ether,  $C_6H_6$ , or toluene. — Eas. sol. boilg.  $C_6H_6$ ; moderately sol. hot but spar. sol. cold pct. ether; spar. sol. alc. or ether.

$\bar{C}$  with *trans*-tolane dichloride (3:4210) forms an isomorphous mixt. (8) formerly erroneously regarded as an individual cpd. designated as "ditolano hexachloride."

## PREPARATION OF $\bar{C}$

### FROM DINUCLEAR INITIAL MATERIALS

[For prepn. of  $\bar{C}$  from benzil (1:9015) with excess  $PCl_5$  (32% yield (10)) in s.t. at 200° for 6-7 hrs. (5), or from *ms*-dichlorodesoxybenzoin ("chlorobenzil") [Beil. VII-436, VII<sub>1</sub>-(234)] with  $PCl_5$  in s.t. at 290° (11) in  $POCl_3$ ; refs.; from diphenylacetylene (tolane) [Beil. V-65]; or from either *cis*-(3:1380) or *trans*-(3:4210) refs.]

### FROM MONONUCLEAR INITIAL MATERIALS

From benzotrichloride. [For prepn. of  $\bar{C}$  from benzotrichloride (3:6540) by reduction in alc. with  $H_2$  + colloidal Pd (75% yield (4)) or  $H_2$  + Pd/ $BaCO_3$  (14) in alc.-alkali, or by htg. with Cu powder at 100° (6) or in  $C_6H_6$  under reflux for 4 hrs. (30-36% yield (5)) (1) cf. (10), see indic. refs.; for formn. of  $\bar{C}$  from benzotrichloride (3:6540) with excess dilute (0.2 N)  $MeMgCl$  in ether (7), with  $EtMgBr$  (3) or  $C_6H_5MgBr$  (3), or by pyrolysis over hot Pt (15), or by htg. with Ni in atm. of  $CO_2$  (16) see indic. refs.]

## CHEMICAL BEHAVIOR OF $\bar{C}$

[ $\bar{C}$  on reduction with conc.  $HI + P$  (1) or with  $H_2$  in alc.-alk. + Pd/ $CaCO_3$  (14) gives bibenzyl (1:7140), m.p. 52°.]

[ $\bar{C}$  on removal of two adjacent chlorine atoms with Fe powder in boilg. AcOH (12) cf. (5), with Cu powder at 160° (6), with excess conc. (2 N)  $MeMgCl$  in ether refluxed 4 hrs. (7), with  $H_2$  + hydrazine hydrate in  $MeOH/KOH$   $1\frac{1}{2}$  hrs. at b.p. (17), or with Zn dust in boilg. alc. (18) (5) (2) (10) gives either or both *trans*-(3:4210) and *cis*-(3:1380) tolane dichlorides; note that use of insufficient Zn gives (8) cf. (5) (10) the *cis*-tolane dichloride (3:1380) + an isomorphous mixt. of  $\bar{C}$  + *trans*-tolane dichloride (3:4210).]

[ $\bar{C}$  with Na/Hg in alc. gives (11) diphenylacetylene (tolane) (see ref. above), some stilbene (1:7250) and hibenzy (1:7149) also being formed (2).  $\bar{C}$  on htg. with Zn dust gives (2) stilbene (1:7250)]

[ $\bar{C}$  is very resistant to hydrolysis and is unattacked by  $H_2O$ , alc., or AcOH in s.t. at 207° (2); note, however, that  $\bar{C}$  with AcOH in s.t. at 230-250° or with  $H_2SO_4$  at 165° is claimed (2) to give benzil (1:9015).]

[ $\bar{C}$  is very resistant to action of boilg.  $HNO_3$  (2); note, however, that *p,p'*-dinitrotolane dichloride, m.p. 264-265° dec., has been prepd. indirectly (19) (from *p*-nitrobenzal(di)-chloride with acetone + KOH).]

[ $\bar{C}$  with anhydrous HF at 100° yields (20) 1,2-difluoro-1,2-diphenylethylene, m.p. 122-123° (20); however,  $\bar{C}$  with HF in pres. of  $HgO$  gives (20) 1,2-dichloro-1,2-difluoro-1,2-diphenylethane, m.p. 128-130° (20)]

M.P. (contd.) 160-161° (3)  
160° (4) (5)

Long ndls. from hot aq. (4); cryst. from  $C_6H_6$  + pct. eth. — Eas. sol. alc., ether, or  $CHCl_3$  (5).

[For prepn. of  $\bar{C}$  from 2,4,6-trichloroaniline (Beil. XII-627] via conversion by diazo reactn. to 2,4,6-trichlorobenzonitrile, m.p. 77.5° (1), 75° (6), thence to 2,4,6-trichlorobenzamide (see below) and hydrolysis of latter see (1) (4) (5) (2) (12); for prepn. of  $\bar{C}$  from 2,4,6-trichlorotoluene (3:0380) by oxidn. with  $HNO_3$  see (3).]

$\bar{C}$  on soln. in 5 pts conc.  $HNO_3$  yields (1) 2,4,6-trichloro-3-nitrobenzoic acid [Beil. IX-405], cryst. from  $CHCl_3$ , m.p. 169.2° (1)

$\bar{C}$  with  $PCl_5$  (5) (73% yield (2)) or with  $SOCl_2$  + pyridine (7) gives 2,4,6-trichlorobenzoyl chloride, b.p. 272° (5), 107-107.5° at 6 mm. (2), 120.1-120.4° at 3 mm (7). — This acid chloride is very stable to aq (5) and is alleged to give no ester with  $MeOH$  (5). [Note, however, that with  $EtOH$  reactn. is 99% complete in 1 min. (7).] [For study of reactn. of 2,4,6-trichlorobenzoyl chloride with  $MeMgCl$  (8) or  $MeMgBr$  (12) giving (50% yield (2)) di-(2,4,6-trichlorobenzoyl)methane, m.p. 160-161°, see (8), with  $MeMgBr$  giving 2,4,6-trichloroacetophenone, m.p. 51° (8) (14), see (8); with  $C_6H_6$  +  $AlCl_3$  yielding 2,4,6-trichlorobenzophenone, m.p. 103.5°, see (9)]

— Methyl 2,4,6-trichlorobenzoate: unrecorded. [ $\bar{C}$  +  $MeOH$  +  $HCl$  yields no ester (4) (10)]

— Ethyl 2,4,6-trichlorobenzoate: unrecorded. [ $\bar{C}$  +  $EtOH$  +  $HCl$  yields no ester (5)]

① 2,4,6-Trichlorobenzamide: m.p. 181° (1), 177° (6). [This amide has not been recorded as prepd. from the acid chloride +  $NH_3$ ; it has been obtd. only by partial hydrolysis (11) (6) (1) of 2,4,6-trichlorobenzonitrile (see above)] (The amide itself is only slowly hydrolyzed to  $\bar{C}$  by 75%  $H_2SO_4$  at 160° (6), but for conversion to  $\bar{C}$  via  $HNO_3$  see (11) (1) (2)]

② 2,4,6-Trichlorobenzanilide: from 2,4,6-trichlorobenzoyl chloride + aniline (12), ndls., m.p. 197° (12).

### 3:4580 3,5-DICHLOROPHTHALIC ACID

 $\text{C}_6\text{H}_4\text{O}_4\text{Cl}_2$ 

Beil. IX - 817  
IX<sub>1</sub>—

M.P.  $164^\circ$  (1)  
 $164^\circ$  dec. (2)

[See also 3,5-dichlorophthalic anhydride (3:2375).]

Colorless ndls. or thls. from aq.  $\text{HCl}$ ; readily sol. in cold alc., ether, or acetone, but spar. sol. in  $\text{C}_6\text{H}_6$  or  $\text{CHCl}_3$  even on boil.

[For prep'n. of  $\bar{\text{C}}$  from 3,5-dichlorophthalic anhydride (3:2375) on boil. with aq. see (1) (2); from aq. soln. of  $\text{NH}_4\bar{\text{H}}\bar{\text{A}}$  by passing in  $\text{HCl}$  gas see (1) (2); from 3,5-dichloro-1,2-dimethylbenzene [Beil. V-364] (itself obtd. in good yield from dimethyldihydroresorcinol ("methone") (1:0768) with  $\text{PCl}_5$  in  $\text{CHCl}_3$  (2) (3)) by oxidn. with dil.  $\text{HNO}_3$  in s.t. at  $190-200^\circ$  see (2).]

Salts.  $\text{NH}_4\bar{\text{H}}\bar{\text{A}}$ , spar. sol. aq., eas. prep'd. by mixing aq. solns. of  $(\text{NH}_4)_2\bar{\text{A}}$  +  $\bar{\text{C}}$ ;  $\text{Ag}\bar{\text{A}}$ , white curdy ppt. from warm aq. soln. of  $(\text{NH}_4)_2\bar{\text{A}}$  by addn. of aq.  $\text{AgNO}_3$ .

Esters. Dimethyl 3-chlorophthalate and methyl hydrogen 3-chlorophthalate are unreported: diethyl 3-chlorophthalate (from  $\text{Ag}\bar{\text{A}}$  with  $\text{EtI}$  in dry ether) is oil, b.p.  $312-313^\circ$  at 760 mm. (2); ethyl hydrogen phthalate is unreported.

$\bar{C}$  on htg. alone (1) or with  $\text{AcCl}$  (2) yields 3,5-dichlorophthalic anhydride (3:2375), m.p.  $89^\circ$ .

3:4580 (1) Waldmann, Schwenk, *Ann* 487, 293 (1931). (2) Crossley, LeSueur, *J. Chem. Soc.* 81, 1536-1537 (1902). (3) Crossley, LeSueur, *J. Chem. Soc.* 82, 826-827 (1902).

3:4600 2,6-DICHLOROHYDROQUINONE  
(*m*-Dichlorohydroquinone)

$\text{C}_6\text{H}_4\text{O}_2\text{Cl}_2$

Yellow lfts. from alcohol; reddish yel. lfts. from  $CHCl_3$ /gr. — Insol. cold aq.; spar. sol. cold alc.; eas. sol. hot alc. or ether. —  $\bar{C}$  is sublimable [for study of sublimation press see (8)]

[For studies of heat of formation see (9); for studies of heat of combustion see (10) (11).]

[For studies of bactericidal actn. of  $\bar{C}$  see (12); for patent on use of  $\bar{C}$  as vulcanization accelerator see (13)]

### PREPARATION OF $\bar{C}$

From 2,3,5-trichlorohydroquinone. [For prepn. of  $\bar{C}$  from 2,3,4-trichlorohydroquinone (3:4052) by oxidn., e.g., with  $CrO_3$  at  $6^\circ$  (10), conc.  $HNO_3$  (14) (5) see indic. refs.]

From phenol or chlorinated phenols. [For prepn. of  $\bar{C}$  from pheool (1:1420) via sulfonation followed by oxidn. with  $KClO_3 + HCl$  see (3) (15) cf. (22), note that by this method both  $\bar{C}$  and 2,3,5,6-tetrachlorobenzoquinone-1,4 ("chloranil") (3:4978) are produced; for sepn. of  $\bar{C}$  from latter see (5) (16).]

[For prepn. of  $\bar{C}$  from 2,3,5-trichlorophenol (3:1340) or from 2,3,6-trichlorophenol (3:1160) with fuming  $HNO_3$  on protracted htg. (17), or from 2,4,6-trichlorophenol (3:1673) with mixt. of conc.  $HNO_3 +$  conc.  $HCl$  boiled for a few minutes (2), or from 2,3,4,6-tetrachlorophenol (3:1687) by oxidn. with 5 wt. pts. fuming  $HNO_3$  (70% yield (1)), see indic. refs.]

From amines, aminophenols, etc. [For formn. of  $\bar{C}$  from aniline during electrolytic oxidn. in  $HCl$  soln. see (18); from *p*-aminophenol hydrochloride with  $Ca(OCl)_2$  soln. see (10); from 2,3,5-trichloro-4-aminophenol hydrochloride by action of  $Br_2$  (20) or  $NaOBr$

{30}; from benzal *p*-anisidine or benzal *p*-phenetidine by treatment with *ter*-AmOCl (3:9287) followed by subsequent oxidn. with  $K_2Cr_2O_7/H_2SO_4$  see {4}.]

From various derivs. of  $\bar{C}$  by hydrolysis. [For formn. of  $\bar{C}$  from various imide derivs. of  $\bar{C}$  by acid hydrolysis, e.g., from the corresp. *N*-(*p*-chlorophenyl)imide [Beil. XII-611] {21}, *N*-(2,4,6-trichlorophenyl)imide [Beil. XII-628] {22} {7}, or *N*-(2,4-dinitrophenyl)imide [Beil. XII-754] {23}, see inde. refs.]

From miscellaneous sources. [For formn. of  $\bar{C}$  from  $C_6H_6$  (1:7400) by oxidn. with  $CrO_2Cl_2/AcOH$  {24}, from copper salt of quinic acid [Beil. X-535, XI-(270)] by oxidn. with  $MnO_2/NaCl/H_2SO_4$  {14}, or from benzoquinone-1,4 (1:9025) with  $Cl_2$  {25} see inde. refs.]

### CHEMICAL BEHAVIOR OF $\bar{C}$

Reduction.  $\bar{C}$  with aq.  $SO_2$  {5} {14} {15} {16}, or  $\bar{C}$  in ether soln. with aq.  $SO_2$  {1} reduces to 2,3,5-trichlorohydroquinone (3:4052). [Note that this reaction is used {16} to separate  $\bar{C}$  from 2,3,5,6-tetrachlorobenzoquinone-1,4 ("chloranil") (3:4978) since the latter is but slowly reduced by aq.  $SO_2$ .] [For studies of oxidn.-reduction potential of system  $\bar{C}$  + 2,3,5-trichlorohydroquinone (3:4052) see {6} {26} {27}.]

Oxidation.  $\bar{C}$  with strong  $HNO_3$  on digestion is degraded with formn. of trichloronitromethane ("chloropicrin") +  $CO_2$  {15}.

Chlorination. [ $\bar{C}$  with  $Cl_2$  reacts only very slowly; however,  $\bar{C}$  with  $Cl_2 + I_2 + aq.$  {15}, or  $\bar{C}$  with  $Cl_2 + HCl$  {28}, gives 2,3,5,6-tetrachlorobenzoquinone-1,4 ("chloranil") (3:4978).]

Reaction with  $HCl$ .  $\bar{C}$  with conc.  $HCl$  on protracted boilg. {29} {3}, or  $\bar{C}$  with fuming  $HCl$  in s.t. at  $130^\circ$  {30}, gives 2,3,5,6-tetrachlorohydroquinone (3:4941).

Behavior of  $\bar{C}$  with other inorganic reactants. With aq. alkali. [ $\bar{C}$  with dil. aq.  $KOH$  turns green and then dis. to a red-brown soln. from which upon acidification is pptd. {5} 2,5-dichloro-3,6-dihydroxybenzoquinone-1,4 ("chloroanilic acid") (3:4970).]

With aq.  $K_2SO_3$ . [ $\bar{C}$  dis. in warm aq.  $K_2SO_3$  or  $KHSO_3$  and on cooling ppts. {31} the potassium salt of 2,3,5-trichlorohydroquinonesulfonic acid-6 [Beil. XI-300]; the mother liquor conts. a cpd. which on boilg. with  $KOH$  gives {31} the salt of 2,5-dihydroxybenzoquinone-1,4-disulfonic acid-3,6 [Beil. XI-353].]

With  $NH_3$ . [ $\bar{C}$  with alc.  $NH_3$  reacts vigorously yielding {3} a dark soln. from which can be obt'd. in small amt. 3,6-dichloro-2,5-diaminobenzoquinone-1,4 ("chloranilamide") [Beil. XIV-144].]

With  $PCl_5$ . [ $\bar{C}$  with  $PCl_5 + POCl_3$  in s.t. at  $180-200^\circ$  gives {5} hexachlorobenzene (3:4949).]

Behavior of  $\bar{C}$  with organic reactants. With phenol.  $\bar{C}$  with  $K$  phenolate (2 moles) at  $100^\circ$  for 20 min. gives {32} 3-chloro-2,5-diphenoxybenzoquinone-1,4, or, tbs. from alc., m.p.  $169-170^\circ$  {32}.

With 2,3,5-trichlorohydroquinone.  $\bar{C}$  (1 mole) with 2,3,5-trichlorohydroquinone (1 mole) (3:4052) in  $CHCl_3$  soln. gives on evapn. {6} {33} the corresp. quinhedrone, green-black cryst., m.p.  $114-115^\circ$  {6},  $103^\circ$  {33}.

With acetyl chloride.  $\bar{C}$  with  $AcCl$  in s.t. at  $160-180^\circ$  gives {5} 2,3,5,6-tetrachlorohydroquinone diacetate (cf. 3:4941).

With aniline. [ $\bar{C}$  (1 mole) with aniline hydrochloride (1 mole) in  $AcOH$  on boilg. and subsequent partial evapn. {34} cf. {35} gives (66.5% yield {34}) 2,3,5-trichloro-6-anilino-benzoquinone-1,4 [Beil. XIV-137], blue lfts. from hot alc., but without def. m.p. {35}.— $\bar{C}$  with aniline (excess) in alc. {30} {35} or  $AcOH$  {35} gives, however, 2,5-dichloro-3,6-dianilinobenzoquinone-1,4 [Beil. XIV-144, XIV<sub>1</sub>-(421)], yel.-brown metallic lfts. from  $C_6H_6$ , m.p.  $290^\circ$  {35},  $285-290^\circ$  {30}.]

With triphenylphosphine.  $\bar{C}$  with 20% soln. of  $(C_6H_5)_3P$  in  $CHCl_3$  gives (36) wine-red color; note, however, that a very similar behavior is shown by 2,3,5,6-tetrachlorobenzoquinone-1,4 ("chloranil").

Cryst. from  $C_6H_6$  (2), scales from alc. (4). — Subl. in ndls. (4).

[For prepn. of  $\bar{C}$  from naphthalic acid (1:0890) via conv. with  $Hg(OAc)_2$  to anhydro-8-hydroxymercuri-1-napbthoic acid and subsequent reactn. with  $Cl_2$  in AcOH see (1) (3) (6) (7) cf. (8); from 8-aminonaphthoic acid-1 [Beil. XIV-534, XIV-1-(623)] via diazotization and reactn. with  $CuCN$  see (4); from  $\alpha$ -naphthoic acid (1:0785) with  $Cl_2$  in AcOH contg.  $I_2$  see (4); from 8-nitronaphthoic acid-1 [Beil. IX-653] (3) with  $SOCl_2$  in  $C_6H_6$  (some dichloronaphthostyryl also being formed) see (3); from 8-chloro-1-naphthonitrile (see below) by hydrolysis see (9); from 8-chloro-1-naphthoamide (see below) by hydrolysis with  $AcOH/H_2SO_4 + NaNO_2$  see (5) (2).]

$\bar{C}$  with  $Cl_2$  in AcOH contg.  $I_2$  yields (4) (1) 5,8-dichloronaphthoic acid-1 [Beil. IX-651], scales from alc., m.p. 186-187° (4) (1).

$\bar{C}$  with  $PCl_5$  yields (5) 8-chloro-1-napbthoyl chloride (props. not reported).

$\bar{C}$  with cold red fuming  $HNO_3$  yields (10) (11) 8-chloro-5-nitronapbthoic acid-1, lfts. or ndls. from alc., m.p. 227° (10), 225-226° (11). [This prod. with Cu bronze in boilg. toluene for 3 hrs. yields (11) 5-nitronapbthoic acid-1 [Beil. IX-652], m.p. 241-242°.

Salts.  $CaA_2 \cdot 2H_2O$ ; ndls. sol. in 42 pts. cold aq. (4).

— Methyl 8-chloro-1-naphthoate: oil, b.p. 188-189° at 16.2 mm. (2). [From  $\bar{C}$  with ethereal diazomethane (2).]

④ Ethyl 8-chloro-1-naphthoate: ndls. from alc., m.p. 50° (4), 49-50° (5). [From dry  $Ag\bar{A}$  with  $EtI$  at 100° (4) or from acid chloride (above) with  $NaOEt$  (5).] [For reactn. of this ester with Cu bronze at 290° yielding diethyl 1,1'-binaphthyl-8,8-dicarboxylate, m.p. 183°, see (5) (9); for reactn. of the ester with 1-bromonaphthalene + Cu bronze at 290° yielding ethyl 1,1'-binaphthyl-8-carboxylate, m.p. 146°, see (9); for reactn. of this ester with 2-bromonaphthalene + Cu at 290° yielding ethyl 1,2'-binaphthyl-8-carboxylate, m.p. 105°, see (9).]

— 8-Chloro-1-naphthonitrile: ndls. from  $MeOH$ , m.p. 150-151° (9), 145-146° (2), b.p. 200° at 18 mm. (9), 242-244° at 15.5 mm. (7) (2). [From 8-chloronaphthylamine-1 [Beil. XII-1256] via diazotization and reactn. with  $CuCN$  (yields: 57% (5), 22% (2)) (9).]

— 8-Chloro-1-naphthoamide: ndls. from alc., m.p. 203.5° (5). [From the nitrile (above) by hydrolysis with  $AcOH/H_2SO_4$  (5).]

170° (3)  
166° (4)

[See also 2,5-dichlorobenzoquinone-1,4 (3:4470).]

Colorless ndls. from boilg. aq., tbs. from  $C_6H_6$ , mechmic pr. from acetone; spar. sol. cold aq, sol. boulg. aq, very eas. sol. alc., ether, or warm  $AcOH$ . — Sublimes in ndls.

[For prepn. of  $\bar{C}$  from 2,5-dichlorobenzoquinone-1,4 (3:4470) by reductn. with  $SO_2$  see (5); from chlorobenzoquinone-1,4 (3:1109) with hot conc.  $HCl$  (83% yield (6)) (4) or in  $CHCl_3$  with  $HCl$  gas (4) see indie. refs.; from hydroquinone (1:1590) with  $HCl + KClO_3$  (2) (7), in  $AcOH$  or better  $CHCl_3$  with  $Cl_2$  (poor yield together with 2,3-isomer) (6), or in  $MeOH$  with  $Cl_2$  (8) see indie. refs.; from chlorohydroquinone (3:3130) with  $HCl + KClO_3$  (68% yield) see (9), from 2,5-dichloro-p-aminophenol (10) by diazotization in  $H_2SO_4 + ZnSO_4$  soln. and hydrolysis of the diazonium salt (10).]

[For use of  $\bar{C}$  as an antioxidant and gum inhibitor in cracked gasoline see (11); for use in aq. petroleum emulsion as insecticidal oil spray see (12); for use as vulcanization accelerator see (19).]

$\bar{C}$  on oxdn. with  $K_2Cr_2O_7$  or  $Na_2Cr_2O_7 + dil. H_2SO_4$  (7) (2) (9) (13) (14) or even with conc.  $HNO_3$  at ord. temp. (4) yields 2,5-dichlorobenzoquinone-1,4 (3:4470) q.v. — [For studies of oxdn.-reductn. potential of system  $\bar{C} +$  corresp. quinone see (9) (15) (16).]

- ① 2,5-Dichlorohydroquinone diacetate: colorless ndls. from dil. alc., m.p. 141° (4) (17). [From  $\bar{C}$  with  $Ac_2O$  (4) or from 2,5-dichlorobenzoquinone-1,4 (3:4470) in  $Ac_2O$  +  $AcOH$  with  $Zn$  dust (17).]
- ② 2,5-Dichlorohydroquinone dihenzoate: colorless wooly ndls. from  $CS_2$ , m.p. 185° (4). [From  $\bar{C}$  on refluxing with  $BzCl$  (4).]
- ③ 2,5-Dichlorohydroquinone dimethyl ether: colorless ndls., m.p. 125° u.c. (17), 123-127° (6), h.p. 261-263° u.c. at 744 mm. (16). [From  $\bar{C}$  in dil. aq.  $NaOH$  on shaking with  $Me_2SO_4$  (63% yield (5)), or from hydroquinone dimethyl ether in  $AcOH$  with  $Cl_2$  (17) (18).] [This prod. with fung.  $HNO_3$  in cold does not nitrate but oxidizes to 2,5-dichlorobenzoquinone-1,4 (3:4470) (17).]

3:4700 4-CHLORO-2-METHYLBENZOIC  
ACID

$C_8H_7O_2Cl$

Beil. IX-468  
IX-

M.P. 172°	(1)
171-172°	(10)
171°	(2)
170° u.c.	(3) (8)
169-170°	(4)
169°	(5)
166-168°	(6)
166°	(7)

Colorless ndls. from nq. alc., dil.  $AcOH$  or  $C_6H_6$ ; eas. sol. hot aq.; eas. volatile with steam. [For prepn. of  $\bar{C}$  from 4-chloro-1,2-dimethylbenzene (3:8675) by oxidn. with boilg. dil.  $HNO_3$  ( $D = 1.20$ ) (7) or with 20 pts. dil.  $HNO_3$  ( $D = 1.10$ ) in s.t. at 160° for 5-6 hrs. (8) (by this method  $\bar{C}$  is always accompanied by the isomeric 5-chloro-2-methylbenzoic acid (3:4670) separable by its less sol. calcium salt (1) (8) (7)) see indic. refs.; from 4-chloro-2-methylbenzaldehyde [Beil. VII-296] by air oxidn. see (4); from chloromethyl 4-chloro-2-methylphenyl ketone (4-chloro-2-methylphenacyl chloride) [Beil. VII-306] by oxidn. with  $KMnO_4$  see (2); from  $\beta$ -chloroethyl 4-chloro-2-methylphenyl ketone (5) by oxidn. at 100° with mixt. of equal pts. conc.  $HNO_3$  and aq. see (5); from 4-chloro-2-methylbiphenyl (3) by oxidn. with  $CrO_3/AcOH$  (8% yield) see (3); from 1-methyl-1-(trichloromethyl)cyclohexadiene-2,5-one-4 [Beil. VII-149] by treatment with  $PCl_5$  giving 4-chloro-2-methylbenzotrichloride, followed by alk. hydrolysis of the latter, see (9); from 4-chloro-2-methylbenzonitrile, m.p. 67° (1) (10), by boilg. for 16 hrs. with 8% nq.  $KOH$  see (1) (10).]

$\bar{C}$  on oxidn. with alk.  $\text{KMnO}_4$  (7) or with 10-20 pta. chl.  $\text{HNO}_3$  ( $D = 1.13$ ) in s.t. at 180-200° for 5 hrs. (1) yields 4-chlorophthalic acid (3:4390).

$\bar{C}$  fused with  $\text{KOH}$  yields (7) 4-hydroxy-2-methylbenzoic acid [Beil. X-215], m.p. 172-173° (7).

Salts.  $\text{NH}_4\bar{A}$ , eas. sol. aq.;  $\text{K}\bar{A} \cdot \text{H}_2\text{O}$ , very eas. sol. aq.;  $\text{Ca}\bar{A}_2 \cdot 3\text{H}_2\text{O}$  more sol. in aq. than corresp. salt of 5-chloro-2-methylbenzoic acid (3:4670);  $\text{Ba}\bar{A}_2 \cdot 4\text{H}_2\text{O}$ , more eas. sol. aq. than calcium salt (for details see (1)).

— Methyl 4-chloro-2-methylbenzoate: unrecorded.

— Ethyl 4-chloro-2-methylbenzoate: oil, b.p. 258° (1),  $D_4^{20} = 1.1626$  (10),  $n_D^{20} = 1.52705$  (10) [From  $\bar{C}$  in EtOH with  $\text{HCl}$  gas (1) or from the amide (see below) with ethyl nitrite in s.t. at 140° for 4-5 hrs. (1)]

— 4-Chloro-2-methylbenzamide: colorless ndls. from hot aq., from alc. or ether, m.p. 183° (1). [Obtd. indirectly by partial sapon. of corresp. nitric (above) (1).]

(3-Chloro- $\beta$ -naphthoquinone)

$\text{C}_{10}\text{H}_6\text{O}_2\text{Cl}$  Beil. VII-720  
VII<sub>1</sub> —

M.P. 172° (1) (2) (3)

Red ndls. from  $\text{CHCl}_3$  — Sol. hot alc., AcOH,  $\text{C}_6\text{H}_6$ ,  $\text{CHCl}_3$ .

[For prepn. of  $\bar{C}$  from  $\beta$ -naphthol (1:1540) by conversion with  $\text{Cl}_2$  in AcOH (2) to 1,1,3,4-tetrachloro-2-keto-1,2,3,4-tetrahydronaphthalene [Beil. VII-371] (lfts. of monohydrate from aq., m.p. 90-91°; anhydrous lfts. or ndls. from hot lgr., m.p. 101-103°)

followed by treatment with aq.  $\text{Na}_2\text{CO}_3$  (2) (3) (overall yield of  $\bar{\text{C}}$  is 56% (4)). — For prepn. of  $\bar{\text{C}}$  from naphthoquinone-1,2 (1:0062) with  $\text{Cl}_2$  in AcOH (1) (5), or from 1,3-dichloronaphthol-2 (3:1900) by oxidn. with conc.  $\text{HNO}_3$  in AcOH (3), see indic. refs.]

$\bar{\text{C}}$  on reduction with  $\text{SO}_2$  in AcOH gives (1) 3-chloro-1,2-dihydroxynaphthaleno [Beil. VI-975], colorless ndls., m.p. 116–117° (1).

$\bar{\text{C}}$  on oxidn. with aq.  $\text{Ca}(\text{OCl})_2$  undergoes rupture of the quinoid ring and a subsequent series of changes (5) resulting in formation of (plithalidyl-3)-dichloroacetic acid [Beil. XVIII-419], tbls. of monohydrate from aq., anhydrous ndls. from  $\text{C}_6\text{H}_6$ , m.p. 157°, accompanied by some 2,2-dichloroindandione-1,3 [Beil. VII-096, VII-1-(375)], m.p. 124–125°.]

$\bar{\text{C}}$  although insol. in aq.  $\text{Na}_2\text{CO}_3$  gradually dissolves in dil. aq. alkali with conversion (1) to 3-chloro-2-hydroxy-naphthoquinone-1,4 (3-chloro-4-hydroxynaphthoquinone-1,2) [Beil. VIII-301], yel. ndls. from alc., m.p. 215°.]

$\bar{\text{C}}$  with alc.  $\text{NH}_3$  on htg. gives (1) 3-chloro-2-hydroxynaphthoquinone-1,4-imine-4 (3-chloro-4-aminonaphthoquinone-1,2) [Beil. VIII-305], m.p. abt. 200°.]

$\bar{\text{C}}$  with alc. aniline on htg. similarly gives (1) 3-chloro-2-hydroxynaphthoquinone-1,4-anil-1 (3-chloro-4-anilino-naphthoquinone-1,2) [Beil. XII-225], yel. ndls. from AcOH, m.p. 253°.]

$\bar{\text{C}}$  with 2,3-dimethylbutadiene-1,3 (1:8050) in spec. purified  $\text{CHCl}_3$  in s.t. at 100° in dark for 1 hr. readily forms (70% yield (4)) a Diels-Alder type adduct  $\text{C}_{16}\text{H}_{18}\text{O}_2\text{Cl}$ , lemon-yel. ndls. from ether/pet. ether, m.p. 87–88°; this adduct is unstable even at 10° and in alc. or ether soln. on shaking with air loses  $\text{HCl}$  and is oxidized (by loss of 2 hydrogen atoms) giving (87% yield (4)) 2,3-dimethylphenanthraquinone, m.p. 237–238° u.c., 242–243° cor. (4). — For study of reaction of  $\bar{\text{C}}$  with excess 2,3-dimethylbutadiene-1,3 (1:8050) giving 36% yield of a halogen-free prod. of m.p. 135° see (6).

— 3-Chloronaphthoquinone-1,2-oxime-1 (3-chloro-1-nitrosonaphthol-2) [Beil. VII-721]; yel.-red ndls. from hot alc., m.p. 167–168° dec. (7). [Prepd. indirectly.]

	(9) (22) (27)		

Colorless ndls. from aq. or alc.; sol. in 1100 pts. aq. at 20° and in 80 pts. aq. at 100° (17); cas. sol. alc., ether,  $\text{C}_6\text{H}_6$ ,  $\text{CHCl}_3$ , AcOH; spar. sol. lgr. — Volatile with steam (12). — Shows sternutatory props.

[For prepn. of  $\bar{\text{C}}$  from *p*-chlorophenol (3:0475) in  $\text{CCl}_4$  with aq.  $\text{NaOH}$  (very small yield (15)) in pres. of  $\text{Cu}$  (19) or in  $\text{CCl}_4$  with alc.  $\text{KOH}$  in s.t. at 140° for 5–6 hrs. (17) see indic. refs.; from dry sodium *p*-chlorophenolate with  $\text{CO}_2$  at 140–150° under press. see (12) (20); from salicylic acid (1:0780) with  $\text{Cl}_2$  in  $\text{CS}_2$  (65% yield (38)) (3), in MeOH (21) or EtOH (22) (much 3,5-dichlorosalicylic acid (3:4935) also being formed), in AcOH (85%

yield (4)) or in nitrobenzene at 50-60° (23), or with  $C_6H_5ICl_2$  in suitable solvents (89% yield (2)), or by hgt. with  $SbCl_5$  (14), or with  $HCl + 30\% H_2O_2$  (56-66% yield (6)), see indic. refs.; from mono K salicylate in aq. with  $Cl_2$  (24) or from di-potassium salicylate with  $KOCl$  (1) (much 3,5-dichlorosalicylic acid (3:4935) being also formed) see indic. refs.]

[For prepn. of  $\bar{C}$  from 5-chloro-2-aminobenzoic acid (5-chloroanthranilic acid) [Beil. XIV-365] with nitrous acid at 50° see (11); from 5-amino-2-hydroxybenzoic acid (5-amino-salicylic acid) [Beil. XIV-579, XIV<sub>1</sub>-(650)] via diazotization and use of  $Cu_2Cl_2$  reactn. (62-71% yield (16)) (25) see indic. refs.; from 5-chloro-2-hydroxybenzonitrile [Beil. X-104] by hydrolysis with  $H_2SO_4$  see (13); from ethyl 5-chloro-2-hydroxybenzoate (see below) by hydrolysis with  $KOH$  see (7) (25), from 5-chloro-2-methoxybenzoic acid (see below) by cleavage with conc.  $HI$  see (10); from chloral-5-chlorosalicylamide (see below) by hydrolysis with 10%  $NaOH$  see (26); from 5-chlorosalicylin by oxidn. with  $K_2Cr_2O_7 + H_2SO_4$  (18) or with  $KMnO_4$  followed by acid hydrolysis (9) see indic. refs.; from 6-chloro-2,3-dimethylchromone (27), 6-chloro-2,3-diphenylchromone (28), or 7-chloro-1,2,3,4-tetrahydroxanthone (5) by alk. hydroly. see indic. refs.]

[For use of various esters of  $\bar{C}$  as mothproofing agents (29), as insecticides (30), or as plasticizers (31) (32) see indic. refs.; for studies of bactericidal power of  $\bar{C}$  see (33) (34); for study of fate of  $\bar{C}$  in animal body see (35)]

[ $\bar{C}$  on electrolytic reduction in aq. alc.  $H_2SO_4$  yields (36) 5-chloro-2-hydroxybenzyl alcohol [Beil. VI-893], m.p. 93° (36);  $\bar{C}$  on reductn. with  $Na/Hg$  as directed (16) yields 5-chloro-2-hydroxybenzaldehyde (3:2800).]

[ $\bar{C}$  with  $PCl_5$  (37) in lgr. (38) yields 4-chloro-2-chloroformylphenylphosphoryl dichloride,  $Cl.CO.C_6H_4Cl.O-P(O)Cl_2$  [Beil. X-103], oil, b.p. 183-184° at 13 mm. (38);  $\bar{C}$  with  $PCl_5$  yields (38) 4-chloro-2-chloroformylphenyl metaphosphite,  $Cl.CO.C_6H_4Cl.O-P:O$  [Beil. X-103], m.p. abt. 55-57°, b.p. 155-156° at 14 mm. (38).]

[ $\bar{C}$  with  $ClSO_3H$  at 50-70° yields (39) 3-chlorosulfonyl-5-chloro-2-hydroxybenzoic acid [Beil. XI<sub>1</sub>-(106)], pr. from  $AcOH$ , m.p. 206-207° (39).]

[ $\bar{C}$  with  $HNO_3 +$  conc.  $H_2SO_4$  at 0° (23), or  $\bar{C}$  on warming with fuming  $HNO_3$  (22), or  $\bar{C}$  in  $AcOH$  treated with 5 pts. fuming  $HNO_3$  in  $AcOH$  (40), yields 5-chloro-3-nitrosalicylic acid [Beil. X-120], pale yel. ndls., m.p. 162-163° (22); note that by loss of  $CO_2$  and further nitration 4-chloro-2,6-dinitrophenol [Beil. VI-260, VI<sub>1</sub>-(128)], yel. ndls. from aq., m.p. 80° (22), is also formed.]

[ $\bar{C}$  in alc. with  $I_2 + HgO$  gives (41) 5-chloro- $\alpha$ -iodo-salicylic acid, colorless ndls. from hot dil. alc., m.p. 224° sl. dec. (41);  $\bar{C}$  in alk. with  $I_2/KI$  yields (25) by loss of  $CO_2$  and further iodination 4-chloro-2,6-diiodophenol [Beil. VI<sub>1</sub>-(112)], yellowish ndls. from alc., m.p. 108° (25) (ethyl ether, m.p. 69°, acetate, m.p. 127.5° (25)).]

$\bar{C}$  in aq. soln. gives with  $FeCl_3$  a violet coloration.

Salts.  $Li\bar{A}$ ,  $2H_2O$  (8);  $Na\bar{A}$  (8) (12),  $K\bar{A}$  (8) all eas. sol. nq;  $Ca\bar{A}_2 \cdot 3H_2O$  (14),  $Ba\bar{A}_2 \cdot 3H_2O$  (11) (12) (14) (17) (18) see indic. refs.;  $Pb\bar{A}_2$  (11),  $Ag\bar{A}$  (12) (18), insol. aq.

Ⓐ Methyl 5-chloro-2-hydroxybenzoate (methyl 5-chlorosalicylate): ndls. from alc., m.p. 50° (1), 48° (7) (12), b.p. 249° sl. dec. (12). [From  $\bar{C}$  in  $MeOH$  with  $HCl$  gas (12), or from  $Ag\bar{A}$  with  $MeI$  (1): also from methyl salicylate (1:1750) by chlorination with methyl *N,N*-dichlorocarbamate in  $AcOH$  (44).]

— Ethyl 5-chloro-2-hydroxybenzoate (ethyl 5-chlorosalicylate): ndls. from alc., m.p. 25° (7). [From ethyl salicylate (1:1755) with  $SO_2Cl_2$  (7).]

Ⓑ 5-Chloro-2-methoxybenzoic acid: ndls. from aq., m.p. 82° (42), 81-82° (10), 80-81° (4). [Obtd. indirectly from 2-methoxybenzoic acid (1:0685) in  $AcOH$  with  $Cl_2$  (4), or from 5-chloro-2-methoxybenzonitrile by alk. hydrolysis (43).]

① 5-Chloro-2-ethoxybenzoic acid: lfts. from dil. alc., m.p. 118° (7).

② 5-Chloro-2-acetoxybenzoic acid: cryst. from  $C_6H_6$ , m.p. 149° (8), 148° (42), 142° (25). [From  $\bar{C}$  with  $AcCl$  (42).]

③ 5-Chloro-2-hydroxybenzamide: lfts. from alc. or  $C_6H_6$ , m.p. 226-227° (26) (13), 223.5-224° (7), 222-223° (8). [From methyl or ethyl 5-chlorosalicylates (above) with alc.  $NH_3$  (7).] [This amide with chloral (3:5210) gives on warming (26) chloral-5-chloro-2-hydroxybenzamide, ndls. from  $C_6H_6$ , m.p. 148-149° dec. (26).]

3:4707 3,5,6-TRICHLORO-2,4-DIMETHYL-  
PHENOL  
(Trichloro-*m*-4-xenol)

M.P. 174° (1)

Pale yellowish ndls.

[For prepn. of  $\bar{C}$  from 3,5,6-trichloro-2,4-dimethylaniline (1) via diazotization and hydrolysis (yield not stated) see (1).]

[For prepn. of basic Hg and Bi derivs. see (1).]

① 3,5,6-Trichloro-2,4-dimethylphenol methyl ether: m.p. 91.5° (1). [From  $\bar{C}$  with  $Me_2SO_4$  + aq alk. (1).]

② 3,5,6-Trichloro-2,4-dimethylphenol ethyl ether: m.p. 53.5° (1).

③ 3,5,6-Trichloro-2,4-dimethylphenyl acetate: m.p. 86° (1).

— 3,5,6-Trichloro-2,4-dimethylphenyl benzoate: unreported.

3:4707 (1) Bures, Borgmann, *Časopis Českoslov. Lékařnictva*, 7, 270-280 (1927); *Cent.* 1928 I 1171; *C.A.* 22, 4503 (1928).

3:4709 3,4,6-TRICHLORO-2,5-DIMETHYLPHENOL  
(Trichloro-*p*-xylenol)

Beil. VI —

VI<sub>1</sub> —

VI<sub>2</sub>-(467)

M.P. 175° (1)

Pale greenish ndls from alc., AcOH, or pet. eth. or by sublimation — Readily sol. in ether,  $C_6H_6$ , or  $CHCl_3$ , less sol. alc. or other org. solvents; insol. aq. — Volatile with steam.

[For prepn. of  $\bar{C}$  from 3,4,6-trichloro-2,5-dimethylaniline (1), via diazotization and hydrolysis (yield not stated), see (1).]

[For conversion of  $\bar{C}$  to basic Hg or Bi derivs. see (1).]

Ⓐ 3,4,6-Trichloro-2,5-dimethylphenol methyl ether: yellowish ndls from dil. alc. or pet. ether, m.p. 91° (1) [From  $\bar{C}$  with  $Me_2SO_4$  + hot aq. alk. (1).]

Ⓑ 3,4,6-Trichloro-2,5-dimethylphenol ethyl ether: alm. colorless cryst., m.p. 79° (1) [From  $\bar{C}$  with  $Et_2SO_4$  + hot aq. alk. (1).]

Ⓒ 3,4,6-Trichloro-2,5-dimethylphenyl acetate: pr. from alc. + ether, m.p. 103° (1). [From  $\bar{C}$  with  $Ac_2O$  (10 pts.) + trace of  $H_2SO_4$  on hfg. (1).]

Ⓓ 3,4,6-Trichloro-2,5-dimethylphenyl benzoate: hexag. pr. from alc. or pet. ether, m.p. 101° (1) [From  $\bar{C}$  with benzoyl chloride + aq. alk. (1).]

3:4709 (1) Bures, Rubes, *Collection Czechoslov. Chem. Commun.* 3, 648-657 (1929), *C.A.* 24, 1851 (1930) also in *Časopis Českoslov. Lékařnictva*, 8, 225-231, 258-264 (1928); *Cent.* 1929, I 506-507; *C.A.* 23, 3674 (1929).

3:4711 *d,l*- $\alpha,\alpha'$ -DICHLOROSUCCINIC ACID  
(*allo*-Dichlorosuccinic acid;  
isodichlorosuccinic acid)

Beil. II - 619

II<sub>1</sub>-(267)

II<sub>2</sub>-(557)

M.P. 175° u.c. (1) (2) (3) (4) (12)

174-175° dec. (5) (6)

173° (7) (8)

170-172° cor., dec. (9)

170° dec. (10)

[See also *meso*- $\alpha,\alpha'$ -dichlorosuccinic acid (3:4930)]

Cryst. from ether + pet. ether. —  $\bar{C}$  is much more sol. aq. than its *meso* stereoisomer; e.g., 100 cc. satd. aq. soln. of  $\bar{C}$  at 0° conts 54.0 g  $\bar{C}$  (8);  $\bar{C}$  is eas. sol. ether, less so in  $CHCl_3$ .

[For prepn. of  $\bar{C}$  from disodium salt of fumaric acid (1:0895) with  $CCl_4$  in dark or diff. daylight at 5° (yields: 75% (7) 60% (8) 40% (9) 30% (10) (note that as a side reactn. some addn. of chloromaleic acid, and that under some conditions the yield is 10% (9)) from maleic anhydride (1:0625) in  $CCl_4$  by addn. of  $Cl_2$  in sunlight followed by hydrolysis see (12) (9); from *d,l*- $\alpha,\alpha'$ -diaminosuccinic acid [Beil. IV-487, IV<sub>2</sub>-(901)] in aq. HCl soln. with  $NOCl$  see (2); from benzoquinone

dichloride [Beil. VII-573] (13) or toluquinone dichloride [Beil. VII-576] (13) by oxidn. with aq.  $\text{KMnO}_4$  (or  $\text{BaMnO}_4$ ) at  $0^\circ$  see (3); from *d,l*- $\alpha,\alpha'$ -dichlorosuccinyl (di)chloride (3:0395) by aq. hydrolysis see (14)]

$\bar{C}$  behaves as a normal dibasic acid: titration with standard dil. aq. alk. gives Neut. Eq. 93.5. — For study of acid strength ( $K_1 = 372.0 \times 10^{-4}$  at  $16^\circ$ ;  $K_2 = 18.0 \times 10^{-4}$  at  $16.7^\circ$  (8) cf. (15); for study of conductivity see (4).

[Salts (of metals):  $(\text{NH}_4)_2\bar{A} \cdot 2\text{H}_2\text{O}$  (10),  $\text{K}_2\bar{A} \cdot \text{H}_2\text{O}$  (6),  $\text{KH}\bar{A} \cdot 2\text{H}_2\text{O}$  (6),  $\text{CaA} \cdot 2\frac{1}{2}\text{H}_2\text{O}$  (10),  $\text{Ba}\bar{A} \cdot 7\text{H}_2\text{O}$  (10),  $\text{Cu}\bar{A} \cdot 2\frac{1}{2}\text{H}_2\text{O}$  (10), all eas. sol. aq.;  $\text{Sr}\bar{A} \cdot 7\text{H}_2\text{O}$  (10), sol. in 15 pts. aq.;  $\text{Pb}\bar{A} \cdot 3\text{H}_2\text{O}$  (10) spar. sol. aq.]

$\bar{C}$  on boilg. with aq. (12) or with aq.  $\text{KOH}$  (7) (6) or aq. acid (6) loses 1  $\text{HCl}$  yielding chlorofumaric acid (3:4853); for study of rate at  $25^\circ$  see (7) (16).

[ $\text{K}_2\bar{A}$  in aq. soln. maintained at neutrality at  $100^\circ$  yields mainly (6) *d,l*-tartaric acid (1:0550)]

$\bar{C}$  with  $\text{PCl}_5$  (2 moles) gives (100% yield (14)) *d,l*- $\alpha,\alpha'$ -dichlorosuccinyl (di)chloride (3:0395), m.p.  $39^\circ$ .

③ Dimethyl *d,l*- $\alpha,\alpha'$ -dichlorosuccinate: m.p.  $43^\circ$  (see 3:0485).

— Diethyl *d,l*- $\alpha,\alpha'$ -dichlorosuccinate: oil (see 3:9578).

— Acid salt of  $\bar{C}$  with *d,l*- $\alpha$ -phenylethylamine: pr. from aq., m.p.  $149$ – $150^\circ$ , rap. htg. (6); satd. aq. soln. at  $25^\circ$  conts. 18.67 g./liter (6). [For details of resolution of  $\bar{C}$  with opt. act.  $\alpha$ -phenylethylamine see (6) (1); note incidentally that, although m.p. of  $\bar{C}$  is  $175^\circ$ , the m.p. of each of the opt. act. stereoisomeric forms is lower, viz.,  $166$ – $167^\circ$  dec. (6),  $168^\circ$  (1).]

185° (6)

[See also 4,5-dichlorophthalic acid (3:4890).]

Tbls. or pr. from hot toluene or from  $\text{CCl}_4$ ; spar. sol. cold but eas. sol. hot  $\text{C}_6\text{H}_6$  or toluene; very little sol. in  $\text{CCl}_4$ .

[For prepn. of  $\bar{C}$  from 4,5-dichlorophthalic acid (3:4890) by htg. at 200° (4) or by htg. with  $\text{AcCl}$  (2) see indic. refs.; for formn. of  $\bar{C}$  (together with other isomers) from phthalic anhydride (1:0725) with  $\text{Cl}_2$  in pres. of Fe or Fe salts at 160–200° (5), or from phthalic anhydride (1:0725) or 3-chlorophthalic anhydride (3:3900) with  $\text{Cl}_2$  in fumg.  $\text{H}_2\text{SO}_4$  in pres. of  $\text{I}_2$  (4) (1), see indic. refs.; for formn. of  $\bar{C}$  from aq. solns. of alk. salts of phthalic acid (1:0820) with  $\text{Cl}_2$  see (2) (6) (7).]

[For sepn. of  $\bar{C}$  from isomeric dichlorophthalic anhydrides by means of salts of corresp.

acids, etc., see (4) (8) (1); by means of differential hydrolysis with  $\text{H}_2\text{SO}_4$  (prods. with no  $\alpha$  chlorine such as  $\bar{\text{C}}$  require  $\text{H}_2\text{SO}_4$  of 98–100% concn., those with 1  $\alpha$  chlorine such as 3,4-dichlorophthalic anhydride hydrolyze with 56–95%  $\text{H}_2\text{SO}_4$ , those with 2  $\alpha$  chlorine atoms such as 3,6-dichloro- or 3,4,5,6-tetrachlorophthalic anhydrides hydrolyze at  $\text{H}_2\text{SO}_4$  concns. of less than 50%) see (9).]

$\bar{\text{C}}$  dislvd. in nbs. alc. yields (4) ethyl hydrogen 4,5-dichlorophthalate, ndls. from  $\text{CHCl}_3$ , m.p. 133–134° (4).

[ $\bar{\text{C}}$  with 1 mole  $\text{NH}_2\text{OH} \cdot \text{HCl} + \text{Na}_2\text{CO}_3$  in aq. soln. as directed (4) yields 4,5-dichlorophthaloylhydroxylamine (*N*-hydroxy-4,5-dichlorophthalimide) [Beil. XXI-504], pr. from  $\text{MeOH}$ , m.p. 195–197° dec. (4); this prod. on warming with aq.  $\text{Na}_2\text{CO}_3$  gives 100% yield 4,5-dichloro-2-aminobenzoic acid (4,5-dichloroanthranilic acid) [Beil. XIV-368, XIV-1-(549)], m.p. 213–214° (4).]

[ $\bar{\text{C}}$  with steam passed over cat. nt 380–420° loses  $\text{CO}_2$  presumably yielding (10) 3,4-dichlorobenzoic acid (3:4925).]

$\bar{\text{C}}$  with benzene +  $\text{AlCl}_3$  (12) or in acetylene tetrachloride (11) gives (98% yield (12)) 4,5-dichloro-2-( $\alpha$ -benzoyl)benzoic acid [Beil. XI-(357)], cryst. from  $\text{C}_6\text{H}_6$  (12) or toluene (11), m.p. 209° (12), 208° (11), which on htg with 20 pts. conc.  $\text{H}_2\text{SO}_4$  at 160° for 1 hr. gives (92% yield (12)) (11) 2,3-dichloroanthraquinone [Beil. VII-788, VII-1-(413)], yellowish ndls. from  $\text{AcOH}$ , m.p. 267° cor. (12), 265° (11). — [ $\bar{\text{C}}$  with  $\alpha$ -xylene +  $\text{AlCl}_3$  in acetylene tetrachloride gives (80% yield (11)) 4,5-dichloro-2-(3',4'-dimethylbenzoyl)benzoic acid, cryst. from cyclohexane, m.p. 184° (11), which with 10 pts. conc.  $\text{H}_2\text{SO}_4$  at 100° gives (45% yield (11)) 6,7-dichloro-2,3-dimethylanthraquinone, cryst. from xylene, m.p. 305° (11). —  $\bar{\text{C}}$  with *o*-dichlorobenzene (3:6055) +  $\text{AlCl}_3$  4 hrs. at 100° gives (80% yield (11)) 3,4-dichloro-2-(3',4'-dichlorobenzoyl)benzoic acid, cryst. from  $\text{C}_6\text{H}_6$ , m.p. 183°, which with 12 pts. conc.  $\text{H}_2\text{SO}_4$  6 hrs. at 100° gives mainly 2,3,6,7-tetrachloroanthraquinone, cryst. from *o*-dichlorobenzene, m.p. 348° (11). — For analogous reactns. of  $\bar{\text{C}}$  with naphthalene (13), pyrene (14), or *o*-chlorotoluene (15) see indic. refs.]

[ $\bar{\text{C}}$  with hydroquinone (1:1590) +  $\text{H}_3\text{BO}_3$  htd. nt 190° and afterward treated with hot conc.  $\text{H}_2\text{SO}_4$  at 150–165° (16), or  $\bar{\text{C}}$  with  $\text{AlCl}_3$  +  $\text{NaCl}$  htd. at 200–220° (17), or  $\bar{\text{C}}$  with *p*-chlorophenol (3:0475) htd. with fuming  $\text{H}_2\text{SO}_4$  +  $\text{H}_3\text{BO}_3$  (18) gives (yield: 80% (17), 15% (16)) 6,7-dichloro-1,4-dihydroxyanthraquinone (6,7-dichloroquinizarin) [Beil. VII-452, VIII-1-(716)], red-br. cryst. from xylene, m.p. 295.5° (17), 288° (16), (diacetate, m.p. 125° (16), dimethyl ether, m.p. 168.5° (17)).]

[For use of  $\bar{\text{C}}$  in prepn. of pigments of the copper phthalocyanine type see (19).]

$\bar{\text{C}}$  with  $(\text{NH}_4)_2\text{CO}_3$  htd. at 250° for  $\frac{1}{2}$  hr. (20) yields 4,5-dichlorophthalimide, pl. from alc., m.p. 221° (20) (note that behavior of  $\bar{\text{C}}$  with conc. aq.  $\text{NH}_4\text{OH}$  is different yielding (4) 4,5-dichlorophthalamic acid (not specifically characterized) which with alk.  $\text{NaOCl}$  gives 4,5-dichloro-2-aminobenzoic acid (above)). — [For behavior of  $\bar{\text{C}}$  with hydrazine hydrate in  $\text{AcOH}$  yielding corresp. cyclohydrazide see (21).]

$\bar{\text{C}}$  (1 pt.) in boilg.  $\text{AcOH}$  (6 pts.) treated with *n*-aniline (1 pt.) gives (82% yield (1)) 4,5-dichlorophthalanil (*N*-phenyl-4,5-dichlorophthalimido) [Beil. XXI-1-(301)], cryst. from  $\text{AcOH}$ , m.p. 212.5–213° cor. (1).

$\bar{\text{C}}$  on saponification with standard alkali (Sap. Eq. = 108.5), followed by acidification, yields 4,5-dichlorophthalic acid (3:4890) q.v

185° at 760 mm.	(18)

White cryst. with camphoraceous odor which readily sublime without melting. — Cryst. from alc., ether,  $\text{CHCl}_3$  or  $\text{CS}_2$ . —  $\bar{C}$  is trimorphous: below about 46° cryst.  $\bar{C}$  is orthorhombic, in range 46-71° cryst.  $\bar{C}$  is triclinic; about 71° cryst.  $\bar{C}$  is cubic at these transition temps. volume alterations occur which have sometimes (5) been mistaken for m.p.'s. — [For details on trimorphism and these transitions see (19) (8) (20) (21) (25) (26); for influence of high press. see (22) — For crystallographic data see (20) (23) (24); for X-ray crystallog. data see (27) (28)]

$\bar{C}$  is almost abs. insol. aq. and vice versa at ord. temp. (29); for patents on drying of  $\bar{C}$  see (30) (31) — [For studies of vap. press. of  $\bar{C}$  at various temps. see (13) (1) (7) (32). — For prevention of "caking" of cryst.  $\bar{C}$  by addn. of 1-10% paraformaldehyde see (33)]

Cryoscopic const. of  $\bar{C}$ , i.e., f.p. lowering per mole solute in 100 g.  $\bar{C}$ , is 5.6° (34). [For thermal anal. of binary systems of  $\bar{C}$  with naphthalene (1:7200) (8) (34), with phenanthrene (1:7210) (34), or with anthracene (1:7235) (31) see indic. refs.]

# USES OF $\bar{C}$

$\bar{C}$  finds many uses in industry, some based on its physical characteristics and some on its chem. behavior. — [I.g., for use of  $\bar{C}$  as solvent for prepn. of solid solns. of  $\text{I}_2$  for use in place of usual tincture see (35); for use of  $\bar{C}$  as means for temporary marking of cloth removable at will by heat (sublimation) see (36)]

[For use of  $\bar{C}$  as addition agent to  $CCl_4$  fire extinguishers see (37); as component of certain types of explosives (e.g., 75% nitrostarch + 20%  $\bar{C}$  + 5%  $NaNO_3$ ) see (38); for use of  $\bar{C}$  as mothproofing agent see (39) (40) (41) (42); for use of  $\bar{C}$  as insecticide and/or fungicide see (43) (44); for use of  $\bar{C}$  together with  $CS_2$  (45) or rotenone (46) as insecticides see indic. refs.]

$\bar{C}$  is an important component of "HC" smoke candles or grenades used for the production of screening clouds or smokes; a mixture of  $\bar{C}$  with powdered metal (usually Zn) once started undergoes vigorous decomposition yielding  $ZnCl_2 + C$ ; other materials are usually added to ignite the mixture and to modify the character of the resultant smoke; for further details see (47) (48) (49). — [For use of this type of reactn. in prepn. of activated carbon see (153)]

### PHYSIOLOGICAL ASPECTS OF $\bar{C}$

[For studies of toxicity of  $\bar{C}$  and its ability to penetrate skin see (50) (51) (52) cf. (160); for studies of  $\bar{C}$  as anthelmintic see (53) (54); for study of antiseptic power of  $\bar{C}$  see (55).]

### DETERMINATION OF $\bar{C}$

For detn. of  $\bar{C}$  by reactn. with Na + ethanolamine in dioxane followed by detn. of resultant chloride ion see (161).

### PREPARATION (OR FORMATION) OF $\bar{C}$

$\bar{C}$  is a by-product of the tech. prepn. of  $CCl_4$  (5:5100) from  $CS_2 + Cl_2$  (56), of prepn. of  $CHCl_3$  (3:5050) and of  $CH_2Cl_2$  (3:5020) (57), and is found (12) (together with other by-products) in the high-boilg. fractn. ("Tri-Nachlauf") from the prepn. of trichloroethylene (3:5170) from acetylene tetrachloride (3:5750). — For quick prepn. of  $\bar{C}$  from  $CCl_4$  (3:5100) refluxed with Al powder (80% yield (14)) or with Al/Hg (65% yield (58)) cf. (96) see indic. refs.; for prepn. of  $\bar{C}$  from ethylene with  $Cl_2$  over activated carbon at 300–350° (90% yield) see (59). — For many other methods of preparation, manufacture, or formation see below.

From various polychloroethanes. From 1,2-dichloroethane (ethylene dichloride) (3:5180). [For prepn. of  $\bar{C}$  from ethylene dichloride in vapor phase with  $Cl_2 + cat.$  (60) (61) or with  $Cl_2$  under press. (62) see indic. refs.; note that ethylene dichloride in liq. phase with  $Cl_2$  gives mainly (61) 1,1,2-trichloroethane (3:5085). — Note also that 1,2-dibromoethane (ethylene dihydride) refluxed with  $AlCl_3$  while treated with  $Cl_2$  (63) gives  $\bar{C}$ .]

From 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750). [For formn. of  $\bar{C}$  together with other prods. from acetylene tetrachloride over pumice at 700° (64), or with anhydr.  $FeCl_3$  on hgt. in s.t. (65), or with  $Cl_2$  (66) in u.v. light at 50–60° (67) or X-radiation (68), or with  $Cl_2$  over activated carbon at 300–400° (69) (70) or at 60–70° (71), or with  $Cl_2$  in pres. of  $AlCl_3$  at 20–100° (71) or at 120° under reflux (80% yield (72)), or with  $Cl_2$  in pres. of Fe at 20–80° (71), or with  $Cl_2$  in  $CCl_4$  soln. (73), or even with aq. bleaching powder (71), see indic. refs. — (Note also that acetylene tetrabromide with  $AlCl_3 + Cl_2$  under reflux yields (63)  $\bar{C}$ ).]

From pentachloroethane (3:5880). [For formn. of  $\bar{C}$  together with other prods. from pentachloroethane with dry  $Cl_2 + AlCl_3$  or with carbon at 300–400° (70), or with  $Cl_2$  in u.v. exc. 10 hrs. (16), see indic. refs. — (Note also that ShC for 2 hrs. gives (75)  $\bar{C}$ ).]

From various  $\bar{C}$  (3:5170). [For formn. of  $\bar{C}$  over

pumice at 700° (64), or with anhydrous  $\text{FeCl}_3$  on htg. in s.t. (65), or with  $\text{Cl}_2$  over act. carbon at 60–70° (98% yield (70)), see indic. refs.]

*From tetrachloroethylene (3:5460).* [For prepn. and/or formn. of  $\bar{\text{C}}$  from tetrachloroethylene with  $\text{Cl}_2$  (162) (76) (77) in direct sunlight (78) cf. (79) (80) (106) or in pres. of suitable cat. in dark at 80–100° (81), or in  $\text{CCl}_4$  soln. at 22° (82) cf. (73) or in vapor phase at 40° and low press. in light and absence of oxygen (33) see indic. refs. (note that tetrachloroethylene (3:5460) with  $\text{Cl}_2$  + light in presence of  $\text{O}_2$  undergoes photo-oxidation to trichloroacetyl chloride (3:5420)).] — For formn. of  $\bar{\text{C}}$  from tetrachloroethylene with  $\text{SO}_2\text{Cl}_2$  in pres. of dibenzoyl peroxide (84), or in small amt. with dibenzoyl peroxide alone (85), or with chlorine monoxide in  $\text{CCl}_4$  at –20° (86), see indic. refs.] See also below under formn. of  $\bar{\text{C}}$  from acetylene.

*From dichloroacetylene (3:5010).* [For formn. of  $\bar{\text{C}}$  from dichloroacetylene with  $\text{Cl}_2$  in  $\text{CCl}_4$  soln. see (2).]

*From various polychloromethanes. From trichloromethane (chloroform) (3:5050).* [For formn. of  $\bar{\text{C}}$  together with other prods. from  $\text{CHCl}_3$  by pyrolysis at 425° (87), in electric arc (6), by actn. of radium radiation (88), or by actn. of  $\text{NCl}_3$  in sunlight (89) see indic. refs.]

*From carbon tetrachloride (3:5100).* [For formn. of  $\bar{\text{C}}$  together with other prods. from  $\text{CCl}_4$  by pyrolysis at 600–1500° (90) cf. (91) (76), by actn. of electric arc (6), dark elec. discharge (92), or radium radiation (88), with hydrogen at 600–650° (93), or with hydrogen over reduced Ni at 270° (94), or from  $\text{CCl}_4$  in nitrogen over  $\text{GeO}_2$  at 500–865° (95), see indic. refs.]

[For prepn. of  $\bar{\text{C}}$  from  $\text{CCl}_4$  (3:5100) by refluxing with Al powder (80% yield (14)), Al/Hg (65% yield (38)), or Al +  $\text{AlCl}_3$  (96), or by htg. with Cu powder in s.t. at 120° (97), amorphous As in s.t. at 160° (98), or molecular Ag in s.t. at 200° (99), see indic. refs.]

*From various hydrocarbons. From methane.* [For formn. of  $\bar{\text{C}}$  together with other prods. from  $\text{CH}_4$  +  $\text{Cl}_2$  in silent elec. discharge see (100).]

*From ethane.* [For formn. of  $\bar{\text{C}}$  together with other prods. from ethane with  $\text{Cl}_2$  in pres. of activated carbon or other cat. at elev. temp. see (101) (102) (103).]

*From ethylene.* [For formn. of  $\bar{\text{C}}$  together with other prods. from ethylene with  $\text{Cl}_2$  over act. carbon at 120–125° (104) or at 300–350° (90% yield (50)) cf. (101) (105).]

*From acetylene.* [For formn. of  $\bar{\text{C}}$  together with other prods. from acetylene with  $\text{Cl}_2$  at 650–1000° as directed (106) or at 700–950° as directed (107), with  $\text{Cl}_2$  in an inert gas such as  $\text{N}_2$  or  $\text{HCl}$  over act. carbon at elev. temp. (108), or with  $\text{S}_2\text{Cl}_2$  in pres. of 1–2% reduced iron (109) (110) see indic. refs. — (Note that by this mode of procedure acetylene tetrachloride (see this heading above) is a probable intermediate.)]

*From miscellaneous sources.*  $\bar{\text{C}}$  has been observed as one of the products of decomposition of many different types of compounds contg. the — $\text{CCl}_3$  group [For example, for formn. of  $\bar{\text{C}}$  (together with other prods.) from iodotrichloromethane on distn. (111), from bromotrichloromethane in ultraviolet light (112), from trichloroacetyl chloride (3:5420) at 600° (113), from trichloroacetyl bromide in s.t. at 400° (113), from trichloroacetyl iodide on distn. at ord. press. (113), from nitrosotrichloromethane with  $\text{O}_2$  at 120° (114), or from nitrotrichloromethane (chloropierin) with  $\text{HCl}$  gas over pumice at 400° (1) see indic. refs. — For formn. of  $\bar{\text{C}}$  together with other prods. from trichloroacetaldehyde (chloral) (3:5210) with  $\text{Cl}_2$ ,  $\text{Br}_2$ , or  $\text{I}_2$  in pres. of  $\text{AlCl}_3$  (115), from trichloroacetic acid (3:1150) by pyrolysis over  $\text{TiO}_2$ , kaolin, or carbon (116), from K trichloroacetate by electrolysis of its soln. in aq. KOAc (15), from ferric trichloroacetate in aq. soln. in light (117) (118) (110), from pentachlorodimethyl ether on htg. with aq. (120), or from trichloromethyl benzoate on htg. (121) see indic. refs.]

The formn. of  $\bar{\text{C}}$  has also been observed in connection with certain acid chlorides [e.g.,

for formn. of  $\bar{C}$  from acetyl chloride (3:7065) with excess  $PCl_5$  in s.t. nt  $180^\circ$  (122), from pentachloropropionyl chloride (3:0470) with  $AlCl_3$  on warming (123), from dichloromaleyl (di)chloride (3:6197) with  $PCl_5$  nt  $230^\circ$  for 6 hrs. (124), or from pentachloroethyl chloroformate with  $AlCl_3$  at  $100^\circ$  (125) see indic. refs.]

[For formn. of  $\bar{C}$  from various alkanes with  $SbCl_5 + I_2$  (126), from a mixt. of dichloropropanes or from hexachlorobutadiene (3:6425) with  $Cl_2$  at  $400^\circ$  and 30 atm. (127), from an electric arc between carbon electrodes in  $Cl_2$  (128), from *n*-propyl chloride (3:7040) or isobutyl chloride (3:7135) with excess  $ICl_3$  in s.t. nt  $200^\circ$  (129), from  $CaC_2$  with gaseous or liq.  $Cl_2$  at  $20^\circ$  under press. (10), from various iodochlorides of ethylene on warming (9), from lignin on oilg with  $SbCl_5 + I_2$  (130), from humic acid with  $KClO_3 + HCl$  (131), from  $\beta, \beta'$ -dichlorodiethyl sulfide ("mustard gas") with dry  $Cl_2$  at  $100^\circ$  (132), or from  $\alpha, \alpha, \beta, \beta, \beta', \beta'$ -hexachlorodiethyl sulfide or  $\alpha, \alpha, \beta, \beta, \beta', \beta'$ -heptachlorodiethyl sulfide with  $Cl_2$  in cold (133) see indic. refs.]

### CHEMICAL BEHAVIOR OF $\bar{C}$

**Pyrolysis.** [ $\bar{C}$  passed over porcelain in hot tube gives (78) tetrachloroethylene (3:5460);  $\bar{C}$  (in stream of air) pyrolyzed nt  $550$ – $600^\circ$  gives (57) tetrachloroethylene (3:5460) +  $CCl_4$  (3:5100) in conversions of substantially 100%. — Note also that  $\bar{C}$  with  $SbCl_5$  above  $450^\circ$  yields almost exclusively (126)  $CCl_4$  (3:5100).]

**Reduction.**  $\bar{C}$  with granulated Zn in boilg. alc. (134), with Zn + dil.  $H_2SO_4$  nt room temp. for several days (100% yield (135)) (136) (76), with Zn + aq. above  $80^\circ$  (137), with  $H_2$  over Ni nt  $270^\circ$  (138), or with alc. KSH (139) loses 2 chlorine atoms giving tetrachloroethylene (3:5460) [for other, less direct conversions of  $\bar{C}$  to tetrachloroethylene see latter under preparation; also below.]]

**Oxidation.**  $\bar{C}$  is oxidized only with considerable difficulty [e.g., for behavior of  $\bar{C}$  over hot CuO see (140); for detn. of chlorine in  $\bar{C}$  by cat. oxidn. over  $Fe_2O_3$  (low results) see (141);  $\bar{C}$  with  $CrO_3/H_2SO_4$  is incompletely oxidized (142);  $\bar{C}$  with  $SO_3$  in s.t. nt  $150^\circ$  (143) cf. (144) yields trichloroacetyl chloride +  $S_2O_5Cl_2$ .]

**Partial replacement of chlorine by fluorine.** [ $\bar{C}$  with  $F_2$  gas over Cu gauze cat. st  $125^\circ$  (145), or with  $SbF_3Cl_2$  htd. under press. (146) (147) (148), or with  $SbF_3 + Cl_2 + SbCl_5$  as directed (149) yields 1,1,2,2-tetrachloro-1,2-difluoromethane, m.p.  $24$ – $25^\circ$ , h.p.  $92^\circ$ , accompanied by numerous other partially fluorinated prods.]]

**Behavior with alkalis.** [ $\bar{C}$  with solid KOH in s.t. nt  $210$ – $220^\circ$  for several days yields (150) KCl + potassium oxalate;  $\bar{C}$  with alc. KOH in s.t. at  $100^\circ$  for a week yields (151) the same prods. accompanied by ethylene and hydrogen;  $\bar{C}$  with *N*/10 abs. EtOH/NaOH at  $25^\circ$  (17), with alc.-free NaOEt in ether under press. htd. to  $140^\circ$  (152), yields tetrachloroethylene (3:5460) (for study of kinetics see (17)).]

**Behavior with metals.** [ $\bar{C}$  with alk. or alk.-earth metals is (like many other polychloro compounds) subject to explosion by mechanical shock; for study of sensitivity of  $\bar{C}$  with Li, Na, K, Mg, Ca, Sr, Ba, Al, or Ti see (154). —  $\bar{C}$  with "molecular" Ag at  $280^\circ$  loses 2 atoms of chlorine yielding (99) tetrachloroethylene (3:5460).]

**Behavior with organometallic compounds.** [For behavior of  $\bar{C}$  with  $RMgX$  compds. see (155) (166);  $\bar{C}$  does not (11) react with Hg di-(*p*-tolyl).]

**Behavior with  $NH_3$  or organic bases.** [ $\bar{C}$  with  $NH_3$  at  $700$ – $800^\circ$  gives up its halogen quant. (157) yielding  $NH_4Cl$ . —  $\bar{C}$  with excess phenylhydrazine in xylene soln. on stdg. or on warming is reduced to tetrachloroethylene (3:5460),  $HCl$ ,  $C_6H_6$ , and  $N_2$  also being formed (158) (note that analogous reactns. are also shown by 1,1,2,2-tetrachloroethane (3:5750) and by pentachloroethane (3:5880)). — For kinetics of reactn. of  $\bar{C}$  with pyridine or piperidine see (159).]

## 3:4840 3,5-DICHLOROBENZOIC ACID

 $C_7H_4O_2Cl_2$ 

Beil. IX - 344

IX<sub>1</sub>-(141)

M.P. 188° (1) (2) (3) (4) (5)

184-185° (6)

182.5-183° (7) (11)

182-182.5° (8)

Ndls from alc. — Sublimes (10). — Very eas. sol. alc., spar. sol. aq. or lgr.

[For prepn from 3,5-dichlorotoluene (3:6310) by oxidn. with dil.  $HNO_3$  at 150-170° see (8) (7); from 3,5-dichlorobenzaldehyde (3:1475) by oxidn. with  $KMnO_4$  (74% yield) see (3); from 3,5-dichlorobiphenyl (3:0360) by oxidn. with  $CrO_3 + AcOH$  see (9); for prepn. from 3,5-diaminobenzoic ac. via diazo reactn. see (1), from 4-amino-3,5-dichlorobenzoic ac. via diazo reactn. see (2); from 3,5-dichloroaniline via conv. to acid hydrolysis of the nitrile see (10), for prepn. from 5-nitro-3-sulfobenzoic acid via  $PCl_5$  and subsequent boilg. with alk. see (11).]

$\bar{C}$  added to 8 pts. fuming  $HNO_3$  ( $D = 1.48$ ), stood 2-3 hrs. at 70°, cooled, ppts. 75% yield 2-nitro-3,5-dichlorobenzoic ac., ndls. from dil. alc., m.p. 194° cor. (5). [This prod. depresses m.p. of  $\bar{C}$  (5).]

$\bar{C}$  with  $PCl_5$  yields (12) 3,5-dichlorobenzoyl chloride, b.p. 135-137° at 25 mm. (12).

— Methyl 3,5-dichlorobenzoate: m.p. 58° (13).

— Ethyl 3,5-dichlorobenzoate: m.p. unrecorded. [For study of velocity of hydrolysis see (14).]

— 3,5-Dichlorobenzamide: unrecorded.

— 3,5-Dichlorobenzanilide: ndls. from dil. alc., m.p. 145° (15).

(10) (15)

B.P. 309-310° at 754.3 mm. sl. dec. (7)

195° at 16 mm.

(3)

Cryst. from alc. as monohydrate,  $\bar{C} \cdot H_2O$ , m.p. 174°; anhydrous ndls. from  $C_6H_6$ ; sublimes in long ndls. — Very insol. aq. (17), very eas. sol. alc., ether; mod. sol.  $C_6H_6$ ; spar. sol. cold lgr.; for quant. data on solubility in 15 solvents at 7 temps. from 0° to 60° see (1) (17). — Odor pronounced only on htg.; dust of  $\bar{C}$  causes sneezing. — Slightly volatile with steam.

[For general review see (1), for use as wood preservative see (17) (19); for studies on toxicity see (20) (21); for fate of  $\bar{C}$  in organism see (22).]

[For prepn. see Beil. VI-194, VI<sub>1</sub>-(104); for comml. prepn. from hexachlorobenzene (3:4939) + NaOH + MeOH see (12) cf. (23); from chlorination of phenol or polychlorophenols in pres. of  $AlCl_3$  see (13), from "hexachlorophenol" (3:3180) by reduction with  $SO_2$  in alc. see (18).]

$\bar{C}$  is acidic and in alc. soln. titrates quant. using thymol-blue (Neut. Eq. = 266.5) (1). [For dissociation const. see (2).] —  $\bar{C}$  is insol. in  $NH_4OH$  (1) but slowly dis. in cold  $Na_2CO_3$  soln. (8) —  $\bar{C}$  in alk. soln. does not couple with diazonium salts. [For spectrophotometric detn. see (11).]

Salts. See Beil. VI-194.  $Na\bar{A}$ , ndls. (from acetone + lgr.), spar. sol. aq. (3),  $Na\bar{A} \cdot H_2O$ , loses aq. at 110°, sol. aq., alc., ether. [For comml. application as preservative see (1) (14).] —  $Ag\bar{A}$ , yel. ppt. turning orange on drying. — Heavy metal salts insol. aq. and often colored (1).

$\bar{C}$  in alk. shaken with  $(CH_3)_2SO_4$  (6), or  $\bar{C}$  treated with diazomethane (6), or  $\bar{C}$  htd. in MeOH with  $CH_3I$  + KOH (15), yields its methyl ether, pentachloroanisole, ndls. from alc., m.p. 108° (6), 106.5° (6).

① Pentachlorophenyl acetate: from  $\bar{C}$  on htg. with  $Ac_2O$  +  $NaOAc$  (15) or from  $\bar{C}$  in  $CS_2$  +  $AcCl$  +  $AlCl_3$  (16); ndls. from alc., m.p. 149.5-150.5° (16), 147-148° (15). [This prod. is very resistant to saponification (16).]

③ Pentachlorophenyl benzoate: from  $\bar{C}$  +  $BzCl$  by warming in pyridine (3); ndls. from alc., m.p. 164-165° (3), 150-160° (15), 159° (19). [Very resistant to saponification (16)]

[See also chloromaleic acid (3:3432).]

TbIs from AcOH —  $\bar{C}$  is very eas. sol. aq, alc. or ether; spar. sol.  $C_6H_6$  or lgr. —  $\bar{C}$  sublimes without forming anhydride

[For prepn of  $\bar{C}$  from chloromaleic acid (3:3432) by repeated evapn. with conc. HCl see (5) (2); from *d,l*- $\alpha,\alpha'$ -dichlorosuccinic acid (3:4711) on boilg. with aq (7), or with aq. KOH (8) (9) or aq acid (9) see indic refs; from *meso*- $\alpha,\alpha'$ -dichlorosuccinic acid (3:4930) with aq KOH at 0° see (7) (8) (9) (note that from this source action of acid yields (9) both  $\bar{C}$  and chloromaleic acid (3:3432)), from diethyl *d,l*- $\alpha,\alpha'$ -dichlorosuccinate (3:9578) on hydrolysis with boilg. 30%  $H_2SO_4$  see (1); from diethyl chlorofumarate (3:6864) by evapn. with 1:1 HCl see (6); from chlorofumaro(di)nitrile (b.p. 172° at 74 mm., 64.0-64.2° at 10 mm.,  $D_4^{20} = 1.2499$ ,  $n_D^{20} = 1.49571$  (22)), by hydrol. see (22)]

[For formn of  $\bar{C}$  from diethyl oxaloacetate [Beil. III-782, III<sub>1</sub>-(273), III<sub>2</sub>-(479)] by actn. of  $PCl_5$  followed by alc. KOH see (11); from acetylenedicarboxylic acid [Beil. II-801, II<sub>1</sub>-(317), II<sub>2</sub>-(670)] with conc. HCl on stdg. 19 days at room temp. see (12) cf. (13); from 3-chlorofuroic acid [Beil. XVIII-282] on oxidn with dil  $HNO_3$  or from 3,5-dichlorofuroic acid [Beil. XVIII-283] or 4,5-dichlorofuroic acid [Beil. XVIII-283] on oxidn. with  $Br_2$ /aq. see (14).]

$\bar{C}$  on gentle boilg. largely decomposes into  $CO + CO_2 + HCl$  (5); but  $\bar{C}$  on vigorous boilg. splits off aq. and isomerizes (or vice versa) yielding (5) chloromaleic anhydride (3:0280). —  $\bar{C}$  with  $P_2O_5$  (6) (15), or with  $POCl_3$  (16) or with  $AcCl$  (5), gives on distn. chloromaleic anhydride (3:0280). —  $\bar{C}$  (1 mole) with chlorofumaryl (di)chloride (3:6105) (1 mole) at 125° for 1 hr. also yields (17) chloromaleic anhydride (3:0280).

[ $\bar{C}$  (as  $K_2\bar{A}$ ) in aq. soln. with  $Na/Hg$  is dehalogenated and reduced yielding (18) succinic acid (1:0530).]

$\bar{C}$  readily reduces aq.  $KMnO_4$ .

[ $\bar{C}$  in aq. soln. on protracted treatment with  $Cl_2$  gives (19)  $\beta,\beta,\beta$ -trichloro- $\alpha,\alpha$ -dihydroxypropionic acid ("trichloropyruvic acid hydrate") [Beil. III-623, III<sub>2</sub>-(408)], adls. from  $CHCl_3$ , m.p. 102° (19). —  $\bar{C}$  does not (5) add  $Br_2$  even at 100° (dif. from chloromaleic acid (3:3432)).]

$\bar{C}$  behaves normally as a dibasic acid: e.g., titration with standard dil. aq. alk. gives Neut. Eq. 75.3; for study of electrometric titration see (2).

[Salt.  $(NH_4)_2\bar{A}$ , cas. sol. aq. (5), but spar. sol.  $MeOH$ ,  $EtOH$ , and insol. in ether, acetone,  $AcOEt$ ,  $CHCl_3$ , or  $C_6H_6$  (20) see indic. refs. —  $KH\bar{A}$ , much less sol. than corresp. prod. from chloromaleic acid, e.g., 100 g. of its satd. soln. at 15° conts. 3.843 g.  $KH\bar{A}$  (5). —  $Ag_2\bar{A}$  (10) (12). —  $Ba\bar{A} \cdot 3H_2O$ , fairly sol. aq. (10). —  $Pb\bar{A} \cdot 2H_2O$  (13).]

[ $\bar{C}$  on stdg. at ord. temp. with slight excess 0.76  $N$  aq.  $KOH$  gives chlorine ion about 40 times as fast (12) as the isomeric chloromaleic acid (3:3432).]

The acid (di)chloride corresp. to  $\bar{C}$ , viz., chlorofumaryl (di)chloride (3:6105), has been reported only by indirect means.

— Dimethyl chlorofumarate: oil (see 3:6582).

— Diethyl chlorofumarate: oil (see 3:6864).

① *bis*-(*p*-Nitrobenzyl) chlorofumarate: m.p. 138.5° (21). [From  $Na_2\bar{A}$  with *p*-nitrobenzyl bromide in 63% alc. refluxed 2 hrs. (21).]

— Chloromaleanil [*N*-phenyl-chloromaleinimide]: adls. from boilg. alc., m.p. 170° (17). [From aniline salt of  $\bar{C}$  on litg. for a few minutes at 170°–180°; note that during the process isomerization occurs and therefore that the prod. is the same as similarly obt'd. from chloromaleic acid (3:3432) q.v.]

② Chlorofumaro-*bis*-(*p*-chloroanilide): pale yel. ndls. from alc., m.p. 223° (17). [From chlorofumaryl (di)chloride (3:6105) with *p*-chloroaniline (4 moles) in dry ether; note that crude prod. is also accompanied by a little *N*-(*p*-chlorophenyl)-chloromaleinimide, m.p. 175° (17).]

③ Chlorofumaro-*bis*-(*p*-bromoanilide): faintly yel. ndls. from boilg. alc., m.p. 236° (17). [From chlorofumaryl (di)chloride (3:6105) with *p*-bromoaniline (4 moles) in dry ether; note that crude prod. is also accompanied by a little *N*-(*p*-bromophenyl)-chloromaleinimide, m.p. 190° (17).]

## PREPARATION OF $\bar{C}$

### FROM BINUCLEAR INITIAL MATERIALS

From stilbene (*trans*-1,2-diphenylethylene). [For prepn. of  $\bar{C}$  from 1,2-diphenylethylene (stilbene) (1:7250) with  $Cl_2$  in  $CHCl_3$  (8) (16), with  $Cl_2$  in ether in sunlight (17) (some "  $\beta$  "stilbene dichloride (3:2570) is also formed), with  $Cl_2$  in ethane soln. (note low temp.) in sunlight (gives 34.4% yield  $\bar{C}$  + 48.7% yield diastereomer (3:2570) (15)) see indic. refs.; with  $PCl_5$  (2 moles) in  $CHCl_3$  soln. (6) or with  $PCl_5$  in  $POCl_3$  in s.t. at 170° (2) see indic. refs.; with  $SO_2Cl_2$  in presence of peroxides at room temp. (yield of crude mixt. is 100%; sepn. of isomers gives 45%  $\bar{C}$  + 33% diastereomer (3:2570) (7)), with nitryl chloride ( $ClNO_2$ ) in ether (57% yield (18)), see indic. refs.]

From isostilbene (*cis*-1,2-diphenylethylene). [For prepn. of  $\bar{C}$  from isostilbene with  $PCl_5$  in  $C_6H_6$  stood 2 days at room temp. see (6).]

From bibenzyl. [For formn. of  $\bar{C}$  from bibenzyl (1:7149) with chromyl chloride ( $CrO_2Cl_2$ ) in  $CS_2$  (other prods. are also formed) see (19).]

From  $\alpha,\alpha'$ -dibromobiphenyl (stilbene dibromide). [For formn. of  $\bar{C}$  from the higher-melting diastereomer (m p. 236°) of stilbene dibromide [Beil. V-602, V<sub>1</sub>-(282), V<sub>2</sub>-(508)] with  $SnCl_4$  in  $C_6H_6$  on refluxing  $\frac{1}{2}$  hr. (5) (note that at ord. temp. replacement is only

partial and yields (5) only stilbene chlorobromide, m.p. 225°) or with  $\text{HgCl}_2$  in acetone/ $\text{CHCl}_3$  refluxed 11 hrs. (poor yield (11)) see indic. refs.]

From *meso*-hydrobenzoin. [For prepn. of  $\bar{\text{C}}$  from *meso*-hydrobenzoin [Beil. VI-1003, VI-1-(490)] with  $\text{PCl}_5$  (2 moles) (20) cf. (15) (yield 43%  $\bar{\text{C}}$  + 22% diastereomer (3:2570) (8) (16)), with  $\text{PCl}_5$  (8) (16), or with  $\text{SOCl}_2$  in  $\text{C}_6\text{H}_6$  + pyridine (100% yield (10)) (13) see indic. refs.]

From *d,l*-hydrobenzoin (*isohydrobenzoin*). [For prepn. of  $\bar{\text{C}}$  from *isohydrobenzoin* [Beil. VI-1004, VI-1-(490)] with  $\text{PCl}_5$  (27-32%  $\bar{\text{C}}$  + much resin (8)) (16) (20) or with  $\text{PCl}_5$  (5) (16) see indic. refs.; note, also, that *l*-isohydrobenzoin with  $\text{PCl}_5$  in  $\text{CHCl}_3$  refluxed 2 hrs. gives (45% yield (1))  $\bar{\text{C}}$ .]

From  $\alpha$ -chloro- $\alpha'$ -hydroxybibenzyl. [For formn. of  $\bar{\text{C}}$  from  $\alpha$ -chloro- $\alpha'$ -hydroxybibenzyl (m.p. 77°, corresp. *p*-nitrobenzoate, m.p. 103-104° (3)) with  $\text{SOCl}_2$  in  $\text{CHCl}_3$  see (3); note that by this method  $\bar{\text{C}}$  is formed exclusively.]

From  $\alpha$ -amino- $\alpha'$ -hydroxybibenzyl. [For prepn. of  $\bar{\text{C}}$  from *d,l*- $\alpha$ -amino- $\alpha'$ -hydroxybibenzyl with  $\text{PCl}_5$  (42% yield (21)) or with  $\text{NOCl}$  (1) see indic. refs.; note also that *d*- $\alpha$ -amino- $\alpha'$ -hydroxybibenzyl in  $\text{HCl}$  with  $\text{NOCl}$  gives (1) 13%  $\bar{\text{C}}$  + 24% of *l*-" $\beta$ "-stilbene dichloride (3:2570) while *l*- $\alpha$ -amino- $\alpha'$ -hydroxybibenzyl in  $\text{HCl}$  with  $\text{NOCl}$  gives (1) 14%  $\bar{\text{C}}$  + 17% *d*-" $\beta$ "-stilbene dichloride (3:2570).]

#### FROM MONONUCLEAR INITIAL MATERIALS

From benzal (di)chloride. [For formn. of  $\bar{\text{C}}$  from benzal (di)chloride (3:6327) by bimolecular reduction with  $\text{H}_2$  + Pd in alc. soln. (22), or with  $\text{H}_2$  + hydrazine hydrate in  $\text{MeOH/KOH}$  (20% yield (12)), or with excess conc. (2 molar)  $\text{MeMgI}$  in ether refluxed 2 hrs. (22% yield (14)), or with excess  $\text{C}_6\text{H}_5\text{MgBr}$  similarly (14), or by action of Ni on hgt. in  $\text{CO}_2$  (23), see indic. refs.]

From benzotrichloride. [For formn. of  $\bar{\text{C}}$  from benzotrichloride (3:6540) by actn. of Ni on hgt. in atm. of  $\text{CO}_2$  see (23).]

#### FROM MISCELLANEOUS INITIAL MATERIALS

[For formn. of  $\bar{\text{C}}$  from diphenylacetaldehyde [Beil. VII-438, VII-1-(234)] with  $\text{PCl}_5$  in  $\text{C}_6\text{H}_6$  under reflux 2 hrs. (41% yield) see (3).]

#### CHEMICAL BEHAVIOR OF $\bar{\text{C}}$

<sup>1</sup> Action of heat.  $\bar{\text{C}}$  on repeated hgt. above its m.p. is partially isomerized to its diastereoisomer (3:2570) as a result of which the m.p. of the sample gradually falls to about 160° but not lower (8) (16).

Reduction.  $\bar{\text{C}}$  with Zn dust +  $\text{AcOH}$  gives good yields (24) of *trans*-1,2-diphenylethylene (stilbene) (1:7250), m.p. 124°.

Hydrolysis. [No study of the direct hydrolysis of  $\bar{\text{C}}$  appears to be recorded. — However,  $\bar{\text{C}}$  with  $\text{AgOAc}$  in boilg.  $\text{AcOH}$  gives an ester which upon hydrolysis gives (60% yield (8) (16)) almost exclusively *d,l*-hydrobenzoin (*isohydrobenzoin*), accompanied by a little

hydrobenzoin; with AgOBz, however, much more of the latter results; however, see also below.]

Other reactions.  $\bar{C}$  with alc. KOH on warming under reflux (20) or in an autoclave at 180° (2) splits out 2 HCl yielding diphenylacetylene (tolane) [Beil. V-656, V<sub>1</sub>-(319), V<sub>2</sub>-(568)], m.p. 60°. —  $\bar{C}$  with pyridine in s.t. at 200° for 8 hrs. does not (17) split out HCl (dif. from the "β" stereoisomer (3-2570) q.v.)

[ $\bar{C}$  with Lil in alc. refluxed 2 hrs. is little affected but in s.t. at 200° for 3 hrs. gives (11) (presumably via halogen interchange and subsequent loss of I<sub>2</sub>) a little *trans*-1,2-diphenylethylene (stilbene) (1:7250). —  $\bar{C}$  with NaI in alc. is unchanged even at 150° in s.t.; using AcOH as solvent, however, in s.t. at 210° stilbene (1:7250) is formed (11). —  $\bar{C}$  does not (11) react with alc. NaBr.]

[ $\bar{C}$  with AgOAc (2 moles + 25% excess) in AcOH at 100° for 9 hrs. gives (25) mixts. of hydrobenzoin diacetate, m.p. 133-134°, and isohydrobenzoin diacetate, m.p. 114-116° (for m.p./compn. diagram of this pair see (25) (26)).]

V-546, V<sub>2</sub>-(446)] in AcOH with  $CrO_3$  or with conc.  $HNO_3$  in s.t. at 110° see (9); from naphthalene tetrachloride-1,2,3,4 (3:4750) with conc.  $HNO_3$  see (1); from 2,2,3,4,4-pentachloro-1-oxo-naphthalene tetrahydride [Beil. VII-370] with dil. alc. or dil. AcOH in s.t. at 120-130° see (15).]

[ $\bar{C}$  on reduction by shaking ether soln. with aq.  $SnCl_2$  (21), or with Sn + HCl (part of halogen is lost (10)), or by refluxing with HI + white P (10) gives 2,3-dichloro-1,4-dihydroxynaphthalene [Beil. VI-979], colorless scales from alc., m.p. 135° (21), 135-140° (10); note that  $\bar{C}$  is reduced by  $SO_2$  + aq. only in s.t. at 130-140° (10). — Note that  $\bar{C}$  with aq.  $K_2SO_3$  or aq.  $KHSO_3$  soln. replaces both chlorine atoms giving (10) K salt of 4-hydroxy-2,3-disulfonaphthyl-1 sulfuric acid [Beil. XI-304].]

$\bar{C}$  on oxidn. with boilg.  $\text{HNO}_3$  ( $D = 1.35$ ) slowly yields (10) phthalic acid (1:0820).— $\bar{C}$  with aqua regia htd. in s.t. yields (22) phthalic (or nitrophthalic) acid accompanied by some trichloronaphthoquinone-1,4 [Beil. VII-730], yel. ndls., m.p. 250°.

$\bar{C}$  with equal wt  $\text{MnO}_2 + 4.8$  wts conc.  $\text{HCl}$  in s.t. at 230° for 10 hrs. (11) cf. (17) yields 2,2,3,3-tetrachloro-1,4-dioxonaphthalene tetrahydride-1,2,3,4 [Beil. VII-702], colorless pr. from ether, m.p. 117° (11).

$\bar{C}$  with  $\text{PCl}_5$  (2 moles) dislvd. in  $\text{POCl}_3$  htd. in s.t. at 180–200° (10), or at 200–250° for 4–5 hrs (22) (with slow rise of temp. to avoid explosion), yields 1,2,3,4,5-pentachloronaphthalene [Beil. V-546], colorless ndls. from alc., m.p. 168.5° (10) (22).

$\bar{C}$  with large excess  $\text{MeMgI}$  in ether gives (45% yield (23)) (by replacement of 1 atom of chlorine and usual reactn. of the two carbonyl groups) 1,2,4-trimethyl-1,4-dihydroxy-3-chloro-1,4-dihydronaphthalene, cryst. from ether by pptn. with pet. ether, m.p. 115–117° (23); with certain other  $\text{RMgX}$  cpds, however, both chlorine atoms are replaced, e.g.,  $\bar{C}$  with large excess  $\text{C}_6\text{H}_5\text{MgBr}$  in ether gives (34% yield (23)) 1,2,3,4-tetraphenyl-1,4-dihydroxy-1,4-dihydronaphthalene, cryst. from  $\text{C}_6\text{H}_6 + \text{alc.}$ , m.p. 241.5° (23); with still other  $\text{RMgX}$  cpds, neither halogen is affected and only the carbonyl groups react; e.g.,  $\bar{C}$  with large excess  $\alpha\text{-C}_{10}\text{H}_7\text{MgBr}$  in ether gives (75% yield (23)) 1,4-di- $\alpha$ -naphthyl-1,4-dihydroxy-2,3-dichloro-1,4-dihydronaphthalene, m.p. 261° dec. (23).]

$\bar{C}$  with 2 pts.  $\text{Cu}$  powder htd. in nitrobenzene or at 240° as directed (24) gives 3% yield triphthaloylbenzene (1,2,3,4-diphthaloylanthraquinone).— $\bar{C}$  with  $\text{HBr}$  in nitrobenzene htd. in pres. of  $\text{CuCl}_2$  yields (25) 2-bromo-3-chloronaphthoquinone-1,4, m.p. 206–207° (25).

$\bar{C}$  with 2,3-dimethylbutadiene-1,3 (1:8050) in pres. of excess 5% alc.  $\text{KOH}$  and a little sodium hydrosulfite boiled 2 hrs. and then oxidized with air gives (26) 2,3-dimethylanthraquinone [Beil. VII-815, VII-425], yel. ndls. from alc., m.p. 205–206°.]

$\bar{C}$  with boilg. alc.  $\text{KOH}$  hydrolyzes 1 chlorine yielding on acidification (10) 3-chloro-2-hydroxynaphthoquinone-1,4 [Beil. VIII-304], yel. ndls. from alc., m.p. 215°; note that  $\bar{C}$  with  $\text{NaOAc}$  htd. in alc. yields (27) the corresp. acetate, viz., 3-chloro-2-acetoxynaphthoquinone-1,4, yel. ndls. from hot alc., m.p. 98° (27).—[For reactn. of  $\bar{C}$  with  $\text{Na}_2\text{S}$  or with  $\text{H}_2\text{S}$  leading to bimolecular condensation with formn. of dibenzothianthrene diquinone or its deriva. see (28) (8).]

$\bar{C}$  with phenol (2 moles) + dry  $\text{K}_2\text{CO}_3$  (i.e.,  $\text{K}$  phenolate) htd. for 1 hr. at 100° gives (96% yield (2)) 2,3-diphenoxynaphthoquinone-1,4, or-yel. ndls. from xylene, m.p. 205° (2).—[For reactn. of  $\bar{C}$  with pyrocatechol (1:1520) in pres. of diethylamine (2), with pyrogallol (1:1555) in pres. of pyridine (29), or with various anthrols and pyridine in prepn. of vat dyes (30) see indic. refs.]

$\bar{C}$  in nitrobenzene treated with  $\text{NH}_3$  gas or  $\bar{C}$  in boilg. alc. treated dropwise with conc.  $\text{NH}_4\text{OH}$  (27) gives (probably by 1,4-addition and subsequent loss of 1  $\text{HCl}$  (31)) (80% yield (2)) 3-chloro-2-aminonaphthoquinone-1,4, yel.-br. ndls. from  $\text{AcOH}$ , m.p. 193° (2) (corresp. acetyl deriv., m.p. 219° (27)).—Similarly,  $\bar{C}$  with aniline (2 moles) in hot alc. gives (87% yield (12)) (32) 3-chloro-2-anilinonaphthoquinone-1,4 [Beil. XIV-168, XIV-434], copper-red ndls., m.p. 202° (32).—[For corresp. reactn. of  $\bar{C}$  with many other aliphatic or arom. amines see (33), with  $\beta$ -naphthylamine see (34), with  $p$ -phenylenediamine (or its monoacetyl deriv.) see (12); with  $p$ -chloroaniline see (27); note that some amines, e.g.,  $o$ -nitroaniline, 2-aminoanthraquinone, and 3-chloro-2-aminonaphthoquinone do not undergo this reactn. (27).—For reactn. of  $\bar{C}$  with pyridine see (2).]

$\bar{C}$  on nitration, e.g., with 4 vol/pts. red fuming  $\text{HNO}_3$  ( $D = 1.52$ ) +  $2\frac{1}{2}$  vol/pts. pure conc.  $\text{H}_2\text{SO}_4$  at 100° for 6 hrs. (35) cf. (36), gives (40–45% yield (35)) 5-nitro-2,3-dichloronaphthoquinone-1,4, pale yel. cryst. from  $\text{CHCl}_3$  (35),  $\text{AcOH}$  (36), or alc. (36), m.p. 175° (35) (36); this prod. with aniline (2 moles) in hot alc. yields (35) 3-chloro-2-anilino-5 (8)-nitronaphthoquinone-1,4, lfts. from nitrobenzene, m.p. 273° (35).

### 3:4860 3,6-DICHLOROPHTHALIC ANHYDRIDE

 $C_6H_2O_3Cl_2$ 

Beil. XVII - 483  
XVII<sub>1</sub>-(254)

M.P. 193.5-194.5° cor. (1)

191° cor. (2)

190-191° (3)

187° (4)

184-186° (5)

185° (6) (7)

B.P. 339° (3)

[See also 3,6-dichlorophthalic acid (3:4870).]

Long colorless ndls. — Sublimes.

[For prepn. of  $\bar{C}$  from 3,6-dichlorophthalic acid (3:4870) by htg. at 130-140° (2) (3) (4), at 160° (8), at 180-190° (5), by distn. under diminished press. (9), or by htg. in a current of dry air at 40° (7) (10) see indic. refs.: from ethyl hydrogen 3,6-dichlorophthalate by htg. at 200-220° see (2) (5); for foran. of  $\bar{C}$  (together with other isomers) from phthalic anhydride (1:0725) with  $Cl_2$  in pres. of Fe or Fe salts at 160-260° (11) or with  $Cl_2$  in fung  $H_2SO_4$  (12) in pres. of  $I_2$  (3), or from 3-chlorophthalic anhydride (3:3900) with  $Cl_2$  in fung.  $H_2SO_4$  in pres. of  $I_2$  (3), see indic. refs.]

[For sepn. of  $\bar{C}$  from isomeric dichlorophthalic anhydrides by means of salts of corresp. acids, etc., see (3) (13) (1); by means of differential hydrolysis with  $H_2SO_4$  (prods. with no  $\alpha$ -chlorine such as 4,5-dichlorophthalic anhydride require  $H_2SO_4$  of 98-100% concn., those with 1  $\alpha$ -chlorine such as 3,4-dichlorophthalic anhydride hydrolyze with 56-95%  $H_2SO_4$ , those with 2  $\alpha$ -chlorine atoms such as  $\bar{C}$  or 3,4,5,6-tetrachlorophthalic anhydride hydrolyze at  $H_2SO_4$  concns. of less than 50%) see (14).]

$\bar{C}$  dislvd. in abs. EtOH yields the acid ester, viz., ethyl hydrogen 3,6-dichlorophthalate,

cryst. from  $\text{CCl}_4$ , m p  $130\text{--}131^\circ$  (3),  $128\text{--}130^\circ$  (2),  $128\text{--}129^\circ$  (5); note that this ester when dislvd. in EtOH and satd with HCl gas, then warmed, does not convert to the neutral ester readily, and that even with 15 pts. EtOH and 7 hr. htg. only 16% diethyl 3,6-dichlorophthalate is formed (2)

[ $\bar{C}$  with 1 mole  $\text{PCl}_5$  htd in s.t. at  $160^\circ$  for 6-7 hrs. (8) or at  $200^\circ$  for 6 hrs. (15) yields pseudo-3,6-dichlorophthaloyl dichloride (3,3,4,7-tetrachlorophthalide), cryst. from  $\text{C}_6\text{H}_6$ , m p.  $122^\circ$  (15), this prod. upon htg. above its m p., or upon solution in inert solvents, or very rapidly upon treatment of such solns. with decolorizing carbon, or slowly even in solid condition, isomerizes to *sym*-3,6-dichlorophthaloyl dichloride, colorless pr., m.p.  $31^\circ$  (15), from low-boilg. pet. ether (in which the pseudo-chloride is spar. sol.). — With MeOH the pseudo chloride yields the pseudo dimethyl ester (4,7-dichloro-3,3-dimethoxyphthalide, m p  $134^\circ$  (15); the neutral dimethyl 3,6-dichlorophthalate (corresp. to the *sym*-chloride) has m p  $82^\circ$  (15)] — [ $\bar{C}$  with 2 moles  $\text{PCl}_5$  htd in s.t. several hrs. at  $200^\circ$  is claimed (8) to yield a prod.  $\text{C}_8\text{H}_2\text{OCl}_6$ , ndls. from nlc, m p  $117^\circ$  (8)]

[ $\bar{C}$  with 1 mole  $\text{NH}_4\text{OH} \cdot \text{HCl} + \text{Na}_2\text{CO}_3$  in aq. as directed (3) for 3,4-dichlorophthalic anhydride (3:4880) yields 3,6-dichlorophthalylhydroxylamine (*N*-hydroxy-3,6-dichlorophthalimide) [Beil. XXI-504], ndls. from MeOH, m p.  $253\text{--}258^\circ$  (3); the conv. of this prod. with boilg. aq.  $\text{Na}_2\text{CO}_3$  to 3,6-dichloroanthranilic acid (analogous to the corresp. process with its isomers) has not been reported (see, however, under the imide below).]

[ $\bar{C}$  with steam passed over cat. at  $350\text{--}420^\circ$  loses  $\text{CO}_2$  presumably yielding (16) 2,5-dichlorobenzoic acid (3:4340).]

$\bar{C}$  with  $\text{AlCl}_3 + \text{C}_6\text{H}_6$  yields (8) (17) 3,6-dichloro-2-benzoylbenzoic acid [Beil. X-750, X<sub>1</sub>-(357)], ndls. from  $\text{C}_6\text{H}_6$  (17) or dil. alc (8), m.p.  $168.5^\circ$  (18), cor. (17),  $150^\circ$  (8); this prod. on ring closure by htg. with conc.  $\text{H}_2\text{SO}_4$  (2) (17) (18) (19) yields 1,4-dichloroanthraquinone [Beil. VII<sub>1</sub>-(411)], yel. ndls. from AcOH, m p.  $187.5\text{--}188^\circ$  (20),  $187.5^\circ$  cor. (17),  $187.5^\circ$  (18),  $186^\circ$  (19). — [For corresp. reactns. of  $\bar{C} + \text{AlCl}_3$  with chlorobenzene (22), with toluene (21), with *o*-chlorotoluene (3:8215) (23), with *p*-chlorotoluene (3:8287) (24), with fluorene (25), with acenaphthene (26), with pyrene (27), or with  $\beta$ -methylbenzanthrone (28) see indie refs.]

[ $\bar{C}$  with hydroquinone (1:1590) +  $\text{H}_2\text{BO}_3$  htd. at  $190^\circ$  and afterward treated with hot conc.  $\text{H}_2\text{SO}_4$  (29), or htd. with  $\text{AlCl}_3 + \text{NaCl}$  at  $200\text{--}220^\circ$  for 20 min (30), gives (yield: 30% (29), 84% (30)) 5,8-dichloro-1,4-dihydroxyanthraquinone (5,8-dichloroquinizarin) [Beil. VIII<sub>1</sub>-(715)], cryst. from xylene (30) or AcOH (29), m p.  $275.5^\circ$  (30),  $266^\circ$  (29) (diacetate, m p.  $180^\circ$  (30),  $170^\circ$  (29))] — [For reactn. of  $\bar{C}$  with  $\text{AlCl}_3 + o$ -cresol (31), with *o*-cresol methyl ether (31) (19), or with *p*-cresol (7) see indie refs.; for reactn. of  $\bar{C}$  with  $\alpha$ -naphthol +  $\text{H}_2\text{BO}_3$  see (9)]

[ $\bar{C}$  in fumg.  $\text{H}_2\text{SO}_4$  treated with  $\text{Br}_2$  yields (33) (34) 3,6-dichloro-4,5-dibromophthalic anhydride, colorless ndls. from AcOH, m p.  $269\text{--}270^\circ$  (34),  $261^\circ$  (33). —  $\bar{C}$  in fumg.  $\text{H}_2\text{SO}_4$  (50%  $\text{SO}_3$ ) htd. with  $\text{I}_2$  as directed (32) gives (97% yield) 3,6-dichloro-4,5-diiodophthalic anhydride, yel. pr. from AcOH, m p.  $258^\circ\text{--}258.5^\circ$  cor. (32)]

[For condens. of  $\bar{C}$  with substituted *m*-aminophenols in prepn. of phthalein dyestuffs see (35); for use of  $\bar{C}$  in prepn. of pigments of phthalocyanine type see (36) (37); for use of  $\bar{C}$  as plasticizer for cellulose esters see (38).]

Fused  $\bar{C}$  treated with dry  $\text{NH}_3$  gas (39) or with urea (37) yields 3,6-dichlorophthalimide [Beil. XXI-504], ndls. from alc., m p.  $242^\circ$  (19). [This prod. on ring opening and Hofmann degradation with aq. alk.  $\text{NaOCl}$  (3) or  $\text{NaOBr}$  (39) gives 3,6-dichloroanthranilic acid [Beil. XIV-367], ndls. from aq. or AcOH, m p.  $153^\circ$  cf. (3). — [For behavior of  $\bar{C}$  with hydrazine hydrate yielding acc. to conditions *N*-amino-3,6-dichlorophthalimide, *N*-(3,6-dichlorophthalimido)-3,6-dichlorophthalimide, or 3,6-dichlorocyclophthalhydrazide see (40)]

$\bar{C}$  (1 pt.) dislvd. in 5 pts. boilg. AcOH and treated with 1 pt. aniline gives on cooling (82% yield (1)) 3,6-dichlorophthalanil [Beil. XXI<sub>1</sub>-(391)], pale yel. lfts. or ndls. from AcOH, m.p. 201° (10), 197-198° cor. (1), 194° (41), 191° (39). [Note, however, that on protracted htg. with excess aniline first one and then the other nuclear halogen also reacts yielding, respectively, 3-anilino-6-chlorophthalanil, unstable form, m.p. 141° cor. (1), stable form., m.p. 160-160.5° cor. (1), and 3,6-dianilinophthalanil, m.p. 197° (41).]

$\bar{C}$  on saponification with standard alk. (Sap. Eq. = 108.5), followed by acidification, yields 3,6-dichlorophthalic acid (3:4870) q.v.

M.P. See text.

[See also 3,6-dichlorophthalic anhydride (3:4860).]

Tbls. from aq.; eas. sol. hot aq. in which it readily gives supersatd. solns.; eas. sol. alc., ether.

$\bar{C}$  on htg. begins to lose aq. even at 100° with formn. of 3,6-dichlorophthalic anhydride (3:4860) cf. (1); this change proceeds with increasing speed as the temperature increases; for this reason no definite m.p. of  $\bar{C}$  is recorded and the m.p. observed is actually that of the anhydride.

[For prepn. of  $\bar{C}$  from 3,6-dichlorophthalic anhydride by hydrolysis see the anhydride

(3:4860); from ethyl hydrogen 3,6-dichlorophthalate by htg. at 200° to convert to the anhydride and hydrolysis of the latter see (1); from 1,4-dichloronaphthalene (3:1655) by boilg. with  $\text{HNO}_3$  ( $D = 1.3$ ) see (2); from 1,4,5-trichloronaphthalene (3:4005) by htg. with  $\text{HNO}_3$  in s.t. see (3); from " $\alpha$ -tetrachloronaphthalene" [Beil. V-546] by oxidn. with  $\text{HNO}_3$  see (4); from 1,4-dichloronaphthalene tetrachloride (1,2,3,4,5,8-hexachlorotetraim) [Beil. V-493] by boilg. with conc.  $\text{HNO}_3$  ( $D = 1.42$ ) see (5) (6); from 5,8-dichloronaphthylamine-2 [Beil. XII-1310] on oxidn. with dil.  $\text{HNO}_3$  in s.t. at 180-200° see (7).]

[For sepn. of  $\bar{C}$  from mixts. with the isomeric 3,4- (3:4880) and 4,5- (3:4890) dichlorophthalic acids see (8) (9).] [For use of  $\bar{C}$  as softener and/or plasticizer for cellulose derivs. see (10).]

Salts.  $\text{NH}_4\bar{A}$ ,  $\text{Na}\bar{A}$ ,  $\text{K}\bar{A}$ , as well as  $(\text{NH}_4)_2\bar{A}$ ,  $\text{Na}_2\bar{A}$ , and  $\text{K}_2\bar{A}$ , are all eas. sol. aq. (8);  $\text{Ag}\bar{A}$ , insol. aq. (8) (12);  $\text{Ca}\bar{A}$ ,  $4\text{H}_2\text{O}$  (5) (12), spar. sol. aq. and pptd. by  $\text{CaCl}_2$  from hot dil. aq. solns. of  $(\text{NH}_4)_2\bar{A}$  (8) (12);  $\text{Ba}\bar{A}$ ,  $\text{H}_2\text{O}$ , spar. sol. aq. (5) (12);  $\text{Zn}\bar{A}$ , eas. sol. aq. (characteristic dif. from 3,4- and 4,5-dichlorophthalic acids and used in sepn. of  $\bar{C}$  (8)).

Esters. Dimethyl 3,6-dichlorophthalate, m p 82° (11) (from  $\text{Ag}\bar{A}$  with  $\text{MeI}$  (11)); methyl hydrogen 3,6-dichlorophthalate, unreported; diethyl 3,6-dichlorophthalate, cryst. from 50% alc., m p 60° (12) (13) (from  $\text{Ag}\bar{A}$  on htg. with  $\text{EtI}$  in s.t. at 100° (12) (13), or in very small yield from ethyl hydrogen 3,6-dichlorophthalate with  $\text{EtOH}$  (1) (14)); ethyl hydrogen 3,6-dichlorophthalate, cryst. from  $\text{CCl}_4$ , m p. 130-131° (8), 128-130° (1), 128-129° (15) (from 3,6-dichlorophthalic anhydride (3:4860) with  $\text{EtOH}$ ).

3:4875 TETRACHLOROPYROCATECHOL   $\text{C}_6\text{H}_2\text{O}_2\text{Cl}_4$  *Beil.* VI - 784  
(Tetrachlorocatechol,  
tetrachloro-1,2-dihydroxybenzene)  $\text{VI}_1$ -(389)  
 $\text{VI}_2$ -(787)

M.P. 101-105° (1)  
104° (2)  
103-101° (3)

[See also tetrachlorobenzoquinone-1,2 (3:3965).]

Colorless anhydrous cryst. from hot dil. alc. (1), lgr. (1) or  $\text{C}_6\text{H}_6$  (2);  $\bar{C}$  from dil.  $\text{AcOH}$  seps. as monohydrate which over  $\text{CaCl}_2$  loses half of its water and above 70-80° all of its aq. (3) (4);  $\bar{C}$  from  $\text{AcOH}$  seps. as a cpd.,  $\bar{C}\cdot\text{AcOH}$ , m.p. 123-124° (3), which can be recrystd. unchanged from lgr. but in air or more rapidly over alk. loses its cryst.  $\text{AcOH}$ ; the above cpd. on soln. in alc. and pptn. with much aq. yields a trihydrate,  $\bar{C}\cdot 3\text{H}_2\text{O}$ , m p. 91°, which can be recrystd. unchanged from aq., alc., or acetone but which from  $\text{C}_6\text{H}_6$  or lgr. seps.  $\bar{C}$  in anhydrous form (4).

[For prepa. of  $\bar{C}$  from pyrocatechol (1:1520) with  $\text{Cl}_2$  in  $\text{AcOH}$  (5) (2) (13) or with  $\text{ICl}$

(3) see indic. refs.; from hexachlorocyclohexene-3-dione-1,2 [Beil. VII-575] by reductn. with  $\text{SnCl}_2$  in  $\text{AcOH}$  see (1).]

$\bar{\text{C}}$  with std. alk. (using phenolphthalein) titrates sharply as a monohydric phenol (4) (6), i.e., Neut. Eq. 248; similarly titration of the cpd.  $\bar{\text{C}}\cdot\text{AcOH}$  (above) gives Neut. Eq. 154 (4).

$\bar{\text{C}}$  on oxidn. with fuming  $\text{HNO}_3$  in  $\text{AcOH}$  gives (81% yield (13)) (1) (5) (7) (8) tetrachloro-*o*-benzoquinone-1,2 (3:3965). — For study of oxidn.-reductn. potential of system:  $\bar{\text{C}}$  + tetrachlorobenzoquinone-1,2 see (7) (8). —  $\bar{\text{C}}$  with equiv. tetrachlorobenzoquinone-1,2 (3:3965) in least possible hot  $\text{CHCl}_3$  gives on cooling the corresp. quinhydrone (14). — [For other complex prods. obt'd. from  $\bar{\text{C}}$  by action of conc.  $\text{HNO}_3$  or  $\text{N}_2\text{O}_4$  (9),  $\text{HNO}_3$  +  $\text{H}_2\text{SO}_4$  (10), or  $\text{NaNO}_2$  in  $\text{AcOH}$  (2) see indic. refs.]

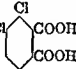

⑤ Tetrachloropyrocatechol diacetate: ndls. from  $\text{AcOH}$ , m.p.  $190^\circ$  (1). [From  $\bar{\text{C}}$  with  $\text{Ac}_2\text{O}$  (1).]

— Tetrachloropyrocatechol monomethyl ether (tetrachloroguaiacol) [Beil. VI-784]: ndls. from hot aq., m.p.  $185\text{--}186^\circ$  (11). [Reported only by indirect means (11).]

— Tetrachloropyrocatechol dimethyl ether (tetrachloroveratrole) [Beil. VI-784]: ndls. from alc., m.p.  $88^\circ$  (11) (12). [Reported only by indirect means (11) (12).]

3:4880 3,4-DICHLOROPHTHALIC ACID   $\text{C}_6\text{H}_2\text{O}_4\text{Cl}_2$  Beil. IX-817  
IX—

M.P. abt.  $195^\circ$  rap. htg. (1)

[See also 3,4-dichlorophthalic anhydride (3:3695).]

Rectangular thls. from aq.; eas sol. aq., ether —  $\bar{\text{C}}$  can only with difficulty be separated from 4,5-dichlorophthalic acid (3:4890) by crystn. (1).

[For prepn. from 3,4-dichlorophthalic anhydride (3:3695) on boilg. with aq. see (1); from *N*-(hydroxy)-3,4-dichlorophthalimide (see under 3,4-dichlorophthalic anhydride) by hydrolysis with hot 10%  $\text{HCl}$  see (1).]

[For sepn. of  $\bar{\text{C}}$  from mixts. with the isomeric 3,6- (3:4870) and 4,5- (3:4890) dichlorophthalic acids see (1) (2).]

Salts.  $\text{NaH}\bar{\text{A}}$ ,  $\text{Ag}\bar{\text{A}}$ ,  $\text{Cu}\bar{\text{A}}$ ,  $\text{Ca}\bar{\text{A}}$ ,  $\text{Ba}\bar{\text{A}}$ ,  $\text{Zn}\bar{\text{A}}$  all spar. sol. aq. (1).

Esters. Methyl hydrogen 3,4-dichlorophthalate and dimethyl 3,4-dichlorophthalate are both unreported; both possible ethyl hydrogen 3,4-dichlorophthalates are known, viz., ethyl 2-carboxy-3,4-dichlorophthalate (from  $\bar{\text{C}}$  + abs.  $\text{EtOH}$  + few drops conc.  $\text{H}_2\text{SO}_4$  refluxed 6 hrs. (3)), ndls. from dil. alc., m.p.  $184^\circ$  (3); and 3,4-dichloro-2-carbethoxybenzoic acid (from diethyl 3,4-dichlorophthalate by partial  $\text{KOH}$  saponification or from the anhydride with abs.  $\text{EtOH}$  (3)), pr. from dil. alc., m.p.  $164^\circ$  (3); diethyl 3,4-dichlorophthalate (from  $\text{Ag}_2\bar{\text{A}}$ ), m.p.  $80^\circ$  (3). [For the *pseudo* diethyl ester of  $\bar{\text{C}}$  see under 3,4-dichlorophthalic anhydride (3:3695).]

$\bar{C}$  on protracted htg. at 220° loses aq. yielding 3,4-dichlorophthalic anhydride (3:3695) q.v.

3:4880 (1) Villiger, *Ber.* 42, 3538-3539, 3541-3542 (1909). (2) Hodgson, *J. Soc. Dyers Colourists* 49, 215 (1933). (3) Kirpal, Galuschka, Lassak, *Ber.* 68, 1333-1334 (1935).

### 3:4885 1-CHLORONAPHTHOIC ACID-2

 $C_{11}H_7O_2Cl$ 

Beil. IX - 661

IX<sub>1</sub>—

M.P. 196° (1) (2)

195° (3)

Ndls. from  $C_6H_6$  (1) (2) or from 50% AcOH (3). — Volatile without decompn. (1).

[For prepn. of  $\bar{C}$  from 2-(1-chloronaphthyl)carbinol (2) by oxidn. see (2); from 1-chloro-2-(trichloromethyl)naphthalene [Beil. V-568] by hydrolysis in boilg. AcOH contg. a little aq. see (1), from 1-chloro-2-naphthonitrile (see below) by hydrolysis with AcOH/ $H_2SO_4$ /aq. mxt. see (4), from methyl 1-chloro-2-naphthoate (see below) by hydrolysis with boilg. 15% alc. KOH (46% yield) see (3)]

$\bar{C}$  with 2% Na/Hg in aq. reduces (1) to  $\beta$ -naphthoic acid (1:0800), m.p. 184° (1).

[The direct conv. of  $\bar{C}$  to 1-chloro-2-naphthoyl chloride is not actually reported; however, this acid chloride, m.p. 59-60.5° (5), b.p. 226° at 150 mm. (5), b.p. 199-200° at 11.2 mm (5), has been obtained (5) (3) (6) from 1-hydroxy-2-naphthoic acid [Beil. X-331, XI-(145)] with  $PCl_5$  (yield 60.7% (5)) (2)]

Salts.  $Ag\bar{A}$ , white floccs spar sol. aq.,  $Ca\bar{A}_2 \cdot 2H_2O$ , cryst. from aq. (1).

— Methyl 1-chloro-2-naphthoate: ndls. from alc., m.p. 50° (2), cryst. from pet. eth. + acetone, m.p. 44-48° (5), b.p. 189-193° at 17.5 mm (3), 186.5-189° (but press. not given) (5). [From  $\bar{C}$  in MeOH with  $HCl$  gas (2) or from the acid chloride (above) in boilg. MeOH (5) (3).] [This ester with Cu bronze + a trace of  $I_2$  at 200° yields (5) dimethyl 1,1'-binaphthyl-2,2-dicarboxylate]

— Ethyl 1-chloro-2-naphthoate: unreported.

— 1-Chloro-2-naphthonitrile: colorless ndls. from MeOH but m.p. not stated (4), b.p. 183-184° at 11 mm (4). [From 1-chloro-2-naphthylamine [Beil. XII-1308, XII<sub>1</sub>-(542)] by diazotization and reactn. with  $KCu(CN)_2$  (4).]

3:4885 (1) Wolfenstein, *Ber.* 21, 1190-1191 (1888). (2) Achmatowicz, Lindenfeld, Roczniki Chem. 18, 69-74 (1934); *Cent.* 1939, II 389, not in C.A. (3) Bergmann, Hershberg, *J. Chem. Soc.* 1936, 333. (4) Willstaedt, Scheiber, *Ber.* 67, 473-474 (1934). (5) Kuhn, Albrecht, *Ann.* 463, 283-285 (1928). (6) Strohbach, *Ber.* 34, 4181 (1901).

### 3:4890 4,5-DICHLOROPHTHALIC ACID

 $C_6H_2O_4Cl_2$ 

Beil. IX - 818

IX<sub>1</sub>-(366)

M.P. 199-200° (1)

200° rap. htg. (2)

[See also 4,5-dichlorophthalic anhydride (3:4830).]

Ndls. from aq.

[For prepn. of  $\bar{C}$  from 4,5-dichlorophthalic anhydride (3:4830) by hydrolysis see (2)]

(3); from aq. soln. of alk. salts of phthalic acid (1:0820) with  $\text{Cl}_2$  in pres. of Sb cpds. see (3) (4); from 4,5-dichloro-1,2-dimethylbenzene (1) by oxidn. with dil.  $\text{HNO}_3$  ( $D = 1.3$ ) in s.t. at  $180^\circ$  for 7 hrs. see (1) cf. (5) (6).]

[For sepn. of  $\bar{\text{C}}$  from mixts. with thn isomeric 3,4- (3:4880) and 3,6- (3:4870) dichlorophthalic acids see (2) (8).] — [For use of  $\bar{\text{C}}$  as softener for cellulose derivs. see (9).]

Salts.  $\text{NH}_4\bar{\text{H}}\bar{\text{A}}$ ,  $\text{NaH}\bar{\text{A}}$ ,  $\text{KH}\bar{\text{A}}$  (all from aq. solns. of the corresp. eas. sol. neutral salts by addn. of  $\text{AcOH}$ ) are spar. sol. cold aq. (2):  $\text{Cu}\bar{\text{A}}$ ,  $\text{Ca}\bar{\text{A}}$ ,  $\text{Ba}\bar{\text{A}}$ ,  $\text{Zn}\bar{\text{A}}$ , and  $\text{Ag}_2\bar{\text{A}}$  are all spar. sol. (2).

Esters. Dimethyl 4,5-dichlorophthalate and diethyl 4,5-dichlorophthalate are unreported; methyl hydrogen 4,5-dichlorophthalate is unreported, but ethyl hydrogen 4,5-dichlorophthalate, ndls. from  $\text{CHCl}_3$ , m.p.  $133\text{--}134^\circ$ , is obtained from the anhydride (3:4830) with  $\text{EtOH}$  (2).

[ $\bar{\text{C}}$  on fusion with  $\text{NaOH}$  at  $175\text{--}185^\circ$  gives (small yield (3)) 4,5-dihydroxyphthalic acid [Beil. X-552,  $\text{X}_1$ -(276)], m.p.  $175^\circ$ .

$\bar{\text{C}}$  on htg. loses  $\text{H}_2\text{O}$  yielding (2) 4,5-dichlorophthalic anhydride (3:4830), m.p.  $187^\circ$ .

⑩ Di-(*p*-nitrobenzyl) 4,5-dichlorophthalate: cryst. from alc., m.p.  $164.5^\circ$  (10). [From  $\text{Na}_2\bar{\text{A}}$  with *p*-nitrobenzyl bromide (2 moles) btd. in alc. (10).]

### 3:4892 PENTACHLOROBENZALDEHYDE

 $\text{C}_7\text{HOC}_l_5$ 

Beil. VII —

VII<sub>1</sub>-(134)M.P.  $202.5^\circ$  (1) (2) $197\text{--}199^\circ$  (3)

Colorless ndls. from  $\text{C}_6\text{H}_6$ /alc.; eas. sol. hot  $\text{C}_6\text{H}_6$  or  $\text{CS}_2$ ; spar. sol. alc., ether, lgr.

[For prepn. of  $\bar{\text{C}}$  from pentachlorobenzal (di)chloride (3:3590) by hydrolysis with conc.  $\text{H}_2\text{SO}_4$  at  $60\text{--}100^\circ$  or fuming  $\text{H}_2\text{SO}_4$  at  $40\text{--}50^\circ$  (90% yield (2)) (3) see indic. refs.; from pentachlorobenzaldehyde diethylacetal (see below) by acid hydrolysis see (1).]

$\bar{\text{C}}$  with aq. alk.  $\text{KMnO}_4$  refluxed 7 hrs. oxidizes to (90% yield (1)) pentachlorobenzoic acid (3:4910).

$\bar{\text{C}}$  in  $\text{C}_6\text{H}_6$  shaken with satd. aq.  $\text{NaHSO}_3$  soln. gives (1) the corresp.  $\text{NaHSO}_3$  epd.

$\bar{\text{C}}$  with aq. 50%  $\text{KOH}$  at  $100^\circ$  for 5 hrs. suffers hydrolytic cleavage giving (88% yield (2)) pentachlorobenzene (3:2290) and potassium formate.

$\bar{\text{C}}$  with  $\text{EtOH}$  + dry  $\text{HCl}$  gas gives (60% yield (1)) pentachlorobenzaldehyde diethylacetal, colorless cryst. from pet. ether, m.p.  $45^\circ$ .

[For use of  $\bar{\text{C}}$  on prepn. of dyes of the triphenylmethane series see (4).]

$\bar{\text{C}}$  reacts normally with  $\text{RMgX}$  reagents [e.g.,  $\bar{\text{C}}$  with  $\text{McMgBr}$  gives (49% yield (1)) methyl-pentachlorophenyl-carbinol, colorless cryst. from alc., m.p.  $126^\circ$  (1);  $\bar{\text{C}}$  with  $\text{C}_6\text{H}_5\text{MgBr}$  gives (1) phenyl-pentachlorophenyl-carbinol (pentachlorobenzohydrol), cryst. from  $\text{C}_6\text{H}_6$ , m.p.  $117^\circ$ .]

$\bar{\text{C}}$  with anhydrous  $\text{NaOAc}$  +  $\text{Ac}_2\text{O}$  (Perkin synthesis) at  $170\text{--}180^\circ$  for 60 hrs. gives (30% yield (1)) 2,3,4,5,6-pentachlorocinnamic acid, cryst. from  $\text{C}_6\text{H}_6$ , m.p.  $233^\circ$  cor. (1).

$\bar{C}$  with aniline at 100° condenses giving (1) pentachlorobenzaldehyde aml, greenish ndls. from  $C_6H_6$ /alc., m.p. 187.5° cor. (1).

⑥ Pentachlorobenzaldehyde: colorless ndls. from  $C_6H_6$ , m.p. 201° cor. (1). (From  $\bar{C}$  with  $NH_2OH \cdot HCl + Na_2CO_3$  in dil alc. at stdg. few days (1).)

⑦ Pentachlorobenzaldehyde phenylhydrazones: citron-yel. ndls. from alc., m.p. 152.5° cor. (1) [From  $\bar{C}$  in hot satd  $C_6H_6$  soln with 1 mole phenylhydrazine (1).]

—— Pentachlorobenzaldehyde *p*-nitrophenylhydrazones: unreported.

—— Pentachlorobenzaldehyde 2,4-dinitrophenylhydrazones: unreported.

—— Pentachlorobenzaldehyde semicarbazones: unreported.

197.5-198° cor.	(2)		
197.3-198° cor.	(3)		

Ndls. from  $CCl_4 + C_6H_6$  (2); fairly eas. sol.  $C_6H_6$ , lgr.,  $CHCl_3$ ; spar. sol. alc. or  $AcOH$ .

[For prepn. of  $\bar{C}$  from naphthalene (1:7200) with  $Cl_2$  in pres. of 1% Fe powder + 9.1%  $I_2$  first at 100° then at 150° for 10-12 hrs (90% yield (2)) or with  $Cl_2$  in pres. of  $SbCl_5$  (1) (4) cf. (2) see indic. refs. (for extensive study of merits of many catalysts see (5)).]

[For prepn. of  $\bar{C}$  from mixt. of 2-hydroxynaphthalene-1,5-bis-(sulfonyl chloride) and 2-hydroxynaphthalene-1,6-bis-(sulfonyl chloride) (from  $\beta$ -naphthol with  $ClSO_3H$ ) with  $PCl_5$  in s.t. see (6), from 1-hydroxynaphthalene-tris-(sulfonyl chloride) with  $PCl_5$  in s.t. at 250° see (7); from 1-amino-3,6,8-tris-(sulfonyl chloride) with 3-4 pts.  $PCl_5$  in s.t. at 200-225° for 7 hrs. (40% yield) see (2).]

[For prepn. of  $\bar{C}$  from 2,5,6,7,8-pentachloronaphthoquinone-1,4 (Beil. VII-731) with  $PCl_5$  in s.t. at 250° for 6 hrs. see (5); from hexachloronaphthoquinone-1,4 (see below) with  $PCl_5$  see (3) ]

[For study of action of  $\bar{C}$  (from insulation material on electric wiring) in production of acne see (9); for prepn. of aq. dispersions of  $\bar{C}$  see (10); for use of  $\bar{C}$  as insecticide see (11); for use of  $\bar{C}$  in prepn. of a red mordant dyestuff (by actn. of fmg.  $H_2SO_4$ ) see (12).]

[ $\bar{C}$  with  $H_2$  passed through a red-hot tube (4) or  $\bar{C}$  with Na +  $EtOH$  (2) gives naphthalene (1:7200) together with other prods.]

$\bar{C}$  on oxidn. with 10 pts. fmg.  $HNO_3$  ( $D = 1.52$ ) in s.t. at 90° gives in good yield (2) (3) hexachloronaphthoquinone-1,4, m.p. 222.5° cor., b.p. 412-415° at 758 mm. dec., 265-267° at 14 mm., accompanied by some tetrachlorophthalic acid (3:4946).

[ $\bar{C}$  on htg. with  $SbCl_5 + ICl$  in s.t. at 350° (1) breaks down yielding (2) cf. (1) carbon tetrachloride (3:5100), hexachloroethane (3:4535), hexachlorobenzene (3:4939), and other prods.; under certain conditions (not specified in abstracts)  $\bar{C}$  can be broken down to decachloroindane (perchlorohydrindene) (Beil. V-487, m.p. 138° cor. (2) ]

[ $\tilde{C}$  with pyridine + CuO + hydrazine hydrate yields (13) a hexachloronaphthalene ndls. from chlorobenzene, m.p. 202-204° (13) (note that m.p. is close to that of  $\tilde{C}$ ).]

$\tilde{C}$  is stable toward 3% aq. KOH or NaOH for 12 hrs. in cold or even 2 hrs. boilg.;  $\tilde{C}$  is stable to cold 3% alc. KOH or NaOH for 24 hrs., but on htg. for 2 hrs. splits off some 25-30% chlorine and in part resinifies (2).

② Color test with  $SbCl_5$  in  $CCl_4$ :  $\tilde{C}$  with  $SbCl_5$  in  $CCl_4$  gives stable cherry-red color (2).

[This response is not given by carbon tetrachloride (3:5100), hexachloroethane (3:4835), hexachlorobenzene (3:4939), or decachloroindane (2).]

### 3:4895 PENTACHLOROPROPIONIC ACID

Beil. II —

II<sub>1</sub>-(112)

II<sub>2</sub>-(228)

M.P. 200-215° (see text (1)).

Colorless cryst. from  $CCl_4$ . — Eas sol cold aq.

[For prepn. of  $\tilde{C}$  from trichloroacrylic acid (3:1840) with  $Cl_2$  in  $CCl_4$  soln. in sunlight (yield not reported) see (1)]

$\tilde{C}$  in aq. soln. behaves as a strong acid; on titration it gives a good Neut. Eq., calcd. 246.5; found 245.8 (1).

$\tilde{C}$  is very unstable: e.g.,  $\tilde{C}$  in aq. soln. on warming dec. (1) (with loss of HCl and  $CO_2$ ) into tetrachloroethylene (3:5460); presumably this same decompn. occurs on process of taking its m.p., and the value given above refers to rapid htg. on Hg bath.

Salts. The salts of  $\tilde{C}$  can be obtd. by neutralization with metal hydroxide of a cold satd. aq. soln. of  $\tilde{C}$  followed by evapn. to dryness at low temp.; aq. solns. of the salts are also unstable and rapidly decompose yielding metal chloride +  $CO_2$  + tetrachloroethylene (3:5460) (1). [For studies of influence of light on decompn. of these salts see (2) (3) cf. (4).]

[For study of behavior of  $\tilde{C}$  with  $H_2$  + colloidal Pd see (5).]

Acid chloride. Pentachloropropionyl chloride (3:0470) has been obtd. indirectly, i.e., from trichloroacryloyl chloride with  $Cl_2$  in sunlight (6); colorless cryst., m.p. 42°.

3:4895 (1) Boeseken, *Rec. trav. chim.* 46, 841-843 (1927). (2) Jaeger, *J. Chem. Soc.* 119, 2070-2076 (1921). (3) Jaeger, Berger, *Rec. trav. chim.* 41, 72 (1921). (note that numerous attempts to use this reactn. are given in earlier literature (3) (13) (14) (15) (16) (17) (18) (19) (20) but none is well adapted for pure  $\bar{C}$  owing to simultaneous formn. of more highly chlorinated cpds.); from anthracene with  $SO_2Cl_2$  in  $CCl_4$  (7) (11) or in xylene (11) at ord. temp. (yields nlm. quant. (7) (11)) see indic. refs. (note, however, that the results are sometimes influenced by the source of anthracene used (11)); for formn. of  $\bar{C}$  from anthracene (1:7285) with  $Cl_2$ -aq. (21), with  $S_2Cl_2$  (10), or with  $NOCl$  in s.t. at 150° or at room temp. in sunlight (22) see indic. refs.; for formn. of  $\bar{C}$  from anthracene present in crude phenanthrene during treatment of latter in  $CS_2$  with  $Cl_2$  see (12).]

[For prepn. of  $\bar{C}$  from anthrone (9-hydroxyanthracene) [Beil. VII-473, VII<sub>1</sub>-(256)] with 2 wt. pts.  $PCl_5$  in  $C_6H_6$  or without solv. at 100° for 16 hrs. see (2); for formn. of  $\bar{C}$  from 9,9,10,10-tetrachloro-9,10-dihydroanthracene (9,10-dichloroanthracene dichloride-9,10) [Beil. V-641, V<sub>1</sub>-(309)] by actn. of Zn dust, Cu powder, or phenylhydrazine (3) or on hollg. with anthrone (above) in xylene (6) see indic. refs.; for formn. of  $\bar{C}$  from 1,2,3,4-tetrachloro-9,10-dichloroanthracene by htg. with hydrazine hydrate + Cu powder in pyridine (23), or from 9-benzylanthracene with  $SOCl_2$  in  $CHCl_3$  (24), see indic. refs.; from  $\alpha$ -[9,10-dichloroanthracene tetrahydromide-1,2,3,4] (see below) by treatment with Zn dust in AcOH or with Cu powder in  $C_6H_6$  see (3).]

[ $\bar{C}$  with  $Cl_2$  in cold  $CHCl_3$  or acetylene tetrachloride gives (17) 9,9,10,10-tetrachloro-9,10-dihydroanthracene (see above);  $\bar{C}$  with  $Cl_2$  in  $C_6H_6$  at 60° yields (17) 2,3,9,10-tetrachloro-2,3-dihydroanthracene;  $\bar{C}$  in warm  $CHCl_3$  or cold  $C_6H_6$  gives (17) a mixt. of these prods.; the end prod. of chlorination of  $\bar{C}$  in  $C_6H_6$  at 20° appears (16) (3) to be 1,2,3,4,9,10-hexachloro-1,2,3,4-tetrahydroanthracene [Beil. V-611, V<sub>1</sub>-(287)], m.p. 205-207° (3). —  $\bar{C}$  with  $SO_2Cl_2$  in nitrobenzene at 100° yields (25) 2,9,10-trichloroanthracene.]

$\bar{C}$  adds 2 moles  $Br_2$  giving according to conditions one or the other of two isomeric addn. compds.; i.e.,  $\bar{C}$  moistened with  $CHCl_3$  and treated with 2  $Br_2$  yields (3) (8)  $\alpha$ -[9,10-dichloroanthracene-1,2,3,4-tetrahydromide], colorless hexag. pr. from  $C_6H_6$ , m.p. 141-142° (3), while  $\bar{C}$  with  $Br_2$  vapor gives (3)  $\beta$ -[9,10-dichloroanthracene-1,2,3,4-tetrabromide], ndls. from  $C_6H_6$  (less sol. than  $\alpha$ -isomer), m.p. 178-179° (3), 178° (16) (8), 166° (15); both  $\alpha$ - and  $\beta$ -isomers with alc. KOH lose 2 HBr (the  $\alpha$ - more rapidly than the  $\beta$ -) yielding (3) (8) 2,3-dihromo-9,10-dichloroanthracene, yel. ndls., m.p. 255-256° (3), 251-252° (15) (16) (8).

[ $\bar{C}$  in  $CHCl_3$  treated with  $NO_2$  gas gives (26) 9,10-dichloro-9,10-dinitro-9,10-dihydroanthracene (very unstable white cryst. on strong cooling) which in boilg.  $CHCl_3$  yields anthraquinone (1:9095). —  $\bar{C}$  with conc.  $HNO_3$  ( $D = 1.43$ ) in AcOH at 15-18° yields (27) 9,10-dichloro-9-hydroxy-10-nitro-9,10-dihydroanthracene [Beil. VII<sub>1</sub>-(258)]]

[ $\bar{C}$  with fumg.  $H_2SO_4$  (20%  $SO_3$ ) in nitrobenzene at 12-15° (4) (5) cf. (28) (30) or in benzenesulfonyl chloride below 50° (28), or  $\bar{C}$  with  $ClSO_3H$  in  $CHCl_3$  or  $H_2SO_4$  nt 30° (29),

yields 9,10-dichloroanthracenesulfonic acid-2 [Beil. XI-(44)], cryst. with  $2\frac{1}{2}$  H<sub>2</sub>O from alc., m.p. 158-159° (4), losing aq. in vac. at 140° to anhydrous acid, m.p. 212° cor. dec. (4) (corresp. sulfonyl chloride, m.p. 221-225° dec., corresp. sulfonamide, m.p. 279°, corresp. sulfonanilide, m.p. 247.8° cor. (4)).] — [For disulfonation of  $\bar{C}$  see (33).]

$\bar{C}$  is unaffected (13) by boilg. alc. KOH. — [For behavior of  $\bar{C}$  with pyridine see (31). — For reactn. of  $\bar{C}$  with NaSH in alc. yielding anthranol, anthrone, dianthrone, and other prods. see (32). — For use of  $\bar{C}$  in prepn. of sulfur dyes see (34).]

$\bar{C}$  on oxidation yields (18) anthraquinone (1:9095).

$\bar{C}$  like many other anthracene derivs. adds to suitable unsatd. linkages (35) (36) (37) in Diels-Alder fashion: e.g.,  $\bar{C}$  with maleic anhydride (1.0625) in nitrobenzene, boiled for 15 min., gives on cooling (50% yield (35)) adduct, colorless pr. from xylene, m.p. 258-259°, from chlorobenzene, m.p. 253° (36); in this adduct the halogen is stable toward boilg. alc. KOH (38) (39), but the adduct with AlCl<sub>3</sub> in C<sub>6</sub>H<sub>6</sub> refluxed 10 min. yields (35) 9,10-diphenylanthracene [Beil. V-747, V<sub>1</sub>-(377)], crystal from toluene, m.p. 248° (35). —  $\bar{C}$  with  $\beta$ -chloropropionic acid (3.0460) (used as source of acrylic acid (1:1020) by loss of HCl) boiled for 8 hrs. in o-dichlorobenzene yields an adduct, crystal from anisole, m.p. 245° (38); the halogen of this adduct is stable toward hydrolysis and is not removed by boilg. with 10% alc. KOH for 40 min. (38) —  $\bar{C}$  does not (38) form an adduct with cinnamic acid.

### 3:4920 3,4,5-TRICHLOROBENZOIC ACID

C<sub>7</sub>H<sub>3</sub>O<sub>2</sub>Cl<sub>3</sub>

Beil. IX - 346

IX—

M.P. 210-210.5° (1)

203° (2)

Ndls. from aq. alc. — Sublimes in long ndls. — Somewhat volatile with steam. — Eas.

sol. cold alc., ether, acetone; mod. sol.  $C_6H_6$ ,  $CHCl_3$ ; spar. sol.  $CS_2$ , pet. eth.; alm. insol. cold aq.

[For prepn. of  $\bar{C}$  from 3,4,5-trichlorobenzaldehyde (3:2440) by oxidn. with alk.  $KMnO_4$  see (1); from 3,5-dinitro-4-aminobenzoic acid (chrysanic acid) [Beil. XIV-445] with fung.  $HCl$  at  $200^\circ$  see (2); for formn. (together with other products) from benzotrichloride (3:6540) +  $Cl_2$  see (3).]

[For study of  $Ag\bar{A}$ ,  $Ca\bar{A}_2 \cdot 6H_2O$ ,  $Ba\bar{A}_2 \cdot 4H_2O$  see (2).]

The direct nitration of  $\bar{C}$  has not been recorded. [However, 3,4,5-trichloro-2-nitrobenzoic acid, ndls. from alc., m.p.  $181-181.5^\circ$  (1), and 3,4,5-trichloro-2,6-dinitrobenzoic acid, m.p.  $219-221.5^\circ$  (1), have both been prepared from the corresponding aldehydes.]

$\bar{C}$  with  $PCl_5$  yields (2) 3,4,5-trichlorobenzoyl chloride, m.p.  $36^\circ$  (2).

— Methyl 3,4,6-trichlorobenzoate: unrecorded.

— Ethyl 3,4,5-trichlorobenzoate: from  $\bar{C}$  + alc. +  $HCl$  (2), ndls., m.p.  $86^\circ$  (2).

② 3,4,6-Trichlorobenzamide: from 3,4,5-trichlorobenzoyl chloride + conc. aq.  $NH_4OH$  at  $100^\circ$  (2); ndls. from  $C_6H_6$ , m.p.  $176^\circ$  (2).

— 3,4,6-Trichlorobenzanilide: unrecorded.

3:4920 (1) van de Bunt, *Rec. trav. chim.* 48, 132-133 (1929). (2) Salkowski, *Ann.* 163, 28-33 (1872). (3) Claus, *Bücher*, *Ber.* 20, 1626 (1887)

### 3:4922 2-CHLOROANTHRAQUINONE

 $C_{14}H_7O_2Cl$

[See also 1-chloroanthraquinone (3:4480).]

Pale yel. ndls. from  $C_6H_6$ , chlorobenzene, or toluene; eas. sol. boilg.  $C_6H_6$ , toluene, or  $AcOH$ ; spar. sol. boilg. alc. — Sublimes in vac.

[For f.p./compn. data and diagram of system  $\bar{C}$  + 1-chloroanthraquinone (3:4480) (eutectic, m.p.  $143.9-144.2^\circ$ , contg. about 75%  $\bar{C}$ ) see (5).]

[For use of  $\bar{C}$  in coloring oils, fats, and waxes see (19);  $\bar{C}$  is widely used as intermediate in prepn. of many dyestuffs, but no general summary can be given here although selected examples occur in the following text.]

[For prepn. of  $\bar{C}$  from anthraquinonesulfonic acid-2 [Beil. XI-337, XI-(83)] or its Na salt with 25%  $HCl$  +  $NaClO_3$  at  $100^\circ$  (11) (20) (for use of this method in detn. of mixt. of anthraquinone- $\alpha$ - and  $\beta$ -sulfonic acids or their salts by f.p./compn. curve of resultant mixt. of 1-chloroanthraquinone (3:4480) +  $\bar{C}$  see (5)) see indic. refs.; from sodium anthraquinone-2-sulfonate in dil.  $HCl$  on exposure to light see (9), from anthraquinonesulfonic acid-2 on boilg. with dil.  $H_2SO_4$  +  $NaCl$  +  $NaClO_2$  see (21); from anthracenesulfonic

acid-2 [Beil. XI-194, XI<sub>1</sub>-(44)] with HCl + NaClO<sub>2</sub> at 100° see (22); from anthraquinone-sulfonic acid-2 or its Na salt (23) or from anthraquinonesulfonyl chloride-2 (24) with SOCl<sub>2</sub> in s.t. at 200-230° see indic. refs.]

[For prepn. of  $\bar{C}$  from  $\alpha$ -(4-chlorobenzoyl)benzoic acid [Beil. X-750, X<sub>1</sub>-(356)] by ring closure with conc. H<sub>2</sub>SO<sub>4</sub> at 160-170° (25) (16) (26) (27) (23) (4) (29) (34) (39) in pres. of AlCl<sub>3</sub> (30) see indic. refs. (for study of influence of conditions see espec. (27) (4) (31)); from  $\alpha$ -(3-chlorobenzoyl)benzoic acid (32) or from 2-benzoyl-4-chlorobenzoic acid [Beil. X-750, X<sub>1</sub>-(356)] (33) by similar ring closure with H<sub>2</sub>SO<sub>4</sub> see indic. refs.; from 4-chloro-2-benzoyl-benzoyl chloride on hgt. see (33).]

[For prepn. of  $\bar{C}$  from 2-chlorobutadiene-1,3 (chloroprene) (3:7080) + naphthoquinone-1,4 (1:9040) in C<sub>6</sub>H<sub>6</sub> see (6); from  $\alpha$ -chlorocrotonaldehyde (3:8117) + naphthoquinone-1,4 (1:9040) in C<sub>6</sub>H<sub>6</sub> with piperidine see (74); from 2-aminoanthraquinone (see below) via diazotization and rapid hgt. of diazonium chloride at 150° see (8); from 2-chloroanthraquinonecarboxylic acid-4 by hgt. at 256-290° (7) or from 2-chloroanthraquinonecarboxylic acid-5 by hgt. in s.t. at 310-320° or by distn. of its Ba salt with BaO see (17) of (15); from 2,9,10-trichloro-9-hydroxy-10-nitro-9,10-dihydroanthracene [Beil. VII<sub>1</sub>-(258)] in C<sub>6</sub>H<sub>6</sub>, nitrobenzene, or AcOH by hgt. at 90-95° see (35); from 2,9,10-trichloroanthracene [Beil. V<sub>1</sub>-(325)] (36) or from 2-chloroanthrone-9 (or 10) (12) by oxidn. with CrO<sub>3</sub> see indic. refs.]

[For prepn. of  $\bar{C}$  from 1-chloroanthraquinone (3:4480) by hgt. with conc. H<sub>2</sub>SO<sub>4</sub> at 200-205° for 9 hrs. see (37).]

[ $\bar{C}$  on reductn. with Zn dust + conc. aq. NH<sub>4</sub>OH under reflux yields (18) (37) 2-chloroanthracene [Beil. V<sub>1</sub>-(324)], m.p. 217° (37), 215° (18). —  $\bar{C}$  on reductn. with hydrazine hydrate in MeOH/KOH at 10 atm. and 135° for 1½ hrs. in pres. of Pd/CaCO<sub>3</sub> cat. yields (38) bis-(2,2'-anthraquinonyl) [Beil. VII<sub>1</sub>-(495)], m.p. 387-388°. —  $\bar{C}$  on reductn. with Al powder + conc. H<sub>2</sub>SO<sub>4</sub> (40) or with Sn + HCl (39) yields a mixt. of 3-chloroanthrone-9, m.p. 150° (38) (corresp. acetate, m.p. 146° (41) (42)), and 2-chloroanthracene-9, m.p. 155° (41) (corresp. acetate, m.p. 143° (41)); this mixt. of chloroanthrones can be sepd. by acetylation with Ac<sub>2</sub>O + pyridine and fractional crystn. of the resultant acetates (42). — For use of this reductn. method in prepn. of vat dyes see (43). — For study of oxidn./reductn. potential of  $\bar{C}$  see (13).]

[ $\bar{C}$  with MeOH/KOH in s.t. at 130° yields (44) 2-methoxyanthraquinone [Beil. VIII-343, VIII<sub>1</sub>-(658)], r.p. 196°. —  $\bar{C}$  with 2-hydroxyanthraquinone + NaOAc + Cu powder htd. at 250-260° for 12 hrs. gives (66% yield (45)) di-(2-anthraquinonyl) ether, pale yel. ndls. from pyridine, m.p. 324° (45). —  $\bar{C}$  with K xanthate + Cu powder boiled for 16 hrs. in AmOH gives (56% yield (45) (46)) di-(2-anthraquinonyl) sulfide, *cryst. from xylene*, m.p. 290.5-291° (45). —  $\bar{C}$  with thioacetic acid (2-mercaptobenzoic acid) + solid KOH htd. in AmOH at 150° for 8 hrs. gives (77% yield (3)) S-(2-anthraquinonyl)thioacetic acid [Beil. X<sub>1</sub>-(56)], m.p. 278° cor. (3); this prod. on hgt. with H<sub>2</sub>SO<sub>4</sub> or better with p-toluenesulfonyl chloride at 200° (3) (47) ring-closes by loss of H<sub>2</sub>O to 1,2-phthalylthioxanthone [Beil. XVII<sub>1</sub>-(291)], yel. ndls. from AcOH, m.p. 278° cor. (3).]

[ $\bar{C}$  with NaOH + glycerol htd. at 190° is claimed (48) to yield anthraquinone (1:9095). —  $\bar{C}$  with NaOH + NaClO<sub>2</sub> htd. 28 hrs. at 195° (49) cf. (50) (51) (52) gives (95% yield (49)) 1,2-dihydroxyanthraquinone (alizarin) (1:9165). —  $\bar{C}$  with NaSH boiled in aq. alc. yields (53) 2-mercaptoanthraquinone [Beil. VIII-346, VIII<sub>1</sub>-(659)], yel. ndls. from AcOH, m.p. 206° (54). —  $\bar{C}$  with Na<sub>2</sub>Se boiled in dil. alc. yields (55) 2-selenomercaptoanthraquinone, but  $\bar{C}$  with Se + NaOAc htd. at 205-210° in a mixt. of trichlorobenzene + tetralin for 8 hrs. yields (56) di-(2-anthraquinonyl) selenide.]

[ $\bar{C}$  with conc. aq. NH<sub>4</sub>OH in pres. of Cu salts under press. and at elevated temp. (180-200°) gives (yields: 97.5% (57), 98.6% (2)) (27) (58) (59) (60) 2-aminoanthraquinone [Beil. XIV-191, XIV<sub>1</sub>-(449)], red ndls., m.p. 302° (for study of influence of conditions see

(57) (2) (27) (61) (62)). —  $\bar{C}$  with hydrazine hydrate + pyridine in s.t. at 170° for 8 hrs. gives (20% yield (63)) 2-hydrazinoanthraquinone [Beil. XV<sub>1</sub>-(200)], or.-yel. ndls. from pyridine, m.p. 228-229° (63).]

[ $\bar{C}$  with 4 moles  $C_6H_5MgBr$  in ether yields (64) (65) 2-chloro-9,10-diphenylanthracene, yel. cryst. powder, or. ndls. from  $AcOH$ , m.p. 194° (64), 193° (66), 185° (65).]

[For formn. of addn. cpds. of  $\bar{C}$  with  $SbCl_5$  in  $CHCl_3$  see (10); for formn. of 2-anthraquinonylpyridinium chloride from  $\bar{C}$  +  $AlCl_3$  in pyridine see (67).]

[The direct sulfonation of  $\bar{C}$  appears not to have been reported in the scientific literature although  $\bar{C}$  with fuming  $H_2SO_4$  at 125-130° in pres. of Hg salts cf. (73) as directed is claimed in a patent (68) to yield 2-chloroanthraquinonesulfonic acid-5. — Two monosulfonic acids of  $\bar{C}$  are known, however, although prepared by indirect means; these are 2-chloroanthraquinonesulfonic acid-6 (corresp. sulfonyl chloride, deep yel. ndls. from chlorobenzene, m.p. 202° (69), from  $C_6H_6$ , m.p. 202-203° (71)), and 2-chloroanthraquinonesulfonic acid-7 (corresp. sulfonyl chloride, yel. cryst. from  $C_6H_6$ , m.p. 205° (70), 200-201° (71), 176° (69)); note that the alkali salts of both these acids are almost completely insoluble in aq. (71) and the above anomaly in m.p. of the sulfonyl chlorides may have been due to impure material. —  $\bar{C}$  on htg. with fuming  $H_2SO_4$  (40%  $SO_3$ ) at 180° yields (72) a mixt. of sulfonated products which on alk. fusion give 1,2,6-trihydroxyanthraquinone (flavopurpurin) [Beil. VIII-513, VII<sub>1</sub>-(741)] and 1,2,7-trihydroxyanthraquinone (anthrapurpurin) [Beil. VIII-516, VII<sub>1</sub>-(742)].]

## 3:4925 3,4-DICHLOROBENZOIC ACID

 $C_7H_4O_2Cl_2$ 

Beil. IX - 343

IX<sub>1</sub>-(141)

M.P. 211-212° (1)

208-209° (2) (20)

206° (3)

205° (4)

201-205° (5)

M.P. 204.1° (6)

(Contd.) 203° (7)

201-202° (8) (19)

201° (9)

200° cor. (10)

Ndls. from aq., alc., 60% alc. (6),  $C_6H_6$  (2) (6), or 30% AcOH (1) (18). — Volatile with steam. — Appreciably more sol. in hot aq. than in cold; very eas. sol. alc.

[For prepn. of  $\bar{C}$  from 3,4-dichlorotoluene (3:6355) by oxidn. (2) with  $CrO_3$  (8) (11), with dil.  $HNO_3$  in a.t. at 130-140° (9) (3), or with  $KMnO_4$  (6) see indic. refs.; for prepn. by oxidn. of 3,4-dichlorobenzyl chloride (8) (11), 3,4-dichlorobenzal chloride (3:6576) (5) (11), 3,4-dichlorobenzaldehyde (3:6559) (12), 3,4-dichlorobiphenyl (3:6685) (10), or chlorinated isopropylbenzene (cumene) (5) see indic. refs.; for prepn. from benzoic acid (1:0715) by actn. of  $HCl + KClO_3$  (11) (20) or  $Ca(OCl)_2$  (11) see indicated refs.; for still other mase. methods see Beil. IX-343 + IX<sub>1</sub>-(111)]

$\bar{C}$  is scarcely affected by litg. with fuming  $HNO_3$  (13) but on soln. in latter and treatment as directed (13) with conc.  $H_2SO_4$  yields 3,4-dichloro- $\alpha$ -nitrobenzoic acid, m.p. 160° (13). [This prod. may or may not be identical with that of m.p. 465° obtd. indirectly (14).]

$\bar{C}$  with  $PCl_5$  (15) or  $SOCl_2$  (16) yields 3,4-dichlorobenzoyl chloride, b.p. 242° (8), 159-160° at 42 mm. (15), 88.0-88.3° (16). [For formn. of this prod. in chlorination of  $BzCl$  see (4)]

— Methyl 3,4-dichlorobenzoate: unrecorded.

— Ethyl 3,4-dichlorobenzoate: b.p. 202-203° (5). [For study of rate of hydrolysis see (17)]

⑤ 3,4-Dichlorobenzamide: from 3,4-dichlorobenzoyl chloride +  $\text{NH}_3$  (8); m.p.  $133^\circ$  (8);  $166-168^\circ$  (17, 169° (18).

— 3,4-Dichlorobenzanilide: unrecorded.

### 3:4928 3-CHLORONAPHTHOIC ACID-2

 $\text{C}_{11}\text{H}_7\text{O}_2\text{Cl}$ 

Beil. IX - 661

IX<sub>1</sub>-(278)

M.P.  $216.5^\circ$  (1)

$216^\circ$  (2)

$212-213^\circ$  (3)

Cryst. from MeOH + aq. (2) or from  $\text{C}_6\text{H}_6$  (3). — Eas. sol. org. solv.

[For prepn. of  $\bar{\text{C}}$  from 3-aminonaphthoic acid-2 [Beil. XIV-535, XIV<sub>1</sub>-(623)] via diazotization and use of  $\text{Cu}_2\text{Cl}_2$  reactn. (alm. quant. yield) see (3); from the corresp. acid chloride (below) by hydrolysis with aq. see (1).]

$\bar{\text{C}}$  with Cu bronze refluxed in nitrobenzene for 2 hrs. gives (48% yield (4))  $\beta$ -naphthoic acid (1:0800), m.p.  $185^\circ$  (4).

[No record can be found of direct conv. of  $\bar{\text{C}}$  to the corresp. acid chloride (3-chloro-2-naphthoyl chloride); however, this compd., m.p.  $56.5^\circ$  (1), b.p.  $248^\circ$  at 160 mm. (1), has been ohtd. indirectly from 3-hydroxy-2-naphthoic acid (1:0850), with  $\text{PCl}_5$  in 49% yield (1); note that 3-hydroxy-2-naphthoic acid with  $\text{SOCl}_2$  gives instead 3-hydroxy-2-naphthoyl chloride, m.p.  $96^\circ$  (5),  $94.5^\circ$  (6), in 82% yield (5).

[For condens. of  $\bar{\text{C}}$  with pyrazolanthrone see (8).]

⑤ Methyl 3-chloro-2-naphthoate: cryst. from MeOH, m.p.  $58-59^\circ$  (3),  $58^\circ$  (7). [From  $\bar{\text{C}}$  in MeOH with conc.  $\text{H}_2\text{SO}_4$  (88% yield (7)), from  $\bar{\text{C}}$  with ethereal diazomethane (3), or from the acid chloride (above) with 5 pts. MeOH (3).] [For reactn. of this ester with 1-aminoanthraquinone see (7).]

⑥ Ethyl 3-chloro-2-naphthoate: lfts. from lt. pet. or from alc., m.p.  $57-59^\circ$  (3),  $50^\circ$  (1); b.p.  $218-222^\circ$  at 160 mm. (1),  $195-197^\circ$  at 18 mm. (3), volatile with steam. [From  $\bar{\text{C}}$  in EtOH with HCl gas (1) (3).]

⑦ 3-Chloro-2-naphthoamide: ndls. from AcOH, m.p.  $236-237^\circ$  (1). [From the acid chloride (above) with conc. aq.  $\text{NH}_4\text{OH}$  (1).]

3:4928 (1) Scarborough, *Ann.* 31, 1158 (1913). (2) Hosaeus, *Ber.* 26, 668-671 (1893). (3) (4) Clemo, Spence, *J. Chem. Soc.* 1928, 2818. vs *Colourists* 56, 170 (1940). (6) Abrahart, *J. Ber.* 51, 22-23 (1918). (8) I.G., *Brit.* 298,775, Nov. 8, 1928; French 644,589, Oct. 10, 1928.

3:4930 *meso*- $\alpha,\alpha'$ -DICHLOROSUCCINIC ACID

Beil. II - 619

II<sub>1</sub>-(267)II<sub>2</sub>-(558)

M.P. 220° cor., dec. (in sealed cap. tube) (1)

217-218° (2)

214-218° (10)

215° u.c. (3)

215° dec. (4) (5) (6) (11) (18)

213° (7) (16)

210° dec. (8)

209-213° (9)

(See also *d,l*- $\alpha,\alpha'$ -dichlorosuccinic acid (3:4711).)

Hexag. pr. from aq. —  $\bar{C}$  is readily sol. aq. although less so than its *d,l*-isomer; e.g., 100 cc. satd. aq. soln. of  $\bar{C}$  at 0° conts. 12.0 g.  $\bar{C}$  (4);  $\bar{C}$  is eas. sol. alc., ether, acetone or  $\text{CHCl}_3$ ; spar. sol.  $\text{C}_6\text{H}_6$  or lgr.

[For prepn. of  $\bar{C}$  from disodium salt of maleic acid (1:0470) in satd. aq.  $\text{NaCl}$  soln. with  $\text{Cl}_2$  at 0° in dark or diffuse daylight (yields 74.5% (7), 66% (10), 65% (1)) cf. (10) see indic. refs. (note that as a side reactn. some addn. of  $\text{HOCl}$  also occurs leading to as much as 7% (1) chloromaleic acid); from fumaric acid (1:0895) with excess  $\text{Cl}_2$  in s.t. in sunlight for 3-4 days see (6); from *meso*- $\alpha,\alpha'$ -diaminosuccinic acid [Beil. IV-486, IV<sub>2</sub>-(901)] in aq.  $\text{HCl}$  with  $\text{NOCl}$  or  $\text{AgNO}_2$  (75% yield) see (3); from *meso*- $\alpha,\alpha'$ -dichlorosuccinyl (di)-chloride (3:0087) by hydrolysis with aq. see (5).]

[For formn. of  $\bar{C}$  from bis-acetyl peroxide (9) by decomposition in chloroacetic acid (3:1370) at 85-95° ( $\text{CO}_2 + \text{CH}_4$  are also formed) see (9).]

$\bar{C}$  behaves as a normal dibasic acid: titration with standard dil. aq. alk. gives Neut. Eq. 93.5. — [For study of acid strength ( $K_1 = 361 \times 10^{-4}$  at 20.2°,  $K_2 = 9.4 \times 10^{-4}$  at 17.8° (4)) see (4) (8); (18) for study of conductivity see (11).]

[Salts (of metals).  $\text{Ag}_2\bar{A}$ , amorphous ppt. (6) which on boilg with aq. for 10 hrs. yields (12) both *d,l*-tartaric acid (1:0550) and *meso*-tartaric acid (1:0490);  $\text{Ca}\bar{A} \cdot 2\text{H}_2\text{O}$ , eas. sol. aq. and alc. (6);  $\text{Sr}\bar{A} \cdot \text{H}_2\text{O}$  (6);  $\text{Ba}\bar{A}$ , very eas. sol. aq., insol. alc. (6);  $\text{Zn}\bar{A} \cdot 3\text{H}_2\text{O}$  (6);  $\text{Cd}\bar{A} \cdot 3\text{H}_2\text{O}$ , very eas. sol. aq., insol. alc. (6).]

$\bar{C}$  with cold aq.  $\text{KOH}$  loses 1  $\text{HCl}$  yielding (5) (7) (14) chlorofumaric acid (3:4853);  $\bar{C}$  with  $\text{NaOAc}/\text{AcOH}$  on boilg. (13) (17) or aq. soln. of  $\text{Na}_2\bar{A}$  on boilg.  $\frac{1}{2}$  hr. (12) loses 1  $\text{HCl}$  yielding chloromaleic acid (3:3432);  $\bar{C}$  on warming in dil.  $\text{H}_2\text{SO}_4$  gives both (14) chlorofumaric and chloromaleic acids. [For study of rate of decompn. of  $\bar{C}$  by aq., acids, or alkalis see (7) (8) (15).]

$\text{K}_2\bar{A}$  in aq. soln. maintained at neutrality at 100° dec. with formn. (14) of acetaldehyde (1:0100),  $\text{CO}_2 + \text{meso}$ -tartaric acid (1:0490).

$\bar{C}$  with  $\text{Ac}_2\text{O}$  at 150° yields (12) chloromaleic anhydride (3:0280).

The acid chloride (3:0087) corresp. to  $\bar{C}$  is known but is usually obtd. indirectly.

Ⓐ Dimethyl *meso*- $\alpha,\alpha'$ -dichlorosuccinate: m.p. 31.5-32° (see 3:0240).

Ⓑ Diethyl *meso*- $\alpha,\alpha'$ -dichlorosuccinate: m.p. 63° (see 3:1364).

— Acid salt of  $\bar{C}$  with *dl*, $\alpha$ -diphenylethylamine: tbls. from aq., m.p. 133-134° rap. htg. (13); satd. aq. soln. at 25° conts. 61.4 g./liter (13). [For the corresp. acid salts

of  $\bar{C}$  with the two opt. act. forms of this base see (13); both have m.p. 128–129°, and their satd. aq. solns. at 25° cont. 76.1 g./liter (13).]

3:4933 4-CHLORO-3-HYDROXYBENZOIC ACID  $C_7H_5O_3Cl$  Beil. S.N. 1068

M.P. 219.5–220.5° (1)

Colorless ndls. from aq.

[For prepn. of  $\bar{C}$  from 4-amino-3-hydroxybenzoic acid (1) via diazotization and use of  $Cu_2Cl_2$  reactn. see (1); note that the prod. formerly [Beil. X-143] supposed to have been  $\bar{C}$  is now regarded (1) as probably the 6-chloroisomer (3:4720).]

3:4933 (1) Beyer, *Rec. trav. chim.* **40**, 627 (1921).

3:4935 3,5-DICHLORO-2-HYDROXYBENZOIC ACID  $C_7H_4O_3Cl_2$  Beil. X - 104  
 (3,5-Dichlorosalicylic acid)  $X_1-(48)$

M.P. 220–221° (1)

219–220° (2)

219.5° (3) (10)

219° (4) (5) (6) (7)

215° (8)

214° (9) (11) (12)

Colorless scales or ndls. from aq. alc.; very spar. sol. hot aq., eas. sol. alc., ether; sublimes with partial decomposition.

[For prepn. of  $\bar{C}$  from o-hydroxybenzoic acid (salicylic acid) (1:0780) in aq. KOH (3 moles) (11) (10), or in aq. KOH (1 mole) (14) (17), or in aq. KOH (2 moles) (15) (16), in EtOH (17), in AcOH (12) (10) (2), or in  $CS_2$  susp. (17) with  $Cl_2$  see indic. refs.; with 30%  $H_2O_2 + HCl$  (80% yield) see (4); by htg. with  $SbCl_5$  see (13). (Note that by most of these methods 5-chloro-2-hydroxybenzoic acid (5-chlorosalicylic acid) (3:4705) may also be formed; from this  $\bar{C}$  may also be sep. via its spar. sol.  $Ba\bar{A}_2$  (17).)]

[For prepn. of  $\bar{C}$  from sulfosalicylic acid with  $Cl_2$  in aq. see (8); from K 2,4-dichlorophenolate with  $CO_2$  at 140° see (11); from 3,5-dichlorosalicylaldehyde by oxidn. with alk.

KMnO<sub>4</sub> (yield 100%) see {9}; from 3,5-dichloro-2-methoxybenzoic acid with 45% HI in s.t. at 120-130° see {3}; from chloral-3,5-dichlorosalicylamide by hydrolysis see {1}.]

$\bar{C}$  on htg. with CaO (17) {7} or at 200° in aniline (18) loses CO<sub>2</sub> yielding 2,4-dichlorophenol (3:0560).

$\bar{C}$  with FeCl<sub>3</sub> gives {13} {2} a dark violet color.

[ $\bar{C}$  in 60% fuming H<sub>2</sub>SO<sub>4</sub> treated with Cl<sub>2</sub> at 80-90° for 15 hrs. gives (70% yield {19}) 3,5,6-trichlorosalicylic acid, white pl. from aq. alc. or aq. AcOH, m.p. 207° cor. {19}; (this with Ac<sub>2</sub>O + trace H<sub>2</sub>SO<sub>4</sub> gives corresp. acetate, ndls. from lgr., m.p. 129.5° cor. {19}).]

$\bar{C}$  in AcOH treated with fuming HNO<sub>3</sub> yields {20} 4,6-dichloro-2-nitrophenol, m.p. 122° {20}.

$\bar{C}$  with PCl<sub>5</sub> (1 mole) yields (5) {10} 3,5-dichloro-2-hydroxybenzoylchloride (3,5-dichlorosalicyloyl chloride), ndls. from ether + pet. eth., m.p. 79°. [For details on various phosphorus compounds also formed in this reaction see {21}] [Note also existence of anhydride of  $\bar{C}$  (from the acid chloride + Ag $\bar{A}$ ), cryst. from CHCl<sub>3</sub>, m.p. 186-187° {5} {28}].

[ $\bar{C}$  in aq./alc./H<sub>2</sub>SO<sub>4</sub> gives {22} on electrolytic reduction 3,5-dichloro-2-hydroxybenzyl alcohol, ndls. from C<sub>6</sub>H<sub>6</sub>, m.p. 82° {22}; for study of prepn. and thermal rearr. of allyl {23}, crotyl {23}, benzyl {24}, and other {25} ethers of  $\bar{C}$  see indic. refs.]

① Methyl 3,5-dichloro-2-hydroxybenzoate: ndls. from alc. or ether, m.p. 150° {15}, 147° {5} {26}, 143-144° {7} {3}, 142° {12}. [From Ag $\bar{A}$  + MeI in s.t. at 135° {12}, from 3,5-dichlorosalicyloyl chloride (above) with MeOH {5}, or from methyl salicylate (1:1750) in AcOH with Cl<sub>2</sub> {26}]. [This ester with Ac<sub>2</sub>O yields {7} corresp. acetate, ndls. from MeOH, m.p. 57° {7}].

② Ethyl 3,5-dichloro-2-hydroxybenzoate: cryst. from ether, m.p. 57° {5}, 47° {12}. [From Ag $\bar{A}$  + C<sub>2</sub>H<sub>5</sub>I as above {12} {3}, from 3,5-dichlorosalicyloyl chloride (above) with EtOH {5}, or from ethyl salicylate (1:1755) with Cl<sub>2</sub> {27}].

— 3,5-Dichloro-2-hydroxybenzamide: m.p. 209° {11}.

— 3,5-Dichloro-2-hydroxybenzanilide: m.p. 134.5° {5} [From 3,5-dichlorosalicyloyl chloride (above) with aniline in ether {5}].

3:4936 4-CHLORONAPHTHOIC ACID-1

C<sub>11</sub>H<sub>7</sub>O<sub>2</sub>Cl Beil. IX - 651  
IX<sub>1</sub>—

M.P. 221-223° {2}  
210° {1}

Ndls. from alc.; eas. sol. alc. or AcOH; spar. sol. aq.,  $\text{CHCl}_3$ , ether, or hydrocarbons.

[For prepn. of  $\bar{C}$  from 4-aminonaphthoic acid-1 [Beil. XIV-533] by diazotization, conversion with  $\text{CuCN}$  to 4-chloronaphthonitrile (see below), and hydrolysis of the latter by boilg. with a mixt. of 50% AcOH (2 vols.) + conc.  $\text{H}_2\text{SO}_4$  (1 vol.) see (1); from 1-chloro-4-(chloromethyl)naphthalene, m.p. 78-79° (2), by oxidn. with dil.  $\text{HNO}_3$  see (2); or from 1-bromo-4-chloronaphthalene [Beil. V-548, V<sub>2</sub>-(445)] by conv. to  $\text{RMgBr}$  and carbonation see (2).]

$\bar{C}$  does not react either with conc.  $\text{NH}_4\text{OH}$  at 200° or with  $(\text{NH}_4)_2\text{CO}_3$  at 220° (1).

Salts. The alk. salts of  $\bar{C}$  are eas. sol. aq.; the calcium, barium, and silver salts are sparingly sol. aq.; the iron, lead, and copper salts are insol. aq. (1).

— Methyl 4-chloro-1-naphthoate: unreported.

— Ethyl 4-chloro-1-naphthoate: unreported.

— 4-Chloro-1-naphthonitrile: long white ndls. from AcOH, m.p. 110° (1).

① *p*-Bromophenacyl 4-chloro-1-naphthoate: m.p. 130.5-131° (2).

+  $\text{Cl}_2$  + anhyd.  $\text{FeCl}_3$  at  $125^\circ$  (33), cf. (34); from various addn. prods. of chlorine with trichloro- (35), tetrachloro- (36), or pentachloro- (37) benzenes usually by means of  $\text{MeOH}/\text{NaOH}$ , from 2,3,5,6-tetrachloro-*N*-nitroaniline, 2,3,5,6-tetrachloro-*N*-nitroacetanilide, or 2,3,5,6-tetrachloro-4-nitro-*N*-nitroaniline in boilg.  $\text{AcOH}$  + conc.  $\text{HCl}$  (8), from tetrachlorophthalyl *sym*-dichloride or from pentachlorobenzoyl chloride on distn. (38).]

$\bar{\text{C}}$  with  $\text{H}_2$  over  $\text{Ni}$  at  $270^\circ$  gives (39)  $\text{C}_6\text{H}_6$ , chlorobenzene, dichlorobenzene, trichlorobenzene, etc. —  $\bar{\text{C}}$  in boilg. alc. with large excess of  $\text{Na}$  is completely dehalogenated (40).

$\bar{\text{C}}$  is unattacked by  $\text{ICl}$  in s.t. at  $300^\circ$  (41) and does not react with  $\text{MeMgI}$  or with  $\text{MeMgBr}$  in ether even on long boilg. (42).

[ $\bar{\text{C}}$  with liq.  $\text{Cl}_2$  in sunlight yields (37) by addn. both decachlorocyclohexane, m.p.  $92^\circ$ , and dodecachlorocyclohexane, m.p. in sealed cap. tube  $285^\circ$ . —  $\bar{\text{C}}$  with  $\text{F}_2$  in  $\text{CCl}_4$  soln. at  $0^\circ$  yields (43) small amts. of both hexachlorotetrafluorocyclohexene,  $\text{C}_6\text{Cl}_4\text{F}_2$ , m.p.  $113$ – $114^\circ$ , and hexachlorohexafluorocyclohexane,  $\text{C}_6\text{Cl}_2\text{F}_4$ , m.p.  $94$ – $96^\circ$ . —  $\bar{\text{C}}$  in vapor phase with  $\text{F}_2$  in pres. of  $\text{Cu}$  gives a mixt. of 12 individual prods. (44).]

$\bar{\text{C}}$  with aq.  $\text{NaOH}$  at  $135$ – $138^\circ$  and 11–12 atm. for 3–4 hrs. (14) or with excess 5–15% soln. of  $\text{NaOH}$  in  $\text{MeOH}$  at  $135^\circ$  under press. (45) or  $\bar{\text{C}}$  with  $\text{NaOH}$  in  $\text{EtOH}$  in s.t. at  $150$ – $160^\circ$  (47) or in dry glycerol at  $250$ – $280^\circ$  (47) gives (80% yield (14)) sodium salt of pentachlorophenol (3:4850). —  $\bar{\text{C}}$  with  $\text{MeOH}/\text{NaOH}$  in ethyl methyl ketone soln. at b.p. for  $\frac{1}{2}$  hr. gives (43% yield (46)) methyl pentachlorophenyl ether, ndls. from alc., m.p.  $108$ – $109^\circ$ . [For studies of kinetics of reactn. of  $\bar{\text{C}}$  with  $\text{MeOH}/\text{NaOH}$  in s.t. at  $151^\circ$  (2), at  $176^\circ$  (48), at  $180^\circ$  (48), at  $183^\circ$  (49) see indic. refs.; of  $\bar{\text{C}}$  with  $\text{EtOH}/\text{NaOH}$  or with  $\text{NaOEt}$  soln. at  $175^\circ$  see (2).]

$\bar{\text{C}}$  on boilg. with mixt. of fuming  $\text{HNO}_3$  + conc.  $\text{H}_2\text{SO}_4$  gives (50) tetrachlorobenzoquinone-1,4 (chloranil) (3:4978).

Cryst. from alc. —  $\bar{C}$  is almost insol. in cold aq.; e.g., 100 ml. satd. aq. soln. at 25° conts. 0.0068 g.  $\bar{C}$  (33); note that  $\bar{C}$  is thus much less sol. in aq. than *m*-chlorobenzoic acid (3:4392) and far less sol. than *o*-chlorobenzoic acid (3:4150). — At 14-16° 100 ml. satd. soln. of  $\bar{C}$  in acetone conts. 2.6 g.  $\bar{C}$ , in EtOAc 1.6 g.  $\bar{C}$ , in 75% AcOH 0.3 g.  $\bar{C}$ , in  $CCl_4$  0.04 g.  $\bar{C}$ , in  $C_6H_6$  0.017 g.  $\bar{C}$ , in  $CS_2$  0.16 g.  $\bar{C}$  (22). — [For study of soly. of  $\bar{C}$  in acetone (8),  $C_6H_6$  (8) (9), heptane (9) see indic. refs.]

[For study of distribution at 25° of  $\bar{C}$  between aq. + toluene or aq. +  $CHCl_3$  see (35); for adsorption of  $\bar{C}$  on charcoal from its solns. in acetone or  $C_6H_6$  see (8); for soly. of  $\bar{C}$  in aq. solns. of various salts (including NaA) see (33).]

$\bar{C}$  can be sublimed in vac. (19). —  $\bar{C}$  is but very slightly volatile with steam (for details see (10)). — [For crystallographic data see (36) (37).]

Binary systems contg.  $\bar{C}$ . [For f.p./compn. data on system  $\bar{C}$  + aq. see (38). — For f.p./compn. data and diagrams of system  $\bar{C}$  + BrOH (1:0715), eutectic, m.p. 115°, contg. about 10 wt %  $\bar{C}$ , see (22) (16); for f.p./compn. data on systems  $\bar{C}$  + *p*-toluic acid (1:0795) (11),  $\bar{C}$  + *p*-hydroxybenzoic acid (1:0840) (11), or  $\bar{C}$  + *p*-methoxybenzoic acid (anisic acid) (1:0805) (15) see indic. refs.]

[For f.p./compn. data and diagrams on systems  $\bar{C}$  + *o*-chlorobenzoic acid (3:4150), eutectic, m.p. 132°, contg. abt. 10 wt %  $\bar{C}$ , see (22) (16);  $\bar{C}$  + *m*-chlorobenzoic acid (3:4392), eutectic, m.p. 132°, contg. abt. 10 wt %  $\bar{C}$ , see (22) (16);  $\bar{C}$  + *p*-chlorobenzoic acid (3:4392), eutectic, m.p. 132°, contg. abt. 10 wt %  $\bar{C}$ , see (22) (16);  $\bar{C}$  + *p*-iodobenzoic acid (42) see indic. refs.]

[For f.p./compn. data and diagrams on systems  $\bar{C}$  + *p*-bromobenzoic acid (16),  $\bar{C}$  + *p*-iodobenzoic acid (42) see indic. refs.]

Ternary systems contg.  $\bar{C}$ . [For influence of addn. of  $\bar{C}$  to the eutectic mixt. of *o*-chlorobenzoic acid (3:4150) with *m*-chlorobenzoic acid (3:4392) see (43); for data on ternary system of all three chlorobenzoic acids, eutectic m.p. 104.9°, contg. 48.3 mole % *ortho* + 44.0 mole % *meta* + 7.7 mole % *para* isomers, see (39).]

Miscellaneous. [For study of fate of  $\bar{C}$  in animal organism see (44) (45) (46) (47); note that conjugation with glycine to yield the expected *N*-(*p*-chlorobenzoyl)glycine (*p*-chlorohippuric acid) [Beil. IX-341], m.p. 143° (45), does occur. — For study of toxicology of  $\bar{C}$  see (46) (48). — Note that sodium salt of  $\bar{C}$  (see also below) is widely used under name "Mikrobin" as preservative. — For use of  $\bar{C}$  as vulcanization regulator see (49).]

Preparation. [For prepn. of  $\bar{C}$  from *p*-chlorotoluene (3:8287) by oxidn. with boilg. 5% aq.  $KMnO_4$  (60% yield (51)) (22) (50) (52) (53) (133), with  $MnO_2 + H_2SO_4$  (100% yield (51)), with  $CrO_3$  (54), with dil.  $HNO_3$  in s.t. at 140–145° for  $\frac{1}{2}$  hr. (55) or at 115–120° for 5–6 hrs. (56) see indic. refs.; from *p*-chlorotoluene (3:8287) by oxidn. with air in the pres. of various catalysts (57), or at 235–240° and 50–60 atm. press. in pres. of  $FeO \cdot OH$  (58), or in aq. alk. at 260° under press. (59) see indic. refs.; for formn. of  $\bar{C}$  from *p*-chlorotoluene (3:8287) by electrolytic oxidn. (2) (60), by action of  $NOCl$  (30), or by long exposure to  $I_2 + aq.$  in light (28) see indic. refs.]

[For prepn. of  $\bar{C}$  from *p*-chloroacetophenone (3:6735) by oxidn. with alk.  $KMnO_4$  (61), with  $CrO_3/AcOH/H_2SO_4$  (95% yield (71)), with  $Cl_2 + NaOH$  ( $NaOCl$ ) in nq.  $MeOH$  (93% yield (62)), by liquid phase cat. oxidn. with air in pres. of  $MnO_2$  (91% yield (6)) see indic. refs.; for formn. of  $\bar{C}$  from *p*-chloroacetophenone (3:6735) with  $NOCl$  see (63).]

[For formn. of  $\bar{C}$  from 4-chloro-isopropylbenzene (*p*-chlorocumene) (3:8705) by oxidn. with  $HNO_3$  (64) (23), from 2,4'-dichlorobiphenyl (3:0670) (65) or from 4,4'-dichlorobiphenyl (3:4300) (66) by oxidn. with  $CrO_3/AcOH$ , from benzal-4-chloroacetophenone (24) by oxidn. with  $KMnO_4$  in pyridine (90% yield (24)) see indic. refs.]

[For formn. of  $\bar{C}$  from *p*-chlorobenzaldehyde (3:0765) by oxidn. with  $KMnO_4$  (67) (68) (69) (70) or  $CrO_3$  (67) or even slowly by air see indic. refs.; from *p*-chlorobenzaldehyde copper during recrystn. (presumably as a result of oxidn. by air) see (31).]

[For prepn. of  $\bar{C}$  from *p*-chlorobenzonitrile [Beil. IX-341, IX-1(140)] by hydrolysis with 75%  $H_2SO_4$  (71), from *p*-chlorobenzoyl chloride (3:6550) by hydrolysis with nq., from *p*-chlorobenzotrichloride (3:6825) by hydrolysis, e.g., with aq. in s.t. at 200° (72) or with aq. alk., alk. carbonates, or alk.-carb carbonates (73) (note also formn. of  $\bar{C}$  as by-prod. of prepn. of *o*-chlorobenzaldehyde from *o*-chlorotoluene presumably due to hydrolysis of some *p*-chlorobenzotrichloride (81)), from *p*-chlorobenzal (di)chloride (3:6700) with  $CrO_3$  (74) or on boilg. with aq. for 20 hrs. followed by oxidn. with  $KMnO_4$  (85% yield (17)); from a mixt. of *p*-chlorobenzotrichloride + *p*-chlorobenzal (di)chloride by bydral. with 70%  $H_2SO_4$  or 80%  $AcOH$  or 5%  $NaOH$  at 90–100° in stream of air to effect immediate oxidn. (75) see indic. refs.]

[For prepn. of  $\bar{C}$  from 2-(*p*-chlorobenzoyl)benzoic acid [Beil. X-750, X-1(356)] by hydrolytic cleavage with nq. +  $CaO$  under press. at 325° (93% yield (7)), or from *p*-chlorobromobenzene via conversion to *p*-chlorophenyl lithium bromide (76) or to *p*-chlorophenyl magnesium bromide (77) and subsequent carbonation (90% yield (76)) or from chlorobenzene (3:7903) with  $AlCl_3 + CO_2$  at 100° and 60 atm. press. (82) see indic. refs.]

[For formn. of  $\bar{C}$  from benzoic acid (1:0715) with alk.  $NaOCl$  (20) cf. (78) or  $Ca(OCl)_2$  (79) cf. (25), or from 4-chlorophthalic acid (3:4390) by cat. monodecarboxylation (80), see indic. refs.]

[For formn. of  $\bar{C}$  from di-(*p*-chlorobenzoyl) peroxide by htg. (2) (3), from *p*-aminobenzoic acid via diazotization and use of  $Cu_2Cl_2$  reaction (82% yield (83)), from *p,p'*-diazoaminobenzoic acid (diazoaminobenzene-4,4'-dicarboxylic acid) [Beil. XVI-728] with conc.  $HCl$  (84), from *p*-chloroisooctroacetophenone with warm  $Ac_2O$  (21), from *p*-chlorophenacyl bromide by conv. to quaternary salt with quinoline and treatment with aq.  $NaOH$  (18), from *p*-borobenzoic acid with hot nq.  $CuCl_2$  (26), from di-(*p*-chlorobenzoyl)butane on pyrolysis at 255–265° for 24 hrs. (85), from ethyl *p*-chlorophenyl-azo-carboxylate during oxidn. with  $H_2O_2$  in  $AcOH$  (29), from *p*-hydroxybenzoic acid (1:0840) with  $PCl_5$  followed by aq. (86) (87), or from treatment with nq. of the product from *p*-nitrotoluene with

$\text{SOCl}_2$  in s.t. at 200–220° (88), *p*-toluenesulfonyl chloride with  $\text{SOCl}_2$  in s.t. at 230–250° (88), or sodium *p*-toluenesulfonate in chlorobenzene with  $\text{SOCl}_2$  in s.t. at 250–260° (89) see indic. refs.]

**Chemical behavior.** No specific account of reduction of  $\tilde{\text{C}}$  to benzoic acid appears to be on record; note, however, detn. of chlorine in  $\tilde{\text{C}}$  by use of  $\text{Na} + \text{alc.}$  (90). —  $\tilde{\text{C}}$  on reduction with formic acid at 250–260° in pres. of  $\text{TiO}_2$  gives *p*-chlorobenzaldehyde (3:0765) (89% yield on  $\tilde{\text{C}}$  consumed, or 41% on  $\tilde{\text{C}}$  used (91)). —  $\tilde{\text{C}}$  on electrolytic reduction in alc /  $\text{H}_2\text{SO}_4$  gives (92) *p*-chlorobenzyl alcohol [Beil. VI-444, VI-1-(222)], m.p. 73°, h.p. 234° (92); note proximity of m.p. of this prod. to that (72°) of corresp. prod. obtd. by similar reduction of *o*-chlorobenzoic acid (3:4150). — For study of reduction of  $\tilde{\text{C}}$  with  $\text{H}_2 + \text{Ni}$  in aq. alk. at ord. temp. see (93).

[ $\tilde{\text{C}}$  on electrolytic oxidn. in  $\text{AcOH}/\text{H}_2\text{SO}_4$  gives (2) 4-chloro-2-hydroxybenzoic acid (4-chlorosalicylic acid) (3:4903).]

$\tilde{\text{C}}$  behaves normally as a monobasic acid; e.g.,  $\tilde{\text{C}}$  on titration with standard dil. aq. alk. gives Neut. Eq. 156.5; ionization constant at 25° is  $0.93 \times 10^{-4}$  (94),  $0.78 \times 10^{-4}$  (95),  $1.04 \times 10^{-4}$  (96) cf. (97) (12). — [For study of acid strength of  $\tilde{\text{C}}$  in various alcohols see (98) (99) (100) (13) (101) (27).] — For soly. of  $\tilde{\text{C}}$  in aq. solns. of various salts (including  $\text{Na}\tilde{\text{A}}$ ) see (33). — For sepn. of  $\tilde{\text{C}}$  from *o*-chlorobenzoic acid (3:4150) by use of difference in acid strength see (102).]

**Salts of inorganic bases.**  $\text{NH}_4\tilde{\text{A}}$  (103). — Hydroxylamine salt; m.p. 130° (104). —  $\text{Na}\tilde{\text{A}}$ : widely used as food preservative under name "Mikrobin"; for prepn. from  $\tilde{\text{C}}$  + Na phenolate see (105); for study of influence on enzymes see (106) (107); for study of use as preservative see (108); for studies of detection and/or detn. in foods see (109) (110) (111) (112) (113) (114); forms liquid cryst. on fusion (115).

$\text{Ag}\tilde{\text{A}}$ , sol. in hot aq. (50) (1 l. satd. aq. soln. at 20° conts. 1.08 g. (118)). (Note that this salt (1 mole) with  $\text{I}_2$  (2 equivalents) in dry  $\text{C}_6\text{H}_6$  refluxed 15–18 hrs. yields (116) phenyl *p*-chlorobenzoate, m.p. 100° +  $\text{CO}_2$  +  $\text{AgI}$ , and that analogous behavior is shown to lesser degree by corresp. salt of *m*-chlorobenzoic acid (3:4392) but not by corresp. salt of *o*-chlorobenzoic acid (3:4150).)

$\text{Ca}\tilde{\text{A}}_2 \cdot 3\text{H}_2\text{O}$  (25), 1 l. satd. aq. soln. at 20° conts. 7.37 g. (118). —  $\text{Ba}\tilde{\text{A}}_2 \cdot 3\frac{1}{2}\text{H}_2\text{O}$  (66);  $\text{Ba}\tilde{\text{A}}_2 \cdot 4\text{H}_2\text{O}$  (34);  $\text{Ba}\tilde{\text{A}}_2 \cdot \text{H}_2\text{O}$  (118); 1 l. satd. aq. soln. of latter at 20° conts. 1.09 g.  $\text{Ba}\tilde{\text{A}}_2 \cdot \text{H}_2\text{O}$  (118) (for use of Ba salt in sepn. of the three isomeric chlorobenzoic acids see (43)). —  $\text{Cd}\tilde{\text{A}}_2 \cdot 2\text{H}_2\text{O}$  (117); 1 l. satd. aq. soln. at 20° conts. 7.79 g. (118). — For similar data on salts of  $\tilde{\text{C}}$  with other heavy metals see (118) (119). — For study of various metal ions as precipitants for  $\tilde{\text{C}}$  see (120).

**Salts of organic bases.**  $\tilde{\text{C}}$  with equiv. amt. benzylamine in boilg.  $\text{EtOAc}$  followed by evapn. of solvent yields (121) benzylammonium *p*-chlorobenzoate, m.p. 157.4–158.4° u.e., 160.3–161.3° cor., Neut. Eq. 263.6. —  $\tilde{\text{C}}$  similarly treated with  $\alpha$ -phenylethylamine yields (121)  $\alpha$ -phenylethylammonium *p*-chlorobenzoate, m.p. 150.0–151.0° u.e., 152.2–153.2° cor., Neut. Eq. 277.6.

$\tilde{\text{C}}$  (1 mole) in alc. mixed with codeine (1 mole), m.p. 155°, htd. several minutes, solvent evapd. and resultant sirup recrystd. from aq., yields (122) codeine *p*-chlorobenzoate,  $\text{C}_{18}\text{H}_{21}\text{O}_3\text{N}_2\tilde{\text{C}}$ , m.p. 162° on "Maquenne block"; note that this value although close to that (166°) of codeine *p*-bromobenzoate is widely different from and higher than those for the corresp. salts of either *o*-chlorobenzoic acid (3:4150) or *m*-chlorobenzoic acid (3:4392) which are 134° and 96° respectively. —  $\tilde{\text{C}}$  (1 mole) in alc. (or  $\text{CHCl}_3$ ) with strychnine (1 mole) in alc., boiled for a few minutes, then cooled, yields (123) strychnine *p*-chlorobenzoate,  $\text{C}_{21}\text{H}_{22}\text{O}_2\text{N}_2\tilde{\text{C}}$ , m.p. 251° on "Maquenne block"; note that the m.p. of this salt is far higher than the corresp. products from similar treatment of either the *o*- or *m*-isomers, which are 170° and 185°, respectively.

$\tilde{\text{C}}$  with alcohols gives by conventional processes the corresp. esters: for details on methyl

*p*-chlorobenzoate (3:0535) or on ethyl *p*-chlorobenzoate (3:6750) see these compds. — [For study of rate of esterification of  $\bar{C}$  with MeOH (124) (125) (126), with EtOH (126) (1) (127), with cyclohexanol (128) see indic. refs.]

$\bar{C}$  with oxalyl (di)chloride (3:5060) refluxed in  $C_6H_6$  (129), or Na $\bar{A}$  htd. with *p*-chlorobenzoyl chloride (3:6550) (130) gives (50% yield (130)) *p*-chlorobenzoic acid anhydride, ndls. from dil. acetone or  $C_6H_6$ , m.p. 193–194° (129) (131), 194.8° (130), 191.5° (132); note that this prod. may also form in various other reactions involving  $\bar{C}$ , especially in pres. of tertiary bases or  $Na_2CO_3$  cf. (131) (132).

$\bar{C}$  with  $PCl_5$  (133) (50) (45) (132), with  $SOCl_2$  (134) (135) (136), with  $SOCl_2 + AlCl_3$  (137), or with *p*-chlorobenzotrichloride (3:6825) +  $ZnCl_2$  (138) gives *p*-chlorobenzoyl chloride (3:6550).

[ $\bar{C}$  with chlorobenzene (3:7903) +  $AlCl_3$  refluxed 5½ hrs. gives (98% yield (7)) a mixt. consisting mainly of 4,4'-dichlorobenzophenone (3:4270) accompanied by a small proportion of 2,4'-dichlorobenzophenone (3:1565).]

[ $\bar{C}$  with KCN + CuCN in aq. alc. btd. in s.t. at elevated temp. (139) or  $\bar{C}$  (as K $\bar{A}$ ) with aq. KCN + CuCN refluxed 8–10 hrs. under  $H_2$  in quartz flask exposed to ultra-violet light (140) gives (70% yield (140)) terephthalic acid (1:0910).]

Substitution of nucleus of  $\bar{C}$ .  $\bar{C}$  on mononitration, e.g., with  $HNO_3$  ( $D = 1.6$ ) on warming until soln. occurs (141), or with 10 wt. pts.  $HNO_3$  ( $D = 1.5$ ) at 55–60° for 10 minutes (142), or with 4 vols.  $HNO_3$  ( $D = 1.5$ ) warmed until soln. occurs (143), followed by pouring into aq. gives (yields: 97% (141), 06% (142), 90% (143)) 4-chloro-3-nitrobenzoic acid [Beil. IX-402, IX<sub>1</sub>-(165)], cryst. from hot aq., m.p. 184° (142), 182° cor. (141), 180° (143). — [Note that boilg. conc.  $HNO_3$  ( $D = 1.42$ ) has no action (143) on  $\bar{C}$ ; that the crude mononitration prod. sometimes (143) contains a small amt. of *p*-chloronitrobenzene, m.p. 82°; and that the other possible mononitration isomer, viz., 4-chloro-2-nitrobenzoic acid [Beil. IX-401, IX<sub>1</sub>-(165)], m.p. 140°, is not formed in appreciable amt. by direct nitration of  $\bar{C}$ .]

$\bar{C}$  on dinitration, e.g., with 20 wt. pts. conc.  $H_2SO_4$  + 3.3 wt. pts.  $KNO_3$  at 140° for 1½ hrs. (144), or with 12½ wt. pts. conc.  $H_2SO_4$  + 2.4 wt. pts. fuming  $HNO_3$  ( $D = 1.5$ ) at 135–140° for 2 hrs. (145), then poured into aq., gives (yields: 95% (144), 82% (145)) 4-chloro-3,5-dinitrobenzoic acid [Beil. IX-416], pr. from  $C_6H_6$ , m.p. 159° (144) (145). For use in detection of  $\bar{C}$  see (161). — [Note that none of the three other isomeric 4-chloro-dinitrobenzoic acids has ever been reported.]

[ $\bar{C}$  on sulfonation with  $SO_3$  in fuming  $H_2SO_4$  (52) (146) (147) gives 4-chloro-3-sulfo-benzoic acid [Beil. XI-387].]

— Methyl *p*-chlorobenzoate: m.p. 43° (see 3:0535).

— Ethyl *p*-chlorobenzoate: oil, b.p. 238° (see 3:6750).

① *p*-Nitrobenzyl *p*-chlorobenzoate: m.p. 130° (148). [From  $\bar{C}$  (as Na $\bar{A}$ ) with *p*-nitrobenzyl bromide (m.p. 99°) in boilg. alc. (148).]

② Phenacyl *p*-chlorobenzoate: m.p. 89.5° (149), 87.6° (32). [From  $\bar{C}$  as (Na $\bar{A}$ ) with phenacyl bromide (m.p. 50°) in boilg. alc. (98% yield (32)). — Note that the m.p. of this prod. is only slightly higher than that (85.5°) of the corresp. prod. similarly obtd. from *o*-chlorobenzoic acid (3:4150).]

— *p*-Chlorophenacyl *p*-chlorobenzoate: unreported.

③ *p*-Bromophenacyl *p*-chlorobenzoate: m.p. 126° (32). [From  $\bar{C}$  (as Na $\bar{A}$ ) with *p*-bromophenacyl bromide (m.p. 109°) in boilg. alc. (80% yield (32)).]

— *p*-Iodophenacyl *p*-chlorobenzoate: unreported.

④ *p*-Phenylphenacyl *p*-chlorobenzoate: m.p. 160° cor. (150). [From  $\bar{C}$  (as Na $\bar{A}$ ) with *p*-phenylphenacyl bromide (m.p. 126°) in boilg. alc. (150). — Note that m.p. of this prod. is only slightly higher than that (154°) of corresp. prod. similarly obtd. from *m*-chlorobenzoic acid (3:4392).]

[See also tetrachlorobenzoquinone-1,4 (chloranil) (3:4978)]

Colorless scales or nids from  $C_6H_6$ , solvated pr. from AcOH losing solvate in air (2) (5). — For crystallographic data see (9). —  $\bar{C}$  sublimates with partial decompn. (10); for study of sublimation pressure see (11).

$\bar{C}$  is insol. aq.; almost insol.  $C_6H_6$ ,  $CCl_4$ ,  $CS_2$ ; exs. sol. alc., ether; spar. sol. AcOH.

[For study of lit. of formn. of  $\bar{C}$  see (12); for studies of heat of combustion see (13) (14)]

[For patent on use of  $\bar{C}$  as vulcanization accelerator see (15).]

## PREPARATION OF $\bar{C}$

From tetrachlorobenzoquinone-1,4. For prepn. of  $\bar{C}$  from chloranil (3:4978) by reduction with various reagents see the following. [For use of aq.  $SO_2$  see (10) (16) (note, however, that this reduction is so slow that it has been used (18) as a method of repn. of 2,3,5-trichlorobenzoquinone-1,4 (3:4672) from tetrachlorobenzoquinone-1,4 (3:4978), and also that during the process substantial amounts of trichlorohydroquinone-sulfonic acid and of dichlorohydroquinone di-sulfonic acid are formed (16)); for use of boilg. conc. HCl (9), conc. HBr (9) (10) in AcOH (3), with conc. III + red (18) or yellow (20) phosphorus, or

with KI or NaI in cold acetone (38) see indic. refs.; for use of  $\text{H}_2\text{S}$  (5),  $\text{SnCl}_2 + \text{HCl}$  (9) (8) (6), aq. slightly alkaline hydroxylamine (13), alc. hydrazine hydrate (21), with EtOH on exposure to direct sunlight (7) (study of quantum efficiency of the photochemical reduction (22)), or with hydroquinone (1:1590) in ether (39) see indic. refs.]

[For formn. of  $\bar{\text{C}}$  as hy-product of use of tetrachlorobenzoquinone-1,4 (chloranil) (3:4978) in low-temp. dehydrogenations see (23) (24); for formn. of derivatives (ethers) of  $\bar{\text{C}}$  as hy-products of reaction of chloranil (3:4978) with free radicals see (25) (26) cf. (27); for formn. of  $\bar{\text{C}}$  as hy-product of reaction of chloranil (3:4978) with  $\text{C}_6\text{H}_5\text{MgBr}$  see (31).]

From 2,3,5-trichlorobenzoquinone-1,4. [For prepn. of  $\bar{\text{C}}$  from 2,3,5-trichlorobenzoquinone-1,4 (3:4672) with conc. HCl on protracted boilg. (9) (28), with fuming HCl in s.t. at  $120^\circ$  for 12 hrs. (29), or in AcOH soln. with dry HCl gas (30) see indic. refs.]

From other sources. [For formn. of  $\bar{\text{C}}$  from hydroquinone (1:1590) in AcOH with  $\text{Cl}_2$  (32), or from *p*-nitroaniline (or certain derivatives) with conc. HCl in s.t. at  $180^\circ$  (2), see indic. refs.]

### CHEMICAL BEHAVIOR OF $\bar{\text{C}}$

Oxidation of  $\bar{\text{C}}$ .  $\bar{\text{C}}$  on oxidation, e.g., with aq. alc.  $\text{AgNO}_3$  (10),  $\text{NH}_4\text{OH}/\text{AgNO}_3$  (2), boilg. conc.  $\text{HNO}_3$  (2) (20), etc., gives tetrachlorobenzoquinone-1,4 (chloranil) (3:4978).

[For studies of oxidn.-reductn. potential of system  $\bar{\text{C}}$  + chloranil see (33) (34) (35) (1) (27) (6).]

[Note also that the quinhydrone to be expected from  $\bar{\text{C}}$  with 1 mole of the corresp. tetrachlorobenzoquinone-1,4 (chloranil) (3:4978) is not reported.]

[Note also that, although  $\bar{\text{C}}$  dissolves in aq. KOH without discoloration, the soln. upon exposure to air turns brown and on stdg. ppts. (16) di-potassium salt of chloranilic acid (2,5-dichloro-3,6-dihydroxybenzoquinone-1,4) (3:4970).]

Other reactions of  $\bar{\text{C}}$ . [ $\bar{\text{C}}$  with  $\text{PCl}_5$  (2 moles) gives (16) hexachlorobenzene (3:4939). —  $\bar{\text{C}}$  with 2,3,5-trichlorobenzoquinone (3:4052) + a little aq. htd. at  $100^\circ$  for  $\frac{1}{2}$  hr. undergoes a redistribution reaction (28) cf. (36).]

- ① Tetrachlorohydroquinone dimethyl ether: m.p.  $164^\circ$  (37),  $160^\circ$  (5). [From  $\bar{\text{C}}$  by action of diazomethane in ether soln. (5).]
- ② Tetrachlorohydroquinone diethyl ether: m.p.  $112^\circ$  (16). [From  $\bar{\text{C}}$  with EtI (2 moles) + KOH (2 moles) in alc. in s.t. at  $130$ – $140^\circ$  (16).]
- ③ Tetrachlorohydroquinone diacetate: m.p.  $245^\circ$  (16),  $244$ – $246^\circ$  (7). [From  $\bar{\text{C}}$  with  $\text{AcCl}$  (3:7065) (16) or from chloranil (3:4978) with  $\text{AcCl}$  in s.t. at  $160$ – $180^\circ$  (16).]
- ④ Tetrachlorohydroquinone dibenzoate: m.p.  $233^\circ$  (9). [From  $\bar{\text{C}}$  with  $\text{BzCl}$  (3:6240) (9).]

## 3:4942 7-CHLORONAPHTHOIC ACID-1

 $C_{11}H_7O_2Cl$ 

Beil. S.N. 951

M.P. 243° cor. (1)

238-240° (3)

235° (3)

Cryst. from 60% alc. or by sublimation. — Very sol. alc. or AcOH; sol. ether,  $C_6H_6$ . [For prepn. of  $\bar{C}$  from 7-aminonaphthoic acid-1 (1) (2) via diazotization and use of  $Cu_2Cl_2$  reactn. see (1); from 7-chloro-1-(chloromethyl)naphthalene, m.p. 75° (3), by oxdn. with dil.  $HNO_3$  see (3), from 7-chloro-1-bromonaphthalene [Beil. V-548] via conv. to  $RMgBr$  and carbonation see (3).]

$\bar{C}$  with  $PCl_5$  or  $SOCl_2$  yields (1) 7-chloro-1-naphthoyl chloride, yel. cryst. from pet. eth., m.p. 106° cor (1).

① Methyl 7-chloro-1-naphthoate: cryst from 60% MeOH, m.p. 54° cor. (1). [From  $\bar{C}$  in MeOH with conc.  $H_2SO_4$  (90% yield (1)).]

— Ethyl 7-chloro-1-naphthoate: unreported.

② *p*-Bromophenacyl 7-chloro-1-naphthoate: m.p. 145-146° (3).

③ 7-Chloro-1-naphthoamide: colorless ndls. from 50% alc., m.p. 237° cor. (1). [From the acid chloride (above) with 4 pts. conc. aq.  $NH_4OH$  at ord. temp. for 2 hrs. (75% yield (1)).]

④ 7-Chloro-1-naphthoanilide: brownish ndls. from dil. alc., m.p. 185° cor. (1). [From the acid chloride (above) with 5 pts. aniline at 100° (50% yield (1)).]

3:4942 (1) Goldstein, Fischer, *Helv. Chim. Acta* 21, 1519-1521 (1938). (2) Harrison, Royle, *J. Chem. Soc.* 1926, 87. (3) Horn, Warren, *J. Chem. Soc.* 1946, 144.

## 3:4944 5-CHLORONAPHTHOIC ACID-1

 $C_{11}H_7O_2Cl$ 

Beil. IX -651

IX<sub>1</sub>—

M.P. 245° (1)

244-245° (3)

Ndls. which sublime even below m.p. — Eas sol. alc, spar. sol.  $C_6H_6$  or AcOH.

[For prepn. of  $\bar{C}$  from  $\alpha$ -naphthoic acid (1:0785) with  $Cl_2$  in AcOH contg.  $I_2$  (some of the isomeric 8-chloronaphthoic acid-1 (3:4680) also being formed) see (1); from 5-chloro-1-naphthonitrile (see below) on hydrolysis with fuming  $HCl$  in a.t. see (1); from 5-aminonaphthoic acid-1 [Beil. XIV-533] via diazotization and use of  $Cu_2Cl_2$  reactn. see (1); for

formn. (together with other prods.) from  $\alpha$ -naphthoic acid (1:0785) via reactn. with  $\text{Hg}(\text{OAc})_2$  followed by treat. with  $\text{Cl}_2$  in  $\text{AcOH}$  see (3).]

Salts.  $\text{Ca}\bar{\text{A}}_2 \cdot 2\text{H}_2\text{O}$ ; sol. in 116 pts. aq. at ord. temp. (1).

$\bar{\text{C}}$  on soln. in red. fumg.  $\text{HNO}_3$  gives (2) on cooling 5-chloro-8-nitro $\alpha$ naphthoic acid-1 [Beil. IX-654], ndls. from alc., m.p. 224–225° dec. (2) (ethyl ester, m.p. 121° (2)); if the soln. of  $\bar{\text{C}}$  in red fumg.  $\text{HNO}_3$  be heated there is also formed (2) some 4-chloro-1,8-dinitro-naphthalene [Beil. V-561], pale yel. ndls. from  $\text{AcOH}$ , m.p. 180° (3), 175° (2).

— Methyl 5-chloro-1-naphthoate: unreported.

⑦ Ethyl 5-chloro-1-naphthoate: thls. from alc., m.p. 42° (1). [From  $\text{Ag}\bar{\text{A}}$  with  $\text{EtI}$  in s.t. at 100° (1).]

— 5-Chloro-1-naphthonitrile: ndls. from alc., m.p. 145° (1). [From  $\alpha$ -naphthonitrile [Beil. IX-649, IX<sub>1</sub>-(275)] with  $\text{Cl}_2$  in  $\text{CS}_2$  contg.  $\text{I}_2$  (1).]

— 5-Chloro-1-naphthoamide: lfts. or ndls. from warm alc., m.p. 239° (1). [From 5-chloro-1-naphthonitrile (above) on boilg. with alc.  $\text{KOH}$  for several hrs. (1).]

3:4944 (1) Ekstrand, *J. prakt. Chem.* (2) 38, 147–150 (1888). (2) Ref. 1, pp 170–171. (3) Atterburg, *Ber.* 9, 923 (1876). (3) Whitmore, Fox, *J. Am. Chem. Soc.* 51, 3366–3367 (1929).

### 3:4946 TETRACHLOROPHTHALIC ACID

Beil. IX - 819  
IX<sub>1</sub>-(366)

M.P. See text.

[See also tetrachlorophthalic anhydride (3:4947).]

Colorless lfts., thls., or ndls. from aq. invariably contg.  $\frac{1}{2} \text{H}_2\text{O}$ , and therefore giving in this form Neut. Eq. = 156.5. — This hemihydrate can be recrystd. from anhyd. ether without change. — From anhyd. acetone the acid separates in cryst. contg. combined solv. lost in stream of dry air at room temp., yielding anhyd.  $\bar{\text{C}}$ , Neut. Eq. 152, which absorbs aq. from air giving hemihydrate. —  $\bar{\text{C}}$  on htg. at 98° or above, or on attempts to recryst. from dry  $\text{C}_6\text{H}_6$ ,  $\text{CHCl}_3$ , or higher-boilg. solvents, or on long dryiog over  $\text{P}_2\text{O}_5$  in vac., is converted to tetrachlorophthalic anhydride (3:4947); for this reason the m.p. observed for  $\bar{\text{C}}$  is always actually that of the corresponding anhydride. — For purification of comml.  $\bar{\text{C}}$  see (1) (13).

$\bar{\text{C}}$  is spar. sol. aq., e.g., 100 g. aq. at 14° dis. 0.57 g., at 99° 3.03 g. of hemihydrate (2);  $\bar{\text{C}}$  is eas. sol. alc. or ether (2); extremely sol. in acetone (1); spar. sol.  $\text{C}_6\text{H}_6$  or  $\text{CHCl}_3$  (2). —  $\bar{\text{C}}$  is sol. in hot aq.  $\text{Na}_2\text{CO}_3$  soln. (dif. from tetrachlorophthalic anhydride (3:4947)).

[For prepn. of  $\bar{\text{C}}$  via hydrolysis of tetrachlorophthalic anhydride (3:4947) see that epd.; other methods include the following: from phthalic anhydride (1:0725) (3), from phthalyl dichloride (3:6900) (4), or phthalic acid (1:0820) (5) with  $\text{Cl}_2$  in pres. of Fe or  $\text{FeCl}_3$  see indie. refs.; from 2-(trichloroacetyl)-3,4,5,6-tetrachlorobenzoic acid [Beil. X-693], with dil. aq.  $\text{NaOH}$  see (6); from 2-(pentachlorobenzoyl)-3,4,5,6-tetrachlorobenzoic acid [Beil. X<sub>1</sub>-353], with conc.  $\text{H}_2\text{SO}_4$  at 200–250° (pentachlorobenzene (3:2290) is also formed) see (7); from naphthoquinone-1,2 (1:9062), anthraquinone (1:9095), 1,2,3,4,5,6,7-heptachloro-anthraquinone [Beil. VII<sub>1</sub>-(414)], or 2-(pentachlorobenzoyl)-3,4,5,6-tetrachlorobenzoic acid (see above) on boilg. with excess  $\text{SbCl}_5$  + a little  $\text{I}_2$  see (7) (8); from 1,2,3,4,5-pentachloronaphthalene [Beil. V-546] (9) (10), 1,2,3,4,5,6,8-heptachloronaphthalene [Beil. V-547] (11), or octachloro $\alpha$ naphthalene (3:4893) (12) by oxidn. with  $\text{HNO}_3$  in s.t. as directed

see indic. refs.; from 2,5,6,7,8-pentachloronaphthoquinone-1,4 [Beil. VII-731] by oxidn. with  $\text{CrO}_3$  or  $\text{HNO}_3$  see (11).]

[ $\bar{\text{C}}$  with  $\text{Na}/\text{Hg}$  in dil. aq. alc. (10) (2) yields phthalic acid (1:0825), but  $\bar{\text{C}}$  in 96% alc. with  $\text{Na}/\text{Hg}$  is practically unaffected (1) (2). —  $\bar{\text{C}}$  with  $\text{H}_2$  in pres. of finely divided  $\text{Ni}$  at  $190^\circ$  and 20 atm. press. yields (14) 4,5,6,7-tetrachlorophthalide [Beil. XVII-312], m.p.  $208.5^\circ$  cor. —  $\bar{\text{C}}$  with  $\text{H}_1 + \text{P}$  in s.t. nt  $230^\circ$  for 6 hrs. yields (2) 4,5,6,7-tetrachlorophthalane [Beil. XVII-51], ndls. from toluene, m.p.  $218^\circ$  (2) (unsol. in boilg. aq.  $\text{NaOH}$ ), accompanied by a little 4,5,6,7-tetrachlorophthalide (above) (sol. in boilg. aq.  $\text{NaOH}$ ).]

$\bar{\text{C}}$  with  $\text{CrO}_3$  oxidizes much more slowly (2) than phthalic acid (1:0825) and is very resistant toward  $\text{HNO}_3$  (2); for detn. of chlorine in  $\bar{\text{C}}$  see (1) (16)

[ $\bar{\text{C}}$  with aq.  $\text{KOH} + \text{KCN} + \text{CuCN}$  htd. under press. at  $180^\circ$  for 8–10 hrs. gives (60% yield (15)) benzenhexacarboxylic acid (mellitic acid) [Beil. IX-1008, IX-1-443]. —  $\bar{\text{C}}$  with  $\text{HBr} + \text{H}_3\text{PO}_4$  in nitrobenzene in pres. of  $\text{CuCl}_2$  yields (17) mixts. of bromotrichlorophthalic acids and dibromodichlorophthalic acids. — For actn. of  $\text{PCl}_5$  see under tetrachlorophthalic anhydride (3:4947). —  $\bar{\text{C}}$  with hydrazine hydrate at  $150^\circ$  gives only (18) *N*-aminotetrachlorophthalimide, colorless ndls. from  $\text{AcOH}$ , m.p.  $288^\circ$  dec. (18); earlier opinions (19) (20) that this prod. was tetrachlorophthalcyclohydrazide have been shown (18) to be erroneous. —  $\bar{\text{C}}$  with steam passed over cat. at  $380\text{--}420^\circ$  loses  $\text{CO}_2$  presumably yielding (21) 2,3,4,5-tetrachlorobenzoic acid [Beil. IX-346], m.p.  $186^\circ$ .]

[For use of  $\bar{\text{C}}$  as softener for animal fibers see (22) (23). — For use of  $\bar{\text{C}}$  in prepn. of  $\alpha$ -borneol (1:5990) from turpentine oil (crude pinene) by htg. at  $108^\circ$  for 12 hrs., removal of unchanged terpenes by distn. and alc.  $\text{NaOH}$  saponification of the remaining di-bornyl tetrachlorophthalate, white cryst. from ether, m.p.  $128\text{--}129^\circ$  (24), see (24) (25).]

Salts.  $\text{K}_2\bar{\text{A}}$ , very sol. aq., spar. sol. alc. (2),  $\text{Ba}_2\bar{\text{A}} \cdot 2\frac{1}{2}\text{H}_2\text{O}$  see (2);  $\text{Ca}\bar{\text{A}}$ , on htg. gives octachloroanthraquinone [Beil. VII-789] (17);  $\text{Cu}_2\bar{\text{A}} \cdot 2\text{H}_2\text{O}$ , spar. sol. aq. (2) (earlier report (27) that on dry distn. it gives dodecachlorofluorane later seriously questioned (28));  $\text{Zn}\bar{\text{A}}$ , very sol. aq. (more sol. cold aq. than hot aq.) (2);  $\text{Ag}_2\bar{\text{A}}$ , spar. sol. aq.

⑧ Dimethyl tetrachlorophthalate: cryst. from  $\text{MeOH}$ , m.p.  $92^\circ$  (2). [From  $\text{Ag}_2\bar{\text{A}}$  with  $\text{MeI}$  (2), from *sym*-tetrachlorophthalyl (di)chloride with  $\text{NaOMe}$  (2) or from  $\bar{\text{C}}$  in 10% aq.  $\text{NaOH}$  (3 moles) on warming with  $\text{Me}_2\text{SO}_4$  (29); note that  $\bar{\text{C}}$  in  $\text{MeOH}$  satd. with  $\text{HCl}$  gas gives (30) only the half ester, methyl hydrogen tetrachlorophthalate, cryst. from  $\text{C}_6\text{H}_6$  on addn. of lgr., m.p.  $142^\circ$  (30) with elimination of  $\text{MeOH}$  and conversion to tetrachlorophthalic anhydride (3:4947) q.v.]

⑨ Diethyl tetrachlorophthalate: cryst., m.p.  $60\text{--}60.5^\circ$  (2) (31). [From  $\text{Ag}_2\bar{\text{A}}$  +  $\text{EtI}$  (2) or from *sym*-tetrachlorophthalyl (di)chloride +  $\text{NaOEt}$  (2); note that *unsym*-tetrachlorophthalyl (di)chloride with abs. alc. nt room temp. gives (31) *pseudo*-diethyl tetrachlorophthalate, thls. from alc., m.p.  $126^\circ$  (19), and that this epd. on stdg. in the reactn. mixt. is partially conv. to the normal ester of m.p.  $60.5^\circ$  (31).]

⑩ Di-(*p*-nitrobenzyl) tetrachlorophthalate: ndls. from  $\text{C}_6\text{H}_6$ , or from aq. alc., m.p.  $180\text{--}181^\circ$  (32),  $179\text{--}180^\circ$  (33) [From  $\text{N}_2\bar{\text{A}}$  + *p*-nitrobenzyl bromide on refluxing in alc. (32), or from  $\text{Ag}_2\bar{\text{A}}$  + *p*-nitrobenzyl iodide (33).]

⑪ Di-(*p*-phenylphenacyl) tetrachlorophthalate: cryst. from acetone, m.p.  $193^\circ$  (34). [From  $\text{Na}_2\bar{\text{A}}$  with *p*-phenylphenacyl bromide (2 moles) on htg. in alc. (34).]

### 3:4947 TETRACHLOROPHTHALIC ANHYDRIDE

 $C_2O_2Cl_4$ 

Beil. XVII - 484

 XVII<sub>1</sub>-(254)

M.P. 255-257° cor. (1)

255-256.5° cor. (2)

255° (3)

252° (4), cor. (5)

215° u.c. (5)

[See also tetrachlorophthalic acid (3:4946).]

Colorless pr. or ndls. by sublimation. — Insol. cold aq., hut sol. in boilg. aq. because of hydrolysis to tetrachlorophthalic acid (3:4946); spar. sol. ether. —  $\bar{C}$  is insol. in  $Na_2CO_3$  soln. (dif. from tetrachlorophthalic acid (3:4946)).

[For prepn. of  $\bar{C}$  from tetrachlorophthalic acid (3:4946) by htg. above m.p. (6), by htg. 8 hrs. at 110° (7), by htg. 120 hrs. at 100° (8) (9), by sublimation, htg. at 98°, by crystn. from hot  $C_6H_6$ ,  $CHCl_3$ ,  $AcOH$  (2), or by protracted drying over  $P_2O_5$  in vac. (1) cf. (5) (10) see indic. refs.; from phthalic anhydride (1:0725) with  $Cl_2$  in pres. of Fe salts at 160-260° (11), or with  $Cl_2$  in pres. of  $SbCl_5$  at 200° (10) (12), or with  $Cl_2$  in pres. of fung.  $H_2SO_4$  (50-60%  $SO_3$ ) and  $I_2$  (2) (13) see indic. refs.; from naphthalene (1:7200) with  $ClSO_3H$  in s.t. at 180° see (3).]

[ $\bar{C}$  on reduction with Zn dust + hot  $AcOH$  (10) or with  $H_2$  + Ni at 190° and 20 atm. yields (14) 4,5,6,7-tetrachlorophthalide [Beil. XVII-312], m.p. 203.5° cor.]

$\bar{C}$  reacts with monohydric alcs. to yield corresp. half esters: e.g.,  $\bar{C}$  dislvd. in excess warm  $MeOH$ , htd. 5-10 min., evapd. yields (15) methyl hydrogen tetrachlorophthalate [Beil. IX-820], cryst. from hot  $C_6H_6$  on addn. of lgr., m.p. 139-140° (15), 142° (16), Neut. Eq. 318;  $\bar{C}$  with abs.  $EtOH$  treated as for preceding case gives (15) ethyl hydrogen tetrachlorophthalate, m.p. 93-94° (15), 94-95° (10), Neut. Eq. 332. — [ $\bar{C}$  with *ter*-butyloxymagnesium

bromide in ether + dioxane at 50-55° for 1 hr. gives (54% yield (17)) *ter*-butyl hydrogen tetrachlorophthalate, decomposing at 142°, Neut. Eq. 360; for analogous formn. of *ter*-amyl, triethylcarbiny, tri-*n*-propylcarbiny, tri-*n*-butylcarbiny and tri-*n*-amylcarbiny hydrogen tetrachlorophthalates see (17).] — [For reactn. of  $\bar{C}$  with glycerol and use in prepn. of resins of glyptal type see (3) (18).]

$\bar{C}$  with 1 mole  $PCl_5$  in s.t. 4 hrs. at 220° (19) cf. (10) or  $\bar{C}$  with 1 mole  $PCl_5$  +  $POCl_3$  refluxed 72 hrs. (20) gives (90% yield (20)) *unsym.*-tetrachlorophthalyl (di)chloride (3,3,4,5,6,7-hexachlorophthalide) [Beil. XVII-(484)], cryst. from  $C_6H_6$  with 1 mole solvent, m.p. 118° (10) (20), 118-120° (19), but losing  $C_6H_6$  in air to give solvent free cpd., ndls. from pet. ether, m.p. 137° (19) (20); this prod. on distn. (19) undergoes partial rearr. to *sym.*-tetrachlorophthalyl (di)chloride, pr. from pet. ether, m.p. 48° (19). — Note that the latter *sym.*-phthalyl (di)chloride (which is very soluble in most org. solvents) gradually changes even in solid form and very rapidly in solution (particularly in pres. of animal charcoal) to the *unsym.*-tetrachlorophthalyl (di)chloride (which is spar. sol. in most org. solvents) (19). —  $\bar{C}$  with  $SOCl_2$  +  $ZnCl_2$  at 200-240° yields (21) cf. (22) tetrachlorophthalyl (di)chloride but whether the *unsym.* or *sym.* forms or their mixture is not stated. — Note also that with abs. EtOH the *unsym.* acid chloride yields (19) *pseudo* diethyl tetrachlorophthalate, thls. from alc., m.p. 126° (19), while the *sym.* acid chloride gives (19) *sym.* diethyl tetrachlorophthalate, m.p. 60.5° (19).]

$\bar{C}$  with 2 moles  $PCl_5$  in s.t. at 200° for 5-6 hrs. yields (10) a prod. (regarded as either 1,1,3,3,4,5,6,7-octachlorophthalide or 2-(trichloromethyl)-3,4,5,6-tetrachlorobenzoyl chloride), cryst. from ether, m.p. 140° (10), and practically unaffected by warm alc. KOH.]

$\bar{C}$  with arom. hydrocarbons +  $AlCl_3$  yields corresp. *o*-aroyl-tetrachlorobenzoic acids: e.g.,  $\bar{C}$  with  $C_6H_6$  +  $AlCl_3$  (23) (24) (25) or  $\bar{C}$  with  $C_6H_5MgBr$  (26) gives 2-benzoyl-3,4,5,6-tetrachlorobenzoic acid [Beil. X-750], ndls. from 80% AcOH or  $C_6H_6$ , m.p. 201° (24), 200° (23), 188-189° (26), which on ring closure with 20 pts. conc.  $H_2SO_4$  at 200° for 5 min. (23) gives 1,2,3,4-tetrachloroanthraquinone [Beil. VII-789], gold-yel. fls., m.p. 191° (23). —  $\bar{C}$  with toluene +  $AlCl_3$  gives (yields: 100% (27), 95% (23), 94% (29)) 2-(*p*-toluyl)-3,4,5,6-tetrachlorobenzoic acid, cryst. from  $C_6H_6$ , m.p. 174.5° cor. (29), 172° (28) (30) (the value of 142° (27) may be a misprint for 172°), which on ring closure with 12 pts.  $H_2SO_4 \cdot H_2O$  at 190-200° for 2 min. (27) or with 9 pts. fuming  $H_2SO_4$  (2%  $SO_3$ ) at 120-130° for 30 min. (28) gives (21% yield (28)) 2-methyl-5,6,7,8-tetrachloroanthraquinone, yel. ndls. from toluene, m.p. 195-196° (27), or from EtOAc, m.p. 102° (28). — For corresp. reactns. of  $\bar{C}$  with *o*-xylene (1:7430), *m*-xylene (1:7430), *p*-xylene (1:7415), and ethylbenzene (1:7410) and use in identif. of these cpds. see (7). — For reactn. of  $\bar{C}$  with  $\alpha$ -naphthyl  $MgBr$ , *p*-methoxyphenyl  $MgBr$ , or *p*-bromophenyl  $MgBr$  yielding corresp. *o*-aroyl-tetrachlorobenzoic acids see (26).]

$\bar{C}$  with chlorobenzene (3:7903) +  $AlCl_3$  at 140° for 3 hrs. gives (92% yield (31)) 2-(*p*-chlorobenzoyl)-3,4,5,6-tetrachlorobenzoic acid, cryst. from AcOH, m.p. 162-165° (31), which with conc.  $H_2SO_4$  at 140° for 30 min. gives 2,5,6,7,8-pentachloroanthraquinone, yel. cryst. from AcOH, m.p. 192° (31). — For corresp. reactns. of  $\bar{C}$  with *p*-dichlorobenzene (3:9950), with 1,2,4-trichlorobenzene (3:6120), or with nitrobenzene see (31).]

$\bar{C}$  with phenols and appropriate condensing agents gives two different types of reactns. according to circumstances, viz., formation of corresp. *o*-hydroxyaroyl-tetrachlorobenzoic acids (cf. above) or of corresp. tetrachlorophthalic acids. — E.g.,  $\bar{C}$  with 1 mole phenol +  $AlCl_3$  in acetylene tetrachloride at 125° for 3 hrs. gives (yields: 79% (32), 82% (33)) 2-(*o*-hydroxybenzoyl)-3,4,5,6-tetrachlorobenzoic acid [Beil. XI-(470)], fls. from xylene/AcOH, m.p. 216-218° cor. (32), 210° (33), which with boilg. NaOH loses HCl and ring-closes to 2,3,4-trichloroxanthonecarboxylic acid-2 [Beil. XVIII-(499)], colorless ndls. from alc., m.p. 261-264° cor. (32), 262-265° dec. (33). — For corresp. reactns. of  $\bar{C}$  with

*o*-cresol (1:1400) (32) (34), *m*-cresol (1:1730) (32), *p*-cresol (1:1410) (32),  $\alpha$ -naphthol (1:1500) (38),  $\beta$ -naphthol (1:1540) (32), *nn*-isole (1:7445) (34) see indie. refs., with hydroquinone (1:1590) +  $\text{AlCl}_3$  +  $\text{NaCl}$  at 150–155° for 1½ hrs. giving 82% yield 2-(2',5'-dihydroxybenzoyl)-3,4,5,6-tetrachlorobenzoic acid, m.p. 231°, or on further htg. in the above melt at 210–215° for 1 hr. ring closing to 1,4-dihydroxy-5,6,7,8-tetrachloroanthraquinone, red cryst. from xylene, m.p. 247°, see (35). — However,  $\bar{\text{C}}$  with 2 moles phenol in pres. of fuming  $\text{H}_2\text{SO}_4$  (20%  $\text{SO}_3$ ) as directed (8) (36) gives 65% yield phenoltetrachlorophthalcin [Beil. XVIII-148, XVIII-1-(375)], m.p. 316–317° dec. (36), accompanied by about 10% (37) of 3',4',5',6'-tetrachlorofluoran [Beil. XIX-148, XIX-1-(076)], colorless pr. from  $\text{C}_6\text{H}_6$ , m.p. 298° dec. (33), 290–291° (37) (for sepn. of this by-prod. from the phenoltetrachlorophthalcin see (37)). — For condens. of  $\bar{\text{C}}$  with *o*-cresol (1:1400) to *o*-cresoltetrachlorophthalcin see (45); with resorcinol (1:1539) to 3',4',5',6'-tetrachlorofluorescein [Beil. XIX-227, XIX-1-(722)] see (10) (9).]

[For condens. of  $\bar{\text{C}}$  with *m*-diethylaminophenol see (39); with *N*-aryl-*m*-aminophenols in prepn. of phthalcin dyes see (40); for condens. of  $\bar{\text{C}}$  with hydroxyisodibenzanthrone in prepn. of vat dyes see (41); for use of  $\bar{\text{C}}$  as textile softener see (42).]

[ $\bar{\text{C}}$  with steam passed over cat. at 380–420° loses  $\text{CO}_2$  presumably yielding (43) 2,3,4,5-tetrachlorobenzoic acid [Beil. IX-346], m.p. 186°.]

$\bar{\text{C}}$  on fusion and treatment with  $\text{NH}_3$  gas (10) (4), or on warming with formamide (2), or on fusion with  $(\text{NH}_4)_2\text{CO}_3$  (47) gives (yields: 91% (2), 90% (47)) tetrachlorophthalimide [Beil. XXI-505, XXI-1-(391)], lfts. from  $\text{AcOH}$ , dimethylaniline or nitrobenzene, m.p. 338–339° cor. (2), 336–337° (47); for reactn. of this prod. with  $\text{KOMe}$  forming *K* tetrachlorophthalimide and use of latter in identification of alkyl halides, etc., see (47). — [For reactn. of  $\bar{\text{C}}$  with hydrazine hydrate in dil. alc. yielding *N*-aminotetrachlorophthalimide, ndls. from  $\text{AcOH}$ , m.p. 288° dec., see (48); for reactn. of  $\bar{\text{C}}$  with hydroxylamine in aq. and in  $\text{MeOH}$  see (49). —  $\bar{\text{C}}$  in boilg.  $\text{AcOH}$  treated with *nn*-line yields (2) cf. (50) *N*-phenyl-tetrachlorophthalimide (tetrachlorophthalanil) [Beil. XXI-505, XXI-1-(391)], m.p. 274–275° cor. (2). — For reactn. of  $\bar{\text{C}}$  with  $\alpha$ -phenylenediamine see (6).]

$\bar{\text{C}}$  on warming with aq., or with nq. alk. followed by acidification, yields tetrachlorophthalic acid (3:4910) q.v. [For use of differential hydrolysis of  $\bar{\text{C}}$  in sepn. from 3,4-dichlorophthalic anhydride (3:3095), 3,6-dichlorophthalic anhydride (3:4860), or 4,5-dichlorophthalic anhydride (3:4830) see under these epds.]

### 3:4948 8-CHLORONAPHTHOIC ACID-2

 $C_{10}H_7O_2Cl$ 

Beil. IX - 662

 IX<sub>1</sub>—

M.P. 260° (1)

Fine ndls. best purified by sublimation (1)

[For prepn. of  $\bar{C}$  from 8-aminonaphthoic acid-2 [Beil. XIV-536] via diazotization and use of  $Cu_2Cl_2$  reactn. see (1).]

Salts. (1).  $Ca\bar{A}_2 \cdot 7H_2O$ ;  $Ba\bar{A}_2 \cdot 6H_2O$ ; both spar. sol. cold aq. but eas. sol. hot aq.

$\bar{C}$  with  $Cl_2$  in AcOH contg.  $I_2$  yields (1) 5,8-dichloronaphthoic acid-2 [Beil. IX-662], mulls. from alc., m.p. 237° (1) (ethyl ester, m.p. 64-65° (1)).

— Methyl 8-chloro-2-naphthoate: unreported.

Ⓔ Ethyl 8-chloro-2-naphthoate: lfts. from alc., m.p. about 29° (1). [From  $\bar{C}$  in EtOH with dry HCl gas (1).]

### 3:4952 5-CHLORONAPHTHOIC ACID-2

C<sub>11</sub>H<sub>7</sub>O<sub>2</sub>Cl

Beil IX - 662

IX<sub>1</sub>-

M.P. 270° cor. (1)

263° (2)

Ndls. from alc. or AcOH. — Sol. in hot alc., in C<sub>6</sub>H<sub>6</sub> or AcOH. — Sublimes in ndls. even below m.p.

[For prepn. of  $\bar{C}$  from 5-amino-2-naphthoic acid [Beil. XIV-536] via diazotization and use of Cu<sub>2</sub>Cl<sub>2</sub> reactn. see (2); from 5-chloro-2-naphthonitrile (below) by hydrolysis in AcOH/H<sub>2</sub>SO<sub>4</sub>/aq. medium (alm. 100% yield (1)) or with alc. KOH (2) see indic. refs.]

$\bar{C}$  with PCl<sub>5</sub> yields (1) 5-chloro-2-naphthoyl chloride, m.p. 89° cor., sol. in pet. eth. or C<sub>6</sub>H<sub>6</sub>, but only very slowly hydrolyzed by aq. even on hfg. (1).

$\bar{C}$  on mononitration by soln. in excess conc. HNO<sub>3</sub> (*D* = 1.42) yields (2) on cooling 5-chloro-*z*-nitronaphthoic acid-2, ndls. from AcOH, m.p. 271° (ethyl ester, m.p. 118°);  $\bar{C}$  on dinitration with red fumg. HNO<sub>3</sub> + a little conc. H<sub>2</sub>SO<sub>4</sub> yields (1) 5-chloro-*z,y*-dinitronaphthoic acid-2, ndls. from AcOH, m.p. about 243° (ethyl ester, m.p. 132°);  $\bar{C}$  on trinitration by conversion to mononitro- $\bar{C}$  (above) and treatment with excess fumg. HNO<sub>3</sub> + conc. H<sub>2</sub>SO<sub>4</sub> yields (1) 5-chloro-*z,y,z*-trinitronaphthoic acid-2, yel. cryst. from AcOH, m.p. 260-261° dec. (ethyl ester, m.p. 183°).

Salts (2)  $\text{Na}\ddot{\text{A}}\cdot 2\text{H}_2\text{O}$  sol. aq.;  $\text{Ca}\ddot{\text{A}}_2\cdot 3\frac{1}{2}\text{H}_2\text{O}$ , sol. in 4430 pts. cold aq.;  $\text{Ba}\ddot{\text{A}}_2\cdot 4\frac{1}{2}\text{H}_2\text{O}$ , very spar. sol. cold aq.

⑤ Methyl 5-chloro-2-naphthoate: m.p.  $81^\circ$  cor. (1). [From  $\ddot{\text{C}}$  in MeOH with conc.  $\text{H}_2\text{SO}_4$  (90% yield (1)).]

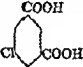

⑥ Ethyl 5-chloro-2-naphthoate: ndls. from alc., m.p.  $45^\circ$  (2).

— 5-Chloro-2-naphthonitrile: ndls. from alc., m.p.  $142^\circ$  cor. (1),  $144^\circ$  (2). [From 2-naphthonitrile (Beil IX-659, IX<sub>1</sub>-(277)) with  $\text{Cl}_2$  in AcOH contg.  $\text{I}_2$  (2) or from 5-amino-2-naphthonitrile (Beil. XIV-536) via diazotization and use of  $\text{Cu}_2\text{Cl}_2$  reactn. (28% yield (1)).]

— 5-Chloro-2-naphthoamide: ndls., m.p.  $190.5^\circ$  cor. (1),  $186-187^\circ$  (2). [From 5-chloro-2-naphthentriole (above) by hydrol. with alc. KOH (1) (2) or from acid chloride (above) with 4 pts. conc. aq.  $\text{NH}_4\text{OH}$  for 2 hrs. at ord. temp. (80% yield (1)).]

⑦ 5-Chloro-2-naphthoanilide: m.p.  $202.5^\circ$  cor. (1). [From the acid chloride (above) with 3 pts. aniline at  $100^\circ$  (90% yield (1))]

3:4952 (1) Goldstein, Matthey, *Helv. Chim. Acta* 21, 65-66 (1938). (2) Ekstrand, *J. prakt. Chem.* (2) 43, 411-417 (1891).

3:4960 5-CHLOROISOPHTHALIC ACID   $\text{C}_6\text{H}_4\text{O}_4\text{Cl}$  Beil. IX - 838  
(5-Chlorobenzenedicarboxylic acid-1,3) IX<sub>1</sub>—

M.P.  $278^\circ$  (1)

$\ddot{\text{C}}$  cryst. from aq. in ndls. which even after drying over conc.  $\text{H}_2\text{SO}_4$  cont.  $\frac{1}{2}$  mole  $\text{H}_2\text{O}$ ; this water is lost, however, on htg. at  $120^\circ$  (1). —  $\ddot{\text{C}}$  is sol. at  $15^\circ$  in 3450 pts. aq. (1).

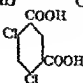

[For prepn. of  $\ddot{\text{C}}$  from 5-aminobenzenedicarboxylic acid-1,3 (5-aminoisophthalic acid) (Beil XIV-556, XIV<sub>1</sub>-(636)) via diazotization and htg. sepg. diazonium salt with strong HCl see (1); from 5-chloro-3-methylbenzoic acid (3.4715) by oxdn. with  $\text{KMnO}_4$  in dil. aq. KOH see (2).]

Salts.  $\text{Na}\ddot{\text{A}}$ ,  $\text{K}\ddot{\text{A}}$ , eas. sol. aq. or alc.;  $\text{Ag}\ddot{\text{A}}$ , ndls. from aq.;  $\text{Mg}\ddot{\text{A}}$ ,  $7\text{H}_2\text{O}$ ;  $\text{Ca}\ddot{\text{A}}$ ,  $2\text{H}_2\text{O}$ , sol. at  $15^\circ$  in 28 pts. aq.;  $\text{Sr}\ddot{\text{A}}$ ,  $\text{H}_2\text{O}$ , sol. at  $15^\circ$  in 108 pts. aq.;  $\text{Ba}\ddot{\text{A}}$ ,  $2\text{H}_2\text{O}$  sol. at  $15^\circ$  in 71 pts. aq.;  $\text{Cd}\ddot{\text{A}}$ , sol. at  $15^\circ$  in 330 pts. aq. (for details see (1)).

— Dimethyl 5-chloroisophthalate: unrecorded.

⑧ Diethyl 5-chloroisophthalate: pr. from alc., m.p.  $45^\circ$  (1). [From  $\ddot{\text{C}}$  in EtOH with HCl gas (1).]

[See also tetrachlorohydroquinone (3:4941).]

Golden-yellow *cryst.* from AcOH, acetone, C<sub>6</sub>H<sub>6</sub>, toluene, or by sublimation. — For crystallographic data see (13) (14) (15).

$\bar{C}$  on careful htg. sublimes without melting (16); for purification of  $\bar{C}$  by sublimation (4) under reduced press. (17) (18) see indic. refs.; for study of sublimation press. of  $\bar{C}$  see (19).

$\bar{C}$  is insol. aq.; alm. insol. in cold alc.; sparingly sol. hot alc. but somewhat more readily in ether;  $\bar{C}$  is sparingly sol. CHCl<sub>3</sub>, CCl<sub>4</sub>, CS<sub>2</sub>; insol. 1gr.

[For study of heat of formn. of  $\bar{C}$  see (20); for studies of heat of combustion see (21) (22).]

[For studies of bactericidal properties of  $\bar{C}$  (23) or toxicity of  $\bar{C}$  (or its associated by-products or contaminants) (24) (25) (26) see indic. refs.]

$\bar{C}$  comprises the essential constituent (99% (27)) of the commercial fungicide "Spergon" [for studies on use of  $\bar{C}$  as (seed) fungicide see (27) (28) (29) (30) (31) (32); for studies on toxicity of  $\bar{C}$  in such use see (33)].

### PREPARATION OF $\bar{C}$

$\bar{C}$  because of its great resistance to further oxidation is formed as the end product of the oxidation with  $HCl + KClO_3$  of a very large number of aromatic organic compounds [e.g., for a list of 16 such which do and 31 which do not give  $\bar{C}$ , see (34); for extension to 130 cases which do, see (35) cf. (36).]

$\bar{C}$  can also be prepared by a very large number of methods (see below): of these the best appear to be those from benzoquinone-1,4 (1:9025) using conc.  $HCl + 30\% H_2O_2$  at  $60^\circ$  (97% yield (37)) cf. (38), and from *p*-aminophenol by conversion with  $SO_2Cl_2$  (10 moles) at  $70^\circ$  (6) or at  $40-45^\circ$  for 4 days (73% yield (1)) to *N,N*-dichloro-2,3,5,6-tetrachloro-4-aminophenol, m.p.  $71.5^\circ$  (6), and reaction of the latter with boilg.  $EtOH$  (1) (6) in pres. of an inert solvent (39) to give (80-85% overall yield from *p*-aminophenol (1)) of  $\bar{C}$  of exceptional purity and free from 2,3,5-trichlorobenzoquinone-1,4 (3:4672).

### FROM VARIOUS PHENOLS

From phenol. [For prepn. of  $\bar{C}$  from phenol (1:1420) with conc.  $HNO_3 +$  fung.  $HCl$  (i.e., with aqua regia) on htg. in open flask in direct sunlight (25% yield (17)) (40), or in fung.  $HCl$  with  $Cl_2$  followed by htg. with conc.  $HNO_3$  at  $100^\circ$  for 20 hrs. (34% yield (17)) cf. (40), by electrolysis in  $HCl/AcOH$  (41), or by action of conc.  $HCl + KClO_3$  (42) (43) (note, however, that this method gives (17) (44) (45) (46) (47) a product seriously contaminated with 2,3,5-trichlorobenzoquinone-1,4 (3:4672) q.v.) see indic. refs. — For prepn. of  $\bar{C}$  from phenol-contg. industrial waste waters with  $Cl_2$  in alk. soln. followed by oxidn. with  $HNO_3$  see (48) (49) (50) (51) (52).]

From various halophenols. From 2,4,6-trichlorophenol. [For prepn. of  $\bar{C}$  from 2,4,6-trichlorophenol (3:1673) with  $ClSO_3H$  (53), with  $Cl_2 +$  fung.  $H_2SO_4$  followed by  $ClSO_3H$  (90% yield (54)), with aqua regia (17) (40), with  $HCl + KClO_3$  (42) (55), with  $CrO_3/AcOH$  (15), or with  $K_2Cr_2O_7/H_2SO_4$  (15) see indic. refs. — Note also that many of the processes starting from phenol (above) doubtless pass through 2,4,6-trichlorophenol.]

From pentachlorophenol. [For prepn. of  $\bar{C}$  from pentachlorophenol (3:4850) with  $ClSO_3H$  (53) (54), with cold fung.  $HNO_3$  (56) (57) (58), or with  $Cl_2 +$  conc.  $HCl$  at  $100^\circ$  (58) see indic. refs.]

From "hexachlorophenol." [For formn. of  $\bar{C}$  from "hexachlorophenol" (hexachlorocyclohexadien-1,4-one-3) (3:3180) with conc. (68) or fung. (69)  $HNO_3$ , with conc.  $H_2SO_4$  at  $100^\circ$  (68) (69), with aq. or  $HCl$  in s.t. at  $160^\circ$  (69), or with  $AlCl_3$  ( $\frac{3}{8}$  mole) in s.t. at  $160^\circ$  (70) see indic. refs.]

From 2,4,6-triiodophenol. [For prepn. of  $\bar{C}$  from 2,4,6-triiodophenol with  $Cl_2$  in boilg.  $AcOH$  soln. (100% yield) see (10).]

From various nitroso- and nitro-phenols. [For prepn. of  $\bar{C}$  from *p*-nitrosophenol in conc.  $HCl$  at  $90^\circ$  with  $Cl_2$  see (59).]

[For formn. of  $\bar{C}$  from *o*-nitrophenol (17) (40) (60), *p*-nitrophenol (17) (40) (60), 2,4,6-trinitrophenol (picric acid) (17) (40) (61) with aqua regia, or from picric acid with  $Cl_2$  (61) or  $Cl_2 + I_2$  (62) in hot aq. soln., or from picric acid with  $HCl + KClO_3$  (42) (47) see indic. refs.; for formn. of  $\bar{C}$  from *p*-nitrophenol or 2,4-dinitrophenol with aq.  $NaOCl$  soln. see (63).]

From polyhydric phenols. From *resorcinol*. [For formn. of  $\bar{C}$  from resorcinol (1:1530) with  $\text{ClSO}_3\text{H}$  (40 wt. pts.) at  $150\text{--}160^\circ$  for 25 hrs. (note that much 2,3,5-trichlorobenzoquinone-1,4 (3:4672) is also formed) see {64} cf. {51}.]

From *hydroquinone*. [For formn. of  $\bar{C}$  from hydroquinone (1:1590) with  $\text{Cl}_2$  in  $\text{AcOH}$  (5), with  $\text{Cl}_2$  + conc.  $\text{HCl}$  at  $100^\circ$  (65) {53}, with aqua regia (4), with  $\text{ClSO}_3\text{H}$  at  $150\text{--}160^\circ$  (8) see indic. refs.; for formn. of  $\bar{C}$  from hydroquinone-pyridinium chloride with  $\text{SOCl}_2$  (2) or from hydroquinone-2,6-bis-(sulfonyl chloride) with  $\text{PCl}_5$  in s.t. at  $140\text{--}150^\circ$  for 6 hrs. (67) see indic. refs.]

From *pyrogallol*. [For formn. of  $\bar{C}$  from pyrogallol (1 1555) with  $\text{ClSO}_3\text{H}$  at elevated temp. see {66} ]

From various quinones. From *p-benzoquinone*. [For formn. of  $\bar{C}$  from benzoquinone-1,4 (1.9025) with  $\text{Cl}_2$  in conc.  $\text{HCl}$  (53) {65} with  $\text{Cl}_2$  in  $\text{AcOH}$  (71) cf. {72}, or with  $\text{HCl}$  +  $\text{KClO}_3$  (42) see indic. refs.]

From the *dichloro-p-benzoquinones*. [For formn. of  $\bar{C}$  from 2,3-dichlorobenzoquinone-1,4 (3:2855), from 2,5-dichlorobenzoquinone-1,4 (3:4470), or from 2,6-dichlorobenzoquinone-1,4 (3:3750) with  $\text{Cl}_2$  in  $\text{CHCl}_3$  see {73}.]

From *trichloro-p-benzoquinone*. [For formn. of  $\bar{C}$  from 2,3,5-trichlorobenzoquinone-1,4 (3:4672) with  $\text{Cl}_2$  +  $\text{I}_2$  + aq. (47), or with  $\text{Cl}_2$  +  $\text{HCl}$  (65), see indic. refs.]

From various amines. [For formn. of  $\bar{C}$  from aniline in 10%  $\text{HCl}$  by electrolytic oxidation (23% yield (9)) (74), with  $\text{HCl}$  +  $\text{KClO}_3$  (75) (76), with  $\text{Na}_2\text{Cr}_2\text{O}_7$  +  $\text{HCl}$  (89), or with aqua regia (60) see indic. refs. — For formn. of  $\bar{C}$  from diphenylamine, 2,4-dichloroaniline, *m*-nitroaniline, aniline black, or phenylhydrazine with aqua regia see {60}.]

[For formn. of  $\bar{C}$  from *p*-phenylenediamine with aqua regia (60) (4), with  $\text{ClSO}_3\text{H}$  (large excess) at  $150\text{--}160^\circ$  for 5 hrs. (77), with  $\text{Cl}_2$  in  $\text{AcOH}$  (78), or with  $\text{HCl}$  +  $\text{KClO}_3$  (3) see indic. refs.; from 2,6-dichloro-*p*-phenylenediamine with  $\text{HCl}$  +  $\text{KClO}_3$  see {79}.]

[For formn. of  $\bar{C}$  from *o*-aminobenzoic acid (anthranilic acid) (42) (80), *m*-aminobenzoic acid (80), *p*-aminobenzoic acid (80), *L*-tyrosine ( $\alpha$ -amino- $\beta$ -(*p*-hydroxyphenyl)propionic acid) (81) with  $\text{HCl}$  +  $\text{KClO}_3$  see indic. refs.; from sulfanilic acid (aniline-*p*-sulfonic acid) with aqua regia see {60}.]

[For formn. of  $\bar{C}$  from 2,3,5,6-tetrachloro-*p*-phenetidine by diazotization and boilg. see {82}.]

From miscellaneous sources. [For formn. of  $\bar{C}$  from 1,2,4,5-tetrachlorobenzene (3:4115) as by-product of nitration with fuming  $\text{HNO}_3$  see under (3:4115); from hexachlorobenzene (3:4939) on boilg. with mixt. of fuming  $\text{HNO}_3$  + conc.  $\text{H}_2\text{SO}_4$  see {83}; from *N*-nitro-2,4,6-trichloroaniline in dil. alc. or  $\text{AcOH}$  soln. with  $\text{HCl}$  or  $\text{H}_2\text{SO}_4$  see {84}; from *N*-nitro-acet-2,3,5,6-tetrachloroaniline on boilg. in toluene or xylene see {85}; from tetrachlorobenzoquinone-1,4-mono-(2,4,6-trichlorophenylimide) by  $\text{H}_2\text{SO}_4$  hydrolysis see {86}; from various azo dyes by oxidn. with  $\text{NaOCl}$  soln. at  $0^\circ$  see {87}; from anisolesulfonic acid or phenetole-sulfonic acid in aq. soln. with  $\text{Cl}_2$  see {88}; from nitrobenzene with  $\text{ClSO}_3\text{H}$  (20 wt. parts) at  $150^\circ$  for 20 hrs. (95% yield) see {7} ]

## CHEMICAL BEHAVIOR OF $\bar{C}$

### REDUCTION OF $\bar{C}$

$\bar{C}$  upon reduction by a wide variety of reagents gives tetrachlorohydroquinone (3:4941) the text of which should be consulted for details.

### OXIDATION OF $\bar{C}$

$\bar{C}$  is extremely stable to oxidizing agents in neutral or acid soln. and is unaffected by aqua regia or hot conc.  $\text{HNO}_3$ .

## BEHAVIOR WITH CHLORINE

[ $\bar{C}$  with  $MnO_2$  + conc.  $HCl$  in s.t. at  $180^\circ$  for 10 hrs. adds 1 mole  $Cl_2$  giving (45) hexachlorocyclohexen-2-dione-1,4 [Beil. VII-574], m.p.  $89^\circ$  (45).]

## BEHAVIOR WITH OTHER INORGANIC REACTANTS

In many of the reactions of  $\bar{C}$  with other reagents, 2 of the chlorine atoms are often replaced by other groups as exemplified below.

With aqueous alkali.  $\bar{C}$  with dil. aq. alk. at  $70-80^\circ$  readily replaces 2 chlorine atoms by hydroxyls giving (16) (3) (00) (91) (92) 2,5-dichloro-3,6-dihydroxybenzoquinone-1,4 (chloranilic acid) (3:4970), m.p.  $282-284^\circ$  s.t. (92).

With ammonia. [ $\bar{C}$  with alc.  $NH_3$  on boilg. replaces 2 chlorine atoms by amino groups giving (75% yield (103)) (93) (94) 2,5-dichloro-3,6-diaminobenzoquinone-1,4 (chloroanilamide) [Beil. XIV-144]. — Note, however, that  $\bar{C}$  with aqueous  $NH_4OH$  gives (16) 2,5-dichloro-3-amino-6-hydroxybenzoquinone-1,4 (chloranilamic acid) [Beil. XIV-250].]

With various salts. [ $\bar{C}$  with sodium azide as directed (95) (96) gives 2,5-dichloro-3,6-bis-azidobenzoquinone-1,4. —  $\bar{C}$  with  $NaNO_2$  (2 moles) in conc. aq. soln. on warming gives (97) cf. (98) 2,5-dihydroxy-3,6-dinitrobenzoquinone-1,4 (nitranilic acid) [Beil. VIII-384, VIII-1-(683)]. —  $\bar{C}$  with  $KCN$  (2 moles) in 85%  $MeOH$  gives (99) 2,5-dihydroxy-3,6-dicyanobenzoquinone-1,4 (cyananilic acid) [Beil. XI-(520)].]

[ $\bar{C}$  with warm dilute aq. acid  $KHSO_3$  gives mainly (100) (101) the salt of 2,5-dichloro-3,6-disulfohydroquinone [Beil. XI-301], while with conc. solns. (100) or with neutral  $K_2SO_3$  (101) (102) the main prod. is the salt of thiochronic acid [Beil. XI-302, XI-(80)], now (102) recognized as cyclohexadien-2,5-di-4-one-1-pentasulfonic acid-2,3,4,5,6.]

With  $PCl_5$ . [ $\bar{C}$  with  $PCl_5$  +  $PCl_3$  in s.t. at  $190-200^\circ$  for 4 hrs. gives (05% yield (104)) cf. (43) hexachlorobenzene (3:4939); note also, however, that  $\bar{C}$  with  $PCl_5$  +  $PCl_3$  at  $135-140^\circ$  followed by treatment with aq. may also yield (45) (105) mono-(pentachlorophenyl)-phosphoric acid (monohydrate), m.p.  $224^\circ$  (105), and other products.]

BEHAVIOR OF  $\bar{C}$  WITH ORGANIC REACTANTS

With aromatic hydrocarbons. [ $\bar{C}$  with various aromatic hydrocarbons yields addition compounds: e.g.,  $\bar{C}$  with 1,2,4,5-tetramethylbenzene (durene) (1:7195) in hot  $AcOH$  gives (106) (107) a red cpd.  $\bar{C}$  2 durene;  $\bar{C}$  with hexamethylbenzene (1:7265) gives from hot  $AcOH$  (108) violet-brown ndls. of a 1:1 cpd., m.p.  $198-202^\circ$  (108) (for further study of this prod. see (109) (110));  $\bar{C}$  with acenaphthene (1:7225) gives (111) (112) from  $AcOH$  (107) a violet 1:1 addn. cpd.]

With dienes and other unsaturates.  $\bar{C}$  with many dienes and other highly unsaturated compounds forms addn. products and/or gives color reactions.

[ $\bar{C}$  with cyclopentadiene (1:8030) in  $C_6H_6$  in pres. of a little  $Me_3N$  gives (113) a 1:1 addn. cpd., yellowish ndls. from abs. alc., m.p.  $146-146.5^\circ$  (113) (corresp. dibromide with  $Br_2$  in  $CHCl_3$  in direct sunlight, lfts. from  $AcOEt$ , m.p.  $269^\circ$  (113)); note that in absence of  $Me_3N$  yield in 14 days is only 40%, in presence of  $Me_3N$  100% (for study of cat. influence of  $Me_3N$  and of  $CCl_3COOH$  see (114)).]

[For study of color reactions of  $\bar{C}$  in  $CHCl_3$  soln. with various trienes see (115) cf. (116) (117).]

[For studies of influence of  $\bar{C}$  on polymerization of styrene (1:7435) see (118) (119) (120); for study of effect of  $\bar{C}$  on polymerization or depolymerization of natural rubber see (121); for use of  $\bar{C}$  as vulcanization accelerator see (122).]

With organic OH (or SH) reactants. With alcohols. [ $\bar{C}$  in boilg.  $MeOH$  gradually treated with calcd. amt. 1%  $MeOH/KOH$  gives (123) (124) a mixt. of 2,5-dichloro-3,6-

dimethoxybenzoquinone-1,4 (chloranilic acid dimethyl ether) [Beil. VIII-380], dark red pr. from  $C_6H_6$ , m.p. 141–142° (123), and 2,6-dichloro-3,5-dimethoxybenzoquinone-1,4 (isochloroanilic acid dimethyl ether) [Beil. VIII-387], dark red pr., m.p. 159° (125) (126), 157–158° (123), 155.5° (127). — Note, however, that  $\bar{C}$  with MeOH/NaOMe (5–6 moles) gives 2,5-dichloro-3,6-dimethoxybenzoquinone-1,4-bis (monomethyl acetal) [Beil. VIII-381] accompanied by tetrachlorohydroquinone (3:4941).]

*With phenols.* [ $\bar{C}$  (1 mole) with phenol (2 moles) in aq. KOH at 100° gives (128) 2,5-dichloro-3,6-diphenoxybenzoquinone-1,4 (chloranilic acid diphenyl ether) [Beil. VIII-380], dark red pr. from  $C_6H_6$ , m.p. 243° (128). —  $\bar{C}$  (1 mole) with aq. K *p*-cresolate (2 moles) at 100° gives (129) 2,5-dichloro-3,6-di-(*p*-toloxy)benzoquinone-1,4 (chloranilic acid di-*p*-tolyl ether) [Beil. VIII-681)], cryst. from toluene, m.p. 254–255° (129) ]

*With mercaptans.* [ $\bar{C}$  (1 mole) with EtSH (4 moles) with EtOH/KOH (4 moles) as directed gives (95% yield (130)) 2,3,5,6-tetra-*kis*-(ethylthio)benzoquinone-1,4 [Beil. VIII-535], dark green ndls from alc., m.p. 90–91° (131).]

*With thiophenols.* [ $\bar{C}$  (1 mole) with  $C_6H_5SH$  in alk. soln. might be expected to yield 2,3,5,6-tetra-*kis*-(phenylmercapto)benzoquinone-1,4, but neither this reaction nor the expected product appears to have been reported. — However, various analogous cases are known: e.g.,  $\bar{C}$  (1 mole) with *p*-thiocresol (4 moles) in AcOH at 100° for  $\frac{1}{2}$  hr. gives (132) 2,3,5,6-tetra-*kis*-(*p*-tolylthio)benzoquinone-1,4, cryst. from AcOH, m.p. 203° (132). —  $\bar{C}$  (1 mole) with *o*-nitrothiophenol in boilg. EtOH for 1 hr. gives (96) 2,3,5,6-tetra-(*o*-nitrophenylmercapto)benzoquinone-1,4, no m.p. given.]

*With organic amines. General.* The behavior of  $\bar{C}$  with aliphatic amines appears to have been little studied from the structural viewpoint. [However, for studies on color reactions of  $\bar{C}$  with *prim.*, *sec.*, and *ter.*-amines (or their salts) (133), for use of  $\bar{C}$  (in epichlorohydrin soln.) as a test for plasmochin (134) (135), or for use of  $\bar{C}$  in detection of  $MeNH_2$ ,  $Me_2NH$ , or  $Me_3N$  and differentiation from  $NH_3$  (136) (137), for use in spot test reactions of 38 different amines (147) see indie. refs.]

*With primary aliphatic amines.* [ $\bar{C}$  with  $MeNH_2$  might be expected to give 2,5-dichloro-3,6-bis-(methylamino)benzoquinone-1,4 or even 2,3,5,6-tetra-*kis*-(methylamino)benzoquinone-1,4, but the reaction has not been reported and neither product is known.]

*With primary aromatic amines.* [ $\bar{C}$  with aniline in boilg. alc. refluxed 30 min gives (81% yield (138)) (100) (93) (139) 2,5-dichloro-3,6-dianilinobenzoquinone-1,4 [Beil. XIV-144, XIV-421)], yel.-hr. lfts. from  $C_6H_6$  or nitrobenzene, m.p. 292–293° (138), 290° (140), 288–290° (141); note that this product serves as bases for prepn. of many complex dyestuffs which cannot be discussed here. —  $\bar{C}$  with many other homologous and analogous primary aromatic amines behaves similarly.]

[ $\bar{C}$  with phenylhydrazine in absol. alc. evolves  $N_2$  and gives (10) a chlorine-contg prod., m.p. 229–230°, of undetermined structure.]

*With various organometallic reactants.* [ $\bar{C}$  (1 mole) in alc. with diethyl sodiomalonate (4 moles) in  $C_6H_6$  gives (10% yield (142)) tetraethyl 2,5-dichloro-*p*-benzoquinone-3,6-dimalonate [Beil. X-940], yel. ndls. from alc., m.p. 132° (143).]

[For behavior of  $\bar{C}$  with ethyl sodio-acetoacetate see (144) (145), Beil. X-860, and Beil. X-935 ]

[For behavior of  $\bar{C}$  with excess  $C_6H_5MgBr$  see (146).]

Ⓢ Color tests for  $\bar{C}$ . Of the large number of color tests shown by  $\bar{C}$  with various reactants, the following have been especially employed as preliminary tests for  $\bar{C}$  itself; note that for details, limitations, etc., the original references should be consulted.

*With dimethylaniline.*  $\bar{C}$  on warming with dimethylaniline gives intense violet color (Mulliken).

With ethyl cyanoacetate.  $\bar{C}$  with ethyl cyanoacetate (2-3 drops) + excess alc.  $\text{NH}_4\text{OH}$  (2-3 ml. of mixt. of 1 pt. abs.  $\text{EtOH}$  + 1 pt. conc.  $\text{NH}_4\text{OH}$ ) gives intense bluish-violet coloration, changing to blue, green, and finally reddish brown (148). [Note that the reaction is also shown by certain other quinones, e.g., benzoquinone-1,4 (1:9025),  $\alpha$ -toluquinone, thymoquinone, and naphthoquinone-1,4 (1:9040), but is not given by anthraquinone (1:9095), phenanthraquinone (1:9086), naphthoquinone-1,2 (1:9062), or 2,5-dichloro-3,6-diaminobenzoquinone-1,4 (chloranilamide) (148).]

With triphenylphosphine.  $\bar{C}$  with 20% soln. of  $(C_6H_5)_3P$  in  $CHCl_3$  gives (149) a wine-red color. [Note, however, that a similar behavior is also shown by 2,3,5-trichlorobenzoquinone-1,4 (3:4672) and certain other quinones (149).]

## DIVISION B. LIQUIDS WITH BOILING POINTS REPORTED AT ORDINARY PRESSURE

### Section 1. $D_4^{20}$ greater than 1.1500

(1.15000-1.15100)

1.15000 PHOSPHENE

(distillation residue)

$OM_2$

$Bo. III = 13$

$III_1(7)$

$III_2(12)$

BP	FP
$8.2^{\circ}C$ at 716 mm. (1)	$-118^{\circ}C$ (1) $D_4^{20} = 1.1392$ (1)
$8.5^{\circ}C$ at 716 mm. (2)	$-126^{\circ}C$ (1)
$8.1^{\circ}C$ at 716 mm. (3)	$-127.5^{\circ}C$ (1) (see p. 267)
$8.07^{\circ}C$ at 716 mm. (4)	$-128^{\circ}C$ (1)
$7.95^{\circ}C$ at 716 mm. (1)	
$7.94^{\circ}C$ at 716 mm. (4)	
$8.06^{\circ}C$ at 716 mm. (1)	

(see p. 267)

1.15000-1.15100. The boiling point of the sample was  $8.2^{\circ}C$  at 716 mm. (1) and  $8.5^{\circ}C$  at 716 mm. (2). The freezing point was  $-118^{\circ}C$  (1) and  $-126^{\circ}C$  (1). The density was  $1.1392$  (1) at  $20^{\circ}C$ . The refractive index was  $1.3412$  (1) at  $20^{\circ}C$ . The sample was a colorless liquid with a strong odor of phosphorus.

1.15000-1.15100. The boiling point of the sample was  $8.1^{\circ}C$  at 716 mm. (3) and  $8.07^{\circ}C$  at 716 mm. (4). The freezing point was  $-127.5^{\circ}C$  (1) and  $-128^{\circ}C$  (1). The density was  $1.1392$  (1) at  $20^{\circ}C$ . The refractive index was  $1.3412$  (1) at  $20^{\circ}C$ . The sample was a colorless liquid with a strong odor of phosphorus.

1.15000-1.15100. The boiling point of the sample was  $7.95^{\circ}C$  at 716 mm. (1) and  $7.94^{\circ}C$  at 716 mm. (4). The freezing point was  $-128^{\circ}C$  (1). The density was  $1.1392$  (1) at  $20^{\circ}C$ . The refractive index was  $1.3412$  (1) at  $20^{\circ}C$ . The sample was a colorless liquid with a strong odor of phosphorus.

1.15000-1.15100. The boiling point of the sample was  $8.06^{\circ}C$  at 716 mm. (1). The freezing point was  $-128^{\circ}C$  (1). The density was  $1.1392$  (1) at  $20^{\circ}C$ . The refractive index was  $1.3412$  (1) at  $20^{\circ}C$ . The sample was a colorless liquid with a strong odor of phosphorus.

1.15000-1.15100. The boiling point of the sample was  $8.2^{\circ}C$  at 716 mm. (1) and  $8.5^{\circ}C$  at 716 mm. (2). The freezing point was  $-118^{\circ}C$  (1) and  $-126^{\circ}C$  (1). The density was  $1.1392$  (1) at  $20^{\circ}C$ . The refractive index was  $1.3412$  (1) at  $20^{\circ}C$ . The sample was a colorless liquid with a strong odor of phosphorus.

1.15000-1.15100. The boiling point of the sample was  $8.1^{\circ}C$  at 716 mm. (3) and  $8.07^{\circ}C$  at 716 mm. (4). The freezing point was  $-127.5^{\circ}C$  (1) and  $-128^{\circ}C$  (1). The density was  $1.1392$  (1) at  $20^{\circ}C$ . The refractive index was  $1.3412$  (1) at  $20^{\circ}C$ . The sample was a colorless liquid with a strong odor of phosphorus.

1.15000-1.15100. The boiling point of the sample was  $7.95^{\circ}C$  at 716 mm. (1) and  $7.94^{\circ}C$  at 716 mm. (4). The freezing point was  $-128^{\circ}C$  (1). The density was  $1.1392$  (1) at  $20^{\circ}C$ . The refractive index was  $1.3412$  (1) at  $20^{\circ}C$ . The sample was a colorless liquid with a strong odor of phosphorus.

solvents at pressures below 1 atm. see (32) cf. (33); for patent on removal of  $\bar{C}$  from contaminated drinking water by extraction with org. solvents see (34)].

[For technical papers (36) (37) (38) (39) (40) (41) (42) (43) (44) (45) and patents (46) on adsorption of  $\bar{C}$  by various forms of carbon see indic. refs.]

[For influence of  $\bar{C}$  in extinction of H/O flames see (47).]

### PHYSIOLOGICAL ASPECTS OF $\bar{C}$

$\bar{C}$  is more than ten times as toxic as  $Cl_2$ . An atmosphere contg. 1 part by vol. of  $\bar{C}$  in 6000 may cause lung injuries in 2 min., 1 part in 30,000 is very dangerous, and 1 part in 200,000 is probably fatal for exposures of 30 min. The maximum permissible concn. for prolonged exposure is about 1 p.p.m., i.e., 0.004 mg./l. (48).

The least detectable odor of  $\bar{C}$  is 5.6 p.p.m., the least concn. that affects the throat is 3.1 p.p.m., the least concn. that causes irritation of the eyes is 4.0 p.p.m., the least concn. that causes coughing is 4.8 p.p.m. (48) (49). A concn. of 0.02-0.05% is lethal to most animals in a short time, a concn. of 0.0025% is dangerous for exposures of 30-60 min., and the maximum concn. to which animals can be exposed for several hours without serious effects is 0.0001% or 1 p.p.m. (48) (50).

[For report of industrial accidents from  $\bar{C}$  (51), for legal (British) aspects of industrial poisoning by  $\bar{C}$  (52), for toxicology and treatment of poisoning by  $\bar{C}$  (53), for immunization against  $\bar{C}$  (54), for variations in toxicity of  $\bar{C}$  for small animals with duration of exposure (55) see indic. refs.]

[For studies relating to chemical warfare aspects of  $\bar{C}$  with respect to foodstuffs see (56) (57).]

### USES OF $\bar{C}$

Apart from the uses of  $\bar{C}$  as a chemical warfare agent (above), many chemical utilizations are indicated below under its chemical behavior. (In addition will be mentioned here a few further examples as follows: for use of mixt. of  $\bar{C}$  + HF for cracking of hydrocarbon oils see (58); for use as dehydrating agent in conversion of amides to corresp. nitriles see (59); for use in sepn. of Pt metals see (60).]

### DETECTION OF $\bar{C}$

$\bar{C}$  may be detected by its characteristic odor (see above) and by various color reactions of which the following represent the more important types.

For detection of  $\bar{C}$  by the yellow or orange color produced by reaction with Harrison's reagent (a soln. in EtOH (100 ml.) of *p*-dimethylaminobenzaldehyde [Beil. XIV-31, XIV-1-360]) (5 g.) (for prepn. see (61)) and of diphenylamine [Beil. XII-174, XII-1-163]) (5 g.) see (62) (63) (64) (65) (66) (67) (68) (69) (70) (71) (83); note that this test suffers interference from HCl,  $Cl_2$ ,  $ClSO_3H$ ,  $TiCl_4$ , chloromethyl chloroformate (3:5275), diphosgene (3:5515), and triphosgene (3:1915); for application of this reagent in an absorptive tube see (72) cf. (73).

For detection of  $\bar{C}$  by green color imparted to a test paper impregnated with a xylene soln. of 0.5% 6-nitroso-3-dimethylaminophenol (4-dimethylamino-*o*-benzoquinoneoxime-1) [Beil. XIV-131] and a xylene soln. of 0.5% *m*-diethylaminophenol [Beil. XIII-408, XIII-1-130]) see (74) (75) (76).

For spot test detection of  $\bar{C}$  by use of phenylhydrazine cinnamate (for prepn. see (77)) in  $CHCl_3$  or  $CCl_4$  followed by treatment with 1%  $CuSO_4$  soln. to give a red-violet color from the 1,5-diphenylcarbohydrazide [Beil. XV-292, XV-1-72]) produced see (78).

For study of detection of  $\bar{C}$  with resorcinol (1:1530) or vanillin (1:0050) see (79); by

indirect use of the Gilman color test for  $\text{RMgX}$  compounds see (80) cf. (81); for study of utility of various dyestuffs in detection of  $\bar{\text{C}}$  see (82).

### DETERMINATION OF $\bar{\text{C}}$

Methods for the quant. detn. of  $\bar{\text{C}}$  may be classified under three main types according to whether they are based upon hydrolysis, reaction with alkali iodides, or reaction with aniline.

Detn. by methods based on hydrolysis. (For studies of methods based upon alkaline hydrolysis of  $\bar{\text{C}}$  and subsequent detn. of resultant chloride ion see (83) (84) (85) (86) (87) (88) (89) (90); for especial criticism of this method see (91).]

Detn. by reaction with alkali iodide. [For studies of methods based upon reaction of  $\bar{\text{C}}$  with  $\text{NaI}$  (92) (91) or  $\text{KI}$  (93) in acetone followed by thiosulfate titration of the liberated  $\text{I}_2$  see indic. refs.]

Detn. by reaction with aniline. [For study of methods based upon reaction of  $\bar{\text{C}}$  with aniline and gravimetric estn. of the resultant  $N,N'$ -diphenylurea (carbanilide) (94) (95) cf. (91) or titration of the residual aniline  $\text{HCl}$  in the filtrate (96) see indic. refs.]

Related topics. [For detn. of small amts.  $\text{Cl}_2$  in pres. of  $\bar{\text{C}}$  (97), of  $\text{HCl}$  in  $\bar{\text{C}}$  (98) (85), for analysis of mixts. of  $\bar{\text{C}}$  +  $\text{Cl}_2$  +  $\text{NOCl}$  (99), for anal. of mixts. of  $\bar{\text{C}}$  with  $\text{CO}$ ,  $\text{CO}_2$ ,  $\text{Cl}_2$ ,  $\text{CCl}_4$ ,  $\text{C}_2\text{Cl}_6$  (88) (86), for anal. of industrial  $\bar{\text{C}}$  (89), or for detn. of  $\bar{\text{C}}$  in air by means of an ultraviolet photometer (R. + H. Tri-Per Analyzer) (100) see indic. refs.]

### PREPARATION OR FORMATION OF $\bar{\text{C}}$

From  $\text{CO} + \text{Cl}_2$ . The photochemical reaction of  $\text{CO}$  with  $\text{Cl}_2$  to yield  $\bar{\text{C}}$  was the method by which it was first prepared in 1812 (9) (for extensive history see (10)). Over the years the reaction has been very extensively studied. The more important earlier reports include those of Wilm and Wischin (101), Wildermann (102), Dyson and Hardin (103), Weigert (104), Coehn and Becker (105), Chapman and Gee (106), etc. Since 1920 the number of studies of this reaction has so greatly increased as to preclude in this text any detailed analysis; however, the following references ((107)-(134), incl.) arranged in receding chronology will be found fruitful from one viewpoint or another.

[For studies on formn. of  $\bar{\text{C}}$  from  $\text{CO} + \text{Cl}_2$  in dark at  $349-452^\circ$  (135) in liq. medium (145), or over cat. such as  $\text{Pt}$  at  $300-400^\circ$  (136), activated carbon (6) (137), or  $\text{AlCl}_3$  at  $30-35^\circ$ , or in  $\text{CHCl}_3$  soln. (138) see indic. refs. — For formn. of  $\bar{\text{C}}$  from  $\text{CO} + \text{NOCl}$  over activated carbon at  $100-250^\circ$  see (139) cf. (137).]

[For formn. of  $\bar{\text{C}}$  from  $\text{CO}$  passed over heated  $\text{AgCl}$  (140) (141), over  $\text{CuCl}_2$ ,  $\text{PbCl}_2$ , or  $\text{NiCl}_2$  at  $450-750^\circ$  (141), over heated  $\text{AuCl}_3$  (142), or through boilg.  $\text{SbCl}_3$  (143), or over chlorides of Pt metals (144) see indic. refs.]

From various chlorinated hydrocarbons. From  $\text{CCl}_4$ . [For studies on formn. of  $\bar{\text{C}}$  from  $\text{CCl}_4$  (3:5100) during use of latter as fire extinguisher see (146) (84) cf. (147) (368); for patents on repression of formn. of  $\bar{\text{C}}$  in such use see (148) (149) (150) cf. (368); for formn. of  $\bar{\text{C}}$  from  $\text{CCl}_4$  fire extinguishers on  $\text{Mg}$  see (151); for phosgene content of smoke from Berger mixt. ( $\text{Zn} + \text{chlorohydrocarbons}$ ) see (152).]

[For formn. of  $\bar{\text{C}}$  from  $\text{CCl}_4$  with  $\text{O}_2$  in light of  $2537 \text{ \AA}$  (153) or with atomic oxygen (154) see indic. refs.]

[For formn. of  $\bar{\text{C}}$  from  $\text{CCl}_4$  by chemical oxidizing agents such as  $\text{O}_2$  over white-hot  $\text{Pt}$  (155), air over  $\text{CuCl}_2$  or  $\text{FeCl}_3$  at elev. temp. (156),  $\text{GeO}_2$  (157), chromic acid (1) (158), pyrosulfuryl chloride (1 mole) + sulfuric acid monohydrate (2 moles) on warming (158) (159) (160) (161) (162) (163) see indic. refs.]

[For formn. of  $\bar{\text{C}}$  from  $\text{CCl}_4$  by passing with  $\text{CO}_2$  over pumice at  $350^\circ$  (161), by htg. with

ZnO at 200° (164), with P<sub>2</sub>O<sub>5</sub> at 200–220° for 2 days (165), or over gypsum at 900° (166), or even by htg. with a little aq. in s.t. at 250° (220) see indic. refs.]

*From CHCl<sub>3</sub>.* [For an extensive account of formn. of  $\bar{C}$  from CHCl<sub>3</sub> (3:5050) by oxidn. in air and light see (167). Note that such oxidn. is not effected by air in absence of light, nor by light in absence of air (168). With limited air in sunlight CHCl<sub>3</sub> reacts according to equation  $\text{CHCl}_3 + \text{O} \rightarrow \text{COCl}_2 + \text{HCl}$ , but with excess air in sunlight in sense  $2\text{CHCl}_3 + 5\text{O} \rightarrow 2\text{CO}_2 + 3\text{Cl}_2 + \text{H}_2\text{O}$  (169). Note that CHCl<sub>3</sub> + air over dry KOH gives some  $\bar{C}$  (170). For studies on photochem. oxidn. of CHCl<sub>3</sub> (171) in tropical sunlight (172) including search for possible intermediate peroxides (173) (174) see indic. refs. For studies of Cl<sub>2</sub>-sensitized photochem. oxidn. of CHCl<sub>3</sub> see (175) (176) (177). For oxidn. of CHCl<sub>3</sub> by atomic oxygen see (154).]

[For formn. of  $\bar{C}$  from CHCl<sub>3</sub> (3:5050) by shaking with siloxen + excess O<sub>2</sub> (178), by action of O<sub>3</sub> (179) (180), by passing over CuO at 350–550° (181) or gypsum at 900° (166), with K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> + H<sub>2</sub>SO<sub>4</sub> (1) (158), with ClSO<sub>3</sub>H at 120° (187), or during explosion of CHCl<sub>3</sub> with alkali metals (182) see indic. refs.]

*From Cl<sub>2</sub>C=CCl<sub>2</sub>.* [For formn. of  $\bar{C}$  from tetrachloroethylene (3:5460) during Cl<sub>2</sub>-sensitized photochem. oxidn. see (183) (184) (185).]

*From Cl<sub>2</sub>C=CHCl.* [For formn. of  $\bar{C}$  from trichloroethylene (3:5170) with air or O<sub>2</sub> see (186).]

*From various compounds containing the trichloromethyl group.* [For formn. of  $\bar{C}$  from trichloroacetaldehyde (ehloral) (3:5210) by Cl<sub>2</sub>-sensitized (188) or Br<sub>2</sub>-sensitized (189) photochem. oxidn. with O<sub>2</sub> at 70–90°, with Cl<sub>2</sub> in sunlight (190), or with AlCl<sub>3</sub> on warming (191) see indic. refs.]

[For formn. of  $\bar{C}$  from trichloroacetic acid (3:1150) on htg. with ZnCl<sub>2</sub> (192), on illuminating dry acid in pres. of air (193), or on electrolysis of aq. soln. (194) see indic. refs.; from trichloroacetyl chloride (3:5420) at 600° (195); from trichloroacetonitrile in air (196); from trichloroacetyl hydrogen peroxide on warming (200); from trichlorobromomethane + Br<sub>2</sub> + O<sub>2</sub> in light (197) see indic. refs.]

[For formn. of  $\bar{C}$  from di-(trichloromethyl) carbonate (triphosgene) (3:1915) on distn. (198), htg. at 200° in s.t. (199), or on mixing with charcoal and htg. just above m.p. (78°) (198) see indic. refs.; from trichloromethyl ehloroformate (diphosgene) (3:5515) on htg. above 300° (200) (209) or on contact with activated carbon, charcoal, or iron oxide at ord. temp. (198); from methyl trichloromethyl carbonate [Beil. III-17, III-(8), III-(15)], h.p. 57–58° at 17 mm. (204),  $D_4^{17} = 1.5228$  (204),  $n_D^{17} = 1.4487$  (204), on hoilg. at ord. press. (202) or on warming with AlCl<sub>3</sub> (203) (204); from ethyl trichloromethyl carbonate, h.p. 78° at 19 mm. (204),  $D_4^{20} = 1.4205$  (204),  $n_D^{20} = 1.4450$  (204), or from *n*-propyl trichloromethyl carbonate, h.p. 93° at 12 mm. (204),  $D_4^{20} = 1.359$  (205),  $n_D^{20} = 1.4451$  (205), on warming with AlCl<sub>3</sub> (203); from isoamyl trichloromethyl carbonate, h.p. 120° at 23 mm. (204),  $D_4^{20} = 1.2644$  (204),  $n_D^{20} = 1.4466$  (204), phenyl trichloromethyl carbonate [Beil. VI-(88)], m.p. 70.5° (204), or *p*-tolyl trichloromethyl carbonate (206) on warming with aq. (but not with aq. NaOH) (206); from *bis*-(trichloromethyl) oxalate [Beil. III-17] at 350–400° (207); or from trichloromethyl perchlorate (208) see indic. refs.]

[For formn. of  $\bar{C}$  from trichloronitromethane (chloropicrin) [Beil. I-76, I-(20), I-(41)] in u.v. light (210), on hoilg. (at 112°) under ord. press. (211), on passing with HCl over pumice at 400° (212), or on treatment with fuming H<sub>2</sub>SO<sub>4</sub> (20% SO<sub>3</sub>) at 100° (213) see indic. refs.]

*From miscellaneous sources.* [For formn. of  $\bar{C}$  from CO<sub>2</sub> + CCl<sub>4</sub> (3:5100) + cat. at elevated temp. (225), from CS<sub>2</sub> with aqua regia (214) or Cl<sub>2</sub>O (215); from COS with Cl<sub>2</sub> at red heat (1); from COS over fused CuCl<sub>2</sub> (1) or through hoiling SbCl<sub>5</sub> (1); from thiophosgene with air or O<sub>2</sub> under various conditions (216); from anhydrous Na<sub>2</sub>CO<sub>3</sub> with

$\text{PCl}_5$  (217); from pentachloropropionyl chloride (3:0470) with  $\text{AlCl}_3$  at  $60^\circ$  (218); from oxalyl (di)chloride (3:5060) at  $600^\circ$  or with  $\text{AlCl}_3$  in  $\text{CS}_2$  on warming (219) see indie. refs.]

## CHEMICAL BEHAVIOR OF $\dot{\text{C}}$

Pyrolysis of  $\dot{\text{C}}$ .  $\dot{\text{C}}$  on heating above  $300^\circ$  decomposes in two ways: (1) into  $\text{CO} + \text{Cl}_2$  ( $\text{CO}$  equilibrium) and (2) into  $\text{CO}_2 + \text{CCl}_4$  ( $\text{CO}_2$  equilibrium). The extent of these reactions together with the influence of various factors has been extensively studied. [For a concise summary of earlier work see the review of Dyson (11); for many important details see the original references represented by (225) (221) (222) (5) (135) (6) (223) (224).]

Photochemical decompn. of  $\dot{\text{C}}$ . [ $\dot{\text{C}}$  on exposure to short-wave u.v. light decomposes yielding (105) (226)  $\text{CO} + \text{Cl}_2$ ; for more recent studies of this photochem. decompn. see (227) (228) (229) (230) (231); for application to problem of separation of isotopes of  $\text{Cl}_2$  see (232).]

Electrolysis of  $\dot{\text{C}}$ . [ $\dot{\text{C}}$  or a soln. of  $\text{AlCl}_3$  in  $\dot{\text{C}}$  upon electrolysis gives (233)  $\text{CO} + \text{Cl}_2$ ]

## BEHAVIOR OF $\dot{\text{C}}$ WITH INORGANIC REACTANTS

Reduction of  $\dot{\text{C}}$ . [ $\dot{\text{C}}$  +  $\text{H}_2$  in u.v. light at  $10^\circ$  gives  $\text{CO} + \text{HCl}$  + traces of formaldehyde (1:0145) but at  $80^\circ$  gives  $\text{CO} + \text{CO}_2 + \text{CH}_4 + \text{HCl}$  (234). —  $\dot{\text{C}}$  +  $\text{H}_2$  over Pd or Ni on pumice, or over vanadium carbide, at  $300\text{--}450^\circ$  gives (235) cf. (236)  $\text{CO} + \text{HCl}$  + small amts. formaldehyde (1:0145) cf. (229).]

Oxidation of  $\dot{\text{C}}$ . [For study of photochem. oxidn. of  $\dot{\text{C}}$  see (230).]

Hydrolysis of  $\dot{\text{C}}$ . Contrary to earlier reports  $\dot{\text{C}}$  with aq. is almost instantly hydrolyzed but the rate is influenced by the manner in which contact is effected and whether the aq. is in vapor or liquid state. [For studies on the hydroly. of  $\dot{\text{C}}$  see (237) (4) (96) (238); for study of rate of hydrolysis in dioxane at  $25^\circ$  (239) or in toluene at  $25^\circ$  and at  $45^\circ$  (240) see indie. refs.]

Behavior of  $\dot{\text{C}}$  with metal oxides, sulfides, or phosphates. [ $\dot{\text{C}}$  with metallic oxides on htg. at  $250\text{--}600^\circ$  (depending upon the metal) gives the corresp. metal chloride which in some cases, e.g.,  $\text{FeCl}_3$ ,  $\text{ThCl}_4$ , readily sublimes in pure form; for examples of this reaction see (211) (212) (213); for use in prepn. of  $\text{AlCl}_3$  see (219).]

[ $\dot{\text{C}}$  on htg. with metal sulfides gives (216)  $\text{COS}$  [Boil. III-131, III<sub>2</sub>-(61), III<sub>2</sub>-(101)], b.p.  $-50.2^\circ$  (211), f.p.  $-138.2^\circ$  (214) (use with  $\text{CdS}$  in prepn. (215)), and the metal chloride cf. (211).]

[ $\dot{\text{C}}$  on htg. with certain phosphates (217) gives  $\text{CO}_2 + \text{POCl}_3$  + metal chloride (use in prepn. of  $\text{POCl}_3$  (218)).]

Analogs of  $\dot{\text{C}}$ . *Carbonyl fluoride*. [This compound, b.p.  $-83.1^\circ$  (250), m.p.  $-114.0^\circ$  (250), has been prepd. from  $\text{AgF}_2 + \text{CO}$  (250),  $\text{F}_2 + \text{CO}$  (251) cf. (250), or from acetone with  $\text{F}_2$  (252), but has not been reported from  $\dot{\text{C}}$ . Note that  $\dot{\text{C}}$  with  $\text{HF}$  at  $80^\circ$  and 250 Hg. eq. in. in  $\text{Cu}$  bomb gives (25-50% yield (253)) carbonyl chlorofluoride,  $\text{COClF}$ , b.p.  $-42^\circ$ , m.p.  $138^\circ$  (253).]

*Carbonyl bromide*. [ $\dot{\text{C}}$  with  $\text{HBr}$  at  $150^\circ$  (254) or with  $\text{AlBr}_3$  (255) gives carbonyl bromide [Boil. III-29, III<sub>2</sub>-(9), III<sub>2</sub>-(7)], but this prod. is better prepd. from  $\text{CBr}_4$  by oxidn. with conc.  $\text{H}_2\text{SO}_4$  (256) (257) (258) (for study of photochemical oxidn. see (259)); for studies of structure (26) and pyrolysis (260) (261) (262) see indie. refs.]

*Carbonyl cyanide*. [This compound, b.p.  $65.0\text{--}65.5^\circ$  (263),  $d_4^{25} = 1.124$  (263),  $n_D^{25} = 1.2019$  (263), has been prepd. from acetone- $\alpha$ -chloroethyl ester (1:0145) by conversion (264) to di- $\alpha$ -chloroacetone [Boil. I-266, I<sub>2</sub>-(413)], thence to diacetyl-dichloroacetone (265), then acetone- $\alpha$ -acetyl cyanide (267) which was then pyrolyzed at  $160\text{--}165^\circ$  and

210–220 mm. (263) cf. (265). For formn. using propionyl (instead of acetyl) derivatives see (266).]

Behavior of  $\bar{C}$  with inorganic acids. [ $\bar{C}$  with HF as directed (250) (see analogs of  $\bar{C}$  above) gives carbonyl chlorofluoride. —  $\bar{C}$  with HBr does not react even at 200° (267). —  $\bar{C}$  as liq. does not react with HI, but  $\bar{C}$  as gas reacts with HI gas even at room temp. with sepn. of  $I_2$  (267).]

Behavior of  $\bar{C}$  with inorganic salts. [ $\bar{C}$  with KI or NaI in acetone solns. gives CO +  $I_2$  (use in detn. of  $\bar{C}$  (91) (92) (93)).]

[The behavior of  $AlCl_3$  with  $\bar{C}$  has been extensively studied; for studies of solns. of  $AlCl_3$  in liq.  $\bar{C}$  from viewpoint of vapor pressure (268), density (269), and conductance (270) see indic. refs. — For general studies of liq.  $\bar{C}$  as solvent (271) (272) including studies on system  $\bar{C}$  +  $Cl_2$  (273) and on phosgeno salts such as calcium phosgeno-aluminate (274) (275) and others (276) see indic. refs.].

Behavior with various inorganic nitrogen compounds. With  $NH_3$ . [ $\bar{C}$  in lgr. (277) or  $C_6H_6$  (278) gives urea, biuret, cyanuric acid, cyamelide, ammelide, etc.;  $\bar{C}$  as gas with  $NH_3$  as gas gives urea (279) cf. (280) (143), guanidine, cyanuric acid (281), and cyamelide (282). — For reaction of  $\bar{C}$  in toluene soln. with aq.  $NH_4OH$  as a source of isocyanic acid see (283). — Note also that  $\bar{C}$  with sodamide reacts in cold in sense  $COCl_2 + 3NaNH_2 \rightarrow NaNCO + 2NaCl + 2NH_3$ , but at about 250° in sense  $COCl_2 + 5NaNH_2 \rightarrow Na_2N-C\equiv N + 2NaCl + NaOH + 3NH_3$  (284).]

[ $\bar{C}$  with  $NH_4Cl$  at elevated temps., e.g., 200–400°, gives (285) (286) carbamyl chloride,  $NH_2.CO.Cl$  [Beil. III-31, III<sub>1</sub>-(15)], b.p. 61–62° dec. (285). — For study of analogous carbamyl fluoride and carbamyl bromide (previously unknown) see (287).]

With hydroxylamine. [For studies on behavior of  $\bar{C}$  with  $NH_2OH$  see (288) (289)]

With hydrazine: [ $\bar{C}$  with 1 mole hydrazine would be expected to give *N*-aminocarbamyl chloride,  $NH_2.NH.CO.Cl$ , but this compound appears to be unknown;  $\bar{C}$  with 2 moles hydrazine should yield *N,N'*-diaminourea (carbohydrazide) [Beil. III-121, III<sub>1</sub>-(57), III<sub>2</sub>-(96)], but this compound has not been reported as prepd. by this method.]

#### BEHAVIOR OF $\bar{C}$ WITH ORGANIC REACTANTS

With hydrocarbons. [For studies on photochem. reaction of  $\bar{C}$  with alkanes (290) or with cycloalkanes (291) or with aliphatic or alicyclic acid chlorides (292) as a means of replacement of hydrocarbon H atoms by the  $CO.Cl$  group see indic. refs. — For reaction of  $\bar{C}$  with satd. nonaromatic hydrocarbons in pres. of cat. yielding ketones see (293). — Note also that  $\bar{C}$  with  $CH_4 + H_2 + cat.$  is claimed (236) to give acetaldehyde (1:0100).]

$\bar{C}$  with aromatic hydrocarbons in pres. of a Friedel-Crafts' type cat. condenses according to conditions with either one or two moles of hydrocarbon yielding, respectively, the corresp. acid chloride or ketone. No attempt can be made here to collect the reported cases of these types since the many acid chlorides contained in this book afford numerous examples.

[ $\bar{C}$  with ethylene +  $AlCl_3$  in  $CS_2$  adds to the unsatd. linkage giving (295) (296) (297) (298)  $\beta$ -chloropropionyl chloride (3:5690) although the method has been questioned (299) (300). —  $\bar{C}$  with propylene +  $AlCl_3$  as directed (301) gives  $\beta$ -chloroisobutyryl chloride (3:9101).] [ $\bar{C}$  with acetylene (302) or acetylene homologs (303) gives complex condensation products suitable for molding.]

With alcohols.  $\bar{C}$  with alcohols reacts according to circumstances with either 1 mole alcohol giving the corresponding chloroformate (chlorocarbonate) esters, or with 2 moles alcohol giving the corresponding carbonate ester. The countless known cases cannot here be cited in detail but the following examples are given; see also the summary of Dyson (308).

$\bar{C}$  with MeOH (1:6120) gives (304) methyl chloroformate (3:5075) q.v. and/or dimethyl carbonate (1:3046);  $\bar{C}$  with EtOH (1:6130) gives ethyl chloroformate (3:7295) q.v. and/or diethyl carbonate (1:3150);  $\bar{C}$  with *n*-PrOH (1:6150) gives *n*-propyl chloroformate (3:7540) q.v. and/or di-*n*-propyl carbonate (1:3373);  $\bar{C}$  with isopropyl alcohol (1:6135) gives isopropyl chloroformate (3:7405) q.v. and/or di-isopropyl carbonate (1:3261);  $\bar{C}$  with *n*-butyl alcohol (1:6180) gives *n*-butyl chloroformate (3:7980) q.v. and/or di-*n*-butyl carbonate (1:3626);  $\bar{C}$  with isobutyl alcohol (1:6165) gives isobutyl chloroformate (3:7760) q.v. and/or di-isobutyl carbonate (1:3501);  $\bar{C}$  with *n*-AmOH (1:6205) presumably gives *n*-amyl chloroformate (3:9380) q.v., but di-*n*-amyl carbonate appears to be unreported;  $\bar{C}$  with isoamyl alcohol (1:6200) gives isoamyl chloroformate (3:8215) q.v. and/or di-isoamyl carbonate (1:3937).

$\bar{C}$  with allyl alcohol (1:6145) gives allyl chloroformate (3:7487) q.v. and/or diallyl carbonate;  $\bar{C}$  with cyclohexanol (1:6415) gives cyclohexyl chloroformate (3:5770) q.v.;  $\bar{C}$  with benzyl alcohol (1:6480) gives benzyl chloroformate (3:9565) q.v. — [For analogous reaction of  $\bar{C}$  with unsatd. monohydric alcohols such as methallyl alcohol, crotyl alcohol, etc., see (305).]

$\bar{C}$  with monohydroxyethers gives analogous products: e.g.,  $\bar{C}$  with  $\beta$ -methoxyethanol (1:6405) gives  $\beta$ -methoxyethyl chloroformate (3:9140) q.v.;  $\bar{C}$  with  $\beta$ -ethoxyethanol (1:6410) gives  $\beta$ -ethoxyethyl chloroformate (3:9250) q.v. — [For reaction of  $\bar{C}$  with polyhydroxyethers such as diethylene glycol (1:6525), triethylene glycol (1:6538), tetraethylene glycol, etc., giving corresp. bis-(chloroformates), see (306).]

[For study of behavior of  $\bar{C}$  toward various alkali alkoxides see (307).]

[Note that  $\bar{C}$  as liq. reacts with enol form of acetone (1:5900) in  $\frac{1}{2}$  hr. at room temp. giving (330) isopropenyl chloroformate (3:7358).]

With phenols. The reaction of  $\bar{C}$  with phenols is more sluggish than with alcohols, and the corresp. diaryl carbonates are usually obtained from  $\bar{C}$  with 2 moles of the corresponding sodium phenolate cf. (308).

[ $\bar{C}$  (as liquid) with phenol (1:1420) in s.t. at 140–150° (309), or  $\bar{C}$  in toluene (310) or trichloroethylene (3:5170) (311) with aq. phenol (311) or aq. Na phenolate (310), or  $\bar{C}$  with Na phenolate in toluene (312), or  $\bar{C}$  with 10% aq. Na phenolate at 30° (313) gives (yields: 45% (312), 44% (313)) phenyl chloroformate [Beil. VI-159, VI<sub>1</sub>-(88), VI<sub>2</sub>-(157)], b.p. 97–98° at 25 mm. (310), 83–84° at 12 mm. (313),  $n_D^{25} = 1.5180$  (313); for use as acylating agent see (314).]

[ $\bar{C}$  in toluene shaken with a soln. of *o*-cresol (1:1400) in aq. NaOH (310) (315) gives *o*-tolyl chloroformate [Beil. VI-356], b.p. 119° at 35 mm. (310), 114° at 25 mm. (310). —  $\bar{C}$  in toluene shaken with a soln. of *m*-cresol (1:1730) in aq. NaOH (315) gives *m*-tolyl chloroformate [Beil. VI-379], b.p. 103° at 22 mm. (315). —  $\bar{C}$  in toluene shaken with a soln. of *p*-cresol (1:1410) in aq. NaOH (315), or  $\bar{C}$  passed as gas into aq. Na *p*-cresolate below 10° (316), gives (78–80% yield (316)) *p*-tolyl chloroformate [Beil. VI-393, VI<sub>2</sub>-(380)], b.p. 108° at 30 mm. (315) (316).]

Countless other phenols behave with  $\bar{C}$  in generally similar fashion but cannot be detailed here.

With carboxylic and sulfonic acids.  $\bar{C}$  with carboxylic acids or sulfonic acids or their salts at elevated temps. or in pres. of tertiary bases effects conversion to the corresponding carboxylic acid chlorides or sulfonyl chlorides.

[E.g.,  $\bar{C}$  with AcOH (1:1010) at 110–120° (317), or at 160° over  $MgCl_2$  on diatomaceous earth (318) cf. (319) (320), or  $\bar{C}$  with NaOAc at 120° under press. (321), or  $\bar{C}$  with  $Ac_2O$  (1:1015) + cat. (322) gives acetyl chloride (3:7065). —  $\bar{C}$  with chloroacetic acid (3:1370) over activated carbon at 200° gives (323) chloroacetyl chloride (3:5235). —  $\bar{C}$  with anhydrous oxalic acid (1:0535) in pres. of tertiary amines yields (324) oxalyl (di)chloride

(3:5060). —  $\bar{C}$  with cinnamic acid (1:0735) in pres. of tertiary amines yields (324) cinnamoyl chloride (3:0330). —  $\bar{C}$  with phenoxyacetic acid (1:0680) in pres. of tertiary amines yields (324) phenoxyacetyl chloride (3:8790). —  $\bar{C}$  with lauric acid (1:0605) at 140–150° gives (85–90% yield (325)) lauroyl chloride (3:9858). —  $\bar{C}$  with palmitic acid (1:0650) at 140–150° gives (70–75% yield (325)) palmitoyl chloride (3:9912). —  $\bar{C}$  with stearic acid (1:0660) at 140–150° gives (70–75% yield (325)) stearoyl chloride (3:9960). —  $\bar{C}$  with oleic acid (1:0565) gives (325) oleoyl chloride (3:9940).]

[ $\bar{C}$  with benzoic acid (1:0715) at 140–200° (326), or in pres. of tertiary bases or their salts (324), or  $\bar{C}$  with  $\text{AgOBz}$  in s.t. at 100° (327) gives benzoyl chloride (3:6240). —  $\bar{C}$  with salicylic acid (1:0780) in toluene (328) or in  $\text{C}_6\text{H}_6$  in presence of tertiary bases (324) gives salicyloyl chloride (3:0085). —  $\bar{C}$  with furoic acid (1:0475) under press. at not above 100° gives (329) furoyl chloride (3:8515).]

[Many other cases including sulfonic acids, e.g., (324), cannot be detailed here.]

With amines. With primary amines.  $\bar{C}$  with primary amines reacts in various ways according to conditions to yield *N*-alkyl (or aryl) carbamyl chlorides, *N*-alkyl (or aryl) isocyanates, or *N,N'*-dialkyl (or aryl) ureas. Examples of these types of reaction are included below.

[ $\bar{C}$  with  $\text{CH}_3\text{NH}_2\cdot\text{HCl}$  at 250–300° gives (285) (331) *N*-methylcarbamyl chloride [Beil. IV-64]; for stabilization of this prod. by formn. of insol. compds. with  $\text{AlCl}_3$ , etc., see (332); note that treatment with  $\text{CaO}$  causes loss of  $\text{HCl}$  giving (285) methyl isocyanate [Beil. IV-77, IV<sub>1</sub>-(337), IV<sub>2</sub>-(578)], best prepd. by other means, e.g., from  $\text{NaN}_3$  with  $\text{Ac}_2\text{O}$  (333) or  $\text{AcCl}$  (334) (335). —  $\bar{C}$  with  $\text{CH}_3\text{NH}_2$  in  $\text{C}_6\text{H}_6$  + aq. alkali, however, gives *N,N'*-dimethylurea [Beil. IV-65, IV<sub>1</sub>-(331), IV<sub>2</sub>-(568)], m.p. 106°.]

[ $\bar{C}$  with  $\text{C}_2\text{H}_5\text{NH}_2\cdot\text{HCl}$  at 250–300° gives (285) *N*-ethylcarbamyl chloride [Beil. IV-114]; note that treatment of this prod. with  $\text{CaO}$  causes loss of  $\text{HCl}$  giving (285) ethyl isocyanate [Beil. IV-122, IV<sub>1</sub>-(357), IV<sub>2</sub>-(613)], b.p. 60°.]

[ $\bar{C}$  with other primary aliphatic or cycloaliphatic amine hydrochlorides under conditions such that  $\text{HCl}$  is removed from reaction mixt. gives corresp. isocyanates (336) cf. (337).]

[ $\bar{C}$  with aniline hydrochloride presumably yields *N*-phenylcarbamyl chloride [Beil. XII-346, XII<sub>1</sub>-(230)], m.p. 53–59°, but this compound is usually prepd. by other means (338) (339) since it readily loses  $\text{HCl}$  at 90–100° or by action of aq. or aq. alk. (340) giving phenyl isocyanate; for stabilization of *N*-phenylcarbamyl chloride by formn. of molecular compound with  $\text{AlCl}_3$  see (332). —  $\bar{C}$  in dry aniline (341) or aq. aniline (342) (96) gives *N,N'*-diphenylurea (carbanilide) [Beil. XII-352, XII<sub>1</sub>-(233)], m.p. 238°; for use of this reaction as method of quant. detn. of  $\bar{C}$  see (94) (95) cf. (91). —  $\bar{C}$  with fused aniline  $\text{HCl}$  or carbanilide (343), or  $\bar{C}$  with aniline  $\text{HCl}$  in  $\text{C}_6\text{H}_6$  at 120° under press. (344) cf. (337), gives phenyl isocyanate [Beil. XII-437, XII<sub>1</sub>-(259)], b.p. 166°.]

$\bar{C}$  with countless other arom. prim. amines behaves in generally similar fashion but details cannot be included here [however, for reaction of  $\bar{C}$  with *p*-nitroaniline in  $\text{EtOAc}$  soln. giving *N*-*p*-nitrophenylcarbamyl chloride which on recrystn. from  $\text{CCl}_4$  loses  $\text{HCl}$  yielding *p*-nitrophenyl isocyanate see (345) (346) (347)].

With secondary amines. [ $\bar{C}$  with  $(\text{CH}_3)_2\text{NH}$  in  $\text{C}_6\text{H}_6$  at 0° (348) (349), or  $\bar{C}$  over fused  $(\text{CH}_3)_2\text{NH HCl}$  (350) (351), gives *N,N'*-dimethylcarbamyl chloride [Beil. IV-73], h.p. 167°, which with dimethylamine in  $\text{C}_6\text{H}_6$  yields (349) *N,N,N',N'*-tetramethylurea [Beil. IV-74, IV<sub>1</sub>-(335), IV<sub>2</sub>-(574)], liquid, b.p. 177°.]

[ $\bar{C}$  with  $(\text{C}_2\text{H}_5)_2\text{NH}\cdot\text{HCl}$  at elev. temp. (350), or with  $(\text{C}_2\text{H}_5)_2\text{NH}$  in  $\text{C}_6\text{H}_6$  (352), gives *N,N*-diethylcarbamyl chloride [Beil. IV-120, IV<sub>2</sub>-(611)], liquid, h.p. 186–190°, which with diethylamine gives (353) cf. (354) *N,N,N',N'*-tetraethylurea [Beil. IV-120, IV<sub>2</sub>-(611)], liquid, b.p. 210–215°.]

[ $\bar{C}$  with piperidine  $\text{HCl}$  would be expected to give *N*-piperidylformyl chloride ("penta-

methylenecarbamyl chloride") [Beil. XX-54], b.p. 237-238°, but this compound has been reported only by other means.]

$\bar{C}$  with aromatic secondary amines behaves in generally analogous fashion but cannot be detailed here.

*With tertiary amines.* [ $\bar{C}$  with *N,N*-dimethylaniline at ord. temp. is claimed (355) (356) to give 4,4'-bis-(dimethylamino)benzophenone ("Miehler's ketone") [Beil. XIV-89; XIV-1-(391)], m.p. 174°. However,  $\bar{C}$  passed into boiling *N,N*-dimethylaniline evolves  $\text{CH}_3\text{Cl}$  (3.7005) and gives (almost quant. yield (357)) *N,N'*-dimethyl-*N,N'*-diphenylurea [Beil. XII-418, XII-1-(251)], m.p. 121°. — Similarly,  $\bar{C}$  with boiling *N,N*-diethylaniline evolves  $\text{C}_2\text{H}_5\text{Cl}$  (3.7015) and gives *N,N'*-diethyl-*N,N'*-diphenylurea [Beil. XII-422], m.p. 79°]

[For use of  $\bar{C}$  in sepn. of a mixture of aniline, *N*-ethylaniline, and *N,N*-diethylaniline see (361).]

*With arylhydrazines* [ $\bar{C}$  in toluene added to cold ether soln. of phenylhydrazine gives (358) 1,5-diphenylcarbohydrazide ("diphenylcarbazine") [Beil. XV-292, XV-1-(72)], m.p. 175-175.5° u.c. when pure (359) For use of this reaction, followed by  $\text{CuSO}_4$  treatment of the resultant product, as a delicate test for  $\bar{C}$  see (78).]

*With other nitrogenous organic reactants* [For a concise review of behavior of  $\bar{C}$  with other nitrogenous classes such as amides, amidoximes, thioureas, thiosemicarbazides, etc., see the review of Dyson (360).]

*With hexamethylenetetramine.*  $\bar{C}$  with hexamethylenetetramine in  $\text{CHCl}_3$  gives (362) (363) (364) a compound of compn.  $\bar{C} \cdot 2\text{C}_6\text{H}_{12}\text{N}_4$ , m.p. 187-190° dec., (363) 196-197° from  $\text{MeOH}$  (364). — [For use of hexamethylenetetramine in paints protective against  $\bar{C}$  see (365); for use of alumina or silica gels contg. hexamethylenetetramine as absorbents for  $\bar{C}$  see (366).]

3:5005 1,1-DICHLOROETHYLENE  $\text{H}_2\text{C}=\text{C}-\text{Cl}$   $\text{C}_2\text{H}_2\text{Cl}_2$  Beil. I - 186  
(Vinylidene (di)chloride;  $\text{Cl}$  I<sub>1</sub>-(77)  
*unsym.*-dichloroethylene) I<sub>2</sub>-(158)

B.P. 31.7° at 760 mm. (1) F.P. -122.1° (1)  $D_4^{20} = 1.2129$  (1)  $n_D^{20} = 1.4249$  (1)

Care must be taken to avoid confusion of  $\bar{\text{C}}$  with vinyl chloride (3:7010), with 1,2-dichloroethane (ethylene (di)chloride) (3:5130), or especially with the isomeric compounds *cis*-1,2-dichloroethylene (3:5042), *trans*-1,2-dichloroethylene (3:5028), or their ordinary mixture (3:5030).

$\bar{\text{C}}$  when pure is colorless liq. with mild and characteristic odor; note, however, that at temps. above 0° and especially in pres. of oxygen or other cat.  $\bar{\text{C}}$  polymerizes to a white powder insoluble in the monomeric  $\bar{\text{C}}$ . (For much further comment on polymerization see below.)

#### PREPARATION OF $\bar{\text{C}}$

[For prepn. of  $\bar{\text{C}}$  from 1,1,2-trichloroethane (3:5330) by elimination of 1 HCl with alc. KOH (2) (by this process  $\bar{\text{C}}$  was initially prepared (3)), or with excess aq.  $\text{Ca}(\text{OH})_2$  at 70-80° (90% yield (4)) (5), or with aq. or alc.  $\text{NH}_3$  at ord. temp. (100% yield (7)), or with Na in dry ether (36) see indic. refs.; from 1,1,1-trichloroethane (3:5085) with excess aq.  $\text{Ca}(\text{OH})_2$  at 70-80° see (4) (5); for formn. of  $\bar{\text{C}}$  (as by-product of the isomeric 1,2-dichloroethylenes (3:5030)) from trichloroethane by catalytic pyrolytic dehydrochlorination see (6).]

[For prepn. of  $\bar{\text{C}}$  from 1,1,1,2-tetrachloroethane (3:5555) by loss of HCl by actn. of aq. + Fe, Zn, or Cd on warming under reflux see (8); from 1-bromo-1,1,2-trichloroethane by loss of Br-Cl with Zn dust + boilg. alc. see (37).]

[For formn. of  $\bar{\text{C}}$  (together with vinyl chloride) from ethyl trichloroacetate (3:5950) by actn. of Zn in alc. see (9).]

[For formn. of  $\bar{\text{C}}$  (20% yield) from 1,2-dichloroethane (ethylene (di)chloride (3:5130) with  $\text{Cl}_2$  in pres. of  $\text{AlCl}_3/\text{NaCl}/\text{FeCl}_3$  at 400-480° see (10); note that some 22% 1,2-dichloroethylenes (3:5030) + 29% trichloroethylene (3:5170) + 29% higher chlorination prods. are also formed.].

#### PURIFICATION AND STABILIZATION OF MONOMERIC $\bar{\text{C}}$

[For purification of  $\bar{\text{C}}$  by distn. as an azeotrope with MeOH, followed by removal of the latter by extraction with aq., see (11).]

Many compds. recommended as stabilizers or polymerization inhibitors for monomeric  $\bar{C}$  have been described in patents: e.g., see (12) (13) (14) (15) (16).

### CHEMICAL BEHAVIOR OF MONOMERIC $\bar{C}$

$\bar{C}$  + chlorine. [ $\bar{C}$  with  $Cl_2$  at 25–35° in pres. of absence of cat. adds 1 mole halogen giving (85–92% yield (17)) 1,1,1,2-tetrachloroethane (3:5555).]

$\bar{C}$  + bromine.  $\bar{C}$  with  $Br_2$  adds 1 mole halogen yielding (18) 1,1-dichloro-1,2-dibromoethane [Beil. I-93], oil, b.p. 175° at 760 mm. decg., 65° at 13 mm., f.p. –66.85°,  $D_4^{25} = 2.2203$ ,  $D_4^{20} = 2.2449$ ,  $D_4^{15} = 2.2695$ ,  $n_D^{25} = 1.55930$  (18).

$\bar{C}$  + hydrogen chloride.  $\bar{C}$  with dry  $HCl$  gas at 25–35° in pres. of  $AlCl_3$  or  $FeCl_3$  adds 1 mole  $HCl$  giving (85–90% yields (19) (20)) 1,1,1-trichloroethane (3:5085).

$\bar{C}$  + hydrogen bromide. The addition to  $\bar{C}$  of  $HBr$  appears to be unreported.

Polymerization of  $\bar{C}$ . Polymerization of  $\bar{C}$  either with itself or with other cpds. (especially other substituted ethylene derivs.) leads to a large group of industrially important materials broadly designated as "vinylidene polymers." Certain plasticized and stabilized copolymer compositions have been named "Saran." [For extremely valuable comprehensive reviews of this general field see (1) (21) (22); in view of the comprehensive surveys and prior literature (including patents) references given (especially in (1)), the following text will in general include only citations since 1942.]

$\bar{C}$  when carefully purified and free from oxygen polymerizes only very slowly; however, in the pres. of various catalysts, notably peroxides, polymerization readily occurs (for amplification see (1)).

[For patents involving polymeric  $\bar{C}$  from viewpoint of purification (23), storage of super-cooled material (24), heat treatment to increase tensile strength (25), improvement of stability to light and heat (26) (27) (28) (29), or coloring (30) see indic. refs. — For studies on structure of fibers of polymeric  $\bar{C}$  see (1) (31). — For identification of common comml. plastics (including "Saran" and "Velon") see (32).]

[For review of copolymerization of  $\bar{C}$  see (1); for copolymerization with butadiene (33), with vinyl chloride or vinyl acetate (34), with styrene, acrylonitrile, various methacrylates, etc. (35), see indic. refs.]

3:5010 DICHLOROACETYLENE  
(1,2-Dichloroethyne)

Beil I - 245

I<sub>1</sub>-(106)

I<sub>2</sub>-(222)

B.P.

F.P.

32-33° at 748 mm. (1) (2) (3)

-66 to -64.2° (1)

$D_4^{20} = 1.261$  (9)

29° cor. at 743 mm. (4)

$n_D^{20} = 1.42790$  (9)

Colorless oil which ignites in air and explodes even on stirring; however, its 5-10% soln. in ether is safely handled (4).

[For prepn. of  $\bar{C}$  from acetylene + aq. alk. KOCl soln. under  $N_2$  see (1) (2) (3); from 1,1,2-trichloroethylene (3:5170) in  $N_2$  at 130° over solid granular KOH (65% yield (4)) see (4) (5) (9); from 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) with KOH in xylene under  $N_2$  (can be carried out as a lect. expt.) see (6) (9); for formn. of  $\bar{C}$  from barium salt of  $\alpha,\beta,\beta$ -trichloroacrylic acid (3:1840) by hgt. in  $H_2$  see (13).]

$\bar{C}$  forms with diethyl ether a molecular cpd.,  $\bar{C} \cdot \bar{C}_2H_5O$ , eas. decomposed by aq. into its components (5); for  $D$  and  $n$  of ether solns. of  $\bar{C}$  see (9).

$\bar{C}$  on combustion yields  $CO$ ,  $CO_2$ ,  $COCl_2$  (4) together with other products (5).

[For use of  $\bar{C}$  in extraction of coffee see (7).]

$\bar{C}$  in  $CCl_4$  treated 9 hrs. with strong  $Cl_2/CCl_4$  soln. gives (1) on evapn. hexachloroethane (3:4835), m.p. 187° in s.t. (1).

$\bar{C}$  on passing into  $Br_2/aq.$  yields (1) a heavy oil which on stdg. under the excess reagt. solidifies to cryst. of 1,2-dichloro-1,1,2,2-dibromoethane; after recrystn. from alc., m.p. 209-210° dec., with yellowing at 200° (1). [Note that  $\bar{C}$  in  $CCl_4$  treated with  $Br_2/CCl_4$  can add 1 mole  $Br_2$  giving (65% yield (4)) 1,2-dichloro-1,2-dibromoethylene, b.p. 172° at 760 mm. (8),  $D_4^{15} = 2.3036$  (8),  $n_D^{15} = 1.57954$  (8), m.p. +4.40° (8), 4.9° (4).]

$\bar{C}$  with  $I_2$  in ether (4) or  $CCl_4$  (5) gives slowly 1,2-dichloro-1,2-diiodoethylene, cryst. from ether or pet. eth., m.p. 70° (4). [Another stereoisomer, m.p. 5-7°, is formed only to extent of 10% and is removed by the solvent (5).]

[For studies on behavior of  $\bar{C}$  on polymerization (10), and its reactions with  $NH_3$  (10), amines (10) (11), alcoholates (10), diethyl sodio-malonate (10), organic Mg compds. (12), ethyl diazoacetate (12), and  $NO_2$  (12) see indic. refs.]

Chem.* (2) 135, 142-144 (1932). (7)

### BINARY SYSTEMS CONTAINING $\bar{C}$ (See also azeotropes containing $\bar{C}$ )

$\bar{C} + Cl_2$ : for f.p./compn. data and diagram (various compounds and eutectics are formed) see (21).

$\bar{C} + C_2H_5Cl$  (3:7015): for f.p./compn. data and diag (eutectic, f.p.  $-149.7^\circ$ , conts. 31.7 wt. %  $\bar{C}$ ) see (17). —  $\bar{C} + CHCl_3$  (3:5050): for f.p./compn. data and diag. (eutectic, f.p.  $-103.4^\circ$ , conts. 70.5 wt. %  $\bar{C}$ ) see (17); for data on b.p.,  $D_4^{20}$ , and liq./vapor equilibria see (34). —  $\bar{C} + CCl_4$  (3:5100): for data on b.p.,  $D_4^{20}$ , and liq./vapor equilibria see (34). —  $\bar{C} + 1,1$ -dichloroethane (3:5035): for f.p./compn. data see (19). —  $\bar{C} + 2,2$ -dichloropropane (3:7140): for f.p./compn. data see (22).

$\bar{C} + isobutyl\ bromide$ : for f.p./compn. data see (19). —  $\bar{C} + methylene\ (di)bromide$ : for f.p./compn. data see (19).

$\bar{C} + methylene\ (di)iodide$ : for f.p./compn. data see (19).

$\bar{C} + dimethylaniline$ : for  $D_4^{25}$  and  $n_D^{24.5}$  for 0-100%  $\bar{C}$  see (23); for f.p./compn. data and diagram (eutectic, m.p.  $-97.2^\circ$ , conts. 91 wt. %  $\bar{C}$ ) see (168).

### TERNARY SYSTEMS CONTAINING $\bar{C}$ (See also azeotropes containing $\bar{C}$ )

$\bar{C} + CHCl_3 + CCl_4$ : system forms ternary eutectic, f.p.  $-111.4^\circ$ , contg. 60 wt. %  $\bar{C} + 27.0$  wt. %  $CHCl_3$  (3:5050) + 13.0 wt. %  $CCl_4$  (3:5100) (17).

### BINARY AZEOTROPES CONTAINING $\bar{C}$

$\bar{C} + H_2O$ :  $\bar{C}$  forms with aq. a const.-boilg. mixt., b.p.  $38.1^\circ$ , contg. 98.5 wt. %  $\bar{C}$  (68).  
 $\bar{C} + MeOH$ :  $\bar{C}$  forms with MeOH (1:6120) a const.-boilg. mixt., b.p.  $39.2^\circ$  (4) at 760 mm (3), contg. 92 wt. % (3), 94 wt. % (4)  $\bar{C}$ . —  $\bar{C} + EtOH$ :  $\bar{C}$  forms with EtOH (1:6130) a const.-boilg. mixt., b.p.  $41.0^\circ$  at 760 mm. (3), contg. 96.5 wt. % (3)  $\bar{C}$ . —  $\bar{C}$  forms with formaldehyde dimethylacetal (1:0105) a const.-boilg. mixt., b.p.  $45.0^\circ$  (36), contg. (36) 41 wt. %  $\bar{C}$ , cf. (37). —  $\bar{C} + acetone$ : note that this system forms no azeotrope; note also that  $\bar{C}$  is the only known liquid which with MeOH (see above) gives a const.-boilg. mixt. boilg. lower than acetone and at the same time not forming a binary azeotrope with acetone (4).

### TERNARY AZEOTROPES CONTAINING $\bar{C}$

$\bar{C} + H_2O + EtOH$ : forms no ternary azeotrope (68).

$\bar{C} + MeOH + acetone$ : this system forms no ternary azeotrope; for discussion see (4) (38).

$\bar{C} + CHCl_3 + acetone$ : for discussion see (4).

### OTHER PHYSICAL PROPERTIES OF $\bar{C}$

[For study of thermal conductivity of  $\bar{C}$  see (39); for studies of heat capacity of  $\bar{C}$  (40) as calculated from spectroscopic data (41) see indic. refs.; for studies of critical temp. of  $\bar{C}$  (7) (15) (6) and method for its microdetermination (6) see indic. refs.; for ebullioscopic const., viz.,  $2.6^\circ$  for 1000 g.  $\bar{C}$ , see (43).]

[For studies of adsorption of  $\bar{C}$  on wood charcoal at  $25^\circ$  and  $50^\circ$  (44) or on coconut charcoal over range  $-31.5^\circ$  to  $184^\circ$  (45), on  $Al(OH)_3$  gel (46), on  $Fe(OH)_3$  gel (47), on  $Cr_2O_3$  (48) see indic. refs.;  $\bar{C}$  is preferentially adsorbed (42) by silica gel from its mixt. with  $CHCl_3$  (3:5050).]

[For study of attempt to separate isotopes of  $Cl_2$  by reversible fractional distn. of  $\bar{C}$  see (49).]

PHYSIOLOGICAL ASPECTS OF  $\bar{C}$ 

$\bar{C}$  has low toxicity compared to other chlorinated hydrocarbon solvents; the maximum allowable conc. for 8 hrs. daily exposure is 500 p p m. (50). [For study of relative toxicity of  $\bar{C}$  see (51); for extensive study of industrial hygiene and toxicity of  $\bar{C}$  (together with 12 other chlorinated solvents (52)) (53) (50) see indic. refs.; for study of  $\bar{C}$  upon running activity of male rat see (54).]

USES OF  $\bar{C}$ 

$\bar{C}$  is widely used as a solvent, as a fluid for refrigeration processes, and for removing water from other organic materials; examples of all these aspects are cited below.

[For study of utility of  $\bar{C}$  as solvent for the ozonization of org. compds. see (10); for use of  $\bar{C}$  as solvent for the extraction of vitamin A (55) or of soy-bean oil (56) see indic. refs.; for general studies (15) (57) (58) and patents (59) (60) (61) (62) (63) (64) (65) on use of  $\bar{C}$  in refrigerating machines and systems see indic. refs.; for use of  $\bar{C}$  in detn. of water content of liquids (66) (67) or for prepn. of abs. EtOH (68) (69) (70) see indic. refs.]

DETECTION OR DETERMINATION OF  $\bar{C}$ 

[For detection of  $\bar{C}$  in pres. of acetone (by means of Fujiwara color test with pyridine + NaOH) see (71); for distinction of  $\bar{C}$  from  $\text{CHCl}_3$  (3:5050) and from  $\text{CCl}_4$  (3:5100) by color tests see (72) (73) (also under  $\bar{C}$  below).]

[For detn. of  $\bar{C}$  in blood by removal through aeration, pyrolytic decompn. of  $\bar{C}$ , and alk. absorption of resultant HCl as directed see (74); for detn. of C, H, and Cl in  $\bar{C}$  by combustion see (75). Note that the R. + H. Tri-Per Analyzer, a recording ultra-violet photometer very useful for detn. of trichloroethylene (3:5170) and tetrachloroethylene (3:5460), is insensitive (76) to  $\bar{C}$ .]

PREPARATION OR FORMATION OF  $\bar{C}$ 

From methane. [The chlorination of  $\text{CH}_4$  under various conditions to yield  $\bar{C}$  (accompanied by more or less  $\text{CH}_3\text{Cl}$  (3:7005),  $\text{CHCl}_3$  (3:5050), and  $\text{CCl}_4$  (3:5100)) has been extensively studied and no attempt will be made here to sift out details. For examples of leading scientific papers ((77)-(88), incl.) and patents ((89)-(96), incl.) see indic. refs.]

From methyl chloride. [The chlorination of  $\text{MeCl}$  to  $\bar{C}$  has also been extensively studied; many of the relevant data are included in the papers and patents on the chlorination of methane (see preceding paragraph), to which should be added the following patents (91) (97) (98) (99) (100). Note patent (98) on separation of  $\text{MeCl}$  (3:7005) from  $\bar{C}$  by hydrolysis of former to  $\text{MeOH}$  (1:6120) with  $\text{Ca}(\text{OH})_2$  under press.]

From chloroform. [For formn. of  $\bar{C}$  from  $\text{CHCl}_3$  (3:5050) by replacement of 1 chlorine by hydrogen using  $\text{Zn} + \text{alc. HCl}$  (101),  $\text{Zn} + \text{AcOH}$  (103),  $\text{Zn}$  dust + alc.  $\text{NH}_3$  (102) (8) (2),  $\text{Al/Hg} + \text{aq.}$  (103),  $\text{Fe} + \text{AcOH}$  (103), or  $\text{Si}_2\text{H}_5 + \text{AlCl}_3$  in absence of air (104) see indic. refs.]

From carbon tetrachloride. [For prepn. of  $\bar{C}$  from  $\text{CCl}_4$  (3:5100) using aq.  $\text{FeSO}_4 + \text{NaOH}$  see (105).]

From miscellaneous sources. [For prepn. or formn. of  $\bar{C}$  from  $\text{CH}_2\text{I}_2$  with  $\text{Cl}_2$  (first prepn. of  $\bar{C}$ ) (106) cf. (158); from polyoxymethylene with  $\text{PCl}_5$  in s t. (107); from  $\text{MeOH} + \text{S}_2\text{Cl}_2 + \text{Cl}_2$  (108); or from chloroacetic acid (3:1370) by electrochem. oxidn. (109) see indic. refs.]

CHEMICAL BEHAVIOR OF  $\bar{C}$ 

Oxidation of  $\bar{C}$ . [ $\bar{C}$  with air at ord. temps. and press. does not give inflammable mixts.; at high temps. vapor of  $\bar{C}$  becomes inflammable and ignites at  $642^\circ$  in air, at  $606^\circ$  in  $\text{O}_2$ ;

limiting condens. of  $\bar{C}$  for inflammability in  $O_2$  are 15.5–66.4%;  $N_2$  does not greatly affect the lower limit of inflammability in  $O_2$  but greatly reduces the upper limit (110). — For study of inflammability of mixts. of  $\bar{C}$  with  $O_2$  +  $N_2$ , air +  $CO$ , or  $O_2$  +  $N_2$  +  $MeBr$  see (111). — For effect of  $\bar{C}$  on flash point of solvents see (115).]

[ $\bar{C}$  with atomic  $O$  gives (112)  $COCl_2$  (3:5000),  $Cl_2$ ,  $HI$ ,  $CO_2$  +  $H_2O$ ;  $\bar{C}$  with air over  $CuO$  at  $450^\circ$  gives (113) little  $COCl_2$  (3:5000); for study of  $Cl_2$ -sensitized photochem. oxidn. of  $\bar{C}$  see (114).]

Fluorination of  $\bar{C}$ . [ $\bar{C}$  with  $SbF_5$  + cat. readily gives (126) (127)  $CH_2F_2$ , b.p.  $-51.6^\circ$ , +  $CH_2ClF$ , b.p.  $-9.0^\circ$ .]

Chlorination of  $\bar{C}$ . [ $\bar{C}$  with  $Cl_2$  as directed (116) (117), or  $\bar{C}$  with  $HI$  gas + air over  $CuCl_2$  at  $440^\circ$  (118), gives  $CHCl_3$  (3:6050) and  $CCl_4$  (3:5100).]

Bromination of  $\bar{C}$ . [ $\bar{C}$  with  $Br_2$  cf. (158) in pres. of  $Al$  gives (128) cf. (129)  $CH_2BrCl$  +  $CH_2Br_2$  (Boil. I-67, I<sub>1</sub>-(10), I<sub>2</sub>-(32)), b.p.  $96.95^\circ$  at 760 mm., f.p.  $-52.7^\circ$ ,  $D_4^{25} = 2.48417$ ,  $D_4^{20} = 2.49702$  (130). — For an alternative synthesis of  $CH_2Br_2$  (88–90% yield) from  $CH_2Br_2$  with  $Na_3AsO_4$  +  $NaOH$  see (138).]

Hydrolysis of  $\bar{C}$ .  $\bar{C}$  on suitable hydrolysis yields formaldehyde (1:0145). [E.g.,  $\bar{C}$  with aq. in pres. of weakly alk. reacting salts such as  $NaHCO_3$ ,  $Na_2HPO_4$ ,  $NaOAc$ , etc., at  $105^\circ$  under press. (119), or  $\bar{C}$  +  $N_2$  over dry  $Na_2CO_3$  at  $310$ – $320^\circ$  (120),  $\bar{C}$  with steam over activated carbon at  $260$ – $270^\circ$  (121),  $\bar{C}$  with aq. at  $140$ – $170^\circ$  under press. (122),  $\bar{C}$  with steam at  $550$ – $850^\circ$  over cat. (123), or  $\bar{C}$  with steam over tin phosphite at  $460^\circ$  (124) gives formaldehyde (1:0145) +  $HI$ . Note that  $\bar{C}$  on protracted htg. with aq. at  $180^\circ$  gives (125) formic acid (1:1005),  $MeCl$  (3:7005),  $MeOH$  (1:6120)  $HI$  +  $CO$ .]

Behavior with inorganic salts. [ $\bar{C}$  with  $NaI$  in acetone liqd. in press. bottle for 20 hrs. as directed (131), or  $\bar{C}$  with  $NaI$  in acetone,  $MeOH$ , or  $EtOH$  at  $120$ – $130^\circ$  under press. (132), gives (60% yield (131)) methylene (di)iodide [Boil. I-71, I<sub>1</sub>-(18), I<sub>2</sub>-(37)], b.p.  $151$ – $153^\circ$  cor. at 330 mm. (133),  $88^\circ$  at 39 mm. (134),  $66$ – $67^\circ$  at 11–12 mm. (24); exists in two crystn. forms, stable form, m.p.  $+5.85^\circ$  (135), metastable form, m.p.  $40^\circ$  (136);  $D_4^{25} = 3.2078$  (130);  $D_4^{20} = 3.3212$  (130);  $D_4^{16} = 3.3345$  (130);  $n_D^{25} = 1.74428$  (130). — For an alternative synthesis of  $CH_2I_2$  (90–97% yield) from iodoform by treatment with  $Na_3AsO_4$  +  $NaOH$  see (137).]

[ $\bar{C}$  with 2 moles  $K_2SO_5$  in aq. at  $150$ – $160^\circ$  gives potassium salt of methanedisulfonic acid (

[ $\bar{C}$  with alc.  $AgNO_3$  does not react even  $CHCl_3$  (3:5050) nor  $CCl_4$  (3:5100) reacts either,  $CH_2Cl$  (3:7005) gives a ppt. within 3 hrs. (140).]

[For formn. of polymeric prods. from reaction of  $\bar{C}$  with metal sulfides or polysulfides see (141); for study of photochem. reaction of  $\bar{C}$  with  $H_2S$  see (149).]

Behavior with metals.  $\bar{C}$  (like many other polyhalogenated hydrocarbons) in presence of metallic  $K$ ,  $Na$ ,  $K/Na$  alloy, or even of certain other active metals explodes under the influence of mechanical or thermal shock. [For study of this characteristic (142), especially with regard to sensitivity toward  $Li$ ,  $Na$ ,  $K$ ,  $Ca$ ,  $Sr$ ,  $Ba$  (143), see indie. refs.]

[Note that  $\bar{C}$  with molten sodium at  $260$ – $300^\circ$  gives (144)  $C$ ,  $H_2$ , and  $CH_4$ , together with smaller amts. of ethane, ethylene, and acetylene gives (145) 92%  $CH_4$  + 8% ethylene, while  $\bar{C}$  +  $Na$  vapor gives 92%  $CH_4$  + 8% ethylene; for further studies of behavior of  $\bar{C}$  attempts to obtain a free methylene radical ( $CH_2$ ) with  $\bar{C}$  +  $Na$  vapor have been unsuccessful (148).]

[For study of stability of various metals with respect to corrosion by  $\bar{C}$  under various conditions see (15).]

Behavior with various organic reactants.  $\check{C}$  with CO +  $AlCl_3$  at 260° and 800 atm. press. for 8 hrs. gives (150) chloroacetyl chloride (3:5235); but  $\check{C}$  with CO, COS, or  $COCl_2$  (3:5000) + cat. at 700° gives (151) malonyl (di)chloride (3:5030).]

$\check{C}$  with  $C_6H_6$  +  $AlCl_3$  gives (152) cf. (153) diphenylmethane (1:7120);  $\check{C}$  with toluene +  $AlCl_3$  gives (152) di-*p*-tolylmethane [Beil. V-615,  $V_1$ -(289),  $V_2$ -(518)], m.p. 28° (154), b.p. 302° cor. at 768 mm (154), accompanied by considerable (152) (155) 2,7-dimethylantracene, m.p. 241° cor. (153),  $\check{C}$  with *o*-xylene (1:7430) +  $AlCl_3$  in acetylene tetrachloride (3:5750) as solvent gives (156) 2,3,6,7-tetramethylantracene, m.p. 299° (156); for behavior of  $\check{C}$  in pres. of  $AlCl_3$  with *m*-xylene (1:7420) or with pseudocumene (1:7470) see (152).]

$\check{C}$  with  $CH_2Br_2$  + 5-10% KCl in pres. of moistened  $AlCl_3$  at 180° in s.t. for 16 hrs. undergoes a redistribution reaction giving (157) a mixt. contg 33%  $\check{C}$  + 18%  $CH_2Br_2$  + 50%  $ClCH_2Br$ ;  $\check{C}$  with  $CH_2I_2$  similarly treated at 114° for 18 hrs. gives (157) a mixt. contg. 33%  $\check{C}$  + 21%  $CH_2I_2$  + 46%  $ClCH_2I$ .]

$\check{C}$  with NaOMe in s.t. at 100° (158), or vapor of  $\check{C}$  over NaOMe + pumice at 200° (37), gives formaldehyde dimethylacetal (1:0105);  $\check{C}$  + NaOEt in s.t. at 100° (158), or  $\check{C}$  with excess EtOH + calcd amt. NaOH at 100-125° under press. (159), gives formaldehyde diethylacetal (1:0135); for analogous behavior of other alcoholates (158) (159) or phenolates (158) see indic. refs.]

$\check{C}$  with alc.  $NH_3$  at 125° in s.t. gives (160) hexamethylenetetramine [Beil. I-583,  $I_1$ -(306)]. —  $\check{C}$  with  $Me_2NH$  in s.t. at 70° gives (161) bis-(dimethylamino)methane. —  $\check{C}$  with  $Me_3N$  in 90% acetone at 55° or more slowly in ether undergoes a quaternization reaction giving trimethyl-chloromethyl-ammonium chloride (constants not detd.) (162).]

Ⓐ Beilstein test for halogen. Note that because of its low b.p.  $\check{C}$  often appears to fail in Beilstein copper gauze test for halogen compds.; in such cases use the modification described by (163) (164)

Ⓑ Hydrolysis to formaldehyde.  $\check{C}$  (2 g.) in 10% MeOH/alk. (20 ml.) boiled 20 min. under good reflux, subsequently acidified with dil.  $H_2SO_4$ , gives soln. containg.  $Cl^-$  and formaldehyde (1:0145).

Ⓒ Color reaction with  $\alpha$ -naphthol/cyclohexanol.  $\check{C}$  (1 drop) with 2 ml. of a 2% soln. of  $\alpha$ -naphthol (1:1500) in cyclohexanol (1:6415) + 1 pellet of solid NaOH, boiled 25 seconds and cooled, gives (72) blue color; one portion of this blue soln. underlaid with equal volume 85%  $H_2SO_4$ , stood 1 minute and shaken, turns green-blue; a second portion of the alkaline blue soln. acidified with equal volume of AcOH (1:1010) stood 1 minute and shaken becomes yellow. [Note that the alkaline boiling also gives a blue color with  $CHCl_3$  (3:5050) and with  $CCl_4$  (3:5100) while other chlorinated solvents (72) give yellow-brown, gray, or brown; in the  $H_2SO_4$  acidification both  $CHCl_3$  and  $CCl_4$  give blue rather than green-blue; in the AcOH acidification  $CHCl_3$  gives an orange-yellow,  $CCl_4$  a red color]

Ⓓ Color test with 2,7-dihydroxynaphthalene/cyclohexanol.  $\check{C}$  (1 drop) with 2 ml. pure cyclohexanol (1:6415) + 1 pellet NaOH + a few mgms. 2,7-dihydroxynaphthalene htd. at 197° (b.p. of ethylene glycol) for 45 seconds, decanted from undissolved NaOH, cooled, and shaken with 2 ml. AcOH + 4 ml. 96% EtOH, gives steel-blue color (73) [Note that under these conditions  $CHCl_3$  (3:5050) gives a deep-red color while  $CCl_4$  (3:5100) gives a pale yellow brown.]

Ⓔ Color test with cyclopentanol.  $\check{C}$  (1 drop) in cyclopentanol (1 ml.) with 1 pellet NaOH boiled 25 seconds, then shaken vigorously for 35 seconds, gives deep red color; upon addition of 4 ml. 96% EtOH and shaking color intensifies or becomes reddish brown (73). [Note that after addn. of alc.  $CHCl_3$  gives only a pale citron-yellow or

yellowish brown and that as little as 20% of  $\bar{C}$  can be detected by this means in  $CHCl_3$  (73);  $CCl_4$  gives (73) after addn. of alc. an intense nut-brown.]

— Formaldehyde di- $\alpha$ -naphthylacetal (methylene di- $\alpha$ -naphthyl ether): unreported.

⑩ Formaldehyde di- $\beta$ -naphthylacetal (methylene di- $\beta$ -naphthyl ether): m.p.  $134^\circ$  (165),  $133-134^\circ$  (166). [From  $CH_2I_2$  with Na  $\beta$ -naphtholate refluxed in alc. (165) (166) (167); not actually reported from  $\bar{C}$  but presumably resulting by above method if some KI be added to refluxing mixture of  $\bar{C}$  + Na  $\beta$ -naphtholate in acetone. Note that this ether fails (165) (167) to form any  $PKOH$  addition compound.]

3:5025 1,1,3-TRICHLORO-2-METHYLPROPENE-1  $C_4H_5Cl_3$ . Beil. S.N. 11

B.P. 45-46° (1)

Note:  $\bar{C}$  readily undergoes allyl transposition so that in reactions of  $\bar{C}$  products derived from the isomeric 1,1,1-trichloro-2-methylpropene-2 (3:5605) may be expected (1) (2) (3) [For prepn. of  $\bar{C}$  (57% yield (1)) from  $\beta,\beta,\beta$ -trichloro-*ter*-butyl alc. ("Chloretone") (3:2662) by hgt. to 200° with  $P_2O_5$  and dimethylaniline see (1).] [A 15% yield of the isomeric 1,1,1-trichloro-2-methylpropene-2 (3:5605) together with some  $\alpha$ -chloroisobutyric acid (3:0235) are separated from  $\bar{C}$  by redistillation (1).]

$\bar{C}$  on hydrolysis by boilg. 2 days with AgOH at 100° under pressure gives (22% yield (2)) 3,3-dichloro-2-methylpropen-2-ol-1, b.p. 78-79°,  $D_{20}^{20} = 1.298$ ,  $n_{20}^{20} = 1.493$ . [The corres. ether, b.p. 129° at 11 mm.,  $D_{20}^{20} = 1.330$ ,  $n_{20}^{20} = 1.5108$ , is also formed in 22%

yield (2). The alc. may be characterized by its *p*-nitrobenzoate, m.p. 91°, or its *N*-phenylcarbamate, m.p. 64° (2).

$\bar{C}$  on htg. with NaOAc + AcOH gives (2) 3,3-dichloro-2-methylpropen-2-yl acetate, b.p. 79° at 12 mm.,  $D_4^{20} = 1.257$ ,  $n_D^{20} = 1.4718$  (2). [With boilg. NaOH this ester regenerates the corresp. alc. (2).]

$\bar{C}$  with NaOH gives in the cold 70% yield (2) of 3,3-dichloro-2-methylpropen-2-yl ethyl ether, b.p. 56° at 12 mm.,  $D_4^{20} = 1.1285$ ,  $n_D^{20} = 1.4610$  (2).

$\bar{C}$  in  $\text{CHCl}_3$ , treated with  $\text{O}_3$ , then hydrolyzed gives  $\alpha$ -chloroacetone (3:5425), b.p. 60-62° at 50 mm. (1).

[For reactns. of  $\bar{C}$  with  $\text{CaI}_2$  and with  $\text{CH}_3\text{MgBr}$  see (2).]

④ 1,1,1,2,3-Pentachloro-2-methylpropane (3:1265): m.p. 59.5° (2). [From  $\bar{C}$  by direct treatment with  $\text{Cl}_2$  (2).]

⑤ 1,2-Dibromo-1,1,3-trichloro-2-methylpropane: m.p. 105° (2). [From  $\bar{C}$  on warming 1 day with excess  $\text{Br}_2$ , then distg. at 12 mm. (2).]

⑥ 3,3-Dichloro-2-methylpropen-2-yl *p*-nitrobenzoate: m.p. 91° (2). [From  $\bar{C}$  on boilg. with dil. alc. soln. of K *p*-nitrobenzoate (2).]

See also both *cis*-1,2-dichloroethylene (3:5042) and ordinary (mixture of *cis* and *trans*) 1,2-dichloroethylene (3:5050); the following text is restricted to studies on substantially pure *trans* isomer.

Note carefully that 1,2-dichloroethylene is not the same as ethylene (dichloride) (3:5130) (there are an almost incredible number of errors in the literature involving this point); neither is it the same as the now very important 1,1-dichloroethylene (vinylidene) (dichloride) (3:5041).

#### GENERAL DATA ON $\bar{C}$

Note that substantially pure  $\bar{C}$  is covered solvent in U.S.A. under designation "Dx 48" (referring to the two chlorine atoms and the h.p.l. [For study of thermal conductivity and for tabulation of constants of normal  $\bar{C}$  see (14) — For toxicity of  $\bar{C}$  see (26) (15) — For use of  $\bar{C}$  in extraction of caffeine from coffee see (16)]).

3:5030 1,2-DICHLOROETHYLENE } ord.  
(Acetylene dichloride) } mixt.

The text under this heading refers to the ordinary mixt. of the two individual stereoisomeric forms, viz., *cis*-1,2-dichloroethylene (3:5042) and *trans*-1,2-dichloroethylene (3:5028). Since the proportion of the two stereoisomers differs according to conditions and previous treatment no definite physical constants can be given, and those for each pure stereoisomer should be consulted.

Note carefully that 1,2-dichloroethylene is *not* the same as ethylene (di)chloride (3:5130) (there are an almost incredible number of errors in the literature involving this point); neither is it the same as 1,1-dichloroethylene (vinylidene (di)chloride) (3:5005).

Furthermore note that some confusion exists in the literature on the relationship between the two isomers; the high-boilg. stereoisomer (3:5042) is now definitely regarded as the *cis* form and the lower-boilg. stereoisomer (3:5028) as the *trans*; however, some records (including "International Critical Tables") have inverted these designations.

### PHYSICAL DATA ON $\bar{\text{C}}$

**General.** Ordinary comml.  $\bar{\text{C}}$  consists of a mixt. of the two stereoisomers; by careful fractional distn. the two stereoisomers can be separated (for references see text of the two pure stereoisomers). — An equilibrium mixt. contg. about 20% of the lower-boilg. (*trans*) (3:5028) and 80% of the higher-boilg. (*cis*) (3:5042) forms can be obt'd. from either by treatment at ord. temp. in sunlight with 1-2%  $\text{Br}_2$  (for data on thermal isomerization see text of both individual stereoisomers). — Note also that the two pure stereoisomers (q.v.) form a eutectic, f.p.  $-91^\circ$ , contg. about 29% *trans* + 71% *cis* forms.

**Solubility relationships of  $\bar{\text{C}}$ .** Soly. of  $\bar{\text{C}}$  in aq. is 0.8 ml. per 100 ml. aq. at ord. temp. (1). — [For soly. of  $\text{I}_2$  in  $\bar{\text{C}}$  over range  $11-25^\circ$  (2) and use of such solns. in detn.  $\text{I}_2$  number of oils and fats (3) (4) see indic. refs. — For solv. power of  $\bar{\text{C}}$  for various org. cpds. see (5) (6).]

**Inflammability of  $\bar{\text{C}}$ .**  $\bar{\text{C}}$  with air forms explosive mixt. in range contg. 3.3-15.3%  $\bar{\text{C}}$  (7); 9.7-12.8%  $\bar{\text{C}}$  (8). [For studies of influence of vapors of  $\bar{\text{C}}$  on mixts. of air with  $\text{CH}_4$  (8), acetylene (10), CO (10) (12), or  $\text{H}_2$  (10) see indic. refs.]

**Miscellaneous data.** [Ebullioscopic const. of  $\bar{\text{C}}$  (for 1 mole solute in 100 g.  $\bar{\text{C}}$ ) = 29.6 (14).]

### USES OF $\bar{\text{C}}$

[For use of  $\bar{\text{C}}$  as solv. for fats and oils (15), as refrigerating liquids (16) (17) (18) (19) (20) (21), for extraction of caffeine from coffee (22), for dehydration (concentration) of propionic acid from aq. solns. (23), for sepn. of *o*- and *p*-isomers of various phenols (24), in dewaxing of mineral lubricating oils (25), for pretreatment in dyeing of cellulose esters and ethers (26) see indic. refs.]

### PHYSIOLOGICAL BEHAVIOR OF $\bar{\text{C}}$

$\bar{\text{C}}$  acts as an anesthetic and narcotic, but full treatment of this aspect is beyond the scope of this work; for lead references, however, see below.

**Toxicity of  $\bar{\text{C}}$ .** [For studies on toxicity of  $\bar{\text{C}}$  see (27) (28) (29) (30) (31); for studies of narcotic action (31) (33) (34) (35) (36) see indic. refs.]

Antiseptic and disinfectant props. of  $\bar{C}$ . [For studies of  $\bar{C}$  from this viewpoint see (37) (38) (1).]

### DETERMINATION OF $\bar{C}$

$\bar{C}$  is detd. by conversion of its halogen by pyrolytic or by chem. means completely to chloride ion followed by either volumetric or gravimetric detn. of the latter.

[For detn. of  $\bar{C}$  by methods involving pyrolytic decompn. of  $\bar{C}$  see (39) (40) cf. (41).]

[For detn. of  $\bar{C}$  by methods involving decompn. of  $\bar{C}$  with Na + ethanolamine in dioxane see (42) cf. (43).]

[For detn. of  $\bar{C}$  by means of  $HgSO_4$  catalyzed addn. of  $Br_2$  (from bromide/bromate soln.) to its unsatd. linkage see (44).]

### PREPARATION OF $\bar{C}$

From various polychloroethanes. From 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750). [For prepn. of  $\bar{C}$  from acetylene tetrachloride by removal of 2 chlorine atoms with  $H_2$  over Ni at 300–320° (45), with Fe or Al + aq. (46) (47) or Zn + aq. (47) (48), with acetylene over hydrogenating cat. (such as Ni) on activated carbon at 350° (49) preferably in pres. of aq. vapor (50), or by electrolytic reduction in pres. of  $ZnCl_2$  (51) cf. (52) see indic. refs. — Note that  $\bar{C}$  is also one of the prods. of pyrolysis of acetylene tetrachloride over pumice at 700° (53).]

From 1,1,1,2-tetrachloroethane (3:5555). [For prepn. of  $\bar{C}$  from unsym.-tetrachloroethane with acetylene over hydrogenating cat. (such as Ni) on activated carbon at 350° (49) preferably in pres. of aq. vapor (50) see indic. refs.; note that mechanism yielding this result is unknown.]

From 1,1,2-trichloroethane (3:5330). [For prepn. of  $\bar{C}$  from 1,1,2-trichloroethane (by loss of HCl) over  $CuCl_2$  on pumice at 400° (54) or with MeOH over  $Al_2O_3$  at 290° (MeCl (3:7005) is also formed) (55) see indic. refs.]

From 1,2-dichloroethane (3:5130). [For formn. of  $\bar{C}$  (22% yield) together with other prods. from ethylene (di)chloride with  $Cl_2$  in pres. of  $AlCl_3/NaCl/FeCl_3$  at 400–480° see (56).]

From various mixed-halogenated ethanes. [For formn. of  $\bar{C}$  from 1,2-dibromo-1,2-dichloroethane (Beil. 1-93, I<sub>1</sub>-(29), I<sub>2</sub>-(64)) by removal of 2 Br with Zn in alc. (57) or with  $H_2$  over Ni at 300–320° (45) see indic. refs.; from 2-bromo-1,1,2-trichloroethane (by elimination of Br-Cl) with Zn dust in boilg. alc. (58) (59) or from 2-iodo-1,1,2-trichloroethane on distn. at atm. press. (60) see indic. refs.]

From acetylene. With chlorine. [Starting from acetylene the addition of 1 mole of  $Cl_2$  yields  $\bar{C}$  to which further addn. of  $Cl_2$  gives 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750), for this reason most of the processes for prepn. of the latter cpd. by this method yield (or may be made to yield)  $\bar{C}$  as a by-product. Since the patents on the addn. of chlorine to acetylene have been extensively cited under the text of 1,1,2,2-tetrachloroethane (3:5750) (prepn. from acetylene), refer to that compound; however, see also (61) (62) (63).]

With other reagents. [For formn. of  $\bar{C}$  from acetylene with  $SbCl_3$  (64) (65) cf. (57), with  $SbCl_3$  +  $SbCl_5$  (66), or with aq. ICl soln. (57), see indic. refs.]

### CHEMICAL BEHAVIOR OF $\bar{C}$

Pyrolysis of  $\bar{C}$ . [ $\bar{C}$  in s.t. at 360° for 10 hrs. is completely decomposed (64) into carbon + HCl.] (See also above under detn. of  $\bar{C}$ .)

Oxidation of  $\bar{C}$ . [ $\bar{C}$  with  $O_2$  in pres. of suitable cat. (e.g.,  $Br_2$  or  $H_2SO_4$ ) gives (67)

chloroacetyl chloride (3:5235). —  $\bar{C}$  with  $O_2 + N_2$  in ultra-violet light evolves HCl but yields (68) only resinous (perhaps polymerization) products.]

[For study of rate of reactn. of  $\bar{C}$  (in AcOH) with  $O_3$  see (69).]

[Note that  $\bar{C}$  with  $NH_3 +$  air over Pt/Rh cat. at 820–850° gives (70) HCN.]

[ $\bar{C}$  with air over (strongly chlorinated) CuO at 450° gives (76) much phosgene (3:5000).]

Stabilization of  $\bar{C}$ . [For stabilization of  $\bar{C}$  by addn. of small amts. of alc.  $NH_3$  (71), with  $Et_3N$  (72), or with various phenols, amines, and aminophenols (73), see indic. refs.] (See also under corresp. subtopic of 1,1,2-trichloroethylene (3:5170).)

Polymerization of  $\bar{C}$ . [ $\bar{C}$  in the pres. of dibenzoyl peroxide (or other org. peroxides) on htg. under press. reacts with itself yielding mainly (74) a dimer, viz., 1,3,4,4-tetrachlorohutene-1 (3:9058), accompanied by other prods.]

[For study of influence of radiation of 1980–1860 Å (from Al aro) and accompanying polymerization see (75).]

Reaction with halogens. *Behavior of  $\bar{C}$  with  $Cl_2$* . [ $\bar{C}$  adds 1 mole  $Cl_2$  giving (69% yield (58)) 1,1,2,2-tetrachloroethane (3:5750); for study of this reactn. in light of 4360 Å see (77).] (See also under the individual *cis*- (3:5042) and *trans*- (3:5028) stereoisomers)

*Behavior with  $Br_2$* . [ $\bar{C}$  adds 1 mole  $Br_2$  giving (60) (57) 1,2-dibromo-1,2-dichloroethane [Beil. I-93, I<sub>1</sub>-(29), I<sub>2</sub>-(64)], h.p. 195° at 760 mm. (78) (59), h.p. 79.0–79.5° at 15 mm. (79); for study of photochem. addn. of  $Br_2$  in gas phase (80) (81) and in  $CCl_4$  soln. (81) (82) in sunlight (83) (84) see indic. refs.]

*Behavior with  $ICl$* . [ $\bar{C}$  in  $CHCl_3$  adds  $ICl$  in sunlight yielding (60) 2-iodo-1,1,2-trichloroethane, b.p. 77° at 0 mm.,  $D_4^{15} = 2.2760$  (60).]

. Reaction with halogen hydrides. *Reaction with  $HCl$* . [ $\bar{C}$  in the absence of cat. does not add dry  $HCl$ ;  $\bar{C}$  with dry  $HCl$  in the pres. of small amts.  $AlCl_3$  at 30–40° gives (87% yield (86)) (85) (104) 1,1,2-trichloroethane (3:5330) accompanied (85) by 1,1,2,3,4-pentachlorobutane (3:0750); this latter prod. and doubtless various others appear to be formed in the pres. of the  $AlCl_3$  by various condensations among the various organic materials (see below).]

Reaction with  $H_2SO_4$ . [ $\bar{C}$  is only slightly attacked at 20° by either 85% or 96%  $H_2SO_4$  and no polymerization occurs (87); on running the  $H_2SO_4$  layer into 10 vols. of cold aq. qual. evidence of formn. of chloroacetaldehyde (3:7212) was obt'd. (87). —  $\bar{C}$  with conc.  $H_2SO_4$  is unchanged up to 120° but at higher temps. carbonizes without evidence of formn. of chloroacetaldehyde (88).]

[However,  $\bar{C}$  with fuming  $H_2SO_4$  (50%  $SO_3$ ) or  $\bar{C}$  with  $SO_3$  followed by aq. gives (88) (89) chloroacetaldehydesulfonic acid from which htg. with 80%  $H_2SO_4$  gives (88) (89) chloroacetaldehyde (3:7212).]

*Behavior with alkali*. [ $\bar{C}$  with alc. KOH (90) (91) loses 1 HCl yielding chloroacetylene (3:7000); this prod. sometimes (92) (93) causes spontaneous ignition of the system especially when its alc. soln. comes in contact with air in cleaning the reaction flask (91).] (See also under the individual *cis*- (3:5042) and *trans*- (3:5028) stereoisomers.)

[Note that  $\bar{C}$  with alc. NaSH does not react even after 6 hrs. reflux. (92).]

*Behavior with  $NH_3$* . [ $\bar{C}$  with liq.  $NH_3$  under high press. reacts only very slightly although a small amt. of chloroacetylene (3:7000) (from loss of HCl) is formed (94).]

*Behavior with metals*. [For study of corrosion of common metals by  $\bar{C}$  see (5).]

*Behavior with other inorganic reactants*. [ $\bar{C}$  with liq. nitryl chloride ( $ClNO_2$ ) in s.t. at 100° for 3 hrs. gives by addn. to unsat'd. linkage (67% yield (95)) 2-nitro-1,1,2-trichloroethane, pale yel. oil, h.p. 63° at 13 mm. —  $\bar{C}$  cautiously added to 4 vols. of a mixt. of conc. + fmg.  $HNO_3$  and warmed gives (96) a small amt. of nitro-trichloromethane (chloropierin). —  $\bar{C}$  with liq.  $N_2O_4$  at ord. temp. for 24 hrs. in an unsealed tube (use of sealed tube leads to serious explosions) reacts (96) to give a little oxalic acid dihydrate (1:0445) together with an unidentified lachrymatory oil.]

## BEHAVIOR WITH ORGANIC REACTANTS

With hydrocarbons.  $\bar{C}$  (1 mole) with cyclopentadiene (1 mole) (1:8030) in s.t. at 180–190° for 15 hrs. yields (97) two Diels-Alder type adducts. — For reactn. of  $\bar{C}$  with  $C_6H_6$  + Al/Hg see under individual *cis*- (3:5042) and *trans*- (3:5028) stereoisomers]

With other chlorinated hydrocarbons. (For reaction of  $\bar{C}$  with itself see above under polymerization.)

With methylene (di)chloride (3:5020).  $\bar{C}$  (1 wt. pt.) with  $CH_2Cl_2$  (3 wt. pts.) +  $AlCl_3$  (0.3 wt. pt.) at 40° for 8 hrs. gives (24% yield (98)) 1,1,2,3-tetrachloropropane (3:6035)].

With chloroform (3:5050).  $\bar{C}$  (1 wt. pt.) with  $CHCl_3$  (3 wt. pts.) +  $AlCl_3$  (0.25 wt. pt.) stirred with sand for 20 hrs. at 30° (99) cf. (100) (101) (102) gives (yields: 63% (99), 70–75% at 50° (100), 46% at 17° in 22 hrs. (100)) 1,1,2,3,3-pentachloropropane (3:6280)]

With carbon tetrachloride (3:5100).  $\bar{C}$  with  $CCl_4$  +  $AlCl_3$  gives (101) (102) cf. (103) 1,1,1,2,3,3-hexachloropropane (3:6460); for reactn. of this system yielding heptachloropentenes see (103)]

With 1,1,2-trichloroethane (3:5330).  $\bar{C}$  with 1,1,2-trichloroethane +  $AlCl_3$  (1%) at 35–40° for 5 days gives (104) two diastereoisomeric 1,1,2,3,4-pentachlorobutanes, viz., liq. (3:9068) and solid (3:0750).]

With 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750).  $\bar{C}$  with acetylene tetrachloride +  $AlCl_3$  gives a mixt. from which can be isolated only (104) solid 1,1,2,3,4-pentachlorobutane (3:0750).]

With 1,1,1,2-tetrachloroethane (3:5555).  $\bar{C}$  with unsym.-tetrachloroethane +  $AlCl_3$  at 40° for 10 days gives (104) 1,1,1,4,4-pentachlorobutene-2 (3:9054).]

With pentachloroethane (3:5880).  $\bar{C}$  with pentachloroethane +  $AlCl_3$  at 40° for 12 days presumably first forms both 1,1,2,2,3,4,4-heptachlorobutane (3:9056) and 1,1,1,2,3,4,4-heptachlorobutane, but the latter loses HCl and by further reaction and/or resinification is lost in the accompanying resins (104); the HCl thus split out adds (in the pres. of  $AlCl_3$ ) to  $\bar{C}$  yielding 1,1,2-trichloroethane which then condenses with more  $\bar{C}$  as stated above (104).]

With hexachloropropene (3:6370).  $\bar{C}$  with hexachloropropene +  $AlCl_3$  in  $CH_2Cl_2$  soln. yields (105) a single 1,1,2,2,3,3,4,5,5-octachloropentene-1, b.p. 145–147° at 11 mm., 113–113.5° at 2 mm.,  $D_4^{25} = 1.749$ ,  $n_D^{25} = 1.5607$  (105). This prod. with conc.  $H_2SO_4$  gives (80% yield (105)) a mixt. of pentachlorobutenecarboxylic acids (105).]

Behavior with organic OH or SH derivs.  $\bar{C}$  (1 mole) with  $C_2H_5SH$  (2 moles) in alc. KOH (2.6 moles) refluxed  $\frac{1}{2}$  hr. gives (yield not stated (106)) 1,2-bis-(ethylthio)ethylene, b.p. 176° at 13 mm.]

$\bar{C}$  (1 mole) with benzyl mercaptan (2 moles) in alc. KOH refluxed 7 hrs. gives (yield not stated (106)) 1,2-bis-(benzylthio)ethylene, white ndls. from alc. or AcOH, m.p. 61°; this prod. in  $CS_2$  adds 1  $Br_2$  giving 1,2-dibromo-1,2-bis-(benzylthio)ethane, ndls. from ether, m.p. 73–74°.]

$\bar{C}$  (1 mole) with thiophenol (2 moles) in alc. NaOEt (2 moles) refluxed 24 hrs., poured into aq., gives (yield not stated (108)) 1,2-bis-(phenylthio)ethylene, b.p. 235–242° nt 760 mm., pl. from lt. pet., m.p. 62°.]

$\bar{C}$  (1 mole) with *p*-tolylmercaptan (2 moles) in 7% alc. KOH refluxed 3 hrs. gives (90% yield (107)) 1,2-bis-(*p*-tolylthio)ethylene, ndls. from alc., m.p. 93°; this prod. in  $CHCl_3$  adds 1 mole  $Br_2$  giving (100% yield) 1,2-dibromo-1,2-bis-(*p*-tolylthio)ethane, cryst. from pet. ether, m.p. 72° (107).]

[For analogous reactn. with  $\bar{C}$  of *o*-nitrothiophenol or *p*-nitrothiophenol see (106).]

$\bar{C}$  (1 mole) with an alk. salt of thiosalicylic acid (*o*-mercaptobenzoic acid) reacts similarly giving (109) (110) cf. (111) (112) 1,2-bis-(*o*-carboxyphenylthio)ethylene ("S,S'-vinylene-

bis-thiosalicylic acid") [Beil. X-128, X<sub>1</sub>-(55)]; this prod. with KOH/NaOH at 220-230° gives (113) 3-hydroxythionaphthene (thioindoxyl) [Beil. XV11-110, XV11<sub>1</sub>-(60)], or by actn. of acid condensing agents (e.g., fuming H<sub>2</sub>SO<sub>4</sub>, ClSO<sub>3</sub>H, etc.) yields (114) the important dyestuff thioindigo [Beil. XIX-177, XIX<sub>1</sub>-(600)]. — Note that the corresp. condens. of  $\bar{C}$  with salicylic acid (*o*-hydroxybenzoic acid) or with anthranilic acid (*o*-aminobenzoic acid) cannot be effected (112).]

Behavior with other misc. organic reactants. [ $\bar{C}$  with paraformaldehyde (1:0080) + cone. H<sub>2</sub>SO<sub>4</sub> gives (115) a resin (cf. behavior of 1,1,2-trichloroethylene (3:5170)).]

[ $\bar{C}$  (1 mole) with EtMgBr (2 moles) yields (110) C<sub>2</sub>H<sub>6</sub> + BrMgC≡C—MgBr + MgCl<sub>2</sub>.]

[ $\bar{C}$  does not (117) react with acetyl iodide even after 150 days at 25°.]

### COLOR TESTS FOR $\bar{C}$

② Color test with  $\alpha$ -naphthol/cyclohexanol.  $\bar{C}$  (1 drop) with 2 ml. of a 2% soln. of  $\alpha$ -naphthol (1:1500) in cyclohexanol (1:6415) + 2 pellets solid NaOH boiled 25 seconds, cooled, gives after acidification with AcOH or 85% H<sub>2</sub>SO<sub>4</sub>, stdg. 1 min., and shaking a violet or red-violet color (118). — [Note that under these conditions the responso given by methylene (di)chloride (3:5020) is green-blue; by both ClICH<sub>2</sub> (3:5050) and CCl<sub>4</sub> (3:5100) is intense blue; by 1,2-dichloroethane (ethylene dichloride) (3:5130) is colorless to pale green; by 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) is intense green-blue; by pentachloroethane (3:5880) is gray-green; by 1,1,2-trichloroethylene (3:5170) is intense green-blue; and by tetrachloroethylene (3:5460) is green (118).]

— Mercury bis-(chloroacetylde) Hg(—C≡C—Cl)<sub>2</sub>. Shining white pl. from hot CHCl<sub>3</sub>; although reported to melt at 185° (110) (120) (121) has also been found (122) to explode with great violence well below that temperature, i.e., 174-175° (122). [From  $\bar{C}$  with aq. Hg(CN)<sub>2</sub> + KOH on shaking at room temp. (01) (123) for 48 hrs. (119), or from  $\bar{C}$  in alc. run into a stirred aq. soln. of HgCl<sub>2</sub> + NaCN + KOH (120), or from  $\bar{C}$  shaken with an aq. soln. of HgO + NaCN + NaOH (122). — Note, however, that in fact this prod. results only from the higher-boilg. (*cis*) stereoisomer of  $\bar{C}$  (3:5042) and that the lower-boilg. (*trans*) stereoisomer (3:5028) reacts much more slowly and quite differently to yield mercury bis-( $\alpha,\beta$ -dichloroethylenide), m.p. 50.3° (122). — Note further that by the above treatment 1,1,2-trichloroethylene (3:5170) gives mercury bis-(trichloroethylenide), m.p. 83°, but this prod. is much more sol. in CHCl<sub>3</sub> than the analogous material from  $\bar{C}$  (for use in detect. of  $\bar{C}$  in pres. of 1,1,2-trichloroethylene see (123)).]

Liquid. — [For h.p. at various press. from 70-277 mm. see (11).] — Alm. insol. aq. [for precise data see (5) (6) (7) (11).] — [For f.p./compn. data of mixts. with 2,2-dichloropropane (3:7140) see (10).] — [For use as dry cleaning fluid see (12); for use as corrosion inhibitor for alk. on tinned metal see (13).]

$\bar{C}$  forms with EtOH (1:6130), b.p. 78.3°, a const.-boilg. mixt., b.p. 54.6°, contg. 88.5 wt. %  $\bar{C}$  (4);  $\bar{C}$  forms with isopropyl alc. (1:6135), b.p. 82.45°, a const.-boilg. mixt., b.p. 56.6°, contg. 82 wt. %  $\bar{C}$  (4);  $\bar{C}$  forms with *ter*-butyl alc. (1:6140), h.p. 82.5°, a const.-boilg. mixt., b.p. 57.1°, contg. 94 wt. %  $\bar{C}$  (14);  $\bar{C}$  forms with acetone (1:5400), b.p. 56°, a const.-boilg. mixt., b.p. 57.55°, contg. 70 wt. %  $\bar{C}$  (14);  $\bar{C}$  forms with  $\text{CS}_2$ , h.p. 46.3°

const.-boil. mixt., b.p. 44.75°, contg. about 28 wt. %  $\bar{C}$  (14). [For study of b.p.,  $D$ , and vapor-liq. equil. of binary mixts. of  $\bar{C}$  with  $\text{CHCl}_3$  (3:5050),  $\text{CCl}_4$  (3:5100), or with 1,2-dichloroethane (3:5130) see (27).]

[For soly. of aq. in  $\bar{C}$  see (29); for adsorption of  $\bar{C}$  by activated carbon at various temps. see (30).]

[For prepn of  $\bar{C}$  from acetaldehyde (1:0100) with  $\text{PCl}_5$  see (15) (16) (17); from vinyl chloride (3:7010) by catalyzed addn. of  $\text{HCl}$  see (18) (19) (20) (note that in absence of catalyst addn. of  $\text{HCl}$  to vinyl chloride is very slow (21)); for formn. of  $\bar{C}$  (22.6%) together with other products from ethane with  $\text{Cl}_2$  above 290° in pres. of ethylene see (28).]

$\bar{C}$  on passing over pumice at dark red heat yields (22) (23) vinyl chloride (3:7010) +  $\text{HCl}$ .

[For reactn. of  $\bar{C}$  +  $\text{AlCl}_3$  with 1,2-dichloroethylene (3:5030) or with trichloroethylene (3:5170) yielding polychlorobutanes see (24); for reactn. of  $\bar{C}$  with amylidene disodium see (25).]

$\bar{C}$  on htg. in s.t. at 120° with aq. alc. soln. of 2 moles  $\text{Na}$  (or  $\text{K}$ )  $\alpha$ -naphtholate yields (26) acetaldehyde di- $\alpha$ -naphthylacetal, ndls., m.p. 117° (26).

See also both *trans*-1,2-dichloroethylene (3:5028) and ordinary (mixture of *cis* and *trans*) 1,2-dichloroethylene (3:5030); the following text is restricted to studies on substantially pure *cis*-stereoisomer.

Note carefully that 1,2-dichloroethylene is *not* the same as ethylene (di)chloride (3:5130) (there are an almost incredible number of errors in the literature involving this point); neither is it the same as the now very important 1,1-dichloroethylene (vinylidene (di)chloride) (3:5005).

### GENERAL DATA ON $\bar{C}$

Note that substantially pure  $\bar{C}$  is commercial solvent in U.S.A. under designation "Di-60" (referring to the two chlorine atoms and the b.p.) [for study of thermal conductivity and for tabulation of constants of comml.  $\bar{C}$  see (18). — For toxicity of  $\bar{C}$  see (40) (23). — For use of  $\bar{C}$  in extraction of caffeine from coffee see (24)].

[For data on vap. press. of  $\bar{C}$  over temp. range 27–59.8° see (12). — For data on flammability of  $\bar{C}$  see (19). — For ebullioscopic constant of  $\bar{C}$ , viz., 34.4° (for 1 mole solute in 100 g.  $\bar{C}$ ), see (20).]

Binary systems contg.  $\bar{C}$ . (See also below under azeotropes.) — [ $\bar{C}$  + *trans*-1,2-dichloroethylene (3:5028): for use of  $n_D^{25}$  in detn. of composition of mixt. see (11); for f.p./compn. data (eutectic, f.p. –91°, contg. about 71%  $\bar{C}$ ) see (17). — For f.p./compn. data on binary systems  $\bar{C}$  + ethylene (di)chloride (3:5130),  $\bar{C}$  + 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750), or  $\bar{C}$  + ethylene (di)bromide see (17). — For study of soly. of various other *cis/trans* isomers in  $\bar{C}$  see (5).]

Quaternary systems contg.  $\bar{C}$ . [For study of system contg.  $\bar{C}$  +  $\text{CHCl}_3$  (3:5050) + trichloroethylene (3:5170) +  $\text{EtBr}$  (eutectic, f.p. –139.1°, contg. 13.8 wt. %  $\bar{C}$  + 19.7 wt. %  $\text{CHCl}_3$  + 21.6 wt. % trichloroethylene + 44.9 wt. %  $\text{EtBr}$  recommended as a non-inflammable mixt. for low-temp. cryostats) see (22); for mixt. of the above four compds. + methylene dichloride (3:5020) (similarly recommended) see (22).]

Azeotropes contg.  $\bar{C}$ . Binary azeotropes —  $\bar{C}$  with aq. forms a const.-boilg. mixt., b.p. 55.3°, contg. 96.65%  $\bar{C}$  (41) (42). —  $\bar{C}$  with  $\text{EtOH}$  (1:6130) forms a const.-boilg. mixt., b.p. 57.7° at 760 mm. (21) (41) (42), contg. 90.20%  $\bar{C}$  (41) (42) = 81.4 mole %  $\bar{C}$  (21)

Ternary azeotropes.  $\bar{C}$  with  $\text{EtOH}$  (1:6130) + aq. forms a const.-boilg. mixt., b.p. 53.8°, contg. 90.50%  $\bar{C}$  + 6.65%  $\text{EtOH}$  + 2.85% aq. (41) (42).

PREPARATION OF  $\bar{C}$ 

Pure  $\bar{C}$  is usually obtd. by careful fractional distillation at ord. press. of the mixt. of *cis* and *trans* stereoisomers comprising ord. 1,2-dichloroethylene (3:5030) [for brief comments on this mode of sepn. see (1) (2) (6) (7) (8) (9) (10) (11) (13) (15) (27)]; note that some workers (13) recommend distn. in atmosphere of  $CO_2$ . — For detn. of the % compn. of mixts. of  $\bar{C}$  with its stereoisomer by means of  $n_D^{25}$  see (11); by means of dielectric const. see (13) (27)].

[For study of possibility of sepn. of  $\bar{C}$  from its stereoisomer by differential adsorption on silica gel see (25).]

[For prepn. of  $\bar{C}$  from pure *trans* stereoisomer (3:5028) by isomerization with 6 wt. %  $Br_2$  in dark for 24 hrs. followed by subsequent fractionation of the resultant mixt. see (11).]

ISOMERIZATION OF  $\bar{C}$ 

$\bar{C}$  under the influence of heat, light, or various catalysts in part isomerizes to *trans*-1,2-dichloroethylene (3:5028). — [For study of thermal isomerization of  $\bar{C}$  in vapor phase nt 185–275° (26), up to 350° (27), up to 975° (28), in liquid phase or in various solutions (13) see indic. refs.; note that the equilibrium mixt. nt 300° conts.  $60.8 \pm 0.7\%$   $\bar{C}$ , at 350° conts.  $59.4 \pm 0.3\%$   $\bar{C}$  (27), at 975° conts.  $52.3\%$   $\bar{C}$  (28) — For study of kinetics of thermal isomerization see (29).]

[For patent on isomerization of pure  $\bar{C}$  to a mixt. contg. 18% *trans* stereoisomer by means of a small amt.  $Br_2$  at 30° or above in pres. of cat. or in vapor phase at not over 300° see (30).]

CHEMICAL BEHAVIOR OF  $\bar{C}$ 

Reactions with inorganic compds.  $\bar{C}$  (in vapor phase at 95° in light of 4360 Å (31)) with  $Cl_2$  (in absence of  $O_2$ ), or  $\bar{C}$  as liquid with  $SO_2Cl_2$  (1½ moles) in pres. of trace of dibenzoyl peroxide refluxed 3 hrs. in dark (8), adds 1 mole halogen giving (85% yield (8)) 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750).

$\bar{C}$  with  $Br_2$  in sunlight adds 1 mole halogen yielding (2) (32) 1,2-dibromo-1,2-dichloroethane [Beil. I-93, I<sub>1</sub>-(29), I<sub>2</sub>-(64)], b p. 195° at 760 mm. (3) (33), b.p. 79.0–79.5° at 15 mm. (2). — [For extensive study of influence of  $O_2$  and other factors see (32); for study of kinetics in  $CCl_4$  soln. see (2) (34) (35); note that rate of addn. of  $Br_2$  either directly or in  $CCl_4$  is half as great as for the stereoisomeric *trans* form (3:5028) but that it is increased in pres. of  $SbBr_3$  (35).]

$\bar{C}$  in the absence of  $AlCl_3$  or other cat. does not add dry  $HCl$ ; satn. of  $\bar{C}$  with dry  $HCl$  changes  $n_D^{25}$  by an amount corresp. to only 2% change in compn. (11).

[ $\bar{C}$  with alc.  $KOH$  splits out 1  $HCl$  yielding chloroacetylene (3:7000); note that this reactn. is about 20 times as fast for  $\bar{C}$  as for its *trans* stereoisomer (2) ]

$\bar{C}$  with aq.  $NaOH/Hg(CN)_2$  behaves quite differently from its *trans* stereoisomer (3:5028): on shaking at room temp. with specified concns. (16)  $\bar{C}$  begins to react within 30 min., losing 1  $HCl$  and pptg. mercuric bis-(chloroacetylde),  $Hg(-C\equiv C-Cl)_2$ ; this prod. cryst. from  $CHCl_3$  (36) (37) (38) in white shining pl. with characteristic acetylene-like odor and although alleged to melt at 185° (36) (37) has also been found to explode with great violence well below that temp., i.e., 174–175° (16).

Reactions with organic compds. [ $\bar{C}$  with  $C_6H_6 + Al/Hg$  nt 0° gives same prods. as does the ordinary (mixture) 1,2-dichloroethylene (3:5030) (presumably indicating partial isomerization of  $\bar{C}$ ); these prods. include dibenzyl, triphenylethane, tetraphenylethane, etc. (15).]

Note 2. For influence of high press. on m.p. of  $\tilde{C}$  see (33); for study of rate of solidification see (35).

Note 3. For  $D_4^I$  over range  $-61.3^\circ$  to  $+59.8^\circ$  see (59).

[For extraordinarily comprehensive reviews of the history and general chemistry of  $\tilde{C}$  see (1) (60).]

[See also methylene (di)chloride (3:5020) and carbon tetrachloride (3:5100).]

## MISCELLANEOUS PHYSICAL PROPERTIES OF $\tilde{C}$

### VARIOUS SOLUBILITY RELATIONS

With water.  $\tilde{C}$  is only very slightly sol. aq. and is eas. volat. with steam; e.g., 100 g. aq. at  $15^\circ$  dissolves 9.852 g.  $\tilde{C}$  (18); water satd. with  $\tilde{C}$  conts. at  $20^\circ$  0.8%  $\tilde{C}$  (63) cf. (64). For studies of soly. of aq. in  $\tilde{C}$  at  $9^\circ$  (65),  $20^\circ$  (63),  $25^\circ$  (65), and  $30^\circ$  (65) see indic. refs.; note that at  $20^\circ$   $\tilde{C}$  satd. with aq. conts. 99.8%  $\tilde{C}$  and has  $D_4^{20} = 1.486$  (63).

With various inorganic compounds. [For data on soly. in  $\tilde{C}$  of  $H_2$  (66),  $O_2$  (78),  $HCl$  (67) (68) (69) (79),  $HBr$  (68) (69),  $H_2S$  (67),  $NH_3$  (67),  $CO_2$  (70) (80) (81),  $N_2O$  (81), and  $NO_2$  (70) see indic. refs. — For data on soly. of  $I_2$  in  $\tilde{C}$  see (71) (72) (73) (74); for study of nature of  $I_2$  solns. in  $\tilde{C}$  see (75); for soly. of  $I_2$  in vapor of  $\tilde{C}$  see (76).]

With organic materials. [For study of absorption of vapor of  $\tilde{C}$  by kerosene see (77).]

BINARY SYSTEMS CONTAINING  $\bar{C}$ (See also azotropes containing  $\bar{C}$ )

$\bar{C}$  with various inorganic compounds.  $\bar{C}$  + *aq.*: for soly. data and diag. see (64); note that a previously described (82) hydrate of  $\bar{C}$  could not be confirmed (64). —  $\bar{C}$  +  $Cl_2$ : for f.p./compn. data and diag. (note that 4 different compounds are formed) see (34). —  $\bar{C}$  +  $Br_2$ : for f.p./compn. data and diag. see (34) (36) (note that no compds. are formed and that eutectic has m.p.  $-72^\circ$  (34) with about 86 mole %  $\bar{C}$ ).

$\bar{C}$  with org. cpds. of Order 1.  $\bar{C}$  + *n-hexane* (1:8530): for f.p./compn. data see (83); for densities over range  $-90^\circ$  to  $+60^\circ$  see (85). —  $\bar{C}$  +  $C_6H_6$  (1:7400): for f.p./compn. data and diag. see (38); for  $D_4^{25}$ /compn. and  $n_D^{25}$ /compn. data over entire range see (19); for  $D_{25}^{25}$ /compn. data see (18); for liq. vapor equil. see (19) (117) (112) (124). —  $\bar{C}$  + *toluene* (1:7405): for f.p./compn. data see (83); for data on specific gravity of system from 15–25° see (86); for study of liq.-vapor equil. see (123). —  $\bar{C}$  + *cyclohexane* (1:8405): for f.p./compn. data see (83); for  $D_4^{20}$  compn. see (47).

$\bar{C}$  + *MeOH* (1:6120): for f.p./compn. data see (37) (84); for  $D_4^{25}$ /compn. and  $n_D^{25}$ /compn. see (44). —  $\bar{C}$  + *EtOH* (1:0130): for  $D_4^{25}$ /compn. data see (45) (46). —  $\bar{C}$  + *benzyl alc.* (1:6480): for density/compn. data over entire range see (87).

$\bar{C}$  + *diethyl ether* (1:6110): for f.p./compn. data and diag. see (42) (88); for  $D_4^{20}$ /compn. see (47). —  $\bar{C}$  + *diisopropyl ether* (1:6125): for  $D_4^{20}$ /compn. see (47). —  $\bar{C}$  + *dioxane-1,4* (1:6400): for  $D_4^{20}$ /compn. see (47). —  $\bar{C}$  + *ethylene glycol dimethyl ether* (1:6141): for study of heat of mixing see (89). —  $\bar{C}$  + *tetraethylene glycol dimethyl ether*: for study of heat of mixing see (89).

$\bar{C}$  + *dimethyl carbonate* (1:3046): for  $D_4^{25}$ /compn. data see (20). —  $\bar{C}$  + *diethyl carbonate* (1:3150): for  $D_4^{25}$ /compn. data see (20).

$\bar{C}$  + *acetone* (1:5400): for f.p./compn. data see (27); for  $D_4^{20}$ /compn. (47),  $D_4^{25}$ /compn. (10) (46),  $n_D^{25}$ /compn. (19), and  $n_D^{25.4}$ /compn. (49) data see indic. refs.; for refractive index/compn. for light of various wave lengths see (52).

With org. cpds. of Order 2.  $\bar{C}$  + *nitrobenzene*: for f.p./compn. data and diag. (eutectic, f.p.  $-71.0^\circ$  conts. 81.5 wt. %  $\bar{C}$ ) see (61). —  $\bar{C}$  + *aniline*: for f.p./compn. data and diag. see (27). —  $\bar{C}$  + *N,N*-dimethylaniline: for  $D_4^{25}$ ,  $D_4^{40}$ ,  $n_D^{24.8}$ , and  $n_D^{30.5}$  over entire range of composition see (43). —  $\bar{C}$  + *quinoline*: for  $D_4^{20}$ /compn. data see (47).

With org. cpds. of Order 3.  $\bar{C}$  +  $CH_2Cl_2$  (3:5020): for f.p./compn. data and diag. (eutectic, f.p.  $-108.4^\circ$  conts. 29.5 wt. %  $\bar{C}$ ) see (39); for data on b.p.,  $D_4^{20}$ , and liq.-vapor equil. see (90). —  $\bar{C}$  +  $CCl_4$  (3:5050): for f.p./compn. data and diag. (eutectic, f.p.  $-81.4^\circ$  conts. 50.6 wt. %  $\bar{C}$  (39)) (36) (83) (91) see indic. refs.; for  $D_4^{20}$ /compn. (48) (90),  $D_{25}^{25}$ /compn. (8), b.p. and liq.-vapor equil. (90) see indic. refs. —  $\bar{C}$  + *1,1-dichloroethane* (3:5035): for b.p.,  $D_4^{20}$ , and liq.-vapor equil. see (90). —  $\bar{C}$  + *1,2-dichloroethane* (3:5130): for data on vap. press. (92) and liq.-vap. equil. (93) see indic. refs. —  $\bar{C}$  + *1,1,1-trichloroethane* (3:5058): for f.p./compn. data see (94). —  $\bar{C}$  + *1,1,2-trichloroethylene* (3:5170): for f.p./compn. data and diag. (eutectic, f.p.  $-100.2^\circ$ , conts. 31.2 wt. %  $\bar{C}$ ) see (39). —  $\bar{C}$  +  $\beta,\beta'$ -dichlorodiethyl ether (3:6025): for  $D_4^{20}$ /compn. data see (47).

With org. cpds. of higher orders.  $\bar{C}$  + *1,2-dibromoethane*: for  $D_4^{20}$ /compn. data see (47). —  $\bar{C}$  +  $CBR_4$ : for f.p./compn. data and diag. see (91). —  $\bar{C}$  +  $CHI_3$ : for vap. press. data see (95). —  $\bar{C}$  +  $CS_2$ : for f.p./compn. data see (83); for  $D_{15}^{15}$  compn. (96) or  $D_{25}^{25}$ /compn. (8) see indic. refs.; for liq.-vapor equil. data see (97).

TERNARY SYSTEMS CONTAINING  $\bar{C}$ (See also azeotropes containing  $\bar{C}$ )

$\bar{C}$  + acetone (1:5400) +  $H_2O$ : for studies of liq. equil. at 25° see (98) (99) (100) (101) (102). —  $\bar{C}$  + acetone (1:5400) +  $MeOH$  (1:6120): for ternary b.p. diag. see (103). —  $\bar{C}$  + acetone (1:5400) + diethyl ether (1:6110): for data on refraction see (104). —  $\bar{C}$  + acetone (1:5400) + diisopropyl ether (1:6125): for ternary b.p. diag. see (103).

$\bar{C}$  + acetone (1:5400) +  $C_2H_6$  (1:7400): for ternary b.p. diag. see (103) (19) (105); for refractive data see (104).

$\bar{C}$  + acetone (1:5400) +  $CH_2Cl_2$  (3:5020): for ternary b.p. diag. see (103).

$\bar{C}$  + acetic acid (1:1010) + aq.: for studies of liq. equil. at 25° see (104) (106) cf. (99). —  $\bar{C}$  + acetic acid + lubricating oil: for studies of liq. equil. at 25° see (107).

$\bar{C}$  +  $CH_2Cl_2$  (3:5020) +  $CCl_4$  (3:5100): eutectic, f.p.  $-111.4^\circ$ , conts. 27 wt. %  $\bar{C}$  + 60 wt. %  $CH_2Cl_2$  + 13 wt. %  $CCl_4$  (39).

QUATERNARY SYSTEMS CONTAINING  $\bar{C}$ 

$\bar{C}$  + acetone (1:5400) +  $AcOH$  (1:1010) + aq.: for study of liq. equil. at 25° see (100); for study of use of system in mixed solv. extraction of lubricating oils see (107) (108). —  $\bar{C}$  + trans-1,2-dichloroethylene (3:5028) + 1,1,2-trichloroethylene (3:5170) +  $C_2H_5Br$ : eutectic, f.p.  $-139.1^\circ$ , conts. 17.7 wt. %  $\bar{C}$  + 13.8 wt. % trans-1,2-dichloroethylene + 21.6 wt. % trichloroethylene + 44.9 wt. %  $C_2H_5Br$  (39).

BINARY AZEOTROPES CONTAINING  $\bar{C}$ 

$\bar{C}$  +  $H_2O$ :  $\bar{C}$  forms with aq. a const.-boilg. mixt., b.p.  $56.1^\circ$ , contg. 97.5 wt. %  $\bar{C}$  (14).

$\bar{C}$  +  $MeOH$  (1:6120):  $\bar{C}$  forms with  $MeOH$  a const.-boilg. mixt., b.p.  $53.5^\circ$  (103) (109), contg. 87.5 wt. % (103) = 65 mole % (109)  $\bar{C}$ , cf. also (110) (111) (4) (112) (113). —  $\bar{C}$  +  $EtOH$  (1:6130):  $\bar{C}$  forms with  $EtOH$  a const.-boilg. mixt., b.p.  $59.3^\circ$  at 760 mm. (111),  $59.35^\circ$  at 760 mm. (14), contg. 93.2 wt. %  $\bar{C}$  (111) cf. (14) = 84 mole %  $\bar{C}$  (111) (see also (4) (110)) of  $D_{15}^{15} = 1.4112$  (14); study of liq.-vap. equil. see (45).

alc. a const.-boilg. mixt., b.p. 60

mole %  $\bar{C}$  (111). —  $\bar{C}$  + formic acid (1:1005):  $\bar{C}$  forms with formic acid a const.-boilg. mixt., b.p.  $50.15^\circ$  at 760 mm. (115), contg. 85 wt. %  $\bar{C}$  (115). —  $\bar{C}$  + ethyl formate (1:3000):  $\bar{C}$  forms with ethyl formate a const.-boilg. mixt., b.p.  $62.8^\circ$  (116),  $62.7^\circ$  (111) at 760 mm., contg. 87 wt. %  $\bar{C}$ . —  $\bar{C}$  + methyl acetate (1:3005):  $\bar{C}$  forms with methyl acetate a const.-boilg. mixt., b.p.  $64.8^\circ$  at 760 mm. (111), contg. 77 wt. %  $\bar{C}$  (111); b.p.  $63.0^\circ$  at 726.3 mm. contg. 50 wt. %  $\bar{C}$  (117); b.p.  $62.6^\circ$  at 717.5 mm. contg. 56 wt. %  $\bar{C}$  (117); for study of constant evapn. system see (125). —  $\bar{C}$  + diisopropyl ether (1:6125):  $\bar{C}$  forms with di-

isopropyl ether a const.-boilg. mixt., b.p.  $66.5^\circ$  at 760 mm. (103). —  $\bar{C}$  + acetone b.p.  $64.3^\circ$  at 760 mm. (109) (103) wt. %  $\bar{C}$  (19) (105), 65.5 mole %  $\bar{C}$  (109); b.p.  $62.4^\circ$  at 732.0 mm. contg. 80 wt. %  $\bar{C}$  (117); b.p.  $62.25^\circ$  at 719 mm. contg. 86 wt. %  $\bar{C}$  (117) cf. also (112); b.p.  $61.95^\circ$  at 716.5 mm. contg. 85 wt. %  $\bar{C}$  (117): for studies of liq.-vapor equil. of  $\bar{C}$  + acetone see (19) (105) (117) (112), for study of vap. press. see (26) (49) (118) (119) (120) (121); for study of distn. of  $\bar{C}$  + acetone in wetted wall column see (122).

TERNARY AZEOTROPES CONTAINING  $\bar{C}$ 

$\bar{C}$  +  $EtOH$  (1:6130) + aq.:  $\bar{C}$  forms with  $EtOH$  + aq. a ternary const.-boilg. mixt., b.p.  $55.4$ – $55.5^\circ$  at 760 mm., contg. about 92.5 wt. %  $\bar{C}$  + 4.0 wt. %  $EtOH$  + 3.5 wt. % aq. (14).

indic. refs. For formn. of  $\bar{C}$  from various chlorinated ketones by action of alkali hypochlorites (haloform reaction) see (235) (236).]

From alcohols. [For concise reviews of prepn. of  $\bar{C}$  from EtOH (1:6130) by action of alkaline hypochlorite solns. see (1) (214); for formn. of  $\bar{C}$  from various other primary and secondary alcohols in similar fashion see (237).]

From miscellaneous sources. [For prepn. of  $\bar{C}$  from trichloroacetic acid (3:1150) by loss of  $CO_2$  under a wide variety of conditions see text of that compound under decarboxylation; from dichloroacetyl chloride (3:5290) on warming with  $AlCl_3$  see text of that compound; from mixtures of salts of fatty acids with inorganic chlorides by electrolysis see (238); from lignin with alkali hypochlorite see (239).]

[For prepn. of trichlorodeuteriomethane (deuteriochloroform) ( $CDCl_3$ ) from chloral deuterate +  $NaOD$  (443) or from chloral (3:5210) +  $D_2O$  +  $CaO$  (444) see indic. refs.; for rate of isotopic exchange between  $\bar{C}$  and  $D_2O$  see (445).]

### CHEMICAL BEHAVIOR OF $\bar{C}$

Pyrolysis of  $\bar{C}$ . [ $\bar{C}$  passed at red heat over asbestos (240), over Pt wire at  $1000^\circ$  (241), with 1%  $I_2$  over pumice at red heat (242) cf. (243), or in electric arc (249) undergoes decomposition, and various proportions of carbon,  $HCl$ , hexachloroethane (3:4835), hexachlorobenzene (3:4939), tetrachloroethylene (3:5460), pentachloroethane (3:6880), and other products are claimed to result.  $\bar{C}$  over htd.  $TiO_2$  gives (245)  $HCl$  +  $CO$  + hexachlorobenzene (3:4939) +  $TiCl_4$ . For other studies of pyrolysis of  $\bar{C}$  at  $368-400^\circ$  (246), at  $425^\circ$  (247), and at  $512^\circ$  (248) see indic. refs.]

Oxidation of  $\bar{C}$ .  $\bar{C}$  is readily oxidized to carbonyl chloride (phosgene) (3:5000) by air, oxygen, ozone, or chemical oxidizing agents. In view of the extremely toxic character of phosgene, and of the extensive use of  $\bar{C}$  in anesthesia, this aspect is of great importance and has been very extensively studied.

By air or oxygen. [For an extensive account of the earlier literature on the oxidation of  $\bar{C}$  in air and light see (250). Note that such oxidation is *not* effected by air in absence of light, nor by light in absence of air (251).  $\bar{C}$  with limited air in sunlight reacts according to the following equation:  $CHCl_3 + O \rightarrow COCl_2$  (3:5000) +  $HCl$  (252) but with excess air in sunlight in sense  $2CHCl_3 + 5O \rightarrow 2CO_2 + 3Cl_2 + H_2O$  (252). Note that  $\bar{C}$  + air over dry  $KOH$  gives (253) some phosgene (3:5000). For later studies on the photochemical oxidation of  $\bar{C}$  (254) in tropical sunlight (255), including search for possible intermediate peroxides (256) (257), see indic. refs. For studies on chlorine-sensitized photochem. oxidn. of  $\bar{C}$  see (258) (259) (260). For oxidn. of  $\bar{C}$  by atomic oxygen see (261). The photochem. oxidn. of  $\bar{C}$  is repressed by various inhibitors of which EtOH has been most extensively studied (262).]

By ozone. [ $\bar{C}$  dissolves ozone yielding a blue soln. in which some  $\bar{C}$  is gradually oxidized (270) (271) to phosgene; for study of  $\bar{C}$  as ozonization solvent see (24) ]

By other chemical means. [ $\bar{C}$  with  $ClSO_3H$  at  $120^\circ$  (263), with  $K_2Cr_2O_7 + H_2SO_4$  (264), or with air over  $CuO$  at  $350-550^\circ$  (265) gives phosgene (3:5000). Note, however, that  $\bar{C}$  with conc.  $H_2SO_4$  above  $200^\circ$  gives (266) (267)  $CO$  +  $CO_2$  +  $HCl$  +  $SO_2$  while  $\bar{C}$  with an equimolal mixt. of  $H_2S_2O_7 + SO_3$  at  $55-60^\circ$  as directed (268) cf. (269) reacts in sense  $CHCl_3 + H_2S_2O_7 + SO_3 \rightarrow CO + 3ClSO_3H$  with  $S_2O_8Cl_2$  (pyrosulfuryl chloride) being formed using more  $SO_3$ , and  $H_2SO_4$  using less  $SO_3$ .]

Inflammability of  $\bar{C}$ . [For studies of inflammability of  $\bar{C}$  in air, oxygen, or  $O_2/N_2O$  mixts. see (272) cf. (273).]

Reduction of  $\bar{C}$ . [ $\bar{C}$  with  $Zn$  + alc.  $HCl$  (274),  $Zn$  +  $AcOH$  (275),  $Zn$  dust + alc.  $NH_3$  (276) (277) (278),  $Al/Hg$  + aq. (275),  $Fe$  +  $AcOH$  (275), or  $Si_3H_8 + AlCl_3$  in abs. of air

(279) gives  $\text{CH}_2\text{Cl}_2$  (3:5020) or further reduction products, e.g.,  $\text{CH}_3\text{Cl}$  (3:7005) or  $\text{CH}_4$  (280);  $\bar{\text{C}}$  with conc.  $\text{HI}$  on htg. gives (281)  $\text{CH}_2\text{I}_2$  [Beil. I-71,  $\text{I}_1$ -(18),  $\text{I}_2$ -(37)];  $\bar{\text{C}}$  with atomic hydrogen gives (282)  $\text{CH}_3\text{Cl}$  (3:7005) +  $\text{HCl}$ .]

**Substitution of  $\bar{\text{C}}$ .** Note that the text of this section refers only to replacement of the single hydrogen atom of  $\text{CHCl}_3$ .

**Fluorination.** [The product of replacement of the H atom of  $\bar{\text{C}}$  by F (289), viz., trichlorofluoromethane,  $\text{CCl}_3\text{F}$  [Beil. I-64], is usually prep'd. by indirect means from sources other than  $\bar{\text{C}}$ , e.g., from  $\text{CCl}_4$  (3:5100) +  $\text{F}_2$  in pres. of As +  $\text{Br}_2$  (283). However, beyond noting a few leading articles on its physical consts., including b.p. =  $23.66^\circ$  (284),  $23.77^\circ$  (285) at 760 mm., m.p. =  $-110.48^\circ$  (284), vapor press (284) (285), liquid density (286), and  $P/V/T$  relationships (287), no complete review of  $\text{CCl}_3\text{F}$  and its relatives (cf. (288)) can be given here.]

**Chlorination.**  $\bar{\text{C}}$  on suitable chlorination yields  $\text{CCl}_4$  (3:5100). [E.g.,  $\bar{\text{C}}$  with  $\text{Cl}_2$  in sunlight (290) or u.v. light (291) (292) (293) (294), at  $260$ – $320^\circ$  (295), or in pres. of  $\text{FeCl}_3$  (296) or of aq. (297), or  $\bar{\text{C}}$  with  $\text{ICl}$  at  $165^\circ$  (298), or  $\bar{\text{C}}$  with aq.  $\text{NaOCl}$  (reaction very slow and incomplete (299)) gives  $\text{CCl}_4$  (3:5100). Note, however, that  $\bar{\text{C}}$  is *not* chlorinated with  $\text{SO}_2\text{Cl}_2$  even in presence of organic peroxides (200).]

**Bromination**  $\bar{\text{C}}$  on suitable bromination gives bromotrichloromethane. [E.g.,  $\bar{\text{C}}$  with  $\text{Br}_2$  in s.t. (301) (298) at  $225$ – $275^\circ$  for 14 hrs. as directed (302), or  $\bar{\text{C}}$  with  $\text{Br}_2$  in light of  $5460 \text{ \AA}$  (303) or  $2650 \text{ \AA}$  in pres. of  $\text{O}_2$  (304), or over carbon at  $180$ – $350^\circ$  (305), or  $\bar{\text{C}}$  with aq.  $\text{NaOBr}$  (299), gives  $\text{CCl}_3\text{Br}$  [Beil. I-67,  $\text{I}_2$ -(31)], b.p.  $105^\circ$  (302),  $104.2$ – $104.35^\circ$  at  $758.5 \text{ mm.}$  (308), m.p.  $-21^\circ$  (302). For prepn. of  $\text{CCl}_3\text{Br}$  from trichloroacetyl bromide by pyrolysis at  $400^\circ$  at ord. press. see (306); for studies of behavior of  $\text{CCl}_3\text{Br}$  with  $\text{Cl}_2$  in light (307) (308) or of its halogen-sensitized photochem. oxidn. (309) see indic. refs.]

**Iodination.** [ $\bar{\text{C}}$  with aq.  $\text{NaOI}$  (299) gives iodotrichloromethane,  $\text{CCl}_3\text{I}$  [Beil. I-71], b.p.  $142^\circ$  (299) (310); for prepn. of this prod. from  $\text{CCl}_4$  (3:5100) with  $\text{AlI}_3$  in  $\text{CS}_2$  (310) or from trichloroacetyl iodide by distn. at ord. press. (306) see indic. refs.]

**Nitration.** [ $\bar{\text{C}}$  with  $\text{HNO}_3$  in s.t. nt  $90$ – $100^\circ$  for 120 hrs. (311) or in boilg. acetyl nitrate (312) gives nitrotrichloromethane (chloropicrin) [Beil. I-76,  $\text{I}_1$ -(20),  $\text{I}_2$ -(41)], b.p.  $111$ – $112^\circ$ , but this product is usually prep'd. by other means, e.g., from calcium picrate with  $\text{Ca}(\text{OCl})_2$  (313) (314).]

**Nitrosation** [No record can be found of any reaction between chloroform and nitrous acid. However, nitrosotrichloromethane [Beil.  $\text{I}_2$ -(39)] has been obtd. indirectly from sodium trichloromethane sulfinate,  $\text{CCl}_3\text{SOONa}$ , by the action of  $\text{HNO}_3$  (315) (316). It is a dark blue liq., b.p.  $5.0$ – $5.5^\circ$  at  $70 \text{ mm}$  (315), but decomposing on distn. at ord. press. The compound is of considerable interest because on reduction with  $\text{H}_2\text{S}$  (315),  $\text{Al/Hg}$  (315),  $\text{SnCl}_2$  (316), or  $\text{SO}_2$  (316) it yields dichloroformaldoxime,  $\text{Cl}_2\text{C}=\text{NOH}$ , a chemical warfare agent with especially terrifying characteristics.]

**Hydrolysis of  $\bar{\text{C}}$ .**  $\bar{\text{C}}$  on hydrolysis gives formic acid (1:1005) in such a form that the reaction mixt. is able to reduce Fehling soln. or  $\text{NH}_4\text{OH}/\text{AgNO}_3$  even at room temp. or more rapidly on warming (dif. from  $\text{CCl}_4$  (3:5100), 1,2-dichloroethane (3:5130), 1,1,2,2-tetrachloroethane (3:5750) and hexachloroethane (3:4835)). Note that, although some CO has been detected, yet formaldehyde (1:0145) is *not* produced (317).

[ $\bar{\text{C}}$  with aq. on protracted htg. in s.t. at  $225^\circ$  gives (318)  $\text{HCOOH}$  (1:1005) +  $\text{CO}$  +

[ $\bar{\text{C}}$  is also hydrolyzed in alc. alk. solns. even more readily than  $\text{CCl}_4$  (3:5100) (321) (191); for use of this principle in estimation of  $\bar{\text{C}}$  see above under determination of  $\bar{\text{C}}$ . For study of kinetics of hydrolysis of  $\bar{\text{C}}$  with alc.  $\text{KOH}$  (325), with  $N/10 \text{ KOH}$  in 95% alc. at  $90^\circ$

(326) cf. (327), or with  $\text{Ba}(\text{OH})_2$  or  $\text{TIOH}$  in 50% alc. (328) (327) see iadic. refs. Note that  $\bar{\text{C}}$  with alc.  $\text{KOH}$  is also claimed by one worker (253) to give ethylene.]

[For further details on ability of  $\bar{\text{C}}$  to reduce Fehling soln. see (317) (329) (330).]

Behavior of  $\bar{\text{C}}$  with inorganic salts. [ $\bar{\text{C}}$  with  $\text{AlCl}_3$  gives a gummy hygroscopic addn prod. which with aq. regenerates  $\bar{\text{C}}$  (331), but  $\bar{\text{C}}$  with  $\text{AlBr}_3$  is more or less (yields: 58-90% (332), 100% (333)) converted to chromoform [Beil. I-68, I<sub>1</sub>-(16), I<sub>2</sub>-(33)], h.p. 149.55° at 760 mm. (334), m.p. 8.05° (334),  $D_4^{25} = 2.87757$  (334),  $D_4^{20} = 2.89054$  (334),  $D_4^{15} = 2.90350$  (334),  $n_D^{15} = 1.60088$  (334).]

[ $\bar{\text{C}}$  with  $\text{CaI}_2$  in s.t. at 100° is partially converted (335) to  $\text{CHI}_3$ , but  $\bar{\text{C}}$  with aq.  $\text{KI}$  even in pres. of  $\text{Cu}$  decomposes yielding (336)  $\text{CH}_4 + \text{H}_2 + \text{CO} + \text{CO}_2$ .]

[For leading reference on behavior of  $\bar{\text{C}}$  with various metal fluorides see (337).]

Behavior of  $\bar{\text{C}}$  with metals. [ $\bar{\text{C}}$  with alkali or even alkaline-earth metals undergoes explosive decompn. on htg. or even at room temp. if subjected to sufficient mechanical shock. For studies of the explosion of  $\bar{\text{C}}$  with alkali metals see (338) (339) (340); for further data on explosions of  $\bar{\text{C}}$  with  $\text{Li}$ ,  $\text{Na}$ ,  $\text{K}$ ,  $\text{Ca}$ ,  $\text{Sr}$ ,  $\text{Ba}$ , and  $\text{Mg}$ , especially with reference to sensitivity to mechanical shock, see (341).  $\bar{\text{C}}$  with molten  $\text{Na}$  at 260-370° as directed (342) gives  $\bar{\text{C}} + \text{H}_2 + \text{CH}_4$  with smaller amts. of  $\text{C}_2\text{H}_6$ ,  $\text{C}_2\text{H}_4$ , and  $\text{C}_2\text{H}_2$ ; for study of  $\bar{\text{C}}$  with  $\text{Na}$  vapor see (343).]

[For study of hazards of behavior of  $\text{CHCl}_3/\text{CCl}_4$  mixts. with  $\text{Al}$  or  $\text{Mg}$  see (344); for extensive study of corrosion of metals by  $\bar{\text{C}}$  see (345).]

[Note that  $\bar{\text{C}}$  with  $\text{Mg}$  in hollg. ether does *not* react, even in pres. of various catalysts (346).]

Behavior of  $\bar{\text{C}}$  with various organic reactants. *With carbon monoxide.* [ $\bar{\text{C}}$  with  $\text{CO} +$  water vapor above 200° in pres. of suitable cat. as directed is claimed (347) to give acetic acid (1:1010);  $\bar{\text{C}}$  with  $\text{CO} + \text{AlCl}_3$  at 150° and 900 atm. for 6 hrs. gives (21% yield (348)) dichloroacetyl chloride (3:5290).]

*With hydrocarbons.* [ $\bar{\text{C}}$  (excess) with octene-1 (1:8375) in pres. of small amts. (0.02 mole) of dihenzoyl peroxide (or diacetyl peroxide) adds to unsatd. linkage giving (349) 1,1,1-trichlorooctane; under similar conditions  $\bar{\text{C}}$  adds to one of the unsatd. linkages of diallyl (1:8045) giving 8,8,8-trichloroheptene-1. — (For other addns. of  $\bar{\text{C}}$  to unsatd. linkages see below).]

[ $\bar{\text{C}}$  with  $\text{C}_6\text{H}_6$  (excess) in pres. of  $\text{AlCl}_3$  (350) (351) (352) (353),  $\text{FeCl}_3$  (354), chromium powder (355), or  $\text{Al}$  powder (356) gives triphenylmethane (1:7220); other aromatic hydrocarbons presumably give analogous results but cannot be detailed here.]

*With saturated halohydrocarbons.* [ $\bar{\text{C}}$  (1.2 moles) with  $\text{EtBr}$  (3.8 moles) +  $\text{AlCl}_3$  (0.07 mole) on htg. as directed (357) gives  $\text{EtCl}$  (3:7015) + 90% yield  $\text{CHBr}_3$  (for physical constants see above under behavior of  $\bar{\text{C}}$  with inorganic salts ( $\text{AlBr}_3$ )). —  $\bar{\text{C}}$  (1 mole) with  $\text{MeI}$  (3 moles) +  $\text{AlCl}_3$  (0.04 mole) on similar treatment gives  $\text{MeCl}$  (3:7005) + (95% yield (357)) iodoform, m.p. 119°. —  $\bar{\text{C}}$  with  $\text{CHBr}_3$  + 5-10%  $\text{KCl}$  in pres. of moistened  $\text{AlCl}_3$  under  $\text{CO}_2$  in s.t. at 135° for 14 hrs. undergoes a redistribution reaction giving (358) 17%  $\bar{\text{C}}$  + 43%  $\text{CHCl}_2\text{Br}$  + 31%  $\text{CHClBr}_2$  + 9%  $\text{CHBr}_3$ .]

*With unsaturated halohydrocarbons.* [ $\bar{\text{C}}$  (3 wt. pts.) with ord. 1,2-dichloroethylene (3:5030) +  $\text{AlCl}_3$  (0.25 wt. pt.) stirred with sand for 20 hrs. at 30° (359) cf. (360) (361) (362) gives (yields: 63% (359), 70-75% at 50° (360), 46% at 17° in 22 hrs. (360)) 1,1,2,3,3-pentachloropropane (3:6280).]

[ $\bar{\text{C}}$  with 1,1,2-trichloroethylene (3:5170) +  $\text{AlCl}_3$  at 20° gives (361) (362) 1,1,1,2,3,3-hexachloropropane (3:6460); note that at higher temp., e.g., 50-60°, yield is greatly diminished and several other prods. (361) are formed.]

[ $\bar{\text{C}}$  (2 moles) with 1,1,2,2-tetrachloroethylene (3:5460) +  $\text{AlCl}_3$  (0.2 mole) refluxed 15-20 hrs. gives (85-93% yield (363)) (364) (365) (366) (367) (368) (369) 1,1,1,2,2,3,3-

heptachloropropane (3:0200); for study of equil. of system  $\bar{C}$  + tetrachloroethylene (3:5400) + unsym.-heptachloropropane (3:0200) see [370].]

*With unsaturated nitriles.* [ $\bar{C}$  with acrylonitrile (vinyl cyanide) in pres. of trimethylbenzyl-ammonium hydroxide at 0-5° for 24 hrs or solid KOH at 0-5° for 4 hrs. adds to unsatd. linkage giving (11-12% yield [371]) [372]  $\gamma,\gamma,\gamma$ -trichloro-*n*-butyronitrile, m.p. 41°, b.p. 214-216° at 760 mm, 90-95° at 12 mm [371] [372].]

*With alcohols or alcoholates.* [ $\bar{C}$  with MeOH over cat. at 200-350° gives [373] MeCl (3:7005),  $\bar{C}$  with EtOH under similar conditions gives [373] EtCl (3:7015).]

[ $\bar{C}$  with Na alcoholates gives the corresp. trialkyl orthoformates. E.g.,  $\bar{C}$  with NaOCH<sub>3</sub> gives [374] [375] trimethyl orthoformate (1:3087);  $\bar{C}$  with NaOC<sub>2</sub>H<sub>5</sub> gives (27-31% yield [376], 36% [377]) [374] [375] triethyl orthoformate (1:3241); orthoformate esters of higher alcs are similarly prepd cf [374] [377]. For study of behavior of  $\bar{C}$  with mixts. of sodium alcoholates see [378]; for treatise on chemistry of aliphatic orthoesters see [379].]

*With mercaptans or mercaptides* [ $\bar{C}$  with NaSCH<sub>3</sub> should yield trimethyl trithioorthoformate [Beil. II-(39)], m.p. 16° [380], b.p. 220° dec [380], 103-104° at 12 mm [381], 96° at 9 mm. [380],  $n_D^{25} = 1.5696$  [381], but this prod. has been reported only by other means, e.g., from CCl<sub>4</sub> (3:5100) with NaSCH<sub>3</sub> [381] and from anhydrous HCOOH (1:1005) with CH<sub>3</sub>SH in s.t. at ord. temp. [380].]

[ $\bar{C}$  with NaSC<sub>2</sub>H<sub>5</sub> gives [382] [383] [386] triethyl trithioorthoformate [Beil. II-95, II-(39)], b.p. 235° dec [380], 174° at 760 mm [384], 136.5° at 23 mm. [385], 133° at 21 mm. [380], 120.5-125° at 12 mm. [381], 127-128° cor. at 12 mm [387],  $D_4^{20} = 1.053$  [380],  $n_D^{25} = 1.5410$  [381], but this product is usually prepd by indirect means, e.g., from anhydrous HCOOH (1:1005) with C<sub>2</sub>H<sub>5</sub>SH in pres. of dry HCl [384] [385] or from CCl<sub>4</sub> (3:5100) with NaSC<sub>2</sub>H<sub>5</sub> [381].]

*With phenols or phenolates*  $\bar{C}$  with phenols (or with substituted phenols having at least one free ortho or para position) in presence of aq. alk. condenses with eventual introduction of the formyl radical and forma. of phenolic aldehydes (Reimer-Tiemann reaction [388]). The countless recorded examples of this reaction cannot be detailed here but the following leading references will be found useful. [For modern studies of the Reimer-Tiemann reaction see [389] [390]; for studies of influence of substituents in the phenolic component see [391] [392] [393] [394] [395]; for extension of the Reimer-Tiemann reaction to other classes such as substituted indoles [396], thiazoles [397] see indic. refs.; for application to  $\beta$ -naphthol (1:1540) giving (38-48% yield [398]) 2-hydroxy-1-naphthaldehyde, m.p. 79-80°, to  $\beta$ -tetralol (5,6,7,8-tetrahydronaphthol-2) [399] see indic. refs.; for studies on theory of Reimer-Tiemann reaction see [400] [401] [402].]

[ $\bar{C}$  with dry KOC<sub>6</sub>H<sub>5</sub> at 110° for 4 hrs. under N<sub>2</sub> gives (15% yield [403]) triphenyl orthoformate [Beil. VI-162, VI-(153)], ndls. from alc., m.p. 76-77° [404], 75° [403], 71.5° [405]; note that this prod. is also formed [405] in the Reimer-Tiemann reaction cf. [390].]

*With aldehydes or ketones.*  $\bar{C}$  with aromatic (but not aliphatic [406]) aldehydes of aq. KOH undergoes addition yielding trichloromethyl-aryl-carbinols. benzaldehyde (1:0185) + aq. KOH gives (16% yield [407]) trichloromethyl-phenyl-carbinol [Beil. VI-476, VI-(237)], m.p. 115° [408], b.p. 115° at 15 mm. [409] cf. [406] (corresp. acetate, m.p. 57° [410]) [409] cf. [406] (corresp. acetate, m.p. 97.5° [409]); analogous behavior of  $\bar{C}$  + alkali with *o*-chlorobenzaldehyde (3:6410) [411], *m*-chlorobenzaldehyde (3:6475) [412], *p*-chlorobenzaldehyde (3:0765) [413], *p*-tolualdehyde (1:0215) [412], and furfural (1:0185) [406] see indic. refs. Note that trichloromethyl-aryl-carbinols are also obtd by reaction of arom. hydrocarbons with chloral (3:5210) q.v.]

[ $\bar{C}$  with acetone (1:5400) in pres. of dry powdered KOH (0.5 mole) below 0° [414] or 2-3° [415], or KOH in alc. as directed [416], or even NaNH<sub>2</sub> [418] gives (yields: 25% [416],

23% (414) (417) (415) 1,1,1-trichloro-2-methylpropanol-2 ( $\beta,\beta,\beta$ -trichloro-*tert*-butyl alcohol = "Chloretone") (3:2662) q.v.; note that use of NaOH lowers the yield (414) and that  $\text{Ca}(\text{OH})_2$  (416),  $\text{Zn}(\text{OH})_2$  (414), or  $\text{Al}(\text{OH})_3$  (414) yields no such product; note also that the crude prod. contains some diacetone alcohol (1:6423) best removed by treatment with aq. (416) since otherwise it forms with the "Chloretone" a const.-boilg. mixt.]

$\bar{\text{C}}$  (2 moles) with ethyl methyl ketone (1:5405) in pres. of dry powdered KOH (419) or of  $\text{NaNH}_2$  (418) gives (13.5% yield (419)) by addition 1,1,1-trichloro-2-methylbutanol-2 [Beil. I- (424)], b.p. 162-165° (418), 110-113° dec. at 620 mm. (419),  $D_4^{20} = 1.2128$  (419),  $n_D^{20} = 1.4460$  (419). Note, however, that analogous addition of  $\bar{\text{C}}$  does not occur with diethyl ketone (1:5420) (420), di-*n*-propyl ketone (1:5447) (420), ethyl *n*-propyl ketone (420), methyl isobutyl ketone (1:5430) (420), or methyl phenyl ketone (acetophenone) (1:5515) (419), but will occur to a very small extent with cyclopentanone (1:5446) (421) or cyclohexanone (1:5465) (421) cf. (418).]

With amines.  $\bar{\text{C}}$  with primary amines in pres. of alc. caustic alkali condenses with loss of 3 HCl giving the corresp. isocyanides whose extremely characteristic odor has caused this general procedure to be used as a test (422) for primary amines. The reaction has, however, been very little studied in the aliphatic series.

$\bar{\text{C}}$  with  $\text{CH}_3\text{NH}_2$  + alc. NaOH should give methyl isocyanide (methyl carbylamine) [Beil. IV-56, IV- (328), IV- (561)], b.p. 59.6° at 760 mm. (423), 59-60° (424),  $D_4^{20} = 0.734$  (424),  $D_4^{20} = 0.7464$  (425),  $n_D^{20} = 1.343$  (424), but this highly explosive (425) (426) (427) substance has been reported only by other means, e.g., from MeI with dry AgCN (425) (423), CuCN (428), or  $\text{CH}_3\text{HgI}$  (429). —  $\bar{\text{C}}$  with  $\text{C}_2\text{H}_5\text{NH}_2$  + alc. NaOH gives (430) ethyl isocyanide (ethyl carbylamine) [Beil. IV-107, IV- (351), IV- (600)], b.p. 78.1° at 760 mm. (431), 78° (424),  $D_4^{20} = 0.747$  (424),  $D_4^{20} = 0.7405$  (425),  $n_D^{20} = 1.362$  (424), but this less explosive prod. (427) is usually obtd. by other means, e.g., from EtI with AgCN (425) (431), etc. —  $\bar{\text{C}}$  with *n*-BuNH<sub>2</sub> + aq. NaOH gives (only 5% yield (432)) *n*-butyl isocyanide (*n*-butyl carbylamine) which is better obtd. (40% yield (432)) from *n*-BuI + AgCN.]

$\bar{\text{C}}$  with aniline in alc. KOH (433) (435) cf. (438) or in  $\text{C}_6\text{H}_6$  +  $\text{NaNH}_2$  (436), or better in MeOH/NaOH (50% yield (434)) or powdered KOH without solvent (35-40% yield (437)) cf. (438), gives phenyl isocyanide (phenyl carbylamine) [Beil. XII-191, XII- (168)], b.p. 165-166° at ord. press. with partial polymerization (435), 78° at 40 mm. (435), 64° at 20 mm. (435),  $D_4^{25.1} = 0.9823$  (424),  $n_D^{25.1} = 1.52828$  (424). — For analogous reactions of  $\bar{\text{C}}$  with *o*-toluidine giving *o*-tolyl isocyanide [Beil. XII-788], b.p. 183-184° cor. at 753 mm. (439), with *p*-toluidine giving (440) (441) *p*-tolyl isocyanide [Beil. XII-903], b.p. 99° at 32 mm. (441), 94° at 25 mm. (434), m.p. 21° (441), 19.5° (434), with *p*-methoxyaniline (*p*-anisidine) giving *p*-methoxyphenyl isocyanide, m.p. 33° (438), 30° (434), with *o*-methoxyaniline (*o*-anisidine) giving *o*-methoxyphenyl isocyanide, b.p. 112° at 16 mm. (438), with *p*-phenylenediamine to give (442) either *p*-aminophenyl isocyanide, m.p. 74°, or *p*-phenylene diisocyanide see indic. refs. — Many other isocyanides are known but cannot be detailed here.]

Ⓐ Color reaction with  $\alpha$ -naphthol/cyclohexanol. A.  $\bar{\text{C}}$  (1 drop) with 2 ml. of a 2% soln. of  $\alpha$ -naphthol (1:1500) in cyclohexanol (1:6415) + 1 pellet of solid NaOH, boiled 25 seconds and cooled, gives (174) blue color; one portion of this blue soln. underlaid with equal vol. of 85%  $\text{H}_2\text{SO}_4$ , stood 1 minute and shaken turns intensely blue; a second portion of the alkaline blue soln. acidified with equal vol. of AcOH (1:1010) stood 1 minute and shaken becomes orange-yellow. [Note that the alkaline boiling also gives a blue color with  $\text{CH}_2\text{Cl}_2$  (3:5020) and with  $\text{CCl}_4$  (3:5100) while other chlorinated solvents (174) give yellow-brown, gray, or brown; in the  $\text{H}_2\text{SO}_4$  treatment  $\text{CH}_2\text{Cl}_2$  (3:5020) gives greenish-blue and  $\text{CCl}_4$  (3:5100) an intense blue; in the AcOH treatment  $\text{CH}_2\text{Cl}_2$  (3:5020) gives a yellow,  $\text{CCl}_4$  (3:5100) a red, color.]

B.  $\bar{C}$  (1 drop) with 2 ml. cyclohexanol (1:6415) + a few mgms.  $\alpha$ -naphthol (1:1500) + 2 ml. 20% aq. KOH boiled 15 seconds with vigorous shaking gives (175) blue color in upper layer. [Neither  $CH_2Cl_2$  (3:5020) nor  $CCl_4$  (3:5100) gives any color, and this form of the test may be used to detect as little as 1%  $\bar{C}$  in either of the other two.]

Ⓔ Color test with 2,7-dihydroxynaphthalene/cyclohexanol.  $\bar{C}$  (1 drop) with 2 ml. pure cyclohexanol (1:6415) + 1 pellet NaOH + a few mgms. 2,7-dihydroxynaphthalene htd. at 197° (b.p. of ethylene glycol) for 45 seconds, decanted from undissolved NaOH, cooled, and shaken with 2 ml. AcOH + 4 ml. 96% EtOH, gives deep red color (175). [Note that under these conditions  $CH_2Cl_2$  (3:5020) gives a steel-blue color while  $CCl_4$  (3:5100) gives pale yellow-brown color (175).]

Ⓕ Color test with cyclopentanol.  $\bar{C}$  (1 drop) in 1 ml. cyclopentanol (1:6412) + 1 pellet NaOH boiled for 25 seconds, then shaken vigorously for 35 seconds, then treated with 4 ml. 96% EtOH and shaken, gives with  $\bar{C}$  only a pale citron-yellow color (175). [Note that in this test  $CH_2Cl_2$  (3:5020) gives a deep red color which intensifies or turns reddish-brown upon addition of EtOH;  $CCl_4$  (3:5100) gives an intense brown color.]

[See also ethoxalyl chloride (3:5025).]

Colorless liq. whose vapors strongly attack respiratory passages. — Solns. of C in ether, CHCl<sub>3</sub>, or alkanes are colorless, but those in phenol, anisole, thioethers, piperonal, and dipentene are yellow (5). — Note that the presence in samples of C of phosphorous compts.

(such as might remain from the reagents used in its prepn.) increases the refractive index (4); such contaminants may be removed by treatment with  $\text{Cl}_2$  and subsequent fractionation (4) (7). —  $\bar{\text{C}}$  is stable to fuming  $\text{H}_2\text{SO}_4$ .

$\bar{\text{C}}$  is an important reagent in organic synthesis; its reactions may conveniently be classified under four main types, viz.: (A) those in which it reacts as an acid chloride (either one or both groups being involved); (B) those in which it acts like a mixture of  $\text{COCl}_2$  (3:5000) +  $\text{CO}$ ; (C) those in which it acts as a chlorinating agent; and (D) those in which it acts as a dehydrating agent. Examples of all these types will be found in the subsequent text, but naturally combinations of the distinctive types may occur simultaneously.

$\bar{\text{C}}$  is also employed in the preparation of various dyestuffs although these cannot be discussed here. [For toxicity of  $\bar{\text{C}}$  see (6); for protection of stopcocks from action of  $\bar{\text{C}}$  see (16).]

**Preparation.** [For prepn. of  $\bar{\text{C}}$  from anhydrous oxalic acid (1:0535) with  $\text{PCl}_5$  (2 moles) (yields: 70% (8), 45–50% (1)) in pres. of an inert solid or liq. diluent (9) and even in units as much as 5 times the original (10), or with  $\text{PCl}_3$  in  $\text{POCl}_3$  in stream of  $\text{Cl}_2$  (11), or with  $\text{COCl}_2$  (3:5000) in pres. of tertiary amines (14) see inde. refs.; from diethyl oxalate (1:1055) with  $\text{PCl}_5$  (poor yields) see (12) (1) (13).]

[For prepn. of  $\bar{\text{C}}$  from  $\text{COCl}_2$  (3:5000) +  $\text{CO}$ , or from  $\text{CO}$  +  $\text{Cl}_2$  over suitable cat. at 200–400° and 200 atm. press., see (15) ]

[For formn. of  $\bar{\text{C}}$  (19% yield (1)) from ethoxalyl chloride (3:5625) with  $\text{PCl}_5$  in s.t. at 170° see (1) ]

**Pyrolysis or decomposition of  $\bar{\text{C}}$ .** [ $\bar{\text{C}}$  on passing through tube at 600° (1) or on htg. at 340° for 70 hrs. in an evacuated s.t. (7) dec. quant. into  $\text{COCl}_2$  (3:5000) and  $\text{CO}$ ; note, however, that at 200°  $\bar{\text{C}}$  shows no trace of phosgene even after 18 hrs. (7) and at ordinary temp. (when protected from light and moisture) can be preserved indefinitely.]

$\bar{\text{C}}$  (1 mole) on slight warming with  $\text{AlCl}_3$  (2 moles) in  $\text{CS}_2$  dec. quant. (1) into phosgene (3:5000) +  $\text{CO}$  and may thus serve as a source of  $\text{COCl}_2$  in Friedel-Crafts reactns. (see below).

$\bar{\text{C}}$  when exposed to light of any wave length below 3800 Å slowly dec., the final prods. being  $\text{COCl}_2$  (3:5000) +  $\text{CO}$  although the initial prods. appear to include  $\text{Cl}_2$  and  $\text{CO}$  (16); this photochemical decn. plays an important part in its use as a reagent for introduction of the  $-\text{COCl}$  group (chloroformylation) (see below).

**Behavior of  $\bar{\text{C}}$  with inorganic reactants.**  $\bar{\text{C}}$  with liq. aq. or dil. aq. alk. yields quant. (1)  $\text{CO}$  +  $\text{CO}_2$  +  $\text{HCl}$ , no trace of oxalic acid (1:0445) or of its semi-acid chloride being formed; however,  $\bar{\text{C}}$  as vapor on treatment with steam does yield also some oxalic acid crystals (1).

$\bar{\text{C}}$  in ether on treatment with dry  $\text{H}_2\text{S}$  for several hrs. is unchanged, but if quinoline (2 moles) is added, vigorous reactn. occurs (1) with evolution of gaseous  $\text{CO}$  +  $\text{COS}$ .]

$\bar{\text{C}}$  on treatment with  $\text{HBr}$  gas for 12 hrs. gives (85% yield (7)) (17) (18) oxalyl (di)bromide [Beil.  $\text{II}_1$ -(236),  $\text{II}_2$ -(509)], b.p. 106° (18), 102–103° at 720 mm., 16–17° at 10 mm., f.p. –19.5° (7) (for study of thermal and photochemical decn. of this prod. see (18)). —  $\bar{\text{C}}$  with  $\text{HI}$  is reduced (7) yielding  $\text{CO}$  +  $\text{I}_2$  (cf. phosgene (3:5000)).]

$\bar{\text{C}}$  with 2  $\text{NaI}$  in dry acetone yields quant. (41)  $\text{CO}$  +  $\text{I}_2$  + 2 $\text{NaCl}$  but  $\bar{\text{C}}$  with aq.  $\text{NaI}$  does not set free iodine giving instead the usual aqueous hydrolysis with formn. of  $\text{CO}$  +  $\text{CO}_2$  + 2 $\text{HCl}$  (41).

$\bar{\text{C}}$  (2 moles) with  $\text{As}_2\text{O}_3$  (1 mole) gives (95% yield (19))  $\text{AsCl}_3$ , b.p. 130°; similarly  $\bar{\text{C}}$  with dry  $\text{CrO}_3$  refluxed 5 hrs. gives (80% yield (19)) chromyl chloride,  $\text{CrO}_2\text{Cl}_2$ , b.p. 114–116° at 745 mm.]

$\bar{\text{C}}$  in  $\text{C}_6\text{H}_6$  with  $\text{H}_2$  in pres. of  $\text{Pd/BaSO}_4$  cat. gives only gaseous products, no trace of glyoxal or glyoxylic acid being formed (20).]

1.43395 (4)

[See also ethoxalyl chloride (3:5625).]

Colorless liq. whose vapors strongly attack respiratory passages. — Solns. of  $\bar{\text{C}}$  in ether, CHCl<sub>3</sub>, or alkanes are colorless, but those in phenol, anisole, thioethers, piperonal, and dipentene are yellow (5). — Note that the presence in samples of  $\bar{\text{C}}$  of phosphorous compds.

(such as might remain from the reagents used in its preparation) increases the refractive index (4); such contaminants may be removed by treatment with  $\text{Cl}_2$  and subsequent fractionation (4) (7). —  $\bar{\text{C}}$  is stable to fuming  $\text{H}_2\text{SO}_4$ .

$\bar{\text{C}}$  is an important reagent in organic synthesis; its reactions may conveniently be classified under four main types, viz.: (A) those in which it reacts as an acid chloride (either one or both groups being involved); (B) those in which it acts like a mixture of  $\text{COCl}_2$  (3:5000) + CO; (C) those in which it acts as a chlorinating agent; and (D) those in which it acts as a dehydrating agent. Examples of all these types will be found in the subsequent text, but naturally combinations of the distinctive types may occur simultaneously.

$\bar{\text{C}}$  is also employed in the preparation of various dyestuffs although these cannot be discussed here. [For toxicity of  $\bar{\text{C}}$  see (5); for protection of stopcocks from action of  $\bar{\text{C}}$  see (16).]

Preparation. [For prepn. of  $\bar{\text{C}}$  from anhydrous oxalic acid (1:0535) with  $\text{PCl}_5$  (2 moles) (yields 70% (8), 45–50% (1)) in pres. of an inert solid or liq. diluent (9) and even in units as much as 5 times the original (10), or with  $\text{PCl}_5$  in  $\text{POCl}_3$  in stream of  $\text{Cl}_2$  (11), or with  $\text{COCl}_2$  (3:5000) in pres. of tertiary amines (14) see indic. refs.; from diethyl oxalate (1:1055) with  $\text{PCl}_5$  (poor yields) see (12) (1) (13).]

[For prepn. of  $\bar{\text{C}}$  from  $\text{COCl}_2$  (3:5000) + CO, or from CO +  $\text{Cl}_2$  over suitable cat. at 200–400° and 200 atm. press., see (15).]

[For formn. of  $\bar{\text{C}}$  (19% yield (1)) from ethoxalyl chloride (3:5625) with  $\text{PCl}_5$  in s.t. at 170° see (1).]

Pyrolysis or decomposition of  $\bar{\text{C}}$ . [ $\bar{\text{C}}$  on passing through tube at 600° (1) or on h.t. at 340° for 70 hrs. in an evacuated s.t. (7) dec. quant. into  $\text{COCl}_2$  (3:5000) and CO; note, however, that at 200°  $\bar{\text{C}}$  shows no trace of phosgene even after 18 hrs. (7) and at ordinary temp. (when protected from light and moisture) can be preserved indefinitely.]

$\bar{\text{C}}$  (1 mole) on slight warming with  $\text{AlCl}_3$  (2 moles) in  $\text{CS}_2$  dec. quant. (1) into phosgene (3:5000) + CO and may thus serve as a source of  $\text{COCl}_2$  in Friedel-Crafts reactns. (see below).

$\bar{\text{C}}$  when exposed to light of any wave length below 3500 Å slowly dec., the final prods. being  $\text{COCl}_2$  (3:5000) + CO although the initial prods. appear to include  $\text{Cl}_2$  and CO (16); this photochemical decn. plays an important part in its use as a reagent for introduction of the —CO.Cl group (chloroformylation) (see below).

Behavior of  $\bar{\text{C}}$  with inorganic reactants.  $\bar{\text{C}}$  with liq. aq. or dil. aq. alk. yields quant. (1) CO +  $\text{CO}_2$  + HCl, no trace of oxalic acid (1:0445) or of its semi-acid chloride being formed; however,  $\bar{\text{C}}$  as vapor on treatment with steam does yield also some oxalic acid crystals (1).

[ $\bar{\text{C}}$  in ether on treatment with dry  $\text{H}_2\text{S}$  for several hrs. is unchanged, but if quinoline (2 moles) is added, vigorous reactn. occurs (1) with evolution of gaseous CO + COS.]

[ $\bar{\text{C}}$  on treatment with HBr gas for 12 hrs. gives (85% yield (7)) (17) (18) oxalyl (di)bromide [Beil. II<sub>1</sub>-(236), II<sub>2</sub>-(509)], b.p. 106° (18), 102–103° at 720 mm., 16–17° at 10 mm., f.p. –19.5° (7) (for study of thermal and photochemical decn. of this prod. see (18)). —  $\bar{\text{C}}$  with  $\text{HI}$  is reduced (7) yielding CO +  $\text{I}_2$  (cf. phosgene (3:5000)).]

$\bar{\text{C}}$  with 2 NaI in dry acetone yields quant. (41) CO +  $\text{I}_2$  + 2NaCl but  $\bar{\text{C}}$  with aq. NaI does not set free iodine giving instead the usual aqueous hydrolysis with formn. of CO +  $\text{CO}_2$  + 2HCl (41).

[ $\bar{\text{C}}$  (2 moles) with  $\text{As}_2\text{O}_3$  (1 mole) gives (95% yield (19))  $\text{AsCl}_3$ , b.p. 130°; similarly  $\bar{\text{C}}$  with dry  $\text{CrO}_3$  refluxed 5 hrs. gives (80% yield (19)) chromyl chloride,  $\text{CrO}_2\text{Cl}_2$ , b.p. 114–116° at 748 mm.]

[ $\bar{\text{C}}$  in  $\text{C}_6\text{H}_6$  with  $\text{I}_2$  in pres. of Pd/ $\text{BaSO}_4$  cat. gives only gaseous products, no trace of glyoxal or glyoxylic acid being formed (20).]

$\bar{C}$  in  $C_6H_6$  with  $NH_3$  gas in cold reacts vigorously yielding (21) oxalic acid diamide (oxamide) [Beil. II-545, II<sub>1</sub>-(237), II<sub>2</sub>-(509)], m.p. above  $400^\circ$  (and therefore useless as derivative for identification), +  $NH_4Cl$ . —  $\bar{C}$  with hydrazine hydrate (excess) presumably yields oxalic acid dihydrazide ("oxalhydrazide") [Beil. II-559, II<sub>1</sub>-(243), II<sub>2</sub>-(514)], m.p.  $244^\circ$  dec., although this method of prepn. seems to be unreported.

[ $\bar{C}$  with K/Na alloy is (like many halogen compds.) sensitive to detonation by mechanical shock (GREAT DANGER) cf. (22). — For behavior of  $\bar{C}$  with other metals see (7).]

Behavior of  $\bar{C}$  with organic reactants. Reaction of  $\bar{C}$  with alkanes and cycloalkanes. [ $\bar{C}$  with satd. aliphatic hydrocarbons and with cycloparaffins in pres. of light and peroxides reacts to replace 1 H atom by the  $-CO.Cl$  group (22) (10); since this group represents the radical corresponding to the unisolatable acid chloride of formic acid, the process might well be designated as "chloroformylation"; however, since the resultant prodn. may readily be hydrolyzed to the corresp. carboxylic acids, the process has also (unfortunately) been designated as "carboxylation." — E.g.,  $\bar{C}$  (1 mole) with cyclohexane (1:8405) (2 moles) + dibenzoyl peroxide (0.005 mole) refluxed for 24 hrs. in light from low-pressure Hg vapor lamp (10) or 300-watt tungsten lamp (23) gives (yields: 85% (23), 65% (10)) cyclohexanecarboxylic acid chloride (hexahydrobenzoyl chloride) (3:8580). — Note that neither simple olefins such as 2-methylbutene-2 (1:8220), octene-1 (1:8375), hexadecene-1 (octene) (1:7000), nor cycloalkenes such as cyclohexene (1:8070) undergo this type of reactn. (24), although phenylethylene (styrene) (1:7435) gives cinnamoyl chloride (3:0330) (0% yield of cinnamic ac. after hydrolysis (24)) and phenylacetylene (1:7425) gives  $\beta$ -chlorocinnamoyl chloride (16% yield of  $\beta$ -chlorocinnamic acid after hydrolysis (24)). — Note also that  $\bar{C}$  under similar conditions with aralkyl hydrocarbons chloroformylates the side chain but yields are very low (5-10%) (25).]

Reactions of  $\bar{C}$  with aromatic hydrocarbons. [ $\bar{C}$  with aromatic hydrocarbons (R.H.) in pres. of  $AlCl_3$  shows both (A) and (B) types of reactn. mentioned above in 2nd paragraph; on one hand (A)  $\bar{C}$  reacts like phosgene yielding  $R.CO.Cl$  (which during the usual subsequent treatment is hydrolyzed to the corresp. acid) and ketones of the type  $R_2CO$ ; on the other (B)  $\bar{C}$  reacts with 2 PH as a bifunctional acid chloride yielding the corresp. 1,2-diketones, which with some of the polycyclic hydrocarbons comprise new cyclic systems of the quinone type. Examples of these various combinations are listed below.]

[ $\bar{C}$  with  $C_6H_6$  +  $AlCl_3$  in  $CS_2$  gives according to mode of procedure either (1) 100% yield benzoyl chloride (3:6240) or 89% yield diphenyl ketone (benzophenone) (1:5150); note that no benzil (dibenzoyl) (1:9015) is formed here although it has been ohtd. (in small proportion) together with benzophenone from oxalyl (di)bromide with  $C_6H_6$  +  $AlBr_3$  in  $CS_2$  (17). —  $\bar{C}$  with toluene +  $AlCl_3$  in  $CS_2$  gives (65% yield (26)) *p*-toluic acid (1:0795). —  $\bar{C}$  with *o*-xylene (1:7430) +  $AlCl_3$  in  $CS_2$  gives (75-80% yield (27)) (26) 3,4-dimethylbenzoic acid [Beil. IX-535, IX<sub>1</sub>-(210)], m.p.  $166^\circ$ , accompanied by some 3,4,3',4'-tetramethylbenzil (4,4'-*o*-xylid), m.p.  $128.5^\circ$  cor. (27);  $\bar{C}$  with *m*-xylene (1:7420) similarly gives (40-50% yield (26)) 2,4-dimethylbenzoic acid [Beil. IX-531, IX<sub>1</sub>-(209)], m.p.  $126^\circ$ ;  $\bar{C}$  similarly with *p*-xylene (1:7415) gives (100% yield (26)) 2,5-dimethylbenzoic acid [Beil. IX-534, IX<sub>1</sub>-(210)], m.p.  $132^\circ$ . —  $\bar{C}$  with ethylbenzene (1:7410) gives (29) *p*-ethylbenzoic acid [Beil. IX-529], m.p.  $112^\circ$ .]

[ $\bar{C}$  with arom. hydrocarbons contg. two uncondensed benzene nuclei shows a distinct tendency to yield dicarboxylic acids despite the fact that the first member is exceptional. E.g.,  $\bar{C}$  with biphenyl (1:7175) +  $AlCl_3$  in  $CS_2$  gives (30) 40% yield di-*p*-xenylic ketone, m.p.  $236^\circ$ , + 25% *p*-xenylic acid, m.p.  $140-141^\circ$ , although the formation in 75% yield of *p*-phenylbenzoic acid (*p*-xenoic acid) [Beil. IX-671, IX<sub>1</sub>-(280)], m.p.  $224^\circ$ , has also been reported (31); for examples of dicarboxylic acid formn. from  $\bar{C}$  +  $AlCl_3$  with 2,2'-dimethylbiphenyl (26), diphenylmethane (32), phenyl *p*-tolylmethane (26), di-*p*-tolylmethane (26),  $\alpha,\beta$ -

diphenylethane (bihenyl) {32},  $\alpha,\beta$ -diphenylethylene (stilbene) {32}, triphenylmethane {32}, see indic. refs.]

[ $\bar{C}$  with polycyclic arom. hydrocarbons frequently, but not always, also gives polycyclic quinones; e.g.,  $\bar{C}$  with naphthalene (1:7200) +  $AlCl_3$  in  $CS_2$  gives {35} a mixt. of  $\alpha$ -naphthoic acid (1:0785) +  $\beta$ -naphthoic acid (1:0800);  $\bar{C}$  with 2-methylnaphthalene (1:7605) +  $AlCl_3$  in  $CS_2$  gives {33} a mixt. of acids + 2,2'-dimethylnaphthal + 3-methylacenaphthene-quinone-1,2; for analogous results with 1,6-, 2,6-, and 2,7-dimethylnaphthalenes see {33} {34};  $\bar{C}$  with anthracene +  $AlCl_3$  in  $CS_2$  gives (70% yield {35}) aceanthrenequinone (1,9-oxalylanthracene) [Beil. VII<sub>1</sub>-(436)], red pr. from  $C_6H_6$ , m.p. 270°, accompanied by some anthracene-9-carboxylic acid (*meso*-anthroic acid).]

[For behavior of  $\bar{C}$  +  $AlCl_3$  with 2-methylantracene {36} {38}, 1,2-dibenzanthracene {37}, retene or dihydrotene {39}, or fluoranthene {40} see indic. refs.; many analogous cases are known but cannot be included here.]

*Reaction of  $\bar{C}$  with alcohols and thiols.* [ $\bar{C}$  with 2 moles primary alcs. especially in pres. of pyridine yields corresp. neutral esters; e.g.,  $\bar{C}$  with MeOH (1:6120) (2 moles) gives dimethyl oxalate (1.0415), m.p. 54°;  $\bar{C}$  with EtOH (1:6130) (2 moles) gives diethyl oxalate (1.1055), h.p. 185°; for analogous behavior of  $\bar{C}$  with *n*-propyl alc. (1:6150) yielding di-*n*-propyl oxalate (1.3726), with isobutyl alc. (1:6165) yielding di-isobutyl oxalate (1:3897), with isoamyl alc. (1:6200) yielding diisoamyl oxalate (1:4181) all in 100% yield see {42}. —  $\bar{C}$  with secondary alcs. (2 moles) also yields {42} {50} the corresp. neutral esters, but yields are less satisfactory and the ability of  $\bar{C}$  to act as a dehydrating agent begins to become evident {42}; e.g.,  $\bar{C}$  with methyl-phenyl-carbinol (1:6475) yields no ester, but only phenylethylene (styrene) (1:7435). —  $\bar{C}$  with tertiary alcs. replaces OH by Cl; e.g.,  $\bar{C}$  with *ter*-butyl alc. (1:6140) gives *ter*-butyl chloride (3:7015);  $\bar{C}$  with triphenylcarbinol (1:5985) gives chlorotriphenylmethane (3:3410) {42}.]

[Note that  $\bar{C}$  with only 1 mole of primary alcs. yields the corresponding half esterification prods.; e.g.,  $\bar{C}$  (1 mole) with EtOH (1:6130) (1 mole) gives (60% yield {43}) ethoxalyl chloride (3:5625); for other examples together with use of such oxalin ester chlorides in prepn. of cellulose esters see {43}.]

[ $\bar{C}$  with ethylene glycol (1:6165) (1 mole) directly {42} or in pyridine {44} or in dry ether {45} gives (57% yield {45}) monomeric ethylene glycol oxalate (2,3-dioxodioxane-1,4) [Beil. XIX-153, XIX<sub>1</sub>-(679)], m.p. 143° {45}, 149° {44}, 153° {42}; for relationships of this monomer to the polymeric forms see {46}.]

[ $\bar{C}$  with  $CH_3SH$  (2 moles) {13} in dry ether {47} gives dimethyl dithioloxalate [Beil. II-565, II<sub>1</sub>-(514)], yel. cryst. from ether or ligr., m.p. 82.5–83.5° {13}, 80° {47}, h.p. 218° at 760 mm. {47}. —  $\bar{C}$  with  $EtSH$  (2 moles) {13} {48} in dry ether {1} gives diethyldithioloxalate [Beil. II-565, II<sub>1</sub>-(244)], m.p. 27–27.5° {13}, 24–25° {1}, h.p. 238–240° at 757 mm. {1}, 235° {13}.]

*Behavior of  $\bar{C}$  with phenols and thiophenols.* [ $\bar{C}$  (1 mole) with phenol (2 moles) in dry ether with metallic Na (2 moles) gives (21% yield {49}) diphenyl oxalate [Beil. VI-155, VI<sub>1</sub>-(87)], m.p. 131° u.c. {49}. —  $\bar{C}$  (1 mole) with *o*-cresol (1:1400) (2 moles) + Na similarly gives {49} di-*o*-tolyl oxalate [Beil. VI-355], ndls. from alc., m.p. 90–91° u.c. {49};  $\bar{C}$  with *m*-cresol (1:1730) similarly gives {49} di-*m*-tolyl oxalate [Beil. VI-379, VI<sub>1</sub>-(187)], ndls. from alc., m.p. 105° u.c. {49};  $\bar{C}$  with *p*-cresol (1:1410) similarly {49} or in pyridine {51} gives di-*p*-tolyl oxalate [Beil. VI-398, VI<sub>1</sub>-(201)], pl. from alc. + ether, m.p. 148° {49}, 147° {51}, for similar behavior of still other phenols see {51}.]

[Note, however, that  $\bar{C}$  (1 mole) with phenols (1 mole) in pres. of  $AlCl_3$  leads to mono-esterification followed by elimination of HCl and ring closure; e.g.,  $\bar{C}$  (1 mole) with  $\beta$ -naphthol (1:1510) +  $AlCl_3$  in  $CS_2$  gives (85% yield {52} {53}) 4,5-benzocumarandione-2,3 [Beil. XVII<sub>1</sub>-(267)], orange ndls. from AcOH, m.p. 180–181° {52}.]

[For behavior of  $\bar{C}$  with resorcinol (1:1530) + Na or K in moist ether see (54).]

[ $\bar{C}$  with  $\beta$ -thionaphthol (2-mercaptanaphthalene) +  $AlCl_3$  in  $CS_2$  esterifies and ring-closes with loss of HCl yielding (55) 4,5-benzothiocoumarandione-2,3 (4,5-benzothionaphthenequinone-2,3), red pdr., m.p. 153°. — For extension of this type of reactn. to prepn. of halogenated thionaphthisatins from  $\bar{C}$  with halogenated 1- or 2-mercaptanaphthalenes +  $AlCl_3$  see (56+).]

[For behavior of  $\bar{C}$  with dithiopyrocatechol (*o*-dimercaptobenzene) see (57).]

[For study of a series of molecular cpds. of  $\bar{C}$  with various hydroxy-azo compds. see (58).]

*Behavior of  $\bar{C}$  with phenol ethers.* [ $\bar{C}$  with mononuclear phenol ethers +  $AlCl_3$  reacts in general according to types A and B of paragraph 2 (above) so that after aqueous treatment involved in destroying the  $AlCl_3$  there results either a diketone or a carboxylic acid; which of these is formed or their proportion varies with nature of components and with conditions. E.g.,  $\bar{C}$  (1 mole) with anisole (methyl phenyl ether) (1:7445) (2 moles) +  $AlCl_3$  (2 moles) in  $CS_2$  gives (yields: 90% (59), 80% (60), 76% (17)) anisil (4,4'-dimethoxybenzil) [Beil. VIII-428, VIII<sub>1</sub>-(705)], golden-yel. ndls. from alc., m.p. 133° (60), 132° (59);  $\bar{C}$  (1 mole) with phenetole (ethyl phenyl ether) (1:7485) (2 moles) +  $AlCl_3$  in  $CS_2$  gives (80% yield (29)) phenetil (4,4'-diethoxybenzil), pr. from ether + alc., m.p. 149°;  $\bar{C}$  similarly with *o*-cresol methyl ether (1:7480) +  $AlCl_3$  in  $CS_2$  gives (76% yield (61)) (59) 4,4'-dimethoxy-3,3'-dimethylbenzil, pale yel. ndls. from AcOH, toluene, or pyridine, m.p. 177° (61), 174° (59). — Note, however, that  $\bar{C}$  with *m*-cresol methyl ether (1:7510) +  $AlCl_3$  in  $CS_2$  yields no diketone, but only (59) 2-hydroxy-6-methylbenzoic acid (6-methylsalicylic acid) [Beil. X-217, X<sub>1</sub>-(95)], m.p. 168°;  $\bar{C}$  with *p*-cresol methyl ether (1:7495) gives no diketone but only (12% yield (59)) 2-hydroxy-5-methylbenzoic acid (5-methylsalicylic acid) [Beil. X-227, X<sub>1</sub>-(98)], m.p. 149° (59). — Many analogous cases of each type are known but cannot be included here.]

[ $\bar{C}$  with pyrocatechol dimethyl ether (veratrole) (1:7560) +  $AlCl_3$  gives (60) 2,3,2',3'-tetramethoxybenzophenone;  $\bar{C}$  with resorcinol dimethyl ether (1:7570) gives (60) 2,4,2',4'-tetramethoxybenzophenone;  $\bar{C}$  with hydroquinone dimethyl ether (1:7160) gives (60) 2,5,2',5'-tetramethoxybenzophenone, but  $\bar{C}$  with orcinol dimethyl ether (3,5-dimethoxytoluene) +  $AlCl_3$  gives (29) by ring closure 6-methoxy-4-methylcoumarandione-2,3, m.p. 165° (29).]

*Behavior of  $\bar{C}$  with organic acids or their derivatives.* [ $\bar{C}$  with silver oxalate in dry ether does *not* yield the unknown oxalic anhydride but instead immediately evolves CO + CO<sub>2</sub> until all the salt has disappeared (1).]

[ $\bar{C}$  with organic acids, their salts, or their anhydrides, gives the corresp. acid chlorides in good yield (19); furthermore under appropriate conditions  $\bar{C}$  with aromatic acids gives good yields (50) of the corresp. arom. anhydrides; for numerous examples see indic. refs.]

*Behavior of  $\bar{C}$  with amines or their derivatives.*  $\bar{C}$  with primary or secondary amines (2 moles) reacts normally as a bifunctional acid chloride yielding corresp. *N*-substituted oxamides (see also below under ①'s).

[Note, however, that with amine salts reaction takes a different course. — E.g.,  $\bar{C}$  with aniline hydrochloride at 15° evolves HCl and gives (100% yield (62)) oxanilyl chloride, C<sub>6</sub>H<sub>5</sub>.NH.CO.CO.Cl [Beil. XII-283, XII<sub>1</sub>-(206)], pr. from pet. ether, m.p. 82.5°;  $\bar{C}$  with  $\alpha$ -naphthylamine.HCl in chlorobenzene at 15° similarly yields (12) *N*-( $\alpha$ -naphthyl)oxamidyl chloride, C<sub>10</sub>H<sub>7</sub>.NH.CO.CO.Cl, m.p. 86° (62);  $\bar{C}$  with  $\beta$ -naphthylamine HCl similarly yields (62) *N*-( $\beta$ -naphthyl)oxamidyl chloride, ndls. from C<sub>6</sub>H<sub>6</sub>, m.p. 114–115° dec. (62). — Note that these prods. with condensing agents such as  $AlCl_3$ .FeCl<sub>3</sub> or H<sub>2</sub>SO<sub>4</sub> ring-close with loss of HCl to yield homologs of isatin: e.g., *N*-( $\alpha$ -naphthyl)oxamidyl chloride +  $AlCl_3$  at 80–85° for 8 hrs. gives (63) 6,7-benzoisatin [Beil. XXI-524, XXI<sub>1</sub>-(414)] ("1,2-naphthisatin"), red ndls., m.p. 255°; *N*-( $\beta$ -naphthyl)oxamidyl chloride with  $AlCl_3$  in

nitrobenzene at 80° gives (75-80% yield (63)) 4,5-benzoisatin ("2,1-naphthisatin") [Beil. XXI-525, XXI-(415)], m.p. 252-253°.]

[Note, furthermore, that the above general synthesis of isatin homologs can be carried out starting with *N*-acylated arom. amines: e.g.,  $\bar{C}$  with Na salt of *N*-(*p*-toluenesulfonyl)-*p*-toluidide in  $CS_2$  splits out NaCl giving (64) *N*-(*p*-toluenesulfonyl)-*N*-(*p*-tolyl)oxamidyl chloride, cryst. from  $C_6H_6$ , m.p. 91-93° (64); this prod. on bfg. with  $AlCl_3$  loses HCl and ring-closes to *N*-(*p*-toluenesulfonyl)-5-methylisatin, cryst. from AcOH or  $C_6H_6$ , m.p. 202-205°, hydrolysis of which by stdg. 1 day with conc  $H_2SO_4$  yields (64) 5-methylisatin [Beil. XXI-509, XXI-(401)], red ndls. from aq. or alc., m.p. 187°.]

[For analogous reactn. of  $\bar{C}$  with secondary arom. amines and ring closure to *N*-substituted isatins see (65).]

[ $\bar{C}$  with *N,N*-dimethylaniline gives various prods. according to conditions:  $\bar{C}$  (1 mole) with dimethylaniline (2 moles) in dry ether in cold gives (100% yield (66)) (*p*-dimethylaminobenzoyl)formyl chloride,  $(CH_3)_2N.C_6H_4.CO.Cl$ , stable only in soln. and on treatment with aq. giving (80% yield (66)) (*p*-dimethylaminobenzoyl)formic acid, golden-yel. lfts. from AcOH or MeOH, m.p. 186-187° dec.,  $\bar{C}$  (1 mole) with dimethylaniline (4 moles) in  $C_6H_6$ , stood 15 hrs. in cold, then heated gives tetramethyldiaminobenzil + the carbinol base of "Crystal Violet" (for many further details see (66)); for use of  $\bar{C}$  in prepn. of "Crystal Violet" see (67).]

[ $\bar{C}$  with *o*-aminothiophenol (80) or with its Zn salt (68) at 60-80° until reactn. begins, then htd. at 100° for 1 hr., gives (60% yield (68)) bis-2,2'-benzothiazolyl [Beil. XXVII-744, XXVII-(626)], m.p. 300.5° u.c. (68), 304° (80); similarly  $\bar{C}$  with Zn salt of *o*-aminoselenophenol gives (69) bis-2,2'-benzoselenazolyl, m.p. 314° u.c. (69).]

*Behavior of  $\bar{C}$  with certain amides.* [ $\bar{C}$  with urea directly or in ether gives (8) (21) parabanic acid (*N,N'*-oxalylurea) [Beil. XXIV-449, XXIV-(401)], cryst. from alc., m.p. 244°, accompanied by more or less oxaldureide, insol, m.p. 270-275° dec. (8). —  $\bar{C}$  with *N,N'*-dimethylurea gives (70% yield (8)) *N,N'*-dimethylparabanic acid [Beil. XXIV-453, XXIV-(404)], m.p. 154° (8). —  $\bar{C}$  with *N*-phenylurea in ether refluxed 3 hrs. gives (88% yield (8)) *N*-phenylparabanic acid [Beil. XXIV-454, XXIV-(405)], lfts. from alc., m.p. 213-214° cor., after sintering at 208° (8). —  $\bar{C}$  with *N,N'*-diphenylurea in ether gives (100% yield (8)) *N,N'*-diphenylparabanic acid [Beil. XXIV-455, XXIV-(405)], ndls. from alc., m.p. 202° cor., after prelim. sintering (8).]

[For examples of condensation of  $\bar{C}$  with various other amides see (21) (70) (71) (73); with various amino acids see (72).]

*Behavior of  $\bar{C}$  with carbonyl compounds.* [ $\bar{C}$  with ketones often acts like  $PCl_5$  by replacing the oxygen with 2 chlorine atoms with evolution of CO +  $CO_2$  for many specific examples see (74); also note that  $\bar{C}$  with vanthone (1:7275) gives (75) (76) xanthone dichloride;  $\bar{C}$  with *N*-methyl- or *N*-phenylacridone gives (77) dichlorides.]

*Behavior of  $\bar{C}$  with organometallic compounds.* [ $\bar{C}$  with nickel carbonyl reacts according to equation  $Ni(CO)_4 + (COCl)_2 \rightarrow NiCl_2 + 6CO$  (13) —  $\bar{C}$  with  $Et_2Cd$  (from  $C_2H_5MgBr + CdCl_2$ ) gives (27% yield (77)) 3-ethylhexanol-3-one-4 (diethyl-propionyl-carbinol) [Beil. I-841, I-(881)], b.p. 178-179° (78). — For interference of  $\bar{C}$  with the Michler's ketone test for  $RMgX$  cpds. see (79).]

- ① Oxalyl (di)chloride/1,4-dioxane mol. cpd.: ndls. or pr. from pet. ether, m.p. 67-68° (81). [From  $\bar{C}$  with 5 wt. pts. dioxane-1,4 (1:6400) in 25 vols. pet. ether at -5° in stream of dry air or  $N_2$ ; the 1:1 mol. cpd. ppts. in 71-78% yield (81). — Note that this prod. may with aniline be converted to oxanilide (see below) or may be dislvd. in excess stand. alk. and titrated back with stand. acid; furthermore, on stdg. in moist air, it is quant. converted to oxalic acid dihydrate (1:0445). — Note also that

under same conditions no ppt. results with acetyl chloride (3:7065), benzoyl chloride (3:6240), malonyl (di)chloride (3:9030), succinyl (di)chloride (3:6200), fumaryl (di)chloride (3:5875), *sym.*-phthaloyl (di)chloride (3:6900), *unsym.*-phthaloyl (di)chloride (3:2395) or terephthaloyl (di)chloride (3:2205) (81).]

① Oxanilide (oxalic acid dianilide): pl. from  $C_6H_6$  or nitrobenzene m.p.  $251^\circ$  (21)  $252-253^\circ$  (71). [From  $\bar{C}$  + aniline in cold ether or from  $\bar{C}$  + aniline hydrochloride in boilg.  $C_6H_6$  (21); note that by virtue of the relative insolubility of oxanilide and its easy quantitative formn. it is often employed as means for quant. detn. of  $\bar{C}$  cf. (1). — Note also that the half reactn. prod. oxanilyl chloride m.p.  $82.5^\circ$  has been mentioned above in main text.]

— Oxal-bis-(*p*-toluidide): m.p.  $268^\circ$  (cf. 1:0445).

— Oxal-bis-( $\alpha$ -naphthalide): m.p.  $234^\circ$ .

— Oxal-bis-( $\beta$ -naphthalide): m.p.  $275^\circ$ .

② Oxal-bis-(phenylhydrazide): cryst. from alc. or AcOH m.p.  $278^\circ$  (82). [From  $\bar{C}$  (1 mole) in  $C_6H_6$  with phenylhydrazine (4 moles) in dry ether (82).]

— Oxal-bis-(*p*-nitrophenylhydrazide): unreported.

— Oxal-bis-(2,4-dinitrophenylhydrazide): yel. cryst. from alc. m.p.  $202^\circ$  after darkening at about  $270^\circ$ . [Prepd. indirectly.]

3:5075 METHYL CHLOROFORMATE  $\text{Cl.COOCH}_3$   $\text{C}_2\text{H}_3\text{O}_2\text{Cl}$  Beil. III - 9  
 ("Methyl chlorocarbonate") III<sub>1</sub>-(5)  
 III<sub>2</sub>-(9)

B.P. 72-73° at 767 mm. {1}	$D_4^{20} = 1.2231$ {1}	$n_D^{20} = 1.38675$ {1}
71.4-72.4° {2}		
71.2-71.5° at 733 mm. {3}	$D_4^{16.5} = 1.2240$ {6}	
71.4° cor. {4}		
71.0-71.5° at 760 mm. {7}		
71-71.5° {20}		
69° at 720 mm. {5}		

[See also ethyl chlorocarbonate (3:7295).]

$\tilde{\text{C}}$  is colorless liquid with penetrating odor and strong lachrymatory properties.

[For prepn. of  $\tilde{\text{C}}$  from carbonyl chloride (phosgene) (3:5000) with MeOH see {8} {9} {7} {4} {10} {20} {21}; from methyl formate (1:1000) with  $\text{Cl}_2$  see {11} {12} (chloromethyl chloroformate (3:5275) is also formed); from pentachloroethyl chloroformate [Beil. III-13, III<sub>1</sub>-(6)] {13} or from bis-(trichloromethyl) oxalate [Beil. III-17] {14} or from methyl trichloromethyl carbonate [Beil. III-17 III<sub>1</sub>-(8) III<sub>2</sub>-(15)] {15} with MeOH see indic. refs.]

Pyrolysis of  $\tilde{\text{C}}$ . Unlike the case of ethyl chloroformate (3:7295) the pyrolysis of  $\tilde{\text{C}}$  appears to have been little studied: in quinoline the decomposition temp. is given {16} {17} as 36°; presumably the decomposition yields MeCl (3:7005) +  $\text{CO}_2$ .

Reactions of the  $-\text{COOMe}$  group of  $\tilde{\text{C}}$ .  $\tilde{\text{C}}$  is not readily decomposed by cold aq. {4} {11} {18} and can even be washed to remove alc.;  $\tilde{\text{C}}$  on boilg. with aq. or dil. acid or dil. alk., however, is readily hydrolyzed yielding MeOH (1:6120) +  $\text{CO}_2$  + HCl.

[ $\tilde{\text{C}}$  with  $\text{Cl}_2$  under various conditions {19} {20} {21} {22} {23} yields successively chloromethyl chloroformate (3:5275) dichloromethyl chloroformate (3:5315) and ultimately trichloromethyl chloroformate ("diphosgene") (3:5515).]

[ $\tilde{\text{C}}$  (10% excess) with  $\text{MeHSO}_4$  at 100° under reflux for 6-8 hrs. gives (100% yield {24})

3:5085 1,1,1-TRICHLOROETHANE  $\text{CH}_3\text{CCl}_3$   $\text{C}_2\text{H}_3\text{Cl}_3$   
(Methylchloroform)

Beil. I - 85

74.1–74.5°	at 747.5 mm. (7)			

Liquid. — [For f.p./compn. data on mixts. of  $\bar{\text{C}}$  with 2,2-dichloropropane (3:7140) or with pentachloroethane (3:5880) see (8); for extensive study of vap. press., heat capacity, and other thermodynamic props. see (21); for soly. of aq. in  $\bar{\text{C}}$  see (22).] [For use of  $\bar{\text{C}}$  as dry cleaning fluid see (10); for use of  $\bar{\text{C}}$  in dewaxing of oils see (11).] [For detn. of  $\bar{\text{C}}$  in air by thermal decompn. method see (23).]

[For prepn. of  $\bar{\text{C}}$  from 1,1-dichloroethane (ethylidene dichloride) (3:5035) by actn. of  $\text{Cl}_2$  see (12) (13) (7); for manufacture of  $\bar{\text{C}}$  from 1,1-dichloroethylene (vinylidene dichloride) (3:5005) by cat. addn. of  $\text{HCl}$  see (14) (15).]

$\bar{\text{C}}$  with  $\text{Ca}(\text{OH})_2$  at ord. temp. loses  $\text{HCl}$  yielding (16) 1,1-dichloroethylene (3:5005).

$\bar{\text{C}}$  with aq. under specified conditions and catalyst hydrolyzes to yield (17) (18)  $\text{AcOH}$ ,  $\text{AcCl}$ , or  $\text{Ac}_2\text{O}$ .

[For study of actn. of fluorine on  $\bar{\text{C}}$  see (19).]

$\bar{\text{C}}$  with phenol + aq.  $\text{NaOH}$  gives (20) small yield of a mixt. of *o*-hydroxyacetophenone (1:1745) and *p*-hydroxyacetophenone (1:1527). [For impt. clarification of previous misapprehension of this reactn. see (20).]

## B.P. (Cont.)

46.3°	at 282 mm. (23)	$n_D^{12.3} = 1.4056$ (71)
42.0°	at 236 mm. (23)	
36.0°	at 170.95 mm. (2)	$n_D^{12} = 1.4674$ (71)
31.0°	at 140 mm. (23)	
25.0°	at 110 mm. (23)	$n_D^{11.19} = 1.40589$ (10)
		$n_D^{10.5} = 1.4601$ (10)

See also Notes 1, 2, and 3.

Note 1. For studies of vap. press. of  $\bar{C}$  over range  $-20^\circ$  to  $+283^\circ$  (72) and range  $+10.2$  to  $70.4^\circ$  (73) see indic. refs.

Note 2. For studies of effect on b.p., vap. press., vapor density of very intensive drying see (74) (75) (70) (77) (70) (80).

Note 3. For study of detn. of b.p. range of  $\bar{C}$  as method of estimation of impurities see (81).

Note 4. For studies on effect of prior history of sample on detn. of f.p. of  $\bar{C}$  see (32) (52) (51).

Note 5. For studies of influence of high press. of f.p. see (41) (83).

Note 6. Solid  $\bar{C}$  has a transition point variously determined as follows:  $-47^\circ$  (85) cf. (17),  $-47.55^\circ$  (33),  $-47.03^\circ$  (15),  $-47.00^\circ$  (32) (36),  $-47.84^\circ$  (30),  $-48.1^\circ$  (47),  $-48.5^\circ$  (80),  $-48.54^\circ$  (87).

Note 7. For studies of density of  $\bar{C}$  over ranges  $-180^\circ$  to  $-80^\circ$  (88),  $0^\circ$  to  $283^\circ$  (crit. temp.) (72), and  $-18^\circ$  to  $+60^\circ$  (80) see indic. refs.

[See also methylene (di)chloride (3:5020) and chloroform (3:5050).]

MISCELLANEOUS PHYSICAL PROPERTIES OF  $\bar{C}$ 

## VARIOUS SOLUBILITY RELATIONS

With water.  $\bar{C}$  is only very slightly sol. aq. and is eas. volatile with steam; e.g., 100 g. aq. at  $0^\circ$  dis. 0.007 g.  $\bar{C}$  (91), at  $10^\circ$  0.083 g. (91), at  $15^\circ$  0.081 g. (8), at  $20^\circ$  0.090 g. (91), at  $30^\circ$  0.077 g. (8), 0.085 g. (91); for study of salting-out effect of KCl or  $MgSO_4$  see (92). — For studies of soly. of aq. in  $\bar{C}$  at  $0^\circ$  (93),  $10^\circ$  (94),  $20^\circ$  (94),  $25^\circ$  (93), and  $30^\circ$  (93) (94) see indic. refs.; for study of reciprocal soly. of  $\bar{C}$  + aq. see (95).

With various inorganic compounds. (For data on soly. in  $\bar{C}$  of  $H_2$  (96),  $O_2$  (97) (94),  $O_3$  (99) (100), air (96),  $N_2$  (at high pressure) (101), NO (107),  $NO_2$  (102),  $N_2O$  (96),  $NH_3$  (103),  $H_2S$  (103),  $SO_2$  (90) (110),  $HI$  (103) (104) (105) (100),  $HBr$  (100),  $Cl_2$  (108) (109) (110), or  $CO_2$  (111) (112) see indic. refs. — For data on soly. of  $I_2$  in  $\bar{C}$  see (113) (121) (122) (123) (124) (125); for study of nature of  $I_2$  solns. in  $\bar{C}$  see (114); for soly. of  $I_2$  in  $CCl_4$  vapor see (115). — For data on soly. of sulfur in  $\bar{C}$  see (128) (129) (130). — For data on soly. of  $AlCl_3$  in  $\bar{C}$  see (135).]

With various organic compounds. (For data on soly. in  $\bar{C}$  of ethane (110), ethylene (110) under high press. (101), acetylene (110), dimethyl ether (117),  $CH_2Cl$  (117) (118),  $COCl_2$  (110) (120) see indic. refs.)

BINARY SYSTEMS CONTAINING  $\bar{C}$ 

(See also azeotropes containing  $\bar{C}$ )

$\bar{C}$  with various inorganic compounds.  $\bar{C} + Cl_2$ : for f.p./compn. data and diag. (note that 5 different cpds. are formed) see (29) cf. (17) (126). —  $\bar{C} + Br_2$ : for f.p./compn. data and diag. (eutectic has f.p. about  $-47.0^\circ$  and conts. about 82.7 mole %  $\bar{C}$  (38)) see (38) cf. (125). —  $\bar{C} + I_2$ : see above under soly. of  $I_2$  in  $\bar{C}$ . —  $\bar{C} + I-Cl$ : for f.p./compn. data and

diag. (series of solid solns.) see (31) cf. (127). —  $\bar{C}$  +  $SO_2$ : for f.p./compn. data and diag see (131) —  $\bar{C}$  +  $H_2S$ : for f.p./compn. diag see (132). —  $\bar{C}$  +  $N_2O_4$ : for f.p./compn. data and diag. see (133) —  $\bar{C}$  +  $PCl_5$ : for formn. of compd.  $2PCl_5 \cdot CCl_4$  see (134). —  $\bar{C}$  +  $PBr_5$ : for formn. of 2 cpds see (134). —  $\bar{C}$  +  $TiCl_4$ : for f.p./compn. data and diag see (53); for b.p. and liq. vapor compn see (48)

$\bar{C}$  with org. cpds. of Order 1.  $\bar{C}$  + *n*-heptane (1:8575): for study of ht. of mixing see (136); for  $n_D^{20}$ /compn. sec (165) —  $\bar{C}$  +  $C_6H_6$  (1:7400): for f.p./compn. data and diag see (137) (138) (90), for data on  $D_4^{20}$  (12),  $D_4^{23}$  (12),  $D_4^{25}$  (12),  $D_4^{25}$  (57) (140) (166), and  $D_{30}^{20}$  (141) versus compn. sec indie refs., for  $n_D^{14.5}$  (142),  $n_D^{20}$  (10), or  $n_D^{25}$  (65) (68) (166) versus compn. sec indie refs.; for refractive indices at various wave lengths see (67); for data on b.p. at 720 mm (10), vap. press. (2) (58) (10) (65) (143) (163), heat of mixing (141) (144), liq.-vapor equil (145), or study of distn. through packed column (139) see indie refs. —  $\bar{C}$  + toluene (1:7403): for data on vap. press. (4) (143),  $D_4^{20}$  (12) cf. (4),  $D_4^{25}$  (166),  $n_D^{15}$  (146), and  $n_D^{25}$  (4) (166) see indie refs. —  $\bar{C}$  + cyclohexane (1:8405): for f.p./compn. data (147),  $D_4^{20}$  (62),  $D_4^{25}$  (140) (58),  $n_D^{25}$  (140) see indie refs.

$\bar{C}$  +  $MeOH$  (1:6120): for  $D_4^{25}$  and  $n_D^{25}$ /compn. sec (151). —  $\bar{C}$  +  $EtOH$  (1:6130): for vap. press. data/compn. sec (148) (149); for  $D_4^{25}$  (59) (166) and  $n_D^{15}$  (167) or  $n_D^{25}$  (166) see indie refs. —  $\bar{C}$  + *n*- $PrOH$  (1:6150): for  $n_D^{25}$ /compn. sec (66) —  $\bar{C}$  + *n*- $BuOH$  (1:6180): for  $n_D^{20}$ /compn. sec (185) —  $\bar{C}$  + *isoAmOH* (1:6200): for  $D_4^{25}$  and  $n_D^{25}$  versus compn. sec (166) —  $\bar{C}$  + cyclohexanol (1:6415): for f.p./compn. data see (150)

$\bar{C}$  + diethyl ether (1:6110): for data on f.p./compn. (152),  $D_4^{20}$  (62),  $D_4^{25}$  (166), and  $n_D^{25}$  (166) see indie refs. —  $\bar{C}$  + diisopropyl ether (1:6125): for  $D_4^{20}$ /compn. sec (62). —  $\bar{C}$  + diazane-1,4 (1:6400): for  $D_4^{20}$ /compn. sec (62). —  $\bar{C}$  + anisole (1:7445): for f.p./compn. data and diag. sec (153) —  $\bar{C}$  + diphenyl ether (1:7125): for f.p./compn. data and diag. sec (153)

$\bar{C}$  + acetone (1:5400): for f.p./compn. data and diag. sec (90) (147); for  $D_4^{20}$  (62),  $D_4^{25}$  (59), and  $n_D^{15}$  (166) versus compn. sec indie refs.

$\bar{C}$  +  $MeOAc$  (1:3005): for  $D_4^{25}$  and  $n_D^{25}$  versus compn. sec (166) —  $\bar{C}$  +  $EtOAc$  (1:3015): for f.p./compn. data and diag. sec (152); for data on vap. press. (65) (192),  $D_4^{25}$  (166),  $n_D^{20}$  (27),  $n_D^{25}$  (166) cf. (65) versus compn. sec indie refs. —  $\bar{C}$  +  $EtOBz$  (1:3721): for  $D_4^{20}$  compn. sec (61) —  $\bar{C}$  + diethyl carbonate (1:3150): for  $D_4^{25}$ /compn. sec (5).

$\bar{C}$  with org. cpds. of Order 2.  $\bar{C}$  + nitrobenzene: for f.p./compn. data and diag. (eutectic, f.p.  $-34.5^\circ$ , conts. 81.5 wt. %  $\bar{C}$  (44)) see (41) cf. (138); for  $D_4^{20}$ ,  $D_4^{25}$ , and  $n_D^{20}$  versus compn. sec (154) —  $\bar{C}$  + aniline: for f.p./compn. data (147) and  $D_4^{25}$ /compn. (155) see indie refs. —  $\bar{C}$  + quinoline: for  $D_4^{20}$ /compn. sec (62)

$\bar{C}$  with org. cpds. of Order 3.  $\bar{C}$  +  $CH_2Cl_2$  (3:5020): for data on b.p.,  $D_4^{20}$ , and liq.-vapor equilibria see (156) —  $\bar{C}$  +  $CHCl_3$  (3:5030): for f.p./compn. data and diag. (eutectic, f.p.  $-81.1^\circ$ , conts. 49.4 wt. %  $\bar{C}$  (16)) (38) (147) (157) cf. (125) see indie refs.; for  $D_4^{20}$ /compn. sec (156) (158) cf. (12); for  $n_D^{25}$  compn. sec (166); for b.p. and liq.-vapor equil. see (156). —  $\bar{C}$  + 1,1-dichloroethane (3:5035): for b.p.,  $D_4^{20}$ , and liq.-vapor equil. see (156). —  $\bar{C}$  + 1,2-dichloroethane (3:5130): for data on b.p. (49) (159), liq.-vapor equil. (49) (159) (160),  $D_4^{20}$ /compn. (49) see indie refs. —  $\bar{C}$  + pentachloroethane (3:5880): for f.p./compn. data and diag. sec (157) —  $\bar{C}$  + 1,1,2,2-tetrachloroethylene (3:5160): for f.p./compn. data (15), vap. press. (3) and liq.-vapor equil. (3) see indie refs. —  $\bar{C}$  + 2,2-dichloropropane (3:7140): for f.p./compn. data sec (45). —  $\bar{C}$  + *tert*-butyl chloride (3:7045): for f.p./compn. data and diag. (complete series of solid solns.) see (47) (161) —  $\bar{C}$  + chlorobenzene (3:7903): for  $D_4^{20}$ /compn. sec (61)

$\bar{C}$  with org. cpds. of higher orders.  $\bar{C}$  +  $CBBr_3$ : for extensive study of this system see (162); for  $D_4^{25}$ /compn. sec (54). —  $\bar{C}$  +  $C_2H_5Br$ : for  $D_4^{20}$ /compn. sec (158) —  $\bar{C}$  + 1,2-dibromoothane: for f.p./compn. data and diag. sec (138).

$\bar{C}$  +  $CHI_3$ : for f.p./compn. data see {45}. —  $\bar{C}$  +  $Etl$ : for vap. press., liq.-vapor equil., and  $n_D^{25.2}$  see {65}.

$\bar{C}$  +  $CS_2$ : for f.p./compn. data {147}, study of distn. {164} {168},  $D_{20}^{20}$ /compn. {164},  $D_{25}^{25}$ /compn. {12}, and  $n_D^{15}$ /compn. {168} see indic. refs.

### TERNARY SYSTEMS CONTAINING $\bar{C}$

(See also azeotropes containing  $\bar{C}$ )

$\bar{C}$  +  $MeOH$  (1:6120) +  $aq.$ : for studies of phase relations {169} cf. {170} and colloidal character {171} see indic. refs. —  $\bar{C}$  +  $EtOH$  (1:6130) +  $aq.$ : for data on soly. relations incl. density and refractive indices see {173} cf. {170}. —  $\bar{C}$  +  $EtOH$  (1:6130) +  $C_6H_6$  (1:7400): for data on vap. press see {148} —  $\bar{C}$  +  $EtOH$  (1:6130) + *glycerol* (1:6540): for study of soly. relations see {172}. —  $\bar{C}$  +  $n-PrOH$  (1:6150) +  $aq.$ : for data and diag. of soly. relations at 20°, and  $n_D^{25}$ /compn., see {66} cf. {170}. —  $\bar{C}$  +  $AcOH$  (1:1010) +  $C_6H_6$  (1:7400): for data on density and  $n_D^{25}$  see {68}; for vap. press. data see {2}. —  $\bar{C}$  + *toluene* (1:7405) + *1,2-dibromoethane*: for extensive study see {4} {174}. —  $\bar{C}$  +  $CH_2Cl_2$  (3:5020) +  $CHCl_3$  (3:5050): for f.p./compn. data (ternary eutectic, f.p. -111.4°, conts. 13 wt. %  $\bar{C}$  + 60 wt. %  $CH_2Cl_2$  + 27 wt. %  $CHCl_3$ ) see {46}.

### BINARY AZEOTROPES CONTAINING $\bar{C}$

$\bar{C}$  +  $MeOH$  (1:6120):  $\bar{C}$  forms with  $MeOH$  a const.-boilg. mixt., b.p. 55.70° at 760 mm., contg. 79.44 wt. % = 44.5 mole %  $\bar{C}$  {175}, b.p. 54.4° at 734 mm., contg. 77 wt. %  $\bar{C}$  {176}, b.p. 54.2° at 718 mm., contg. 79 wt. %  $\bar{C}$  {176}; cf. also {177} {178}. —  $\bar{C}$  +  $EtOH$  (1:6130):  $\bar{C}$  forms with  $EtOH$  a const.-boilg. mixt., b.p. 64.05° {175}, 65.08° {179} at 760 mm., contg. 84.15 wt. % = 61.3 mole % {175}  $\bar{C}$ ; cf. also {180} {181}; for effect of press. on this azeotrope see {182}. —  $\bar{C}$  +  $n-PrOH$  (1:6150):  $\bar{C}$  forms with  $n-PrOH$  a const.-boilg. mixt., b.p. 72.8° {175}, 73.1° {179} at 760 mm., contg. 83.5 wt. % = 75 mole % {175}  $\bar{C}$ ; cf. also {183}. —  $\bar{C}$  + *iso* $PrOH$  (1:6135):  $\bar{C}$  forms with *isopropyl alc.* a const.-boilg. mixt., b.p. 67.5° {175}, 68.95° {184}, contg. about 82 wt. % {175} {184} = 64 mole %  $\bar{C}$ ; cf. also {183}. —  $\bar{C}$  + *n-BuOH* (1:6180):  $\bar{C}$  forms with *n-butyl alc.* a const.-boilg. mixt., b.p. 76.55° at 760 mm., contg. 97.5 wt. %  $\bar{C}$  {179}. —  $\bar{C}$  + *iso* $BuOH$  (1:6165):  $\bar{C}$  forms with *isobutyl alc.* a const.-boilg. mixt., b.p. 75.8° at 760 mm., contg. 94.5 wt. % = 89 mole %  $\bar{C}$  {175} cf. {183} {186}. —  $\bar{C}$  + *ter-BuOH* (1:6140):  $\bar{C}$  forms with *ter-butyl alc.* a const.-boilg. mixt., b.p. 69.5° {175}, 70.5° {185} at 760 mm., contg. 83 wt. % {175}, 76 wt. % {185}  $\bar{C}$ . —  $\bar{C}$  + *ter-AmOH* (1:6160):  $\bar{C}$  forms with *dimethyl-ethyl-carbinol* a const.-boilg. mixt., b.p. about 76° at 760 mm., contg. about 95 wt. %  $\bar{C}$  {185}. —  $\bar{C}$  + *allyl alc.* (1:6145):  $\bar{C}$  forms with *allyl alc.* a const.-boilg. mixt., b.p. 72.5°, contg. 79.5 mole %  $\bar{C}$  {187}.

$\bar{C}$  + *acetone* (1:5400):  $\bar{C}$  forms with *acetone* a const.-boilg. mixt., b.p. 55.9° at 763 mm. {188}, about 56° at 760 mm. {185}, contg. about 11.5 wt. % {185}  $\bar{C}$ . —  $\bar{C}$  + *methyl ethyl ketone* (1:5405):  $\bar{C}$  with *methyl ethyl ketone* forms a const.-boilg. mixt., b.p. 73.8° at 760 mm., contg. 71 wt. % = 53.4 mole % {175}  $\bar{C}$ .

$\bar{C}$  +  $AcOH$  (1:1010):  $\bar{C}$  forms with  $AcOH$  a const.-boilg. mixt., b.p. about 77° at 760 mm., contg. about 97 wt. %  $\bar{C}$  {189}.

$\bar{C}$  +  $EtOAc$  (1:3015):  $\bar{C}$  forms with *ethyl acetate* a const.-boilg. mixt., b.p. 74.75° at 760 mm. {175} {190}, contg. 57 wt. %  $\bar{C}$  {190}; b.p. 76.15° at 789.2 mm. contg. 55.6 mole %  $\bar{C}$  {191}; b.p. 71.56° at 685.0 mm. contg. 58.2 mole %  $\bar{C}$  {27}; b.p. 66.72° at 583.7 mm. contg. 60.75 mole %  $\bar{C}$  {191}; b.p. 61.32° at 484.5 mm. contg. 63.75 mole %  $\bar{C}$  {191}; b.p. 55.22° at 385.2 mm. contg. 67.75 mole %  $\bar{C}$  {191}; b.p. 47.36° at 285.7 mm. contg. 72.6 mole %  $\bar{C}$  {191}: for study of thermodynamics of system see {193}. —  $\bar{C}$  + *methyl propionate* (1:3020):  $\bar{C}$  forms with *methyl propionate* a const.-boilg. mixt., b.p. 75.5° at 760 mm.,

contg. 60 wt. % = 46 mole % (175); b.p.  $76^\circ$  at 760 mm. contg. about 75 wt. % (194)  $\bar{C}$ . —  $\bar{C}$  + *n*-Pr formate (1:2030):  $\bar{C}$  forms with *n*-propyl formate a const.-boilg. mixt., b.p.  $74.6^\circ$  at 760 mm., contg. about 69 wt. %  $\bar{C}$  (184).

$\bar{C}$  + nitromethane:  $\bar{C}$  forms with nitromethane a const.-boilg. mixt., b.p.  $71.3^\circ$  at 760 mm., contg. about 83 wt. %  $\bar{C}$  (184). —  $\bar{C}$  + 1,2-dichloroethane (3:5130):  $\bar{C}$  forms with ethylene dichloride a const.-boilg. mixt., b.p.  $75.30^\circ$  at 760 mm., contg. about 70 mole %  $\bar{C}$  (49) cf. (159); b.p. about  $76^\circ$  at 760 mm. contg. 79 wt. %  $\bar{C}$  (185).

### TERNARY AZEOTROPES CONTAINING $\bar{C}$

$\bar{C}$  + EtOH (1:6130) + aq: this system forms a ternary two-phase const.-boilg. mixt., b.p.  $61.8^\circ$  at 760 mm. (181) (175), contg. 86.3 wt. % = 57.6 mole %  $\bar{C}$  + 10.3 wt. % = 23.0 mole % EtOH + 3.4 wt. % = 19.4 mole % aq; for use of this azeotrope in detn. of water content of wood see (195). —  $\bar{C}$  + *n*-PrOH (1:6150) + aq: this system forms a ternary two-phase const.-boilg. mixt., b.p.  $54.4^\circ$  at 760 mm., contg. 54.4 mole %  $\bar{C}$  + 18.0 mole % *n*-propyl alc. + 27.6 mole % aq. (175). —  $\bar{C}$  + allyl alc. (1:6145) + aq: this system forms a const.-boilg. mixt., b.p.  $65.4^\circ$  at 760 mm., contg. 90.43 wt. % = 64.5 mole %  $\bar{C}$  + 5.44 wt. % = 10.4 mole % allyl alc. + 4.13 wt. % = 25.1 mole % aq. (187); b.p.  $65.15^\circ$  at 760 mm. contg. 53.8 mole %  $\bar{C}$  + 18.7 mole % allyl alc. + 27.5 mole % aq. (175). —  $\bar{C}$  + *ter*-BuOH (1:0140) + aq: this system forms a const.-boilg. mixt., b.p.  $64.7^\circ$  at 768 mm., contg. about 85 wt. %  $\bar{C}$  + 11.9 wt. % *ter*-BuOH + 3.1 wt. % aq. (188).

$\bar{C}$  + methyl ethyl ketone (1:5405) + aq: this system gives a const.-boilg. mixt., b.p.  $65.7^\circ$  at 760 mm., contg. 76.9 wt. %  $\bar{C}$  + 20.1 wt. % methyl ethyl ketone + 3.0 wt. % aq. (188); for use of this azeotrope in detn. of water in wood see (195).

### OTHER SELECTED PHYSICAL CHARACTERISTICS OF $\bar{C}$

[For studies of thermal conductivity of  $\bar{C}$  see (196) (197) (198); for studies of heat capacity of  $\bar{C}$  (39) (15) (183) as calcd. from spectroscopic data (199) (200) see indic. refs.; for studies of specific heat of  $\bar{C}$  see (21); for studies of heat of fusion and/or of transition see (39) (15) (36) (86) (157); for studies on ebullioscopic const. of  $\bar{C}$ , viz.,  $4.88^\circ$  (201),  $4.68^\circ$  (202) per mole solute in 1000 g.  $\bar{C}$ , see indic. refs.; for studies on cryoscopic const. of  $\bar{C}$ , viz.,  $29.9^\circ$  (203),  $29.8^\circ$  (204) per mole solute in 1000 g.  $\bar{C}$ , see indic. refs.]

[For studies of adsorption of  $\bar{C}$  on various carbons (205) (206) (207) (208) (209) (210) (211) (212) (213) at low press. (214) (215), animal charcoal (216), wood or coconut charcoal (217) (218) (219) (220) (221) (222) (223) (224), alumina gel (225) (226), silica gel (227) (224) (228), Fe(OH)<sub>3</sub> gel (229) (230), Cr(OH)<sub>3</sub> gel (231), TiO<sub>2</sub> gel (232), or mica (233) see indic. refs.]

### PHYSIOLOGICAL ASPECTS OF $\bar{C}$

$\bar{C}$  (as vapor) does not cause acute poisoning until exposure for 30 min. to concns. of 1000–1500 p.p.m. (234) but constant exposure to concns. above 100 p.p.m. (234) (235) or even 50 p.p.m. (236) will cause serious physiological disturbances. The least concn. of  $\bar{C}$  in air detectable by odor is 71.8 p.p.m. (237). For further studies of toxicity and industrial hygiene of  $\bar{C}$  see (238) (239) (240); for study of comparative toxicity of  $\bar{C}$  and 1,1,2-trichloroethylene (3:5170) see (241).

### USES OF $\bar{C}$

$\bar{C}$  is widely used as solvent, fire extinguisher, fumigant, anthelmintic, etc.; although any detailed survey of these aspects is beyond the scope of this book, a few special uses are cited. [For study of use of  $\bar{C}$  as solvent for ozonization see (24); for use in concn. of HNO<sub>3</sub> (242)

or AcOH (243) or in drying of higher alcs. (244) see indic. refs.; for use of molecular compound (245) of  $\bar{C}$  with rotenone in extraction (245) and detn. (246) (247) (248) of rotenone see indic. refs.]

### DETECTION OR DETERMINATION OF $\bar{C}$

Detection of  $\bar{C}$ . [For detection of  $\bar{C}$  in pres. of  $CHCl_3$  (3:5050) q.v. by methods based on differences in aq. soly. (249), or on solv. power for papaverine HCl (250) or quinine sulfate (251), or on color reactions with pyrocatechol (1:1520) (252) (253),  $\alpha$ -naphthol (1:1500) (254) cf. (255), or 2,7-dihydroxynaphthalene (255) cf. (254) (for further details on last two see at end of text of this compd. under  $\bar{O}$ ), see indic. refs. For review of literature of tests for  $\bar{C}$  see (256).]

Note that  $\bar{C}$  does *not* (251) reduce Fehling soln. [dif. from  $CHCl_3$  (3:5050)].

Determination of  $\bar{C}$ . Methods for the detn. of  $\bar{C}$  are based upon both physical and chemical procedures or combinations of the two.

Physical methods include those based upon adsorption of  $\bar{C}$ , e.g., on activated carbon (257) or silica gel (258); by thermal conductivity of vapor of  $\bar{C}$  (259); by measurement of vapor press. (260); or on interference refractrometry (234).

Chemical methods include those based upon decompn. of  $\bar{C}$  by combustion and/or hydrolysis followed by detn. of HCl or of chloride ion, or those based upon color reactions. [For examples of methods based upon combustion followed by detn. of HCl (261) (262) (263) (264) (265) (266) (267) (268) (269) (for combustion in  $H_2$  see (269)); methods based upon hydrolysis with nlo. alk. (270) (271) (272) or reduction with Na + ethanolamioe (273) (274) followed by detn. of chloride ion; or methods based upon use of color (Fujiwara) reaction with pyridine + alkali (275) (276) (277) (278) see indic. refs.]

### DETECTION OF OTHER COMPOUNDS IN $\bar{C}$

[For studies on removal of  $CHCl_3$  (3:5050) from  $\bar{C}$  by digestion with Fehling soln. at 60–70° for several hrs. (280); on detection in  $\bar{C}$  of  $CS_2$  by addn. of MeOH (1:6120) and formn. of  $CS_2$ /MeOH azeotrope of h.p. 37.1° nt 751 mm. (188) or by use of xanthate reaction (281); on removal of  $CS_2$  from  $\bar{C}$  by use of nlc. hydrazine hydrate (282) see indic. refs.; for detection in  $\bar{C}$  of carbonyl chloride see (283) (284) (285) (286) and also under phosgene (3:5000).]

### PREPARATION OR FORMATION OF $\bar{C}$

The principal methods of prepn. of  $\bar{C}$  are those involving chlorination of  $CS_2$  or of hydrocarbons, but many other procedures have been studied as exemplified below.

From carbon disulfide. [Prepn. of  $\bar{C}$  from  $CS_2$  by action of  $Cl_2$  was first effected (287) by passage through red-hot tube; in subsequent development of this method use of various catalysts has been found to reduce the required temperature. The overall reaction is believed to occur in two stages, viz., (1)  $CS_2 + 3Cl_2 \rightarrow CCl_4 + S_2Cl_2$  and (2)  $CS_2 + 2S_2Cl_2 \rightarrow CCl_4 + 6S$ . The resultant sulfur may be recovered and used again in prepn. of  $CS_2$ .]

[For an extensive account of prepn. of  $\bar{C}$  prior to 1906 see monograph of Margosches (288); for longer summary as of 1938 see (289); for still later patents and articles on use of  $Cl_2$  (290) (291) (292) (293) (294) (295) or various sulfur chlorides (296) (297) (298) (299) see indic. refs.]

[For studies on use of various catalysts, e.g.,  $Br_2$  (300),  $I_2$  (301),  $I_2 + Fe$  (302),  $MoCl_5$  (303),  $SbCl_5$  (304), or  $FeCl_3$  (304), see indic. refs.; note that  $CS_2$  reacts with  $SbCl_5$  even without addn. of  $Cl_2$  to give  $\bar{C}$  (305).]

[Note that in chlorination of  $\text{CS}_2$  with restricted amts.  $\text{Cl}_2$  various intermediate carbon chlorosulfides have been detected (306) (307).]

From methane. The formation of  $\bar{\text{C}}$ , together with  $\text{CH}_3\text{Cl}$  (3:7003),  $\text{CH}_2\text{Cl}_2$  (3:5020),  $\text{CHCl}_3$  (3:5050), and other products, has been very extensively studied from many viewpoints. The literature of this reaction is diffuse and interlocked with that of methane and of the various other chlorination products. For this reason and because detailed treatment of this topic is beyond the scope of this book, the following citations must be regarded only as leading references.

[The formn. of  $\bar{\text{C}}$  from  $\text{CH}_4$  by action of  $\text{Cl}_2$  was first discovered in 1840 by Dumas (308). For examples of more recent technical papers ((309)–(317), incl.) and patents ((318)–(332), incl.) see indic. refs.]

From other hydrocarbons. [For examples of patents on prepn. of  $\bar{\text{C}}$  from aliph. hydrocarbons higher than methane (including in some cases also their halogen derivatives) see (313) (333) (334) (335) (336) (337). — For prepn. of  $\bar{\text{C}}$  from acetylene +  $\text{Cl}_2$  + cat. nt 100–200° (338) or with  $\text{Cl}_2$  + eutectic of  $\text{AlCl}_3/\text{NaCl}/\text{FeCl}_3$  at 175–200° (339) see indic. refs. (see also below under prepn. of  $\bar{\text{C}}$  from tetrachloroethylene). — For prepn. of  $\bar{\text{C}}$  from naphthalene by destructive chlorination see (340).]

From various chloro and polychloro compounds. [For technical papers on prepn. of  $\bar{\text{C}}$  from chlorinolysis of various chloro and polychloroparaffins (341) or chloropentanes (342) see indic. refs.]

[For patents on prepn. of  $\bar{\text{C}}$  from tetrachloroethylene (3:5460) with  $\text{Cl}_2$  nt 700–800° (343) or with  $\text{Cl}_2$  over activated carbon at 600–650° (337) see indic. refs.; for study of this reaction see (344). For formn. of  $\bar{\text{C}}$  from hexachloroethane (3:4835) pyrolyzed in air at 550–600° see (342).]

[For prepn. of  $\bar{\text{C}}$  from  $\text{CHCl}_3$  (3:5050) by chlorination with  $\text{Cl}_2$  in sunlight (first prepn. of  $\bar{\text{C}}$ ) (345) or u.v. light (346) (347) (348) (349), nt 260–300° (350), or in pres. of  $\text{FeCl}_3$  (351) or of nq. (352), or from  $\text{CHCl}_3$  with  $\text{ICl}$  at 165° (353), or with  $\text{NaOCl}$  (reaction very slow and incomplete (354)), see indic. refs.]

[For formn. of  $\bar{\text{C}}$  from  $\text{CFCl}_3$  with  $\text{AlCl}_3$  see (355); from  $\text{CBrCl}_3$  with  $\text{Cl}_2$  in dark at 100° (356) or in light (357) (358) see indic. refs.]

From miscellaneous sources. [For formn. of  $\bar{\text{C}}$  from charcoal or other form of carbon +  $\text{Cl}_2$  see patents (359) (361) and technical papers (344) (360); from trichloroacetyl chloride (3:5420) on htg. with  $\text{AlCl}_3$  (362) or pyrolysis through glass tube at 600° (363), from trichloromethyl chloroformate (3:5515) on htg. with  $\text{AlCl}_3$  (364), from chloral (3:5210) with  $\text{Cl}_2$  in sunlight (365), or from acetone (1:5400) with  $\text{NaOCl}$  soln. (366) cf. (354), or from phosgene (3:5000) on htg. with cat. (344) cf. (372), see indic. refs.]

[For formn. of  $\bar{\text{C}}$  from dimethyl sulfide [Beil. I-238, I<sub>1</sub>-(144), I<sub>7</sub>-(276)] with  $\text{Cl}_2$  +  $\text{I}_2$  at 100–120° in daylight see (367) (368) (369); from trichloromethyl sulfur chloride ("perchloromethyl mercaptan") [Beil. III-135, III<sub>1</sub>-(63), III<sub>2</sub>-(106)] on htg. with Fe filings or  $\text{ZnF}_2$  (370) cf. (307) (371) or with  $\text{Cl}_2$  +  $\text{I}_2$  in sunlight (370) see indic. refs.; from thiophosgene [Beil. III-134, III<sub>1</sub>-(63), III<sub>2</sub>-(105)] with Fe nt 37° for many months or from "trichloromethyl dithiochloroformate" [Beil. III-215, III<sub>2</sub>-(155)] with Fe in s.t. at 100° see (307).]

### CHEMICAL BEHAVIOR OF $\bar{\text{C}}$

Pyrolysis of  $\bar{\text{C}}$ . [ $\bar{\text{C}}$  on pyrolysis at 600–1500° (373) (374) cf. (344) (375) (376) gives tetrachloroethylene (3:5460) (80% yield (374)), hexachloroethane (3:4835), and other products.  $\bar{\text{C}}$  by action of electric arc (377) cf. (378), dark electric discharge (in  $\text{H}_2$ ) (379), radium emanation (350), gives hexachloroethane (3:4835) and various other products.]

[Note also that  $\bar{C}$  in X-radiation (381) (382) or ultrasonic radiation (383) splits off some  $Cl_2$ . For action of X-radiation on mixts. of  $\bar{C}$  with aq.,  $CHCl_3$ ,  $CHI_3$ , lgr., or cyclohexane see (381) (384); for decompn. of  $\bar{C}$  in u.v. light below 2750 Å see (385).]

**Oxidation of  $\bar{C}$ .**  $\bar{C}$  under various oxidizing conditions yields phosgene and other products. [E.g.,  $\bar{C}$  with  $O_2$  in light of 2537 Å (386) or with atomic oxygen (387) gives carbonyl chloride (3:5000);  $\bar{C}$  with  $O_2$  over white-hot Pt (375), or with air over  $CuCl_2$  or  $FeCl_3$  at elev. temp. (388), or  $\bar{C}$  over  $GeO_2$  (389), or  $\bar{C}$  with pyrosulfuryl chloride (1 mole) + sulfuric acid monohydrate (2 moles) on warming (390) (391) (392) (393) gives phosgene (3:5000). For formn. of phosgene (3:5000) q.v. during thermal decompn. of  $\bar{C}$  (as in use as fire extinguisher) see (394), also below under behavior of  $\bar{C}$  with metals.] [Note that  $\bar{C}$ , unlike  $CHCl_3$  (3:5050), is *not* oxidized by Fehling soln.]

**Reduction of  $\bar{C}$ .** [ $\bar{C}$  with  $K/Hg$  + aq. gives (395) methane;  $\bar{C}$  with  $Fe(OH)_2$  + aq. alk. gives (396)  $CH_2Cl_2$  (3:5020) +  $CHCl_3$  (3:5050);  $\bar{C}$  with  $Zn$  +  $H_2SO_4$  (397) (398), finely divided  $Fe$  + aq. (399) + cat. (400) (401), or on electrolytic reduction (402) gives  $CHCl_3$  (3:5050). For behavior of  $\bar{C}$  with atomic hydrogen see (403).]

[Note that  $\bar{C}$  +  $H_2$  over pumice in hot tube gives (404)  $CHCl_3$  (3:5050),  $CH_2Cl_2$  (3:5020), tetrachloroethylene (3:5460) + hexachloroethane (3:4835), and at red heat (395) methane and ethylene.  $\bar{C}$  with excess  $H_2$  over reduced  $Ni$  at 270° gives (405) hexachloroethane (3:4835) +  $HCl$ .]

**Substitution of  $\bar{C}$ .**  $\bar{C}$  by reaction with  $F_2$ , metallic fluorides, or  $HF$ , etc., each in the presence of appropriate catalysts, undergoes replacement of one or more of its chlorine atoms by fluorine and consequent formation of mixed derivatives such as  $CCl_3F$ ,  $CCl_2F_2$  ("Freon" = "Freon-12" "F-12"),  $CClF_3$ , etc., to whose properties as refrigerants, etc., much attention is currently being given. [Detailed analysis of the conversion of  $\bar{C}$  to these materials is far beyond the scope of this book, but for examples of leading technical papers (406) (407) (408) (409) (410) (411) and patents ((412)-(429)) see indic. refs.] (See also below under behavior of  $\bar{C}$  with inorganic salts.)

**Hydrolysis of  $\bar{C}$ .** [ $\bar{C}$  with aq. on long exposure (e.g., 7 months (430)) to sunlight gives  $CO_2$  +  $HCl$ ;  $\bar{C}$  with large excess of aq. in s.t. at 250° also gives  $CO_2$  +  $HCl$ , but  $\bar{C}$  with very small proportion of aq. under same conditions gives (431) some phosgene (3:5000). At ord. temp. hydrolysis of  $\bar{C}$  by pure aq. is scarcely perceptible, but in presence of  $Fe$ ,  $Cu$ , acid, or alkali, hydrolysis is strongly accelerated especially at higher temperatures (432).  $\bar{C}$  is hydrolyzed by aq. + reduced  $Fe$  but not by aq.  $NaHCO_3$  (342) under reflux.]

[ $\bar{C}$  with boilg. alc. alk. is eventually completely hydrolyzed (use in detn. of  $\bar{C}$  by estimation of resultant chloride ion (see above)); however, reaction is slow and with  $N$  aq. or alc.  $KOH$  or  $NaOEt$  at 60° is very slight in 2 hrs. (433). For study of rate of hydrolysis of  $\bar{C}$  with  $KOH$  in 95% alc. (434) cf. (435), or with  $Ba(OH)_2$  or  $TiOH$  in 50% alc. (436), see indic. refs.]

**Behavior of  $\bar{C}$  with inorganic salts.** [ $\bar{C}$  with  $AlBr_3$  at room temp. for 3 days gives (358)  $CBrCl_3$  [Beil. I-67, I<sub>2</sub>-(31)], b.p. 104.2-104.35° at 758.5 mm. (358), but  $\bar{C}$  with  $AlBr_3$  at 60° gives (437) cf. (438)  $CBr_4$  [Beil. I-68, I<sub>1</sub>-(17), I<sub>2</sub>-(35)], m.p. 94°, b.p. 189.5° at 760 mm. with slight decompn. (439).]

[ $\bar{C}$  with  $AlI_3$  (440),  $Al$  +  $I_2$  in  $CS_2$  (441),  $CaI_2$  +  $2H_2O$  or  $LiI$  +  $1.5H_2O$  in evacuated s.t. at 90-92° for 5 days (50-55% yield (442)) (443), with  $BI_3$  (444), or  $\bar{C}$  (1 mole) +  $C_2H_5I$  (4 moles) +  $AlCl_3$  (0.1 mole) (445), or best  $\bar{C}$  (0.7 mole) with  $CH_3I$  (2.94 moles) +  $AlCl_3$  (0.015 mole) at 40° (92% yield (446)) gives carbon tetraiodide,  $CI_4$  [Beil. I-74, I<sub>1</sub>-(19), I<sub>2</sub>-(39)].]

$\bar{C}$  with alc.  $AgNO_3$  does not react even after several days; note that in this respect  $\bar{C}$  behaves like  $CH_2Cl_2$  (3:5020) and  $CHCl_3$  (3:5050) while  $CH_3Cl$  (3:7005) gives a ppt. within 3 hrs. (446).

Behavior of  $\bar{C}$  with metals.  $\bar{C}$  with alkali or even alkaline-earth metals undergoes explosive decompn. on htg. or even at room temp. if subjected to sufficient mechanical shock. [For studies on the explosion of  $\bar{C}$  with alkali metals see (477) (448); for further studies on explosion of  $\bar{C}$  with Li, Na, K, Ca, Sr, Ba, Mg, Al, and Tl, especially with reference to sensitivity to mechanical shock, see (449). — For behavior of  $\bar{C}$  with Na vapor see (450); for rate of reaction of  $\bar{C}$  with Na atoms see (451); for study of  $\bar{C}$  + Na/Hg as means of sepn. of isotopes of chlorine see (452) cf. (453).]

[For study of hazards of behavior of  $CCl_4/CHCl_3$  mixts. with Mg (454) (455) or Al (454) see indic. refs., note also that  $\bar{C}$  refluxed with Al powder (456) or Al/Hg (457), or  $\bar{C}$  with Al +  $AlCl_3$  at 60–75° (458), or  $\bar{C}$  with Cu powder at 120° (458) or molecular Ag at 200° (431) gives (yields. 80% (456), 65% (457)) hexachloroethane (3:4835).]

Note that  $\bar{C}$  with Mg in boilg. ether does not react, even in the presence of various catalysts (459).

[For extensive study of corrosion of metals by  $\bar{C}$  (460) cf. (461) (462) (463) (432) see indic. refs.]

Behavior of  $\bar{C}$  with other inorganic reactants. [ $\bar{C}$  is claimed to be unaffected by conc.  $H_2SO_4$  at 237° (464) although over  $H_2SO_4$  on pumice at 150°  $\bar{C}$  is reported (465) to give  $HCl$ ,  $SO_2$ ,  $COCl_2$  +  $CO_2$ ]

[For study of photochem. reaction of  $\bar{C}$  with  $H_2S$  giving hexachloroethane (3:4835) + S +  $CCl_3SH$  see (466); for studies on photochem. decompn. of  $Cl_2O$  in  $\bar{C}$  see (467) (468) (469) (470) cf. (471); for behavior of  $\bar{C}$  with  $Br_2O$  giving phosgene (3:5000) +  $Cl_2$  +  $Br_2$  see (472).]

[ $\bar{C}$  with  $NH_3$  under high press. in pres. of Cu +  $I_2$  at 140° for 17 hrs. gives (35–40% yield (473)) guanidine hydrochloride [Beil. III 82, III<sub>1</sub>-(39), III<sub>2</sub>-(69)]. —  $\bar{C}$  with hydrazine hydrate in stream of  $NH_3$  refluxed for several days gives (poor yield (474))  $N,N',N''$ -triaminoguanidine [Beil. III-122, III<sub>1</sub>-(57), III<sub>2</sub>-(97)], as monohydrochloride, m.p. 228° dec.]

Behavior of  $\bar{C}$  with organic reactants. With carbon monoxide. [ $\bar{C}$  with CO +  $AlCl_3$  at 200° and 250 atm for 6 hrs gives (37% yield (475)) trichloroacetyl chloride (3:5420).]

With hydrocarbons. [ $\bar{C}$  (excess) with octene-1 (1:8375) in pres. of small amts. (0.02 mole) of dibenzoyl peroxide (or diacetyl peroxide) adds to unsatd. linkage giving (476) 1,1,1,3-tetrachlorooctane; under similar conditions  $\bar{C}$  adds to one of the unsatd. linkages of diallyl (1:8045) giving 5,7,7,7-tetrachloroheptene-1 or to both giving 1,1,1,3,6,8,8,8-octachloro-octane. — For other addns of  $\bar{C}$  to olefin linkages see below.]

[ $\bar{C}$  with  $C_6H_6$  in pres. of  $AlCl_3$  gives according to conditions triphenylchloromethane (3:3410) (477), triphenylmethane (1:7220) (478), or benzophenone (1:5150) (479). Other arom. hydrocarbons and aryl halides behave similarly but cannot be detailed here.]

With saturated halohydrocarbons.  $\bar{C}$  (0.7 mole) with MeI (2.94 moles) +  $AlCl_3$  (0.015 mole) at 40° gives (92% yield (446)) carbon tetraiodide (see also above under behavior of  $\bar{C}$  with inorganic salts). —  $\bar{C}$  with  $CBr_4$  in pres. of slightly moistened  $AlCl_3$  at 170° for 7 hrs. undergoes a redistribution reaction giving (480) an equil. mixt. of  $CCl_4$ ,  $CCl_3Br$ ,  $CCl_2Br_2$ ,  $CClBr_3$ , and  $CBr_4$ ]

With unsaturated halohydrocarbons. [ $\bar{C}$  with ord. 1,2-dichloroethylene (3:5030) +  $AlCl_3$  gives (481) (482) cf. (483) 1,1,1,2,3,3,3-heptachloropropane (3:6460); for reaction of this system yielding heptachloropentenes see (483).]

[ $\bar{C}$  with trichloroethylene (3:5170) +  $AlCl_3$  at 20–30° for 48 hrs. gives (49% yield (484)) (481) (482) 1,1,1,2,3,3,3-heptachloropropane (3:6560).]

With alcohols or alcoholates. [ $\bar{C}$  with MeOH over cat. at 200–350° gives (485) MeCl (3:7005);  $\bar{C}$  with EtOH under similar circumstances gives EtCl (3:7015).]

[ $\bar{C}$  with  $NaOCH_3$  would be expected to yield tetramethyl orthocarbonate [Beil. III<sub>2</sub>-(4)],

h.p. 112–113° at 724 mm. (486),  $n_D^{12} = 1.3841$  (486), but this reaction is unreported, the expected prod. having been made only by other methods. —  $\bar{C}$  with  $\text{NaOC}_2\text{H}_5$  would be expected to yield tetraethyl orthocarbonate [Beil. III-5, III<sub>1</sub>-(4), III<sub>2</sub>-(5)], h.p. 157–158° (487), 59.6–60° at 14 mm. (486),  $D_4^{18.5} = 0.9197$  (488),  $n_D^{18.5} = 1.39354$  (488), but this reaction is unreported cf. (505); however, the prod. has been prepd. from  $\text{CBr}_4$  with  $\text{NaOEt}$  in dry ether in s.t. at 170° (457), from "thiocarbonyl tetrachloride,"  $\text{CSCl}_4$  cf. (459) refluxed in dry ether with  $\text{NaOEt}$ , and in other ways.]

*With mercaptans or mercaptides.* [ $\bar{C}$  with  $\text{NaSCH}_3$  might be expected to give tetramethyl tetrathioorthocarbonate,  $\text{C}(\text{SCH}_3)_4$ , but this appears to be unreported;  $\bar{C}$  with  $\text{NaSCH}_3$  has been found (492) to react differently giving trimethyl trithioorthoformate [Beil. II<sub>7</sub>-(39)], m.p. 16° (493), h.p. 220° dec. (493), 103–104° at 12 mm. (492), 96° at 9 mm. (493),  $n_D^{15} = 1.5696$  (492), and dimethyl disulfide, b.p. 39–41° at 18 mm. (492). —  $\bar{C}$  with  $\text{NaSC}_2\text{H}_5$  is claimed (491) to give the expected homologous tetraethyl tetrathioorthocarbonate  $\text{C}(\text{SC}_2\text{H}_5)_4$ , but this material was not well characterized, and  $\bar{C}$  with  $\text{NaSC}_2\text{H}_5$  has subsequently (492) been found to give triethyl trithioorthoformate [Beil. II-95, II<sub>7</sub>-(39)], b.p. 235° dec. (493), 174° at 760 mm. (494),  $D_4^{20} = 1.053$  (495),  $n_D^{15} = 1.5410$  (492). — For behavior of  $\bar{C}$  with salts of *n*-propyl, *n*-butyl, and *ter*-butyl mercaptans see (492).]

*With phenols or phenolates.* [ $\bar{C}$  with phenol (1:1420) in pres. of  $\text{ZnCl}_2 + \text{ZnO}$  at 120° gives (496) diphenyl carbonate (1:2335), various dihydroxybenzophenones, and other products; for analogous study of  $\bar{C}$  with *o*-cresol (1:1400) see (497).]

[ $\bar{C}$  with *K* phenolate at 170° gives mainly (498) aurin (paraosolic acid) (4'-4''-dihydroxy-fuchson) [Beil. VIII-361, VIII<sub>1</sub>-(671)]; for analogous behavior of  $\bar{C}$  with *K o*-cresolate and *K m*-cresolate see (498).]

*With diacyl peroxides.* [ $\bar{C}$  refluxed with di-*n*-butyryl peroxide for 17 hrs. gives (499) *n*-propyl chloride (3:7040) + hexachloroethane (3:4835) + ethyl *n*-butyrate (1:3127);  $\bar{C}$  refluxed similarly with di-*n*-isobutyryl peroxide gives (499) isopropyl chloride (3:7025) + hexachloroethane (3:4835) + ethyl isobutyrate (1:3095).]

[ $\bar{C}$  with di- $\alpha$ -naphthyl peroxide under reflux gives (500)  $\text{CO}_2$ ,  $\alpha$ -chloronaphthalene (3:6878),  $\alpha$ -naphthoic acid (1:0785), and other products;  $\bar{C}$  with di- $\beta$ -naphthyl peroxide under reflux gives (500)  $\text{CO}_2$ ,  $\beta$ -chloronaphthalene (3:1285),  $\beta$ -naphthoic acid (1:0800), and other products.]

[ $\bar{C}$  with dibenzoyl peroxide under reflux gives (501) (502) (503) 4-(trichloromethyl)-benzoic acid, hexachloroethane (3:4835), phosgene (3:5000), chlorobenzene (3:7903), and other products; for study of kinetics of reaction see (504).]

*With salts of enolic esters.* [ $\bar{C}$  with diethyl sodio-malonate (505) (507) or with diethyl disodio-malonate (506) (507) (508) (509) gives the Na enolate of tetraethyl  $\alpha,\gamma$ -dicarboxy-glutaconate,  $(\text{C}_2\text{H}_5\text{OOC})_2\text{C}=\text{CH}-\text{CH}(\text{COOC}_2\text{H}_5)_2$  [Beil. II-876, II<sub>7</sub>-(336), II<sub>7</sub>-(710)], h.p. 208–210° at 23 mm. (510), 200–204° at 18 mm. (510); note that this product is also obtd. from  $\text{CHCl}_3$  (3:5050) with diethyl sodio-malonate (505) (511) (512) (513) (514) (515) (516) (517).]

[ $\bar{C}$  with 4 moles of Na enolate of ethyl cyanoacetate in alc. at 100° gives (505) cf. (508) the sodium enolate of diethyl  $\alpha,\gamma$ -dicyanoglutaconate,  $\text{C}_2\text{H}_5\text{OOC}-\text{C}(\text{CN})=\text{CH}-\text{CH}(\text{CN})\text{COOC}_2\text{H}_5$  [Beil. II-878, II<sub>7</sub>-(712)], also obtd. from  $\text{CHCl}_3$  (3:5050) with the Na enolate of ethyl cyanoacetate (518) (519) (520).]

*With amines.* The behavior of  $\bar{C}$  with amines has been little studied. [For studies on the behavior of  $\bar{C}$  with aniline (521) and also with other aromatic amines in pres. of Cu powder (522) or  $\text{I}_2$  (523) see indic. refs.]

Ⓔ Color reaction with  $\alpha$ -naphthol/cyclohexanol.  $\bar{C}$  (1 drop) with 2 mL of a 2% soln. of  $\alpha$ -naphthol (1:1500) in cyclohexanol (1:6415) + 1 pellet of solid NaOH, boiled

25 seconds and cooled, gives (254) blue color; one portion of this blue solution under-laid with equal volume 85%  $H_2SO_4$ , stood 1 min and shaken, remains blue; a second portion of the alkaline blue soln. acidified with equal vol.  $AcOH$  (1:1010), stood 1 min. and shaken, becomes red. [Note that the alkaline boilg. also gives a blue color with  $CH_2Cl_2$  (3.5020) and with  $CHCl_3$  (3.5050), while other chlorinated solvents (254) give yellow-brown, gray, or brown; in the  $H_2SO_4$  acidification  $CH_2Cl_2$  (3.5020) gives greenish blue, while both  $CHCl_3$  (3.5050) and  $\bar{C}$  give intense blue; in the  $AcOH$  acidification  $CH_2Cl_2$  (3.5020) gives yellow while  $CHCl_3$  (3.5050) gives an orange-yellow color]

③ Color test with 2,7-dihydroxynaphthalene/cyclohexanol.  $\bar{C}$  (1 drop) with 2 ml. pure cyclohexanol (1.6415) + 1 pellet  $NaOH$  + a few mgms 2,7-dihydroxynaphthalene htd at  $197^\circ$  (b.p. of ethylene glycol) for 45 seconds, decanted from undissolved  $NaOH$ , cooled, and shaken with 2 ml.  $AcOH$  + 4 ml 96%  $EtOH$ , gives a pale yellow-brown color (255). [Note that under these conditions  $CH_2Cl_2$  (3.5020) gives a steel-blue color while  $CHCl_3$  (3.5050) gives a deep red color.]

④ Color test with cyclopentanol.  $\bar{C}$  (1 drop) in 1 ml. cyclopentanol (1.6412) + 1 pellet  $NaOH$  boiled 25 seconds, then shaken vigorously for 35 seconds, and treated with 4 ml. 96%  $EtOH$  and shaken, gives an intense brown color (255) [Note that, after addition of alc.,  $CH_2Cl_2$  (3.5020) gives a more intense red or becomes reddish brown while  $CHCl_3$  (3.5050) gives only a pale citron-yellow. By comparing with authentic known samples, this test is claimed (255) to be able to detect as little as 5%  $\bar{C}$  in  $CHCl_3$ .]

See also Notes 1 and 2.

Note 1. For b.p. of  $\bar{C}$  at press. 660-860 mm. (25), 400-1080 mm. (2), see indic. refs.;  $\bar{C}$  has b.p. 84.9-85.5° at 777 mm. (53).

Note 2. For vap. press. of  $\bar{C}$  over range -30 to 100° (1), or 0-30° (8), or 0-25° (55) see indic. refs.; for relation between vap. press. and temp. see (56) (25).

Note 3. For values of  $n^{18.4}$  at 14 different wave lengths see (57).

Care must be taken to avoid confusion of  $\bar{C}$  with either *cis* (3:5042) or *trans* (3:5028) 1,2-dichloroethylene.

## MISCELLANEOUS PHYSICAL PROPERTIES

Various solubility relations.  $\bar{C}$  is almost insol. aq., but easily volatile with steam (see under azeotropes); soly. of  $\bar{C}$  in 100 g. aq. at  $0^\circ$  is 0.873 g. {58}, 0.922 g. {8}; at  $10^\circ$  = 0.885 g. {8}; at  $15^\circ$  = 0.872 g. {59}, at  $20^\circ$  = 0.869 g. {8}, 0.849 g. {58}; at  $25^\circ$  = 0.865 g. {15}; at  $30^\circ$  = 0.90 g. {59}, 0.894 g. {8}; at  $35^\circ$  = 0.895 g. {58}; at  $56^\circ$  = 1.030 g. {58}. — [For influence of added salts in diminishing soly. of  $\bar{C}$  in aq. see {16}. — Note that  $\bar{C}$  with aq. under press. forms a solid hydrate which can be maintained up to  $+18^\circ$  under 100 atm. but which at ord. press. decomposes below  $0^\circ$  {60}. — For soly. of aq. in  $\bar{C}$  at  $0^\circ$ ,  $25^\circ$ , and  $30^\circ$  (as detd. by Karl Fischer reagent.) see {61}.]

[For soly. in  $\bar{C}$  of  $\text{NH}_3$  at  $20^\circ$  and 1 atm. {62}, of  $\text{H}_2\text{S}$  at  $20^\circ$  and 1 atm. {62}, of  $\text{HCl}$  at various temps. and press. {62} {63}, of ethylene at  $0-40^\circ$  {4}, or of chlorine at  $-9^\circ$  to  $+40^\circ$  {4} see indic. refs.]

[For soly. in  $\bar{C}$  of  $\text{I}_2$  over range  $11-25^\circ$  (and comparison with other chlorinated solvents) see {64}.]

[For study of industrial recovery of  $\bar{C}$  by countercurrent absorption in kerosene see {65}.]

Adsorption of  $\bar{C}$  by solids. [For studies on adsorption of  $\bar{C}$  by activated carbon {66} {67} {68} {69} {70}, by silica gel {67}, or by alumina gel {71} see indic. refs. — For patent on sepn. of  $\bar{C}$  from nther solvents by adsorption on carbon see {72}.]

Other properties. [For study of thermal conductivity of  $\bar{C}$  see {73}; for study of diffusion of vapors of  $\bar{C}$  through films of various cellulose esters see {74}.]

Binary systems contg.  $\bar{C}$ . (See also azeotropes (below).)

$\bar{C}$  with hydrocarbons —  $\bar{C}$  + *n*-heptane (1:8575): use in testing of distg. columns (detn. of number of theoret. plates) see {75}. —  $\bar{C}$  + cyclohexane (1:8405): for values of  $D_0^{20}$  and  $n_D^{20}$  {49}, for use in detn. of number of theoret. plates in distg. columns {75}, or for sepn. of  $\bar{C}$  from system by forming azeotrope of cyclohexane with  $\text{MeOH}$  {76}, see indic. refs. (see also below under azeotropes).

$\bar{C}$  + benzene (1:7400): note that because of the proximity of the b.p.'s of the components, because of the importance of both as industrial solvents, and because they are not readily separable by chemical means (such as  $\text{H}_2\text{SO}_4$ , etc.) a great deal of study has been given to the system from various viewpoints.

For l.p./compn. data on system  $\bar{C}$  +  $\text{C}_6\text{H}_6$ , eutectic, f.p.  $-54.2^\circ$ , contg. about 67 mole %  $\bar{C}$  see {24} cf. {77}; for  $D_0^{20}$  {78} {79},  $n_D^{20}$  {78} {79} {49}, or  $n_D^{25.2}$  {80} {89} cf. {81} see indic. refs. — For use of this system as test liq. for studying efficiency of distn. columns see {81} {78} {79} {82}, for study of distn. of the system see {78} {79} {81} {82} {83} {84} {85}; for use in detn. number of theoret. plates see {75} {78}; for data on vap. press. of system, vapor liq. compn., etc., see {86} {87} {88} {80} {49} {89} {90}.

$\bar{C}$  + toluene (1:7105): for  $n_D^{20}$  for system see {91} {92}; for vapor-liq. equil. data and study of distn. of system see {83} {91} {92} {93}.

$\bar{C}$  with other cpds. of Order I.  $\bar{C}$  + acetic acid (1:1010): for values of  $D$  and  $n$  for the system see {94}, for vapor-liq. equil. see {95}; see also under values of  $\bar{C}$  (below). —  $\bar{C}$  + phenol (1:1420): for vap. press. of system see {96}. —  $\bar{C}$  + acetone (1:5400): for  $D$  and  $n_D^{20}$  see {49} {94}, for vapor-liquid equil. see {49}. —  $\bar{C}$  + diethyl ether (1:6110): for l.p./compn. data and diag. see {21}; for  $D_0^{20}$  over range  $0-40^\circ$  see {97}. —  $\bar{C}$  + ethylene oxide (1:6105): for soly. and vap. press. {98} and vapor-liq. equil. {106} see indic. refs.

$\bar{C}$  with cpds. of Order III.  $\bar{C}$  +  $\text{CHCl}_3$  (3:5050): for b.p./compn. diag. see {93}. —  $\bar{C}$  +  $\text{CCl}_4$  (3:5100): for  $D_0^{20}$  {100} and vapor-liq. compn. data and diagrams {100} {93} {88} (see also below under azeotropes).

$\bar{C}$  + 1,1-dichloroethane (3:5035): for b.p. at 760 mm.,  $D_4^{20}$ , and vapor-liq. equil. data see {101}. —  $\bar{C}$  + 1,1,2-trichloroethane (3:5330): for l.p./compn. data, eutectic f.p.  $-79^\circ$

Note that oxidn. of  $\bar{C}$  with  $CrO_3/H_2SO_4$  in pres. of Hg yields  $CO_2$  quantitatively (196) (dif. from many polychloro cpds.). — Note also that  $\bar{C}$  does not respond to the R + H "Tri-Per Analyzer" (a recording ultra-violet photometer) (197).

For detn. of  $\bar{C}$  in organs and tissues see (198).

### PREPARATION OF $\bar{C}$

The most-studied method for prepn. and manufacture of  $\bar{C}$  is that from ethylene by addn. of chlorine; this method is also of historical interest as leading to the discovery of  $\bar{C}$  in 1795 (199) and its initial designation as "oil of the four Dutch chemists." — Various other modes of formn. of  $\bar{C}$  have since been discovered and will be indicated below.

**Preparation from ethylene. By use of chlorine.** Ethylene with chlorine under certain conditions adds chlorine quant. yielding only  $\bar{C}$ ; under other conditions, however, the system gives 1,1,2-trichloroethane (3:5330) + HCl. — In the absence of catalysts, the substitution reactn. is avoided by use of very low temperatures; in the presence of catalysts addition (rather than substitution) is facilitated even at the higher temperatures (e.g., 120°) resulting from heat of reactn.

For general articles discussing the various factors involved see (200) (201) (53) (202) (203) (204) (205) (69); for articles discussing the reaction from the viewpoint of utilization of the ethylene of industrial gases see (206)–(214) incl.; for patents on prepn. of  $\bar{C}$  from ethylene +  $Cl_2$  see (215)–(236) incl. [For prepn. of "heavy"  $\bar{C}$  contg. one  $C^{13}$  atom see below under miscell. prepn.]

**By use of  $HOCl$  ( $Cl_2 + H_2O$ , etc.).** Although ethylene with  $HOCl$  solns. gives mainly ethylene chlorohydrin (3:5552) nevertheless some  $\bar{C}$  is formed; for studies of this reactn. see (237) (238) (239) (240) (241).

**By other miscellaneous reagents.** [For formn. of  $\bar{C}$  (together with other prods.) from ethylene with  $Cl_2$  in  $AcOH$  or  $Ac_2O$  soln. (242), with  $HCl$  + air over pumice contg.  $CuCl_2$  at 300° (243), with aq.  $ICl$  (244), with  $NCl_3$  in  $CCl_4$  soln. at 20–25° for 7 days (245), with nitryl chloride ( $ClNO_2$ ) (246), with  $SbCl_5$  or  $CuCl_2$  (247), or with *N*-chlorourea (253) see indic. refs.]

**Formation of  $\bar{C}$  from ethane or acetylene.** [For formn. of  $\bar{C}$  from ethane with  $NOCl$  at 300° (248) or with  $Cl_2 + O_2 + cat.$  at 300–650° (249) see indic. refs.; for formn. of  $\bar{C}$  (together with other prods.) from acetylene with  $HCl$  gas in pres. of  $NO_2$  (250), or with  $Cl_2$  in pres. of  $CCl_4 + AlCl_3/NaCl/FeCl_3$  at 175–250° (251) cf. (252), see indic. refs.]

**Formation of  $\bar{C}$  from miscellaneous sources and by various methods.** [For formn. of  $\bar{C}$  (together with other prods.) from methyl chloride (3:7005) in dark elec. discharge (254); from ethyl chloride (3:7015) with  $Cl_2$  in light (255), with  $NCl_3$  (256), or with  $SbCl_5$  in s.t. at 100° (257); from 1,2-dibromoethane (ethylene dihydride) (1 mole) with  $SbCl_5$  (2 moles) (note that use of only 1 mole  $SbCl_5$  yields ethylene chlorohydride) (258); from 1-chloro-2-iodoethane (ethylene chloro-iodide) with finely divided Ag at 160° (259) see indic. refs.]

[For formn. of  $\bar{C}$  (together with other prods.) from ethylene glycol (1:6465) with excess fuming  $HCl$  in s.t. at 100° (260), with  $PCl_3 + ZnCl_2$  (57% yield (261)), with  $PCl_5$  (262), or  $PCl_5 + ZnCl_2$  (37% yield (261)), with  $SOCl_2 + pyridine$  (62% yield (261)) see indic. refs.; from ethylene oxide (1:6105) with  $S_2Cl_2$  (263); from 1,4-dioxane (1:6400) with Zn + acid chlorides (264); from 2-chloroethanol-1 (ethylene chlorohydrin) (3:5552) by disproportionation in s.t. at 184° for 10 hrs. (265) or during reactn. with  $HBr$  (266); from *bis*-( $\beta$ -chloroethyl) sulfite with  $Cl_2$  (267); from *bis*-( $\beta$ -chloroethyl) sulfate with conc. aq.  $HCl$  (268) or with alk. chloride + dil.  $HCl$  (269) see indic. refs.]

[For formn. of  $\bar{C}$  (together with other prods.) from diazomethane with  $ZnCl_2$  in ether (270), from ethylenediamine with  $NOCl$  in xylene (271), see indic. refs.]

[For prepn. of "heavy"  $\bar{C}$  contg. 1  $C^{13}$  atom (from  $NaC^{13}N$  via  $CH_3C^{13}N$ ,  $CH_3C^{13}H_2NH_2$ ,  $CH_3C^{13}H_2N(CH_3)_2OH$ ,  $CH_2=C^{13}H_2$ ) and its reactn. with  $Cl_2$  see {272}.]

### CHEMICAL BEHAVIOR OF $\bar{C}$

Pyrolysis of  $\bar{C}$ .  $\bar{C}$  on suitable htg. especially in pres. of dehydrohalogenating cat. loses 1 mole  $HCl$  yielding vinyl chloride (3:7010) [e.g.,  $\bar{C}$  over activated carbon at 230–250° (273), or with aq. vapor over cat. at 800–1000° (274), or over pumice at 600° (275) cf. (276) (277), or over alumina at low red heat (278) yields vinyl chloride (3:7010)].

### BEHAVIOR OF $\bar{C}$ WITH INORGANIC REACTANTS

Reaction of  $\bar{C}$  with  $Cl_2$ .  $\bar{C}$  with  $Cl_2$  gives according to the conditions chlorinated derivatives either of the ethylene or ethane series.

[E.g.,  $\bar{C}$  with  $Cl_2$  in pres. of  $AlCl_3/NaCl/FeCl_3$  at 400–480° gives (279) a mixt. contg. 20% 1,1-dichloroethylene (3:5005) + 22% 1,2-dichloroethylene (3:5036) + 29% trichloroethylene (3:5170) + 29% higher chlorination prods.;  $\bar{C}$  with  $Cl_2$  over suitable cat. at 300–500° gives (280) tetrachloroethylene (3:5460)]

[On the other hand,  $\bar{C}$  with  $Cl_2$  in ultra-violet light at 50° (281) (282), or 25° (283), or  $\bar{C}$  with  $Cl_2$  + suitable cat. at not above 60° (284), or  $\bar{C}$  (as liquid) with  $Cl_2$  (285), or  $\bar{C}$  with  $Cl_2$  in pres. of  $AlCl_3/NaCl/FeCl_3$  at 300–425° as directed (279), or  $\bar{C}$  with  $SO_2Cl_2$  + trace of dibenzoyl peroxide refluxed 2 hrs. in dark (286) gives (yields: 80% (284), 70% (283) (286), 50% (279)) 1,1,2-trichloroethane (3:5330). — Furthermore,  $\bar{C}$  with  $Cl_2$  as directed (287) (288) or  $Cl_2$  +  $AlCl_3$  at 70–80° (289) (327) gives 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750). — Finally  $\bar{C}$  (in vapor phase) with  $Cl_2$  + cat. (290) cf. (285) or  $\bar{C}$  with  $Cl_2$  at elev. temp. and press. (291) yields hexachloroethane (3:4835).]

Reaction of  $\bar{C}$  with alkalis.  $\bar{C}$  with alkalis or substances behaving as such may according to circumstances undergo either (or both) of two reactions: on the one hand  $\bar{C}$  may lose  $HCl$  (1 mole) (dehydrohalogenation) yielding vinyl chloride (3:7010); on the other  $\bar{C}$  may be hydrolyzed to ethylene glycol (1:6465).

Dehydrohalogenation.  $\bar{C}$  with aq. alk. at elev. temp. and press. (292) especially in pres. of tetramethylene glycol, etc. (293), or  $\bar{C}$  with  $MeOH/alk.$  (294), or  $EtOH/alk.$  (53) (295), loses  $HCl$  giving (91–93% yield (53)) vinyl chloride (3:7010). — [For study of rate of reactn. of  $\bar{C}$  with  $KOH$  in 95%  $EtOH$  at 90° and 100° (296) (297), with  $NaOEt$  or  $KOEt$  in 95%  $EtOH$  or 48%  $EtOH$  at 90° (296) (297), or with  $MeOH/NaOMe$  at 17–19° (298) see indic. refs. — Note that  $\bar{C}$  with alc.  $NaOEt$  at 100° under press. gives 90% yield (299) ethyl vinyl ether (1:7810).]

Hydrolysis.  $\bar{C}$  under appropriate conditions hydrolyzes to ethylene glycol (1:6465); for general articles from this viewpoint see (110) (214) (314).

[For hydrolysis of  $\bar{C}$  to ethylene glycol with aq. vapor over cat. at 550–850° (300), with aq. at 200° under press. in absence of any acid acceptor (301), or with aq. at 120° under press. (302) see indic. refs. cf. (110).]

[For hydrolysis of  $\bar{C}$  to ethylene glycol with aq.  $KOH$  at elevated temp. and press. see (110). — For study of use of  $Na_2CO_3$  and/or  $NaHCO_3$  in aq. (214) (303) (304) (305) (306) or in 85%  $EtOH$  (307) cf. (214) see indic. refs. — For use of aq.  $CaCO_3$  in pres. of  $NH_4$  salts (308) (309), or aq.  $BaCO_3$  (310) at elev. temp. and press., see indic. refs. — For use of sodium formate in  $MeOH$  at 165° under press. (311) cf. (214), aq. +  $PbO$  in s.t. at 170° (312), or  $Fe_2O_3$  (?) (313) see indic. refs.]

For use of hydrolysis with alk. followed by  $KMnO_4$  oxidn. of resultant ethylene glycol to oxalic acid as means of distinction between  $\bar{C}$  and the isomeric 1,1-dichloroethane (3:5035) see (256).

[For prepn. of "heavy lactn. of  $\bar{C}$  with aq. 2,4-dichlorophenol (3:0560) or with 2,4,6-tri- $H_2NH_2$ ,  $CH_2C^{12}H_2N(C^{13})$  at 73-98° for 24-66 hrs. giving respectively 1,2-bis-(2,4-dichlorom.p. 132-133°, and 1,2-bis-(2,4,6-trichlorophenoxy)ethane, m.p. 167-

of  $\bar{C}$  with 50% NaOH + cellulose see (358). —  $\bar{C}$  with MeOH over  $Al_2O_3$  Pyrolysis of  $\bar{C}$ , HCl yielding (359) vinyl chloride (3:7010) + MeCl (3:7005).] 1 mole HCl yield. of "heavy"  $\bar{C}$ , viz.,  $ClCH_2C^{12}H_2Cl$ , with "heavy" benzyl mercaptan, (273), or with  $CH_2S^{34}H$ , see (272).]

(276) (277), on of  $\bar{C}$  with salts of organic acids.  $\bar{C}$  with salts of acids yields the corresp. ethylene sters; note, however, that reactn. of only 1 chlorine atom can lead to  $\beta$ -chloroethyl and that loss of HCl and subsequent formn. of vinyl esters (or their polymers) can

React-imes occur.

times ei- $\bar{C}$  with NaCN yields (360) succino(di)nitrile [Beil. II-615, II<sub>1</sub>-(265), II<sub>2</sub>-(554)], [E.g. 53-54° (for rate of reactn. of  $\bar{C}$  with alc. KCN see (296)). —  $\bar{C}$  with anhydrous alkali 20% alk.-earth acetate at 230° in glycol diacetate (361) or monoacetate (364), or in alc. at chlc. 0-180° under press (302), or in pres. of an amine salt as cat. at 175-225° (363), yields cat. thylene glycol diacetate (1:3511), b.p. 190°.]

(U) Reaction of  $\bar{C}$  with miscellaneous non-nitrogenous org. cpds. [For reactn. of  $\bar{C}$  +  $Cl_2$  (in  $CCl_4$ ) with CO at 60-70° and 60-70 atm. press. yielding a mixt. of acid chlorides, with  $Cl_2$  ones, etc., see (365). — For reactn. of  $\bar{C}$  with  $CS_2$  + aq. KOH yielding ethylene glycol fluocarbonate see (366)]

trace of  $\bar{C}$  (0.5 mole) + ethylene dibromide (0.5 mole) +  $AlCl_3$  (0.015 mole) refluxed 2 hrs. (283) (287) or stood at 25° for 35 hrs. (368) undergoes a redistribution reaction giving a prod. itg. 49.8 mole % 1-bromo-2-chloroethane [ethylene chlorobromide] [Beil. I-89, I<sub>1</sub>-(28), (acetyl (61)], h.p. 107-108°,  $n_D^{20} = 1.4008$  (369) — Similarly  $\bar{C}$  (1 mole) + ethyl bromide of (283) moles) +  $AlCl_3$  (3%) in steel bomb at 25° for 14 days gives a mixt. contg. five prods. React. mole % as follows.  $\bar{C}$  9%, EtCl 34%, ethylene chlorobromide 18%, ethylene dibromide cording %, and EtBr 29% (367)]

may be. For reactn. of  $\bar{C}$  with diethyl sodio-malonate leading to tetraethyl butane-1,1,4,4- other  $\bar{C}$  racarboxylate [Beil. II-862, II<sub>1</sub>-(333), II<sub>2</sub>-(702)] together with various other prods. see (283) (371).]

of tetram. reactn. of  $\bar{C}$  with amines.  $\bar{C}$  with aniline (4 moles) boiled  $\frac{3}{4}$  hr. yields (372)  $N,N'$ - loses  $HCl$  phenyl-ethylenediamine (1,2-bis-(phenylamino)ethane) [Beil. XII-543, XII<sub>1</sub>-(282)], reactn. of  $\bar{C}$  4% (373) (corresp. bis-acetyl deriv. m.p. 158°), probably accompanied by some  $N,N'$ - 95%  $N,N'$ -diethylpiperazine [Beil. XXIII-8, XXIII<sub>1</sub>-(5)], m.p. 164°. [For nitration of 1,2-bis- reactn. of  $\bar{C}$  (1 mole) +  $AlCl_3$  (3%) in steel bomb at 25° for 14 days gives a mixt. contg. five prods. React. mole % as follows.  $\bar{C}$  9%, EtCl 34%, ethylene chlorobromide 18%, ethylene dibromide cording %, and EtBr 29% (367)].

that  $\bar{C}$  with  $NaNHC_6H_5$  (from aniline +  $NaNH_2$  in dry ether) loses 2 HCl yielding (371) (371).]  $\bar{C}$  with 33% abs. alc.  $Me_3N$  stood 10 days gives (22.5% yield (376)) the corresp. mono- ternary salt,  $\beta$ -chloroethyl-trimethyl-ammonium chloride ("choline dichloride"); study of rate of reactn. of  $\bar{C}$  with  $Me_3N$  in 90% acetone at 55° see (377). — For studies to rate of reactn. of  $\bar{C}$  with other amines, e.g., with benzylamine (296) (297), piperidine (297) (298), pyridine (298) (378), see indic. refs.]

## COLOR REACTIONS OF $\bar{C}$

$\bar{C}$  (2 drops) with 2% soln. of phenolphthalein in cyclohexanol (2 ml.) + trace solid NaOH htd. 5 min. at 190-200° (preferably in bath as directed (379)), when cooled and acidified with AcOH (1 ml.) gives lilac color. [Note that acetylene tetra- chloride (3:5750) with this reagt. gives a somewhat similar result.]

Comment on  $\text{NH}_4\text{OH}/\text{CuCl}$  reagent. Note that  $\bar{\text{C}}$  with  $\text{NH}_4\text{OH}/\text{CuCl}$  does not (380) give any color (dif. from 1,1-dichloroethane (ethylidene (di)chloride) (3:5035) which in 10 min. gives cloudy amethyst coloration (380)).

Comment on Fehling's soln. Note that  $\bar{\text{C}}$  does not reduce Fehling's soln. even on htg. (dif. from ethylidene (di)chloride (3:5035)).

① 1,2-Diphenoxyethane (ethylene glycol diphenyl ether) (1:7235). Lfts. from alc., m.p. 98°. [From  $\bar{\text{C}}$  with aq. K phenolate refluxed 48 hrs. (70–85% yield (353)); note, however, that if only one of the two chlorine atoms reacts some  $\beta$ -chloroethyl phenyl ether, m.p. 28°, b.p. 217–220° at 760 mm. (355), may be formed.]

— 1,2-Di- $\alpha$ -naphthoxyethane (ethylene glycol di- $\alpha$ -naphthyl ether) [Beil. VI-607]. Lfts. from nlc., m.p. 127.5° (381). [From  $\bar{\text{C}}$  +  $\alpha$ -naphthol + aq. NaOH at 120° in s.t. for 8 hrs. (381). — Note that the half reactn. prod.,  $\beta$ -chloroethyl  $\alpha$ -naphthyl ether, has m.p. 28° (355).]

— 1,2-Di- $\beta$ -naphthoxyethane (ethylene glycol di- $\beta$ -naphthyl ether) [Beil. VI-612]. Lfts. from  $\text{C}_6\text{H}_6$ , m.p. 217° (381). [From  $\bar{\text{C}}$  +  $\beta$ -naphthol + aq. NaOH at 120° in s.t. for 8 hrs. (381). — Note that the half reactn. prod.,  $\beta$ -chloroethyl  $\beta$ -naphthyl ether, has m.p. 83° (355).]

② Ethylene 1,2-bis-(isothioureac plcrate): ndls. from alc., m.p. 260° (382), 250° (332). [From  $\bar{\text{C}}$  with thiourea refluxed in nlc. and subsequently treated with  $\text{KOH}$  (332).]

③ 1,2-Diphthalimidoethane (ethylene diphthalimide) [Beil. XXI-402, XXI-(384)]. Ndls. from  $\text{AcOH}$ , dil.  $\text{AcOH}$  or alc., m.p. 236° (383), 232–233° (384), 232° (385). [From  $\bar{\text{C}}$  + K phthalimide (2 moles) in s.t. at 200° (386); note that  $\bar{\text{C}}$  in very large excess with K phthalimide in s.t. at 180–190° for 3 hrs. gives (387) the half reactn. prod.,  $N$ -( $\beta$ -chloroethyl)phthalimide, cryst. from  $\text{CS}_2$  or alc., m.p. 81° (388), 79–81° (387) (389).]

— 1,2-Disaccharinoethane: m.p. 253–254° (392). [Not reported from  $\bar{\text{C}}$  itself, but ohtd. (20% yield) from ethylene (di)bromide with sodium saccharin in aq. butyl-carbitol (1:6517) contg. KI on refluxing for 3 hrs.; note that with shorter reflux (1 hr.) some half reactn. prod., viz.,  $N$ -( $\beta$ -bromoethyl)saccharin, m.p. 99°, is formed (392).]

## 3:5140 3,3-DICHLOROPROPENE-1

(1,1-Dichloropropene-2;  
allylidene (di)chloride;  
"acrolein dichloride")

B.P. 84.4° cor. (1)  
85° (5)

$D_{20}^{25} = 1.170$  (1)  
 $D_{20}^{25} = 1.169$  (2)

$n_D^{25} = 1.450$  (2)

[See also 1,3-dichloropropene-1 (3:5280).]

Note that  $\bar{C}$  represents the synionic mesomer of 1,3-dichloropropene-1 (3:5280); reactions of either mesomer may under certain conditions lead to derivatives of the other; however, in practice the tendency appears to be strongly in the direction of 1,3-dichloropropene-1 (3:5280) so that most of the known reactions of  $\bar{C}$  yield the same products as does the mesomer; the rate of reaction, however, is generally very much slower with  $\bar{C}$ .

[For prepn. of  $\bar{C}$  from acrolein (1:0115) with  $\text{PCl}_5$  (16% yield  $\bar{C}$  accompanied by 32% 1,3-dichloropropene-1 and some 1,1,3-trichloropropene (3:5660) (3)) (1) (4), or from 1,1,3-trichloropropene (3:5660) with alc.  $\text{KOH}$  (5) (other products are also formed), see indic. refs.]

[ $\bar{C}$  with  $\text{Cl}_2$  adds 1 mole halogen giving (4) 1,1,2,3-tetrachloropropane (3:6035), h.p. 179-180° at 756.6 mm. (4).]

[ $\bar{C}$  with conc. HCl in s.t. at  $100^\circ$  for 10 hrs. (4) isomerizes to 1,3-dichloropropene-1 (3:5280).]

[ $\bar{C}$  with NaOEt reacts much more slowly than its mesomer; however, after 15 hrs. refluxing with large excess NaOEt,  $\bar{C}$  gives 1-chloro-3-ethoxypropene [Beil. I-439], b.p.  $126-127^\circ$ ,  $D_4^{16} = 1.018$ ,  $n_D^{16} = 1.438$  (3), i.e., the same product as from the mesomer.]

[ $\bar{C}$  with Na phenolate in abs. alc. refluxed for 4 hrs. gives (3)  $\omega$ -chloroallyl phenyl ether, the same prod. as correspondingly obtd. in  $\frac{1}{2}$  hr. from the mesomer, q.v.]

[ $\bar{C}$  with  $Et_2NH$  in dry ether for 20 days gives (3) only a slight ppt. of diethylamine hydrochloride and but very small yield of  $N,N$ -diethyl- $\gamma$ -chloroallylamine (cf. the mesomer).]

[ $\bar{C}$  with NaOAc (3),  $CaBr_2$  (3),  $CaI_2$  (3) cf. (6), or  $C_6H_5MgBr$  (3) gives more slowly and in poor yields the same products as are formed readily from the mesomeric 1,3-dichloropropene-1 (3:5280), q.v.]

butyl alc. (1:6180): gives a const.-boilg. mixt., b.p. 86.85° at 760 mm.,

wt. %  $\bar{C}$  (55) —  $\bar{C} + isobutyl$  alc. (1:6165): forms const.-boilg. mixt., b.p.

760 mm.,  $D_4^{20} = 1.396$ , contg. 91 wt. %  $\bar{C}$  = 86 mole %  $\bar{C}$  (52e). —  $\bar{C} + ter$ -butyl

B.P. 1:6140): forms const.-boilg. mixt., b.p. 75.8° (6), 75° (52f) at 760 mm.,  $D_4^{20} = 1.326$

contg. 67 wt. %  $\bar{C}$  (6) (84 wt. %  $\bar{C}$  (52f) = 74 mole %  $\bar{C}$  (52f)). —  $\bar{C} + ter$ -amyl alc.

Oil, 60): forms const.-boilg. mixt., b.p. 84.5° (6), 84° (52g),  $D_4^{20} = 1.372$  (52g), contg.

80 wt. %  $\bar{C}$  (6) (88 wt. %  $\bar{C}$  = 83 mole %  $\bar{C}$  (52g)). —  $\bar{C} + allyl$  alc. (1:6145): forms const.-

boilg. mixt., b.p. 80.95° at 760 mm.,  $D_4^{20} = 1.335$ , contg. 84 wt. %  $\bar{C}$  = 70 mole %  $\bar{C}$  (52h).

$\bar{C} + AcOH$  (1010): forms const.-boilg. mixt., b.p. 86.5° at 760 mm., contg. 96.2 wt.

%  $\bar{C}$  (6).

$\bar{C} + 1,2$ -dichloroethane (ethylene dichloride) (3:5130): forms a const.-boilg. mixt., b.p.

82.9° at 760 mm., contg. abt. 18 wt. %  $\bar{C}$  (6).

Ternary azeotropes.  $\bar{C} + EtOH$  (1:6130) +  $H_2O$ : forms a ternary heteroazeotrope,

b.p. 67.25° at 760 mm., contg. 38.4 mole %  $\bar{C}$  + 41.2 mole %  $EtOH$  + 20.4 mole %  $H_2O$

(54a): note that this azeotrope conts. 69.4 vol. %  $\bar{C}$  + 23.8 vol. %  $EtOH$  + 6.8 vol. %

$H_2O$  (53), and that upon condensation at 15° it separates into two layers, the upper having

the composition 0.8 vol. %  $\bar{C}$  + 7.2 vol. %  $EtOH$  + 5 vol. %  $H_2O$  (total upper layer = 13

vol. %), the lower having the composition 68.6 vol. %  $\bar{C}$  + 16.6 vol. % EtOH + 1.8 vol. %  $H_2O$  (total lower layer = 87%) (53). — For further discussion and data see also (8) (49).

$\bar{C}$  + *n*-propyl alc. (1:6150) +  $H_2O$ : forms a ternary heteroazeotrope, h.p. 71.55° at 760 mm., contg. 51.1 mole %  $\bar{C}$  + 16.6 mole % *n*-propyl alc. + 32.3 mole %  $H_2O$  (56b).

$\bar{C}$  + allyl alc. (1:6145) +  $H_2O$ : forms a ternary heteroazeotrope, h.p. 71.4° at 760 mm., contg. 49.2 mole %  $\bar{C}$  + 17.3 mole % allyl alc. + 33.5 mole %  $H_2O$  (56c).

### USES OF $\bar{C}$

Most of the utility of  $\bar{C}$  in industry depends upon its physical properties especially as a solvent; these applications include the dehydration of alcohols and acids, degreasing of metal, wool, and leather, dry cleaning of fabrics, extracting of oils from seeds, etc.; dewaxing of mineral lubricating oils, use as fumigant and insecticide, refrigerant, etc. [For an excellent brief survey of these uses see (57) (58); for further and more recent examples see below.]

Use in dehydration of alcohols. [For use of  $\bar{C}$  in dehydration of EtOH (or MeOH) by azeotropic distn. (Drawinol process) see (8) (49) (53) (59) (60) (61) (62); for patents on this method see (63). — For use of  $\bar{C}$  in denaturing alc. see (64).]

Use in dehydration of acids. [For use of  $\bar{C}$  in concn. of AcOH (1:1010) see patents (65) (66). — For sepn. of AcOH (1:1010) from formic acid (1:1005) by distn. of mixt. with  $\bar{C}$ , the condensate sepg. into an upper layer of an azeotropic mixt. of  $\bar{C}$  + formic acid, the lower layer being  $\bar{C}$  see (67).]

Use of  $\bar{C}$  for degreasing of metal. [For patents on use as metal degreaser of mixts. of  $\bar{C}$  + an alc. + soap (68),  $\bar{C}$  + oleic acid (69),  $\bar{C}$  + ethylene dichloride (3:5130) (70) (71), or  $\bar{C}$  (72) (73) see indic. refs. — For use of  $\bar{C}$  + rosin + boiled linseed oil in cleaning and leaving coating preparatory to etching see (74). — Because of great toxicity of  $\bar{C}$  (see below) special attention (75) must be given to ventilation of degreasers using it.]

Use of  $\bar{C}$  in dry cleaning of fabrics. Because of its solvent power supported by its low b.p. and non-inflammability  $\bar{C}$  is widely used as dry cleaner's solvent [for general articles from this viewpoint see (76) (77) (78); for patent see (79); for solv. actn. of  $\bar{C}$  on dyes see (26)].

Use of  $\bar{C}$  in extraction of fats and oils. [For use of  $\bar{C}$  as solv. for extraction see (81) (82) (83). — For use of  $\bar{C}$  for extraction of soybean oil (84) including  $n_D^{25}$  and  $D$  in g/cc. at 77°, 100°, and 122° F. (19) see indic. refs. — For study of losses of  $\bar{C}$  in extn. of fats see (85).]

[For use of  $\bar{C}$  in detn. of fats in foods (butter, margarine, etc.) see (86) (87).]

[For use of  $\bar{C}$  in detn. of aq. in fats and oils see (88); cf. use of acetylene tetrachloride (3:5750) for this purpose.]

Use of  $\bar{C}$  in dewaxing of mineral lubricating oils. [For articles including use of  $\bar{C}$  for this purpose see (89) (90); for patents see (91).]

Use of  $\bar{C}$  as fumigant, insecticide, etc. [For comparative tests of  $\bar{C}$  see (92); for patents on such use of  $\bar{C}$  (93) or mixts. contg.  $\bar{C}$  (94) see indic. refs.]

Use of  $\bar{C}$  as component of refrigerating liquids. [For use of  $\bar{C}$  with dichloroethylene (3:5030) see (95) cf. (96); for use of  $\bar{C}$  or its mixts. in low-temp. cryostats see (16).]

Miscellaneous uses of  $\bar{C}$ . [For use of  $\bar{C}$  with MeBr (97) or with  $CCl_4$  (98) as fire extinguishing compn. see indic. refs.; for use of  $\bar{C}$  as hoiler or radiator cleaner (99) or as rust-retarder (100) see indic. refs.; for use of  $\bar{C}$  as weed-killer see (101); for addition to liq. HCN to diminish inflammability see (102); in prepn. of starch see (103); in recrystn. of T.N.T. see (104); for use as solv. in ehullioscopy ( $K = 44.3$  per 100 g. solv.) see (105); to replace xylene in histological technique see (106) (107) (108).]

PHYSIOLOGICAL BEHAVIOR OF  $\bar{C}$ 

$\bar{C}$  is one of the more toxic of the group of chlorinated solvents; it is absorbable into the body not only by inhalation but also through the skin (109). — Although full detailed treatment of this aspect of  $\bar{C}$  is beyond the scope of this work, yet the following citations will be found useful as lead references for further information.

Toxicity of  $\bar{C}$ . [For important surveys of physiological properties (110), toxicity (111), comparative toxicity of  $\bar{C}$  and  $CCl_4$  (112) see indic. refs.]

[For studies of liver injury by  $\bar{C}$  (113), of anemia from  $\bar{C}$  (114), of American cases since 1932 of industrial poisoning by  $\bar{C}$  (115), or role of impurities in toxicity of  $\bar{C}$  (116), of industrial hazards of  $\bar{C}$  (117) (118) (119), of relation between toxicity and b.p. (120) see indic. refs. — For other studies of toxicity or of poisoning by  $\bar{C}$  see (121)–(130), incl.]

$\bar{C}$  as narcotic, anesthetic, analgesic, etc. [ $\bar{C}$  has very important use in treatment of trigeminal neuralgia (131) (132) (133); for toxic effects of  $\bar{C}$  after long use as antineuralgic see (134), for chem. exam. of  $\bar{C}$  for medical use see (21).]

[For use of  $\bar{C}$  as anesthetic see (135) (136) (137); for use of  $\bar{C}$  in treatment of migraine see (138); for effect on pain threshold see (139); for neural depressing effect (140) and narcotic actn. of  $\bar{C}$  (141) (142) (143) (144) see indic. refs.]

[For studies of antiseptic and disinfectant actn. of  $\bar{C}$  see (145) (146) (147) (148) (149) (150) (24).]

Miscellaneous related topics. [From dogs after inhalation anesthesia with  $\bar{C}$  from 5–8% of initial  $\bar{C}$  is excreted (151) as trichloroacetic acid (3:1150). — For study of anthelmintic actn. of  $\bar{C}$  see (152). — For actn. of  $\bar{C}$  on alc. fermentation see (153).]

DETERMINATION OF  $\bar{C}$ 

By physical methods. For detn. of  $\bar{C}$  (as vapor) by use of the R + H "Tri-Per-Analyzer" (a recording ultra-violet photometer (154)) see (155); this instrument will measure  $\bar{C}$  in concns. of 10–2000 p.p.m. and is insensitive to methyl chloride (3:7005), methylene (di)chloride (3:5020),  $CHCl_3$  (3:5050),  $CCl_4$  (3:5100), vinyl chloride (3:7010), ethylene (di)chloride (3:5130), acetylene tetrachloride (3:5750), and to many (but not all) common non-chlorinated solvents such as methyl, ethyl, and amyl alcohols, ethyl acetate, etc.; for details see (155). — For detn. of  $\bar{C}$  in air by adsorption on charcoal see (45).

By chemical methods. Those involving decomposition of  $\bar{C}$  and subsequent detn. of resultant chloride ion. One class of these methods involves pyrolytic decomposition of  $\bar{C}$  by appropriate htg. (156) (157) cf. (158) (159) cf. (127); note that  $\bar{C}$  with air at 900–1000° gives exclusively  $CO_2 + HCl$ , provided that concn. of  $\bar{C}$  is not more than 12 mg. per liter; above this amt. from 2–20% of the total carbon and chlorine are converted to  $CO + Cl_2$ , but  $COCl_2$  (3:5000) is not found up to concns. of 100 mg.  $\bar{C}$  per liter (159). — For variation of the pyrolytic method involving burning of  $\bar{C}$  (or solns. of  $\bar{C}$ ) in a lamp see (160) (161) (162) (163) (164).

A second class involves decomposition of  $\bar{C}$  by chem. means, e.g., by use of  $Na + ethanolamine$  in dioxane (165) (166), or by complete hydrolysis of  $\bar{C}$  with excess aq. 25%  $KOH$  in s.t. at 150° for 1 hr. (167).

Note that  $\bar{C}$  on oxidn. with  $CrO_3/H_2SO_4$  as directed (168) gives quant.  $CO_2$ .

Detn. of  $\bar{C}$  by conversion to mercuric trichloroethylenide  $Hg(CCl = CCl_2)_2$ .  $\bar{C}$  with aq.  $KOH$  soln. of  $Hg(CN)_2$  on shaking 24 hrs at room temp. ppts. (169)  $Hg(CCl = CCl_2)_2$  (for amplification see below under behavior of  $\bar{C}$  with inorganic reagents.). — For use of this method in detn. of  $\bar{C}$  even in pres. of methylene (di)chloride (3:5020),  $CHCl_3$  (3:5050),  $CCl_4$  (3:5100), 1,2-dichloroethylene (3:5030), or tetrachloroethylene (3:5460) see (169).

*Detn. of  $\bar{C}$  colorimetrically by use of Fujiwara reaction with pyridine + alkali.*  $\bar{C}$  with pyridine + aq. alk. gives on short warming a red coloration (similar to but recognizably different from the red-violet color obtd. with  $\text{CHCl}_3$ ) which on further warming changes to orange; for use of this color in detn. of  $\bar{C}$  in air (accuracy  $\pm 11\%$  except that at concns. of  $\bar{C}$  as low as 20 p.p.m. error may be as much as 50%) see (170) cf. (111) (127); for use in detn. of  $\bar{C}$  in animal tissue see (171); for table of sensitivity of this test under comparable conditions from  $\bar{C}$  as compared with  $\text{CHCl}_3$  (3:5050),  $\text{CCl}_4$  (3:5100), 1,1,2-trichloroethane (3:5320), 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750), and tetrachloroethylene (3:5400) see (151).

### PREPARATION OF $\bar{C}$

The principal method of preparation or manufacture of  $\bar{C}$  is from 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) by elimination of 1 HCl (see below), but it is formed as a by-product from various other reactions (see below). — [For general reviews of prepn. of  $\bar{C}$  and its relationships with other "chlorinated solvents" see (31) (172).]

From 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750). *By pyrolytic loss of HCl (dehydrochlorination).* [For prepn. of  $\bar{C}$  from acetylene tetrachloride in s.t. at 300° for 15 hrs. (173), over pumice at 700° (174) or 400–500° (175), over pumice + cat. at 500° (176), over pumice contg.  $\text{Cu}_3(\text{PO}_4)_2$  at 450–500° (177), over  $\text{TbO}_2$  below 300° (178), over  $\text{BaCl}_2$  at 300° (179), over bone char at 300–310° (180), over activated carbon at 200–300° (181), 260° (182), or 500° (176) see indic. refs. — Noto claim (183) that formn. of  $\bar{C}$  by dehydrochlorination of acetylene tetrachloride over charcoal at 250–300° is not effective and yield of  $\bar{C}$  diminishes with increase of temp.]

*By pyrolytic loss of HCl in pres. of an org. acceptor.* [For prepn. of  $\bar{C}$  from acetylene tetrachloride (3:5750) or pentachloroethane (3:5880) or 1,1,1,2-tetrachloroethane (3:5555) with acetylene over cat. at 250° (181) cf. (184) or with  $\text{MeOH}$  over  $\text{Al}_2\text{O}_3$  at 280° (185) see indic. refs.]

*By loss of HCl in pres. of an inorganic acceptor.* [For prepn. of  $\bar{C}$  from acetylene tetrachloride (3:5750) by htg. with aq. alk. or alk. carbonates (186) in pres. of tetrachloroethylene glycol, etc., as promoter (187), or with aq.  $\text{Ca}(\text{OH})_2$  or alk. carbonates (186) (188) (192) (193) (for test of Ger. 171,900 (186) see (190) (191)), or with alc.  $\text{KOH}$  (194) (195) cf. (173), or with alc.  $\text{NaOEt}$  (194) see indic. refs.]

[For prepn. of  $\bar{C}$  from acetylene tetrachloride (3:5750) by elimination of 1 HCl with excess  $\text{NH}_3$  gas in pres. of aq. at 60–70° (196), with conc. aq.  $\text{NH}_4\text{OH}$  at 160–170° (196) (191) (for test of Ger. 351,463 (196) see (191)), with liq.  $\text{NH}_3$  at –40° (13) (197), or by refluxing with dry pyridine (198), or by action of  $\text{C}_6\text{H}_5\text{MgBr}$  (199) see indic. refs.]

*Note on impurities in  $\bar{C}$ .* Note that tech.  $\bar{C}$  obtained from 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) by elimination of HCl often contains in its high-boilg. fractions ("Tri-Nachlauf" and "Tetra-Nachlauf") other chlorinated materials such as 1,1,2,3,4,4-hexachlorohutane (3:3155), 1,1,2,3,4,4-hexachlorobutene-2 (3:1945), solid 1,2,3,4-tetrachlorobutadiene-1,3 (3:0370), liq. 1,2,3,4-tetrachlorobutadiene-1,3 (3:6150), and hexachloroethane (3:4835), (207). — [For use of these "Nachlaufe" as insecticides and weed-killers see (268).]

From other halogenated ethanes. [For formn. of  $\bar{C}$  from 1,2-dichloroethane (ethylene dichloride) (3:5130) as by-product (29% yield) of action of  $\text{Cl}_2$  in pres. of  $\text{AlCl}_3/\text{NaCl}/\text{FeCl}_3$  at 400–480° (200), or as by-product of actn. of  $\text{Cl}_2$  in u.v. light (201), see indic. refs.]

[For formn. of  $\bar{C}$  from 1-bromo-1,1,2-trichloroethane by elimination of HBr with hot alc. Na phenolate (60% yield) see (245).]

[For formn. of  $\bar{C}$  from pentachloroethane (3:5880) with acetylene over cat. at 250° (181), or with  $\text{H}_2$  over Ni at 270° (22) (note that  $\bar{C}$  resists further hydrogenation; also

that pentachloroethane over  $\text{NiCl}_2$  without  $\text{H}_2$  yields (22) tetrachloroethylene (3:5460)), or by actn. of  $\text{MeMgI}$  (203) see indic. refs. — For formn. of  $\bar{\text{C}}$  from 1,1,2-trichloro-1,2-dihydroethane with  $\text{H}_2$  over  $\text{Ni}$  at  $300^\circ$  or without  $\text{H}_2$  over  $\text{BaCl}_2$  at  $400^\circ$  see (202).]

From miscellaneous sources.  $\bar{\text{C}}$  is formed as a by-product of actn. of acetylene with  $\text{Cl}_2$  but no citations will be given here [for formn. of  $\bar{\text{C}}$  from chloral (3:5210) with  $\text{P}_2\text{S}_5$  at  $160\text{--}170^\circ$  (204) or from di- or tri-thioparachloral in dry distn. (205), or from 2-(trichloroacryloyl)-3-sulfamidobenzoic acid by alk. hydrolytic cleavage (206), see indic. refs.].

### CHEMICAL BEHAVIOR OF $\bar{\text{C}}$

Pyrolysis of  $\bar{\text{C}}$ .  $\bar{\text{C}}$  passed over pumice at  $700^\circ$  decomposes yielding (174) methylene (di)chloride (3:5020),  $\text{CHCl}_3$  (3:5050),  $\text{CCl}_4$  (3:5100), 1,1,1,2-tetrachloroethane (3:5555), pentachloroethane (3:5880), hexachloroethane (3:4835), 1,2-dichloroethylene (3:5030), tetrachloroethylene (3:5460), pentachlorobenzene (3:2290), hexachlorobenzene (3:4939), and other prods.]

Hydrogenation.  $\bar{\text{C}}$  resists hydrogenation even with  $\text{H}_2$  over  $\text{Ni}$  at  $270^\circ$  (22). — Note, however, that  $\bar{\text{C}}$  with  $\text{HI}$  in sunlight for 2 weeks in absence of air at room temp. is partially (25% (245)) reduced to 1,1,2-trichloroethane (3:5330).]

Oxidation.  $\bar{\text{C}}$  on total oxidation with  $\text{CrO}_3/\text{H}_2\text{SO}_4$  as directed (168) gives quant.  $\text{CO}_2$ . —  $\bar{\text{C}}$  over chlorinated  $\text{CuO}$  at  $450^\circ$  gives  $\text{CO}_2 + \text{H}_2\text{O}$  accompanied (209) by some phosgene (3:5000).

$\bar{\text{C}}$  with  $\text{O}_2$  in ultra-violet light (210) (198) (211) or in pres. of cat. (e.g.,  $\text{Br}_2$ ,  $\text{I}_2$ ,  $\text{H}_2\text{SO}_4$ ,  $\text{HNO}_3$ , etc.) (212) (213) (214) yields dichloroacetyl chloride (3:5290). — Note that  $\bar{\text{C}}$  in absence of  $\text{O}_2$  is not decomposed either by direct or diffused sunlight (9).]

[For study of auto-oxidn. of  $\bar{\text{C}}$  see (215); for study of acidity developed from  $\bar{\text{C}}$  with air or oxygen over range  $-23^\circ$  to  $150^\circ$  see (9).]

$\bar{\text{C}}$  with  $\text{O}_3$  gives (215) a very unstable ozonide which decomposes into phosgene (3:5000),  $\text{CO}$ ,  $\text{HCl}$ , and oxides of chlorine.]

Stabilization. Since in the presence of  $\text{O}_2$  (air)  $\bar{\text{C}}$  has a definite tendency toward oxidation (see above), much study has been given to the problem of its stabilization by addn. of small amts. of other materials. — [For general study of the stability of  $\bar{\text{C}}$  under a wide variety of conditions see (9); for study of method of testing stability and the efficacy of various stabilizers see (216), for use of 2–3% of  $\text{EtOH}$  (1:6130) or of cyclohexane (1:8405) as stabilizers see (217).]

For stabilization of  $\bar{\text{C}}$  a wide variety of compds. have been recommended in the patent literature [e.g., for use of 0.01% or less of hydroquinone monomethyl ether (1:1435) or hydroquinone monobenzyl ether (1:1539) see (218); for use of 0.1% or less of *p*-*ter*-butylphenol (1:1510) or *p*-*ter*-amylphenol (1:1495) see (219); for use of 0.001% *n*-hexylresorcinol (1:1465) see (220); for use of oil-sol. azo dyes contg. phenolic groups see (221); for use of various phenols, amines, and aminophenols see (222) (235); for use of very small amts. alc.  $\text{NH}_3$  see (223); for use of trimethylamine (228) di-isopropylamine (224), triethylamine (225) (226), or other alkylamines (226), various nitrogenous cpds. such as dialkylated cyanamides, allylthiourea, hexamethylenetetramine, propionitrile, etc. (227), pyridine (228), caffeine (229), see indic. refs.].

[For stabilization of  $\bar{\text{C}}$  with mercaptans, e.g., *n*-butyl mercaptan (230), with amylene (231) cf. (222), with gasoline (232), with alk. oleate (233), with fatty acids or soaps (234) see indic. refs.]

Polymerization.  $\bar{\text{C}}$  under certain conditions reacts with itself forming dimeric, trimeric, and prob. polymeric products [e.g.,  $\bar{\text{C}}$  in glass, porcelain, or enameled vessels at  $180\text{--}210^\circ$  under press. (236) and in pres. of small amts. of various antioxidants (237) gives a dimer, a hexachlorobutene (b.p.  $200^\circ$  at 710 mm.) of undetermined structure, accompanied by

higher polymers and by hexachlorobenzene (3:4939);  $\bar{C}$  at elev. temp. and press. or under reflux in pres. of peroxides (such as  $Bz_2O_2$ ) gives (238) (239) mainly dimer, accompanied by some trimer and polymer;  $\bar{C}$  with  $AlCl_3$  gives on refluxing (240) a mixt. of resinous polymers suitable (especially in mixts. with trichlorobenzene) for use as electric-insulating material].

[For copolymerization of  $\bar{C}$  with various dienes (such as chloroprene (3:7080), etc.) see (241).]

**Reaction with halogens. Behavior with fluorine.** [ $\bar{C}$  with  $F_2$  at  $0^\circ$  for 10 hrs. gives (242) by addition 1,2-difluoro-1,2,2-trichloroethane, b.p.  $72.3-72.6^\circ$ ,  $D_4^{20} = 1.5555$ ,  $n_D^{20} = 1.3967$ , accompanied by other prods. such as 1-fluoro-1,2-dichloroethylene, and a hexachlorobutene (3:9050), m.p.  $9.5-11.0^\circ$ , b.p.  $125.5^\circ$  at 25 mm.,  $D_4^{20} = 1.6880$ ,  $n_D^{20} = 1.5442$ , which, however, is not 1,1,2,3,4,4-hexachlorobutene-2 (3:1945), etc.]

**Behavior with chlorine.**  $\bar{C}$  under appropriate circumstances adds 1 mole  $Cl_2$  giving pentachloroethane (3:5880) [e.g., for study of addn. of  $Cl_2$  at  $80^\circ$ ,  $95^\circ$ , and  $115^\circ$  in light of 4360 Å see (243); note, however, that reaction may go further and that  $\bar{C}$  with  $Cl_2$  over activated charcoal at  $60-70^\circ$  either in light or in dark gives (98% yield (244)) hexachloroethane (3:4835)].

**Behavior with bromine.**  $\bar{C}$  readily adds 1 mole  $Br_2$  (245) (even when used as  $Br_2$  aq. (202)) yielding 1,2-dibromo-1,1,2-trichloroethane, b.p.  $204^\circ$  dec. at 760 mm. (245),  $125-126^\circ$  at 85 mm. (202),  $116.5^\circ$  at 50 mm. (245),  $n_D^{20} = 1.5710$  (245). [For study of rate of addn. to  $\bar{C}$  of  $Br_2$  in  $CCl_4$  see (246).]

**Behavior with iodine or thiocyanogen.**  $\bar{C}$  does not add  $I_2$  (Wijs method) or (SCN); (Kaufmann method) (167).

**Behavior with halogen hydrides. Reactn. of  $\bar{C}$  with dry HCl.**  $\bar{C}$  (1 mole) with dry HCl gas (1.57 moles) in pres. of anhyd.  $FeCl_3$  (0.003 mole) in dark 6 days at room temp in abs. of air or peroxides, or  $\bar{C}$  (1 mole) with dry HCl gas (1.62 moles) in pres. of  $AlCl_3$  (0.004 mole) in dark 3 days at  $0^\circ$  in abs. of air or peroxides gives exclusively (245) (yields: 49% and 22%, respectively) 1,1,1,2-tetrachloroethane (3:5555). [Note that  $\bar{C}$  with dry HCl in pres. of 5-10%  $AlCl_3$  at  $30-40^\circ$  gives (86-88% (247)) 1,1,1,2-tetrachloroethane (3:5555), but that  $\bar{C} + AlCl_3$  with dry HCl at  $50^\circ$  gives also (248) the *sym*-1,1,2,2-tetrachloroethane (3:5750), two pentachlorobutadienes (cf. (249)), and hexachlorobenzene (3:4939).]

**Reaction of  $\bar{C}$  with dry HBr.**  $\bar{C}$  in the pres. of an anti-oxidant does not react with HBr even after several days at  $100^\circ$  or after 30 days in sunlight (245).

However,  $\bar{C}$  in the pres. of suitable cat. adds HBr readily, but the mode of addn. differs according to conditions: e.g.,  $\bar{C} + HBr$  in pres. of small amts.  $FeCl_3$  or  $AlCl_3$  gives exclusively in yields up to 81% (245) 1-bromo-1,1,2-trichloroethane, b.p.  $152^\circ$  at 760 mm., b.p.  $54^\circ$  at 20 mm.,  $n_D^{20} = 1.5217$  (245); but  $\bar{C}$  with HBr in pres. of air and/or peroxides gives exclusively in yields up to 91% 2-bromo-1,1,2-trichloroethane, b.p.  $171^\circ$  at 760 mm., h.p.  $68.9^\circ$  at 20 mm.,  $n_D^{20} = 1.5302$ ,  $n_D^{45} = 1.5326$  (245).

**Behavior of  $\bar{C}$  with dry HI.**  $\bar{C}$  does not add HI even after 4 days at room temp. in dark and abs. of air; on exposure of the system for 2 weeks in sunlight 25% of  $\bar{C}$  was reduced to 1,1,2-trichloroethane (3:5330) (245).

**Behavior with oxygenated mineral acids. Reaction of  $\bar{C}$  with  $H_2SO_4$ .** [ $\bar{C}$  with strong  $H_2SO_4$  at elev. temp. undergoes reactns. leading ultimately (250) (189) to high yields of chloroacetic acid (3:1370). — For patents exemplifying various conditions see (251) (252) (253) (254) (255) (256). — Note also that the  $H_2SO_4$  may be replaced by arom. sulfonic acids such as benzenesulfonic acid, etc. (257).]

[ $\bar{C}$  with fuming  $H_2SO_4$  (10%  $SO_3$ ) shaken at  $88^\circ$  for  $\frac{3}{4}$  hrs. gives (258) cf. (255) (259)  $\alpha$ -chloro- $\alpha$ -sulfoacetic acid.]

Reaction of  $\bar{C}$  with  $HNO_3$ . [ $\bar{C}$  with conc.  $HNO_3$  ( $D = 1.42$ , 4 vols.) refluxed 3 hrs. gives mainly (260) cf. (258) dichlorodinitromethane [Beil. I-78, I<sub>1</sub>-(21), I<sub>2</sub>-(44)], accompanied by some trichloronitromethane (chloropicrin); for behavior of  $\bar{C}$  with  $N_2O_5$  in s.t. at 50° for 6 hrs. see (260).]

Behavior with alkali.  $\bar{C}$  in either aq. susp. or alc. soln. does not neutralize  $N/10$  aq. alk. (261) (for contrary earlier claim see (262)), but  $\bar{C}$  with excess 2  $N$  MeOH/KOH in s.t. at 100° for 30 min. uses alk. corresp. to 2 moles, i.e., apparent Sap. Eq. =  $M.W./2 = 65.8$ .

[ $\bar{C}$  with aq. alk. or alk.-earth hydroxides at 175° under press. in pres. of copper salts is claimed (263) to yield salts of glycolic acid (1.0430).]

[ $\bar{C}$  with ether passed as vapor with  $N_2$  over solid KOH + CaO at 130° loses HCl giving (84-90% yield (264)) dichloroacetylene (3:5010) in the form of its mol. cpd. (1:1) with ether, for earlier work in which  $\bar{C}$  alone over solid granular KOH at 130° gives (65% yield (265)) dichloroacetylene (266) see indic. refs.]

[ $\bar{C}$  with EtOH/NaOEt at 60-75° condenses with elimination of NaCl giving (yields: 81% (267), 70% (268)) (269) (204)  $\alpha,\beta$ -dichlorovinyl ethyl ether (3:5540). — Note that reaction of  $\bar{C}$  with alc. NaOEt has been accompanied by spontaneous explosions or ignition (270) (271) (272), presumably because of some form of either chloroacetylene (3:7000) or dichloroacetylene (3:5010) or both cf. (273).]

[For study of stability of  $\bar{C}$  toward water under various conditions see (9); note that carefully purified  $\bar{C}$  is more stable toward aq. than ord. tech. product (274).]

Behavior with metals. [For study of corrosive action of  $\bar{C}$  on soft steel, copper, brass, lead, aluminum, etc., at temps. 50-150° under various conditions see (9) (275) (276) (277) (278) (270) (280) (281). — For study of sensitivity to mechanical shock of  $\bar{C}$  with Li, Na, K, Ca, Sr, Ba see (282).]

Behavior with inorganic metal salts. With  $AlCl_3$ . [ $\bar{C}$  with  $AlCl_3$  (4-5%) on refluxing several hours (249) or  $\bar{C}$  at 225-230° under press. in pres. of Fe cpds. (284) undergoes bimolecular condensation with elimination of HCl and formn. of pentachlorobutadienes; see also comments above on reaction of  $\bar{C}$  with HCl and remarks below on reaction of  $\bar{C}$  with other org. chlorine cpds.]

With  $AlBr_3$ . [ $\bar{C}$  with  $AlBr_3$  as directed (283) undergoes halogen interchange giving 1,1,2-tribromoethylene [Beil. I-191, I<sub>1</sub>-(81), I<sub>2</sub>-(164)], b.p. 163-164°.]

With  $FeCl_3$ . [ $\bar{C}$  with anhydr.  $FeCl_3$  in s.t. at 85° yields (215) pentachloroethane (3:5880), but various side reactions result also in some hexachloroethane (3:4835) and tetrachloroethylene (3:5460).]

Behavior with other miscellaneous inorganic reactants. [ $\bar{C}$  with excess  $Cl_2O$  in  $CCl_4$  at -20° gives (285) pentachloroethane (3:5880), chlmal (3:5210), and octachlorodiethyl ether (3:0738). —  $\bar{C}$  with nitryl chloride ( $ClNO_2$ ) in s.t. at 100° for 3 hrs. gives (286) by addn. 1,1,1,2-tetrachloro-2-nitroethane, colorless nl, b.p. 76° at 18 mm (286). —  $\bar{C}$  with  $S_2Cl_2$  in s.t. at 140-150° for some hours (no reaction in open tube) gives mainly (287) pentachloroethane (3:5880).]

[For an attempt to react  $\bar{C}$  with hydrazine hydrate in pres. of solid KOH see (288).]

## BEHAVIOR OF $\bar{C}$ WITH ORGANIC REACTANTS

(See also above under  $\bar{C}$  with alkali.)

Behavior with hydrocarbons. [ $\bar{C}$  with  $C_6H_6$  in pres. of Al/Hg yields (289) both 1,1-diphenylethane [Beil. V-605, V<sub>1</sub>-(285), V<sub>2</sub>-(511)] and 1,1,2,2-tetraphenylethane [Beil. V-739, V<sub>1</sub>-(371), V<sub>2</sub>-(673)]. —  $\bar{C}$  (1 mmole) with cyclopentadiene (2 moles) at 175-185° under press. yields (309) a Diels-Alder type adduct, b.p. 158-160° at 11 mm., which with phenyl azide gives (309) a hydrotriazole, m.p. 225-226°.]

Behavior with other halogenated hydrocarbons (for reaction of  $\bar{C}$  with itself see above under polymerization).

With  $CHCl_3$  (3:5050). [ $\bar{C}$  in the pres. of  $AlCl_3$  at  $20^\circ$  adds  $CHCl_3$  to its unsatd. linkage yielding (290) (291) 1,1,1,2,3,3-hexachloropropane (3:6460); note that at higher temp., e.g.,  $50-60^\circ$ , yield is greatly diminished and several other prods. (290) are formed.]

With  $CCl_4$  (3:5100). [ $\bar{C}$  in the pres. of  $AlCl_3$  adds  $CCl_4$  to its unsatd. linkage giving at  $20-30^\circ$  for 48 hrs. (49% yield (292)) (290) (291) 1,1,1,2,3,3,3-heptachloropropane (3:6860).]

With 1,1,2-trichloroethane (3:5330). [ $\bar{C}$  in the pres. of  $AlCl_3$  adds 1,1,2-trichloroethane to its unsatd. linkage, then loses  $HCl$ , giving after 7 days at  $40^\circ$  a small yield (293) of 1,1,1,4,4-pentachlorobutene-2 (3:9054) accompanied by much resin.]

With hexachloropropene (3:6370). [ $\bar{C}$  (1 mole) with  $AlCl_3$  + hexachloropropene (1 mole) in  $CH_2Cl_2$  (3:5020) or  $CHCl_3$  (3:5050) at  $30-37^\circ$  gives (82% yield (294)) 1,1,2,3,3,3,4,5,5,5-nonachloropentene-1, colorless liq. with cedar-like odor, b.p.  $128^\circ$  at 2-3 mm.,  $86^\circ$  at 0.2 mm.,  $D_{20}^{20} = 1.812$ ,  $n_D^{20} = 1.5703$  (294);  $\bar{C}$  (2 moles) with  $AlCl_3$  + hexachloropropene (1 mole) as directed gives in 5 hrs. at  $20^\circ$  a mixt. of two dodecachloroheptenes ( $C_7H_2Cl_{12}$ ), one m.p.  $94-96^\circ$ , the other m.p.  $58-62^\circ$  (294).]

Behavior with paraformaldehyde (1:0080). [ $\bar{C}$  with paraformaldehyde in the pres. of conc.  $H_2SO_4$  at  $20-25^\circ$ , followed by treatment with aq., yields (295)  $O=(CH_2CHClCOOH)_2$ ; note, however, that  $\bar{C}$  with paraformaldehyde + conc.  $H_2SO_4$  + an alkyl hydrogen sulfate (296) or an alcohol (297) (to yield the alkyl hydrogen sulfate) gives the corresp. alkyl esters of  $\alpha$ -chloroacrylic acid (3:1445).]

Behavior with organic OH or SH cpds. [ $\bar{C}$  with alc.  $NaOEt$  (see above under behavior of  $\bar{C}$  with alkali) at  $60-75^\circ$  gives (yields: 81% (267), 70% (268)) (269) (204)  $\alpha,\beta$ -dichlorovinyl ethyl ether (3:5540).]

[ $\bar{C}$  (1 mole) with sodium salt of  $C_6H_5SH$  (1 mole) in abs. alc. refluxed 2 hrs. gives (298) both  $\alpha,\beta$ -dichlorovinyl ethyl thioether, b.p.  $77-80^\circ$  at 30 mm., and  $C_2H_5S.CH=CH(SC_2H_5)_2$ , b.p.  $135-140^\circ$  at 20 mm.]

[ $\bar{C}$  (1 mole) with sodium salt of  $C_6H_5SH$  (either 1 mole or excess) in abs. alc. refluxed 24 hrs. gives  $\alpha,\beta$ -dichlorovinyl phenyl thioether, b.p.  $145-150^\circ$  at 22 mm. (298).]

Behavior of  $\bar{C}$  with aromatic amines. With aniline.  $\bar{C}$  (1 mole) with aniline (3 moles) + aq. 15%  $NaOH$  (3 moles) refluxed for 40 hrs., and any unreacted components then removed by steam distn., gives (crude yield 64% (288)) *N*-phenylglycine-(*N,N*-diphenylamidine),  $C_6H_5NH.CH_2.C(=N.C_6H_5).NHC_6H_5$  [Beil. XII-557] (also known as "Sabanejev's base"), colorless cryst. from  $AcOEt$  or by rapid crystn. from hot alc., m.p.  $189-190^\circ$  (288). — [Note that this Sabanejev's base may be hydrolyzed in two distinct stages: e.g., on protracted refluxing with  $EtOH$  (288) it splits off 1 mole aniline leaving *N*-phenylglycine anilide =  $C_6H_5NH.CH_2.CO.NHC_6H_5$  [Beil. XII-556], cryst. from dil. alc., m.p.  $112-113^\circ$  (288); on the other hand the Sabanejev's base (or the *N*-phenylglycine anilide) on more vigorous treatment, e.g. with boiling aq.  $Ca(OH)_2$ , etc., hydrolyzes further yielding *N*-phenylglycine (*N*-phenylaminoacetic acid) [Beil. XII-468, XII-(263)], m.p.  $127-128^\circ$  (an important starting point for prepn. of indigo). — For patents on the prepn. of *N*-phenylglycine from  $\bar{C}$  by reactn. with aniline in the pres. of aq.  $Ca(OH)_2$  at  $170-180^\circ$  under press. see (299) (300).]

[The reactn. of  $\bar{C}$  with aniline + aq. alk. to form Sabanejev's base (above) is also accompanied by various side reactions, including formn. (29% yield (301)) of 1,1,2-tri-(anilino)ethylene, m.p.  $147^\circ$  dec. (301); for further details on this and other by-products see (301) (302).]

With other aromatic amines. [For analogous behavior of  $\bar{C}$  with other aromatic prim. amines in the pres. of aq. alk., e.g., with *p*-toluidine (288) (302) (303) (note that *o*-toluidine behaves abnormally while *m*-toluidine does not react (288)),  $\beta$ -naphthylamine (302) cf.

(288), *p*-anisidine (288), *p*-phenetidine (288), *p*-aminobiphenyl (288), and many others (288) see indic. refs.]

### COLOR TESTS FOR $\bar{C}$

① Color test with  $\alpha$ -naphthol (1:1500).  $\bar{C}$  with a few drops 2% alc.  $\alpha$ -naphthol + conc.  $H_2SO_4$  (2 ml.), shaken, diluted with aq. (1-2 ml.), gives red-peach color (304). [This test was devised especially for detection of  $\bar{C}$  in oils or melted fats (2-ml. samples); in olive oil  $\bar{C}$  can be detected in 1/2000, and can also be noted in presence of castor oil, grapeseed oil, raw linseed oil, lard, etc. Note, however, that test fails with oils which have been subjected to oxidn., e.g., boiled linseed oil, and its sensitivity is improved by the pres. of reducing agts., e.g., by a trace of Zn dust (304).]

② Color test with cyclopentanol (1:6412).  $\bar{C}$  (1 drop) with cyclopentanol (2 ml.) + trace solid NaOH, boiled 25 secs., cooled, acidified with AcOH or 85%  $H_2SO_4$ , stood 1 min., and shaken gives (305) green color. [Note that this same response is also shown by 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) but not by methylene dichloride (3:5020),  $CHCl_3$  (3:5050),  $CCl_4$  (3:5100), ethylene dichloride (3:5130), pentachloroethane (3:5880), *cis* (3:5012) or *trans* (3:5028)-1,2-dichloroethylene, or tetrachloroethylene (3:5460); for sensitivity for  $\bar{C}$  see (305).]

③ Color test with pyridine and aq. alk. (Fujiwara reaction). See above under detn. of  $\bar{C}$ .

Comment on behavior of  $\bar{C}$  with  $NH_4OH/CuCl$ . Note that  $\bar{C}$  with  $NH_4OH/CuCl$  does not give blue color within 5 min. (306) (diff. from pentachloroethane (3:5880) q.v.).

④ Mercury bis-(trichloroethyleneide),  $Hg(-CCl=CCl)_2$  (see also above under detn. of  $\bar{C}$ ). —  $\bar{C}$  with aq. KOH soln. of  $Hg(CN)_2$  on shaking 24 hrs. at room temp. (169), or  $\bar{C}$  with  $HgO + NaOEt + KCN$  in alc. shaken 1 hr. at 40-60° (not higher) (307) (308) cf. (273), gives (yields. 100% (169), 90% (307)) mercury bis-(trichloroethyleneide), cryst. from ether or  $CHCl_3$ , m.p. 83° (169) (273), 82-83° (242) (note that after recrysta. from alc. n.m.p. of 141° (307) has been reported). [For behavior of ordinary 1,2-dichloroethylene with aq. alk.  $Hg(CN)_2$  solns. yielding mercury bis-(chloroacetylide)  $Hg(-C\equiv CCl)_2$ , m.p. 165°, see text of that cpd. (3:5030).]

### 3:5180 DICHLOROACETALDEHYDE

B.P. 80.5-90.5° (1)

88-90° (2) (3)

88.4-89.6° (4)

87-88° (5)

Anhydrous  $\bar{C}$  is strongly lachrymatory liq.; in a.e.  $\bar{C}$  can be kept hut in open containers it gradually changes to an amorphous polymer, insol. alc. but from which  $\bar{C}$  can be regenerated at 126° (2) cf. (6).

[For prepn. of  $\bar{C}$  from dichloroacetaldehyde diethylacetal (3:6116) hy distn. with conc.  $\text{H}_2\text{SO}_4$  (1) (2) (7) or with benzoic anhydride (1:0595) + a little conc.  $\text{H}_2\text{SO}_4$  (3) (yield: 81% (5), 78% (8)) see indic. refs.; for prepn. of  $\bar{C}$  from chloral hydrate (3:1276) with  $\text{Al/Hg}$  see (9); for manufacture of  $\bar{C}$  from chloroform + formaldehyde with  $\text{SO}_2\text{Cl}_2$  at 300° (10) or with heat, pressure, and cat. (11) see indic. refs.]

[For formn. of  $\bar{C}$  from  $\alpha,\beta,\beta$ -trichloroethyl ethyl ether (1),  $\beta,\beta$ -dichlorovinyl methyl (12) or ethyl (1) ethers on hgt. with acids; from  $\beta,\beta,\beta$ -trichlorolactic acid or its sodium salt by hgt. in  $CO_2$  (13) or warming aq. soln. (14) (22), or from its acetate with ethereal  $Et_3N$  followed by warming with aq. (13) (15); from ethyl  $\alpha$ -ethoxy- $\beta,\beta$ -dichloroacrylate on warming with aq. (16); from dichloropyruvic acid by hgt. with aq. (15) see indic. refs.]

[For formn. of  $\bar{C}$  from acetylene with  $HOCl$  (17) or from chloroacetylene (3:7000) with  $NaOCl$  (18) see indic. refs.]

$\bar{C}$  in pres. of conc.  $H_2SO_4$  polymerizes (19) to a cryst. tri (?) mer paradichloroacetaldehyde, m p. 129–130° (19), and eas. sol. alc.; this prod. on hgt. in a s.t. at 240–245° or with conc.  $H_2SO_4$  at 120–130° regenerates  $\bar{C}$ . [For use of  $\bar{C}$  and this polymer as insecticides see (20).]

$\bar{C}$  with 1 mole aq. and cooling yields (1) dichloroacetaldehyde hydrate (3:1085), m.p. 56°.

$\bar{C}$  with abs.  $EtOH$  yields (1) dichloroacetaldehyde monoethylacetal (dichloroacetaldehyde ethyl alcoholate) (3:5310). [For dichloroacetaldehyde diethylacetal, b.p. 184° see 3.6110.]

$\bar{C}$  reduces  $NH_4OH/AgNO_3$ . —  $\bar{C}$  on oxidn. with fung.  $HNO_3$  yields (21) dichloroacetic acid (3:6208).

[ $\bar{C}$  with  $PCl_5$  yields (22) 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) (which if much  $HCl$  is present may be accompanied by  $\alpha,\beta,\beta,\alpha',\beta',\beta'$ -hexachlorodiethyl ether (22)).]

$\bar{C}$  with 1 mole  $NH_2OH.HCl$  in aq. soln. yields (23) a liquid oxime, b.p. 67–69° at 17 mm., 40–44° at 2–3 mm. dec; however, with excess  $NH_2OH.HCl + Na_2CO_3$   $\bar{C}$  yields (14) (16) glyoxal dioxime (Beil I-761, I<sub>1</sub>-(394), I<sub>2</sub>-(818), m p. 177–178° (16), 173° (14).

$\bar{C}$  with excess phenylhydrazine yields (24) (25) glyoxal bis-phenylosazone, pale yel. pl. from holtg. alc., m.p. 169–171° (25), 170° (24).

$\bar{C}$  with 1 mole semicarbazide in alc. yields (26) dichloroacetaldehyde semicarbazone, m p. 155–156° (26);  $\bar{C}$  with 2 moles semicarbazide in aq. soln. gives on boilg. (26) glyoxal bis-semicarbazone, insol. in usual solvents and not melting below 270° (27).

**3:5190 2,3-DICHLOROPROPENE-1**  
 ( $\beta$ -Chloroallyl chloride)

B.P. 94-94.5° (1) (6)

 $D_{25}^{25} = 1.204$  (3) $n_D^{25} = 1.4600$  (5)

94° (2) (3)

92.5° (4)

Colorless oil, insol. aq., sol. alc., ether.

[For prepn. of  $\bar{C}$  from 1,2,3-trichloropropane (3:5840) + aq. alk. (yield 80% (5), 87% (4), 70% (1)) or alc. alk. (4) see indic. refs.; for other misc. methods of formn. see Beil I-199.]

$\bar{C}$  shaken with 6-7 pts. conc.  $\text{H}_2\text{SO}_4$ , poured into aq., and distd. yields (7) chloroacetone (3:5425), b.p. 118°.

$\bar{C}$  adds  $\text{Br}_2$  giving (3) 2,3-dichloro-1,2-dibromopropane [Beil. I-112], b.p. 205° (3).

$\bar{C}$  btd. with fuming  $\text{HCl}$  in s.t. at 100° yields (3) 1,2,2-trichloropropane (3:5475), b.p. 123°.

[For study of addn. of  $\text{HF}$  see (4).]

[For use of  $\bar{C}$  in prepn. of cellulose ethers with unsatd. linkages see (8).]

**3:5200 1,1,2-DICHLOROPROPANE**  
 (Propylene (di)chloride)

B.P. 96.8° at 760 mm. (1) (2)

 $D_4^{20} = 1.1545$  (6) $n_D^{20} = 1.4388$  (9)

96.4-96.6° (3) (4) (5)

96.4° at 760 mm. (6)

95.2-96.0° at 760 mm. (7) (8)

Colorless oil. — For b.p.'s at various pressures from 33-847 mm. see (6) (10). — Almost insol. in aq.; for precise data see (3) (4) (5). — [For use as technical solvent see (11); for use in concn. of  $\text{AcOH}$  by formn. with aq. of const.-boilg. mixt., b.p. 96° see (12).]

[For prepn. of  $\bar{C}$  from corresp. alc., propanediol-1,2 (propylene glycol) (1:6455), with  $\text{PCl}_3 + \text{ZnCl}_2$  (13% yield (13)), or  $\text{PCl}_3 + \text{ZnCl}_2$  (11% yield (13)), or  $\text{SOCl}_2$  (15% yield (13)), or  $\text{SOCl}_2 + \text{pyridine}$  (28% yield (13)), see (13); for prepn. of  $\bar{C}$  from propylene by addn. of  $\text{Cl}_2$  (88% yield (9)) see (9) (14) (30); for formn. of  $\bar{C}$  (35.6% (15)) together with other products by chlorination of propane (15) (16) (17) see indic. refs.; for formn. of  $\bar{C}$  (60% (18)) together with 1,3-dichloropropane (3:5450) (40% (18)) from 1-chloropropane (3:7040) with  $\text{SO}_2\text{Cl}_2$  see (18); for other misc. methods see Beil. I-105.]

[For study of limits of inflammability (3.4%-14.5% by volume) of  $\bar{C}$  in air see (19); for study of thermal conductivity of  $\bar{C}$  see (20); for adsorption of  $\bar{C}$  by activated carbon at various temps. see (31).]

$\bar{C}$  on further chlorination with  $\text{SO}_2\text{Cl}_2$  yields (18) cf. (32) 48% 1,2,2-trichloropropane (3:5475), 37% 1,2,3-trichloropropane (3:5840) cf. (21), and 15% 1,1,2-trichloropropane (3:5630).

$\bar{C}$  on htg. at 540–750°C. loses HCl yielding (15) (22) a mixt. of 3-chloropropene-1 (allyl chloride) (3:7035) and 1-chloropropene-1 (3:7030). —  $\bar{C}$  with aq. alk. under pressure and above b.p. of  $\bar{C}$  yields (23) 2-chloropropene-1 (isopropenyl chloride) (3:7020). —  $\bar{C}$  with alc. KOH (but not NaOH (9)) at 60–75° gives (95% yield (9)) mixt. of 2-chloropropene-1 (3:7020) and 1-chloropropene-1 (3:7030) cf. (21) (28).

[For reactn. of  $\bar{C}$  with salts of lower aliphatic acids yielding esters of *d,l*-propylene glycol (1:6455) see (24); with conc. aq.  $NH_4OH$  at 78–80° giving (92% yield (25)) propylenediamine dihydrochloride and other products (26) see indic. refs.]

$\bar{C}$  htd. with aq. + PbO in s.t. at 150° is said [Beil. I-103] to yield *d,l*-propylene glycol (1:6455), but  $\bar{C}$  htd. with 20 vols. aq. in s.t. at 210–220° yields (2) from the glycol a mixt. of propionaldehyde (1:0110) and acetone (1:5400). — [For behavior of  $\bar{C}$  with boilg. aq. + trace of  $NaHCO_3$ , or with boilg. aq. + Fe, see (15).]

— 1,2-Diphenoxypropane: m.p. 32°, b.p. 175–178° at 12 mm. (27). [From 1-bromo-2-phenoxypropane with 25% alc.  $NaOC_6H_5$  (27); it has not, however, been reported direct from  $\bar{C}$ .]

— 1,2-Di( $\alpha$ -naphthoxy)propane: unrecorded.

— 1,2-Di( $\beta$ -naphthoxy)propane: m.p. 152° (29). [From  $\bar{C}$  with  $\beta$ -naphthol (1:1540) + aq. NaOH in s.t. at 120° (29).]

See also Note 1.				

[See also chloral hydrate (3:1270) and chloral ethylalcoholate (3:0860).]

Important note: The chemistry of anhydrous chloral on one hand and that of chloral hydrate on the other is so closely interwoven that the division of material between them in this book is necessarily arbitrary. For instance, there are many reactions actually employing chloral hydrate as the starting point, which by virtue of the simultaneous use of conc.  $\text{H}_2\text{SO}_4$  are undoubtedly in effect reactions of anhydrous chloral. In such cases the allocation of text between the two entries has been influenced by the nature and magnitude of the context. Although cross references have been liberally employed, the texts of both anhydrous chloral and of chloral hydrate should be compared.

### MISCELLANEOUS PHYSICAL PROPERTIES

Binary systems contg.  $\bar{\text{C}}$ .  $\bar{\text{C}}$  with  $\text{H}_2\text{O}$  combines to give chloral hydrate (3:1270) q.v. (for use in this reaction of  $\bar{\text{C}}$  in effecting drying of halogen compounds used in fire extinguishers see (20)); for extensive study of system  $\bar{\text{C}}$  + nq. see (9).

$\bar{\text{C}}$  with  $\text{EtOH}$  (1:6130) combines to give chloral ethylalcoholate (3:0860) q.v.—For analogous reactions of  $\bar{\text{C}}$  with other alcs. see below under chemical behavior of  $\bar{\text{C}}$ .

Azeotropic mixtures containing  $\bar{\text{C}}$ . A few such systems are known including the following:  $\bar{\text{C}}$  with methylcyclohexane (hexahydrotoluene) (1:8410) gives a const.-boilg. mixt., b.p. 94.45° at 760 mm., contg. 57%  $\bar{\text{C}}$  (2);  $\bar{\text{C}}$  with isobutyl formate (1:3065) gives a const.-boilg. mixt., b.p. 100.1° at 760 mm., contg. 60%  $\bar{\text{C}}$  (21);  $\bar{\text{C}}$  with *n*-propyl acetate (1:3075) gives a const.-boilg. mixt., b.p. 102.55° at 760 mm., contg. 50.5%  $\bar{\text{C}}$  (21);  $\bar{\text{C}}$  with nitromethane gives a const.-boilg. mixt., h.p. 93° at 760 mm., contg. 65%  $\bar{\text{C}}$  (20).

### PREPARATION OF $\bar{\text{C}}$

#### FROM HALOGEN-FREE STARTING POINTS

From ethyl alcohol. [ $\bar{\text{C}}$  was first prepared (22) from  $\text{EtOH}$  (1:6130) by action of  $\text{Cl}_2$ ; for discussion of mechanism of reaction see (23) (24); note that various by-products (25) (26) such as 1,1-dichloroethane (3:5035), 1,2-dichloroethane (3:5130), 1,1,2-trichloroethane (3:5330),  $\beta,\beta,\beta$ -trichloroethanol (3:5775), ethyl dichloroacetate (3:5350), and chloroform

(3:5050) have been detected; for patents on prepn. of  $\bar{C}$  (or its hydrate) from EtOH with  $Cl_2$  see (27) (28); for use of  $Cl_2$  in pres. of  $FeCl_3$  see (29).]

From acetaldehyde. [For prepn. of  $\bar{C}$  from acetaldehyde (1:0100) with  $Cl_2$  see (30) (31)]

From other non-halogenated materials. [For formation of  $\bar{C}$  from ethyl formate (1:3000) with  $SO_2Cl_2$  in s.t. at  $170^\circ$  (32) or from starch nr sucrose by distn. with  $MnO_2 + HCl$  (33) see indic. refs.]

#### FROM HALOGENATED STARTING MATERIALS

From chloro-unsaturates. [For formn. of  $\bar{C}$  from 1,1,2-trichloroethylene (3:5170) with large excess  $Cl_2O$  in  $CCl_4$  at  $-20^\circ$  (34) or on oxidn. in pres. of  $FeCl_3$ ,  $AlCl_3$ ,  $TiCl_4$ , or  $SbCl_3$  as directed (35) see indic. refs.; from chloroacetylene (3:7000) with aq. 30%  $NaOCl + H_3BO_3$  see (36).]

From carbon tetrachloride. [For prepn. of  $\bar{C}$  from  $CCl_4$  (3:5100) with formaldehyde  $+ SO_2Cl_2 + cat.$  at high temp. ( $200-500^\circ$ ) and high press. (20-200 atm.) see (401)]

From various chloral derivatives. [For prepn. of  $\bar{C}$  from chloral hydrate (3:1270) by dehydration with conc.  $H_2SO_4$  (note that  $\bar{C}$  is appreciably soluble in conc.  $H_2SO_4$  (9)) or with  $CaC_2$  slowly in cold but rapidly at  $100^\circ$  (37); from chloral ethylalcoholate (3:0860) (or other chloral alcoholates) with conc.  $H_2SO_4$ , from chloral polymers such as "metachloral" by htg. at  $180-200^\circ$  (38); from trichloroacetaldehyde diethylacetal ("trichloroacetal") (3:6317) above  $200^\circ$  (39) or on distn. with conc.  $H_2SO_4$  (39) (40); from dichloroacetaldehyde diethylacetal ("dichloroacetal") (3:6110) with  $Cl_2$  at  $60-70^\circ$  (41) see indic. refs.]

### CHEMICAL BEHAVIOR OF $\bar{C}$ WITH INORGANIC REACTANTS

#### GENERAL

[For review of chemistry of  $\bar{C}$  and its hydrate (3:1270) see (42).]

#### REDUCTION OF $\bar{C}$

According to the nature of the reagent and the conditions,  $\bar{C}$  (or its hydrate) may undergo reduction either at its  $-CCl_3$  group or at its  $-CHO$  group.

Reduction at  $-CCl_3$  group [ $\bar{C}$  with  $H_2 + Pd$  in alc.  $KOH$  (43) or with  $H_2 + Ni$  + aq. alk. (44) splits off all its halogen as  $HCl$ . —  $\bar{C}$  with  $Zn + AcOH$  (45) (46), with  $Al + AcOH$  (75), with  $Zn + strong HCl$  (47) (48), with  $Zn + dil. H_2SO_4$  (49) (50), reduces to acetaldehyde (1:0100); because of easy volatility of this product the reaction may be used for the identification and detection of  $\bar{C}$  (47) (49) (50), or for detection of  $\bar{C}$  in presence of  $CHCl_3$  (3:5050) or of  $\alpha,\alpha,\beta$ -trichloro-*n*-butyraldehyde ("butyrychloral") (3:5910) (49). — Note that  $\bar{C}$  with aq.  $Zn$  or  $Fe$  powder especially on warming gives (51)  $CH_4 + MeCl$  (3:7005)  $+ CH_2Cl_2$  (3:5020).]

[ $\bar{C}$  in aq. with  $Al/Hg$  gives (52) dichloroacetaldehyde hydrate (3:1085), while  $C$  (as hydrate) on electrolytic reduction (53) gives dichloroacetaldehyde (3:5180)  $+ chloroacetaldehyde$  (3:7212)  $+ acetaldehyde$  (1:0100)]

Reduction at  $-CHO$  group. [ $\bar{C}$  with  $Al(OEt)_3$  in abs. EtOH gives (yields: 85% (54), 84% (55), 80% (56)) (57) (58) (59) cf. (60) 2,2,2-trichloroethanol-1 (3:5775); for reduction of  $\bar{C}$  to this same product using  $Al$  isopropylate in isopropyl alc. (61) in pres. of acetaldehyde (yield 72-87% (62)),  $C_2H_5OMgBr$  (63),  $(CH_3)_2CHOMgBr$  (63), or other metallic isopropylates (64),  $ZnEt_2$  (65) (66),  $AlEt_3$  compd. with ether (88.5% yield (67)) (note, however, that  $SnEt_4$  is not effective (67)), or fermenting yeast (68) (69), see indic. refs. — For formn. of 2,2,2-trichloroethanol-1 (3:5775) during reaction of  $\bar{C}$  with various  $RMgX$  compounds see below under behavior of  $\bar{C}$  with  $RMgX$  cpds.]

[See also chloral hydrate (3:1270) and chloral ethylalcoholate (3:0860).]

Important note: The chemistry of anhydrous chloral on one hand and that of chloral hydrate on the other is so closely interwoven that the division of material between them in this book is necessarily arbitrary. For instance, there are many reactions actually employing chloral hydrate as the starting point, which by virtue of the simultaneous use of conc.  $\text{H}_2\text{SO}_4$  are undoubtedly in effect reactions of anhydrous chloral. In such cases the allocation of text between the two entries has been influenced by the nature and magnitude of the context. Although cross references have been liberally employed, the texts of both anhydrous chloral and of chloral hydrate should be compared.

### MISCELLANEOUS PHYSICAL PROPERTIES

Binary systems contg.  $\bar{\text{C}}$ .  $\bar{\text{C}}$  with  $\text{H}_2\text{O}$  combines to give chloral hydrate (3:1270) q.v. (for use in this reaction of  $\bar{\text{C}}$  in effecting drying of halogen compounds used in fire extinguishers see (20)); for extensive study of system  $\bar{\text{C}}$  + aq. see (9).

$\bar{\text{C}}$  with  $\text{EtOH}$  (1:6130) combines to give chloral ethylalcoholate (3:0860) q.v.—For analogous reactions of  $\bar{\text{C}}$  with other alcs. see below under chemical behavior of  $\bar{\text{C}}$ .

Azeotropic mixtures containing  $\bar{\text{C}}$ . A few such systems are known including the following:  $\bar{\text{C}}$  with methylcyclohexane (hexahydrotoluene) (1:8410) gives a const.-boil. mixt., b.p. 94.45° at 760 mm., contg. 57%  $\bar{\text{C}}$  (2);  $\bar{\text{C}}$  with isobutyl formate (1:3065) gives a const.-boil. mixt., b.p. 100.1° at 760 mm., contg. 60%  $\bar{\text{C}}$  (21);  $\bar{\text{C}}$  with *n*-propyl acetate (1:3075) gives a const.-boil. mixt., b.p. 102.55° at 760 mm., contg. 50.5%  $\bar{\text{C}}$  (21);  $\bar{\text{C}}$  with nitromethane gives a const.-boil. mixt., b.p. 93° at 760 mm., contg. 65%  $\bar{\text{C}}$  (20).

### PREPARATION OF $\bar{\text{C}}$

#### FROM HALOGEN-FREE STARTING POINTS

From ethyl alcohol. [ $\bar{\text{C}}$  was first prepared (22) from  $\text{EtOH}$  (1:6130) by action of  $\text{Cl}_2$ ; for discussion of mechanism of reaction see (23) (24); note that various by-products (25) (26) such as 1,1-dichloroethane (3:5035), 1,2-dichloroethane (3:5130), 1,1,2-trichloroethane (3:5330),  $\beta,\beta,\beta$ -trichloroethanol (3:5775), ethyl dichloroacetate (3:5850), and chloroform

(3:5050) have been detected; for patents on prepn. of  $\bar{C}$  (or its hydrate) from EtOH with  $Cl_2$  see (27) (28); for use of  $Cl_2$  in pres. of  $FeCl_3$  see (29).]

From acetaldehyde. [For prepn. of  $\bar{C}$  from acetaldehyde (1:0100) with  $Cl_2$  see (30) (31).]

From other non-halogenated materials. [For formation of  $\bar{C}$  from ethyl formate (1:3000) with  $SO_2Cl_2$  in s.t. at  $170^\circ$  (32) or from starch or sucrose by distn. with  $MnO_2 + HCl$  (33) see indic. refs.]

#### FROM HALOGENATED STARTING MATERIALS

From chloro-unsaturates. [For formn. of  $\bar{C}$  from 1,1,2-trichloroethylene (3:5170) with large excess  $Cl_2O$  in  $CCl_4$  at  $-20^\circ$  (34) or on oxidn. in pres. of  $FeCl_3$ ,  $AlCl_3$ ,  $TiCl_4$ , or  $SbCl_5$  as directed (35) see indic. refs.; from chloroacetylene (3:7000) with aq. 30%  $NaOCl + H_3BO_3$  see (36).]

From carbon tetrachloride. [For prepn. of  $\bar{C}$  from  $CCl_4$  (3:5100) with formaldehyde +  $SO_2Cl_2$  + cat. at high temp. ( $200-500^\circ$ ) and high press. (20-200 atm.) see (404).]

From various chloral derivatives. [For prepn. of  $\bar{C}$  from chloral hydrate (3:1270) by dehydration with conc.  $H_2SO_4$  (note that  $\bar{C}$  is appreciably soluble in conc.  $H_2SO_4$  (9)) or with  $CuCl_2$  slowly in cold but rapidly at  $100^\circ$  (37), from chloral ethylalcoholate (3:0860) (or other chloral alcoholates) with conc.  $H_2SO_4$ ; from chloral polymers such as "metachloral" by htg. at  $180-200^\circ$  (38); from trichloroacetaldehyde diethylacetal ("trichloroacetal") (3:6317) above  $200^\circ$  (39) or on distn. with conc.  $H_2SO_4$  (39) (40), from dichloroacetaldehyde diethylacetal ("dichloroacetal") (3:6110) with  $Cl_2$  at  $60-70^\circ$  (41) see indic. refs.]

### CHEMICAL BEHAVIOR OF $\bar{C}$ WITH INORGANIC REACTANTS

#### GENERAL

[For review of chemistry of  $\bar{C}$  and its hydrate (3:1270) see (42).]

#### REDUCTION OF $\bar{C}$

According to the nature of the reagent and the conditions,  $\bar{C}$  (or its hydrate) may undergo reduction either at its  $-CCl_3$  group or at its  $-CHO$  group.

Reduction at  $-CCl_3$  group [ $\bar{C}$  with  $H_2 + Pd$  in alc.  $KOH$  (43) or with  $H_2 + Ni$  + aq. alk. (44) splits off all its halogen as  $HCl$ . —  $\bar{C}$  with  $Zn + AcOH$  (45) (46), with  $Al + AcOH$  (75), with  $Zn +$  strong  $HCl$  (47) (48), with  $Zn +$  dil.  $H_2SO_4$  (49) (50), reduces to acetaldehyde (1:0100); because of easy volatility... for the identification and detection of  $\bar{C}$  (47)  $CHCl_3$  (3:5050) or of  $\alpha,\alpha,\beta$ -trichloro-*n*-butyl... — Note that  $\bar{C}$  with aq.  $Zn$  or  $Fe$  powder especially on warming gives (51)  $CH_4 + MeCl$  (3:7005) +  $CH_2Cl_2$  (3:5020).]

[ $\bar{C}$  in aq. with  $Al/Hg$  gives (52) dichloroacetaldehyde hydrate (3:1085), while  $C$  (as hydrate) on electrolytic reduction (53) gives dichloroacetaldehyde (3:5180) + chloroacetaldehyde (3:7212) + acetaldehyde (1:0100).]

Reduction at  $-CHO$  group. [ $\bar{C}$  with  $Al(OEt)_3$  in abs. EtOH gives (yields: 85% (54), 84% (55), 80% (56)) (57) (58) (59) cf. (60) 2,2,2-trichloroethanol-1 (3:5775); for reduction of  $\bar{C}$  to this same product using  $Al$  isopropylate in isopropyl alc. (61) in pres. of acetaldehyde (yield 72-87% (62)),  $C_2H_5OMgBr$  (63),  $(CH_3)_2CHOMgBr$  (63), or other metallic isopropylates (64),  $ZnEt_2$  (65) (66),  $AlEt_3$  compd. with ether (88.5% yield (67)) (note, however, that  $SnEt_4$  is not effective (67)), or fermenting yeast (68) (69), see indic. refs. — For formn. of 2,2,2-trichloroethanol-1 (3:5775) during reaction of  $\bar{C}$  with various  $RMgX$  compounds see below under behavior of  $\bar{C}$  with  $RMgX$  cpds.]

OXIDATION OF  $\bar{C}$ 

$\bar{C}$  or its hydrate (3:1270) on oxidation under appropriate conditions gives trichloroacetic acid (3:1150); under some circumstances extensive decompn. also occurs (see below).

[ $\bar{C}$  on oxidn. with fumg.  $HNO_3$  (70) cf. (71), with  $HNO_2$  (72), with  $NO_2$  at 40–60° (70% yield (73)) or with aq. chlorates + cat. (74) gives trichloroacetic acid (3:1150); for formn. of latter as by-product of action of  $\bar{C}$  with  $O_2$  including comments on inhibitors, etc., see (38) (75).]

[Chloral hydrate (3:1270) on oxidn. with fumg.  $HNO_3$  (63% yield (76)) cf. (72), with  $KMnO_4$  (77) (80), with  $KClO_3$  (78), with aq. chlorates + cat. (74), or with  $Ca(OCl)_2$  (79) gives trichloroacetic acid (3:1150).]

Chloral hydrate (3:1270) reduces  $NH_4OH/AgNO_3$  (81) or Fehling's soln. (for study of sensitivity of this reaction see (82) [for oxidn. of chloral hydrate by  $HgO$ ,  $KMnO_4$ , or  $CrO_3$  see (83)]; for reduction by chloral hydrate of  $AgCl$ ,  $AgBr$ ,  $AgI$ , or  $AgSCN$  to metallic silver (84) or of alkaline solns. of Au, Ag, Bi, and Cu salts (85) see indic. refs.].

[ $\bar{C}$  in dry  $C_6H_6$  is but slowly attacked by silver oxide (86).]

REACTIONS INVOLVING DECOMPOSITION OF  $\bar{C}$ 

(See also below under behavior of  $\bar{C}$  with alkalis.)

[ $\bar{C}$  with aq.  $HIO_3$  at 100° decomposes yielding (87)  $CHCl_3$  (3:5050) +  $CO_2$  +  $ICl_3$  +  $I_2$ . —  $\bar{C}$  on chlorine-sensitized (88) or bromine-sensitized (12) photochemical oxidn. with  $O_2$  at 70–90° decomposes yielding (88) (12)  $COCl_2$  (3:5000) +  $CO$  +  $HCl$ ]

[ $\bar{C}$  on thermal decompn. at about 440°C. especially if catalyzed by  $I_2$  (89) or  $NO$  (89) (90) gives  $CHCl_3$  (3:5050) +  $CO$ .]

[ $\bar{C}$  with  $AlCl_3$  on htg. gives various products according to conditions; these include tetrachloroethylene (3:5460) (91) (92), pentachloroethane (3:5880) (93),  $\alpha,\alpha,\beta,\beta,\gamma,\gamma,\gamma$ -heptachloro-*n*-butyraldehyde ("perchlorobutanal") (94), chloral polymers (especially metachloral (91) (92) (95)), chloralide (3:3510) (92) (94), and others.]

BEHAVIOR OF  $\bar{C}$  WITH HALOGENS

With chlorine. [ $\bar{C}$  with  $Cl_2$  in sunlight decomposes giving (96)  $CCl_4$  (3:5100) +  $COCl_2$  (3:5000) +  $HCl$ ; for extensive study of photochem. reaction of  $\bar{C}$  with  $Cl_2$  at 70–90° giving  $CCl_4$  (3:5100) +  $CO$  +  $HCl$  see (97). — Note that  $\bar{C}$  with  $Cl_2$ ,  $Br_2$ , or  $I_2$  in pres. of  $AlCl_3$  gives (98) hexachloroethane (3:4835).]

With bromine. [ $\bar{C}$  with  $Br_2$  at 150° gives (99) trichloroacetyl bromide + bromotrichloromethane +  $CO$  +  $HBr$ ; for extensive study of photochem. reaction of  $\bar{C}$  with  $Br_2$  at 70–90° giving bromotrichloromethane,  $CHCl_3$  (3:5050),  $COBr_2$ ,  $CO$  +  $HBr$  see (13).]

BEHAVIOR OF  $\bar{C}$  WITH INORGANIC ACIDS

$\bar{C}$  with inorganic acids reacts in various ways according to circumstances; e.g., by formn. of addn. products, by decomposition, by formation of chloralide, by polymerization (see also its own heading below), or by combinations of these reactions.

With  $HCl$ . [ $\bar{C}$  with  $HCl$  gas at –15 to –75° yields (100) (113) an addn. product  $\bar{C} \cdot HCl$  commonly designated as chloral hydrochloride; this crystn. product with aq. dissociates giving  $\bar{C}$  (as hydrate) +  $HCl$ ; note that little, if any, polymerization occurs (100).]

With  $HBr$ . [ $\bar{C}$  with  $HBr$  gas at –15° yields (100) an addn. prod.;  $C \cdot HBr$ , similar in behavior to that of the preceding  $HCl$  addn. product.]

With  $HNO_3$ . [ $\bar{C}$  with  $HNO_3$  at 20° yields (101) an addition prod.,  $C \cdot HNO_3$ .]

With  $H_2SO_4$ . [ $\bar{C}$  with fumg.  $H_2SO_4$  contg. 2%  $SO_3$  gives on warming substantially 100% yields (102) of chloralide (3:3510); note, however, that  $\bar{C}$  with fumg.  $H_2SO_4$  contg.

10%  $\text{SO}_3$  gives nt  $0^\circ$  an addn. prod. of the type  $\text{C}_m(\text{SO}_3)_n(\text{H}_2\text{O})_p$  which on warming dec. giving  $\text{COCl}_2$  (3:5000) +  $\text{SO}_2\text{Cl}_2$  +  $\text{SO}_2$  +  $\text{CO}_2$  +  $\text{CO}$  +  $\text{HCl}$  (102); for other (older) refs. on conversion of  $\bar{\text{C}}$  with fuming  $\text{H}_2\text{SO}_4$  to chloralide (3:3510) see (61) (81) (103) (104); for conversion of chloral hydrate (3:1270) with fuming  $\text{H}_2\text{SO}_4$  to chloralide (3:3510) (yields 61% (105), 44–51% (106)) see indic. refs. — Note, however, that within a narrow range of strength (best about 79.8%)  $\text{H}_2\text{SO}_4$  appears to give with  $\bar{\text{C}}$  or its hydrate certain unstable addition products of type  $\text{CCl}_3\text{CH}(\text{OH})\text{SO}_2\text{OH}\cdot\text{H}_2\text{O}$  (148).]

With  $\text{ClSO}_3\text{H}$ . [ $\bar{\text{C}}$  with chlorosulfonic acid at  $50^\circ$  for several days gives (65% yield (107)) *bis*-( $\alpha,\beta,\beta,\beta$ -tetrachloroethyl) ether (3:0738); note that even at  $-50^\circ$  for 10–12 hrs. yield of this prod. may be as high as 50%; also that various other products including chloralide (3:3510) are also formed; and finally that  $\bar{\text{C}}$  with  $\text{FSO}_3\text{H}$  behaves similarly (107).]

### POLYMERIZATION OF $\bar{\text{C}}$

$\bar{\text{C}}$  is known to give at least three polymers; the oldest and most common polymer is that designated as "metachloral"; in addition two isomeric  $\alpha$ - and  $\beta$ -"parachlorals" (possibly comprising a pair of *cis-trans* stereoisomers) have also been reported (108).

Metachloral. [ $\bar{\text{C}}$  in presence of  $\text{H}_2\text{SO}_4$  below  $0^\circ$  (108) (sometimes suddenly cf. (109)), fuming  $\text{H}_2\text{SO}_4$  (18), pyridine (18), or  $\text{AlCl}_3$  as directed (18) (92) (110) gives metachloral [Beil. I-618,  $I_1$ -(329),  $I_2$ -(680)], a white amorphous polymer of unknown mol. wt. or structure. This polymer is insol. aq., alc., ether, or acids but dissolves in aq.  $\text{Na}_2\text{CO}_3$  forming chloral hydrate (3:1270), on distn. at  $180^\circ$  regenerates  $\bar{\text{C}}$ , oxidizes with  $\text{HNO}_3$  to trichloroacetic acid, with alkalis behaves like  $\bar{\text{C}}$  (see also below), and with  $\text{ClSO}_3\text{H}$  at  $50^\circ$  gives (107) *bis*-( $\alpha,\beta,\beta,\beta$ -tetrachloroethyl) ether (3:0738).]

Parachloral. [ $\bar{\text{C}}$  with a large excess conc.  $\text{H}_2\text{SO}_4$  at  $15$ – $20^\circ$ , carefully dissolved and stood 3 days at  $15$ – $20^\circ$ , gives in addn. to metachloral (above) and chloralide (3:3510) small amts. of two isomeric trimers, viz.,  $\alpha$ -parachloral, rhombs from hot alc., m.p.  $116^\circ$ , h.p.  $223^\circ$  at 760 mm., and  $\beta$ -parachloral, pr. from alc., m.p.  $152^\circ$ , h.p.  $250^\circ$ . Note that yield of parachloral is only about 1% of original  $\bar{\text{C}}$ , that both are more sol. in hot alc. than the main prod. metachloral, that neither form is convertible to the other or to metachloral, and that both on distn. at ord. press. dissociate to  $\bar{\text{C}}$ .]

Mixed polymers. [ $\bar{\text{C}}$  (1 mole) with acetaldehyde (3 moles) +  $\text{HCl}$  gas at  $0^\circ$  for 15–20 hrs. gives (78% yield (111)) 2,4-dimethyl-6-(trichloromethyl)-1,3,5-trioxane, h.p.  $97^\circ$  at 13 mm.,  $D_4^{20} = 1.3915$ ,  $n_D^{20} = 1.4708$ . Similar mixed polymers (presumably analogous to the preceding case) are similarly formed (112) from  $\bar{\text{C}}$  with trimethylacetaldehyde (1:0133),  $\bar{\text{C}}$  with propionaldehyde (1:0110), and  $\bar{\text{C}}$  with isobutyraldehyde (1:0120).]

Behavior of  $\bar{\text{C}}$  with alkalis.  $\bar{\text{C}}$  with conc. aq. alkalis (even in cold (22)), or  $\bar{\text{C}}$  on distn. with aq. alkalis or alk. earths (22) (114) (115), undergoes cleavage into  $\text{CHCl}_3$  (3:5050) + the corresp. salt of formic acid (1:1005); this cleavage is claimed to occur also even with conc.  $\text{NH}_4\text{OH}$  (114) or aq. amines (114) and may also produce some  $\text{CO}$  (114) and chloride ion. — [For extensive studies of kinetics of this cleavage see (116) (117) (118) (119) (120) (121) (122) (126).]

Note that  $\bar{\text{C}}$  is very stable toward hydrolysis by aq. (126) (even in s.t. at  $190$ – $200^\circ$  for 2 hrs. (118)) or by dilute acid (even in s.t. at  $150^\circ$  (118)); however,  $\bar{\text{C}}$  with aq. in sunlight is claimed (123) to give formaldehyde (1:0145) +  $\text{CO}_2$  +  $\text{HCl}$  (presumably by formn. and decompn. of  $\text{OCH}_2\text{C}(\text{OH})_2$ ), and  $\bar{\text{C}}$  with aq. is claimed (124) to undergo slight formn. of dichloroacetic acid (3:6208) +  $\text{HCl}$ .

$\bar{\text{C}}$  with alc.  $\text{KOH}$  gives (125)  $\text{CHCl}_3$  (3:5050) + ethyl formate (1:3000).

[Note that chloral deuterate,  $\text{CCl}_3\text{CH}(\text{OD})_2$  (from  $\bar{\text{C}}$  +  $\text{D}_2\text{O}$ ), with  $\text{NaOD}$  (17) or  $\text{Ca}(\text{OD})_2$  (127) in  $\text{D}_2\text{O}$  gives deuteriochloroform,  $\text{CDCl}_3$ , b.p.  $0.5^\circ$  higher than ord.  $\text{CHCl}_3$ .

OXIDATION OF  $\bar{C}$ 

$\bar{C}$  or its hydrate (3:1270) on oxidation under appropriate conditions gives trichloroacetic acid (3:1150); under some circumstances extensive decompn. also occurs (see below).

[ $\bar{C}$  on oxidn. with fumg.  $HNO_3$  (70) cf. (71), with  $HNO_2$  (72), with  $NO_2$  at 40–60° (70% yield (73)) or with aq. chlorates + cat. (74) gives trichloroacetic acid (3:1150); for formn. of latter as by-product of action of  $\bar{C}$  with  $O_2$  including comments on inhibitors, etc., see (38) (75).]

[Chloral hydrate (3:1270) on oxidn. with fumg.  $HNO_3$  (63% yield (76)) cf. (72), with  $KMnO_4$  (77) (80), with  $KClO_3$  (78), with aq. chlorates + cat. (74), or with  $Ca(OCl)_2$  (79) gives trichloroacetic acid (3:1150).]

Chloral hydrate (3:1270) reduces  $NH_4OH/AgNO_3$  (81) or Fehling's soln. (for study of sensitivity of this reaction see (82) [for oxidn. of chloral hydrate by  $HgO$ ,  $KMnO_4$ , or  $CrO_3$  see (83); for reduction by chloral hydrate of  $AgCl$ ,  $AgBr$ ,  $AgI$ , or  $AgSCN$  to metallic silver (84) or of alkaline solns. of  $Au$ ,  $Ag$ ,  $Bi$ , and  $Cu$  salts (85) see indic. refs.].

[ $\bar{C}$  in dry  $C_6H_6$  is but slowly attacked by silver oxide (86).]

REACTIONS INVOLVING DECOMPOSITION OF  $\bar{C}$ 

(See also below under behavior of  $\bar{C}$  with alkalis.)

[ $\bar{C}$  with aq.  $HIO_3$  at 100° decomposes yielding (87)  $CHCl_3$  (3:5050) +  $CO_2$  +  $ICl_3$  +  $I_2$ . —  $\bar{C}$  on chlorine-sensitized (88) or bromine-sensitized (12) photochemical oxidn. with  $O_2$  at 70–90° decomposes yielding (88) (12)  $COCl_2$  (3:5000) +  $CO$  +  $HCl$ .]

[ $\bar{C}$  on thermal decompn. at about 440°C. especially if catalyzed by  $I_2$  (89) or  $NO$  (89) (90) gives  $CHCl_3$  (3:5050) +  $CO$ .]

[ $\bar{C}$  with  $AlCl_3$  on htg. gives various products according to conditions; these include tetrachloroethylene (3:5460) (91) (92), pentachloroethane (3:5880) (93),  $\alpha,\alpha,\beta,\beta,\gamma,\gamma,\gamma$ -heptachloro-*n*-butyraldehyde ("perchlorobutanal") (94), chloral polymers (especially metachloral (91) (92) (95)), chloralide (3:3510) (92) (94), and others.]

BEHAVIOR OF  $\bar{C}$  WITH HALOGENS

With chlorine. [ $\bar{C}$  with  $Cl_2$  in sunlight decomposes giving (96)  $CCl_4$  (3:5100) +  $COCl_2$  (3:5000) +  $HCl$ ; for extensive study of photochem. reaction of  $\bar{C}$  with  $Cl_2$  at 70–90° giving  $CCl_4$  (3:5100) +  $CO$  +  $HCl$  see (97). — Note that  $\bar{C}$  with  $Cl_2$ ,  $Br_2$ , or  $I_2$  in pres. of  $AlCl_3$  gives (98) hexachloroethane (3:4835).]

With bromine. [ $\bar{C}$  with  $Br_2$  at 150° gives (99) trichloroacetyl bromide + bromotrichloromethane +  $CO$  +  $HBr$ ; for extensive study of photochem. reaction of  $\bar{C}$  with  $Br_2$  at 70–90° giving bromotrichloromethane,  $CHCl_3$  (3:5050),  $COBr_2$ ,  $CO$  +  $HBr$  see (13).]

BEHAVIOR OF  $\bar{C}$  WITH INORGANIC ACIDS

$\bar{C}$  with inorganic acids reacts in various ways according to circumstances; e g., by formn. of addn. products, by decomposition, by formation of chloralide, by polymerization (see also its own heading below), or by combinations of these reactions.

With  $HCl$ . [ $\bar{C}$  with  $HCl$  gas at –15 to –75° yields (100) (113) an addn. product  $\bar{C} \cdot HCl$  commonly designated as chloral hydrochloride; this crystn. product with aq. dissociates giving  $\bar{C}$  (as hydrate) +  $HCl$ ; note that little, if any, polymerization occurs (100).]

With  $HBr$ . [ $\bar{C}$  with  $HBr$  gas at –15° yields (100) an addn. prod.;  $C \cdot HBr$ , similar in behavior to that of the preceding  $HCl$  addn. product.]

With  $HNO_3$ . [ $\bar{C}$  with  $HNO_3$  at 20° yields (101) an addition prod.,  $C \cdot HNO_3$ .]

With  $H_2SO_4$ . [ $\bar{C}$  with fumg.  $H_2SO_4$  contg. 2%  $SO_3$  gives on warming substantially 100% yields (102) of chloralide (3:3510); note, however, that  $\bar{C}$  with fumg.  $H_2SO_4$  contg.

10%  $\text{SO}_3$  gives at  $0^\circ$  an addn. prod. of the type  $\text{C}_m(\text{SO}_3)_n(\text{H}_2\text{O})_p$  which on warming dec. giving  $\text{COCl}_2$  (3:5000) +  $\text{SO}_2\text{Cl}_2$  +  $\text{SO}_2$  +  $\text{CO}_2$  +  $\text{CO}$  +  $\text{HCl}$  (102); for other (older) refs. on conversion of  $\bar{\text{C}}$  with fuming  $\text{H}_2\text{SO}_4$  to chloralide (3:3510) see (61) (81) (103) (104); for conversion of chloral hydrate (3:1270) with fuming  $\text{H}_2\text{SO}_4$  to chloralide (3:3510) (yields: 61% (105), 44-51% (106)) see indie. refs. — Note, however, that within a narrow range of strength (best about 79.8%)  $\text{H}_2\text{SO}_4$  appears to give with  $\bar{\text{C}}$  or its hydrate certain unstable addition products of type  $\text{CCl}_3\text{CH}(\text{OH})\cdot\text{SO}_3\text{OH}\cdot\text{H}_2\text{O}$  (148).]

With  $\text{ClSO}_3\text{H}$ . [ $\bar{\text{C}}$  with chlorosulfonic acid at  $50^\circ$  for several days gives (65% yield (107)) *bis*-( $\alpha,\beta,\beta,\beta$ -tetrachloroethyl) ether (3:0738); note that even at  $-50^\circ$  for 10-12 hrs. yield of this prod. may be as high as 50%; also that various other products including chloralide (3:3510) are also formed; and finally that  $\bar{\text{C}}$  with  $\text{FSO}_3\text{H}$  behaves similarly (107).]

### POLYMERIZATION OF $\bar{\text{C}}$

$\bar{\text{C}}$  is known to give at least three polymers; the oldest and most common polymer is that designated as "metachloral"; in addition two isomeric  $\alpha$ - and  $\beta$ -"parachlorals" (possibly comprising a pair of *cis-trans* stereomers) have also been reported (108).

Metachloral. [ $\bar{\text{C}}$  in presence of  $\text{H}_2\text{SO}_4$  below  $0^\circ$  (108) (sometimes suddenly cf. (109)), fuming  $\text{H}_2\text{SO}_4$  (18), pyridine (18), or  $\text{AlCl}_3$  as directed (18) (92) (110) gives metachloral [Boil. 1-618,  $I_2$ -(329),  $I_2$ -(680)], a white amorphous polymer of unknown mol. wt. or structure. This polymer is insol. aq., alc., ether, or acids but dissolves in aq.  $\text{Na}_2\text{CO}_3$  forming chloral hydrate (3:1270), on distn. at  $180^\circ$  regenerates  $\bar{\text{C}}$ , oxidizes with  $\text{HNO}_3$  to trichloroacetic acid, with alkalis behaves like  $\bar{\text{C}}$  (see also below), and with  $\text{ClSO}_3\text{H}$  at  $50^\circ$  gives (107) *bis*-( $\alpha,\beta,\beta,\beta$ -tetrachloroethyl) ether (3:0738).]

Parachloral. [ $\bar{\text{C}}$  with a large excess conc.  $\text{H}_2\text{SO}_4$  at  $15$ - $20^\circ$ , carefully dissolved and stood 3 days at  $15$ - $20^\circ$ , gives in addn. to metachloral (above) and chloralide (3:3510) small amts. of two isomeric trimers, viz.,  $\alpha$ -parachloral, rhombs from hot alc., m.p.  $116^\circ$ , h.p.  $223^\circ$  at 760 mm., and  $\beta$ -parachloral, pr. from alc., m.p.  $152^\circ$ , h.p.  $250^\circ$ . Note that yield of parachloral is only about 1% of original  $\bar{\text{C}}$ , that both are more sol. in hot alc. than the main prod. metachloral, that neither form is convertible to the other or to metachloral, and that both on distn. at ord. press. dissociate to  $\bar{\text{C}}$ .]

Mixed polymers. [ $\bar{\text{C}}$  (1 mole) with nectaldehyde (3 moles) +  $\text{HCl}$  gas at  $0^\circ$  for 15-20 hrs. gives (78% yield (111)) 2,4-dimethyl-6-(trichloromethyl)-1,3,5-trioxane, b.p.  $97^\circ$  at 13 mm.,  $D_4^{18} = 1.3915$ ,  $n_D^{18} = 1.4708$ . Similar mixed polymers (presumably analogous to the preceding case) are similarly formed (112) from  $\bar{\text{C}}$  with trimethylacetaldehyde (1:0133),  $\bar{\text{C}}$  with propionaldehyde (1:0110), and  $\bar{\text{C}}$  with isobutyraldehyde (1:0120).]

Behavior of  $\bar{\text{C}}$  with alkalis.  $\bar{\text{C}}$  with conc. aq. alkalis (even in cold (22)), or  $\bar{\text{C}}$  on distn. with aq. alkalis or alk. earths (22) (114) (115), undergoes cleavage into  $\text{CHCl}_3$  (3:5050) + the corresp. salt of formic acid (1:1005); this cleavage is claimed to occur also even with conc.  $\text{NH}_4\text{OH}$  (114) or aq. amines (114) and may also produce some  $\text{CO}$  (114) and chloride ion. — [For extensive studies of kinetics of this cleavage see (116) (117) (118) (119) (120) (121) (122) (126).]

Note that  $\bar{\text{C}}$  is very stable toward hydrolysis by aq. (126) (even in a.t. at  $190$ - $200^\circ$  for 2 hrs. (118)) or by dilute acid (even in a.t. at  $150^\circ$  (118)); however,  $\bar{\text{C}}$  with aq. in sunlight is claimed (123) to give formaldehyde (1:0145) +  $\text{CO}_2$  +  $\text{HCl}$  (presumably by formn. and decompn. of  $\text{OCH}_2\text{C}(\text{OH})_2$ ), and  $\bar{\text{C}}$  with aq. is claimed (124) to undergo slight formn. of dichloroacetic acid (3:6208) +  $\text{HCl}$ .

$\bar{\text{C}}$  with alc.  $\text{KOH}$  gives (125)  $\text{CHCl}_3$  (3:5050) + ethyl formate (1:3000).

[Note that chloral deuterate,  $\text{CCl}_2\text{CH}(\text{OD})_2$  (from  $\bar{\text{C}}$  +  $\text{D}_2\text{O}$ ), with  $\text{NaOD}$  (17) or  $\text{Ca}(\text{OD})_2$  (127) in  $\text{D}_2\text{O}$  gives deuteriochloroform,  $\text{CDCl}_3$ , b.p.  $0.5^\circ$  higher than ord.  $\text{CHCl}_3$ ,

(3:5050), m.p.  $-64.69$  to  $-64.15^\circ$ ,  $D_4^{20} = 1.5004$  (higher than 1.4888 for  $\text{CHCl}_3$ ),  $n_D^{20} = 1.4450$  (same as  $\text{CHCl}_3$ ) (17).]

#### BEHAVIOR OF $\bar{\text{C}}$ WITH AMMONIA, HYDROXYLAMINE, HYDRAZINE, ETC.

With  $\text{NH}_3$ . [ $\bar{\text{C}}$  with dry  $\text{NH}_3$  gas (81) (48) in dry  $\text{CHCl}_3$  (128) (129) or chloral hydrate (3:1270) with  $\text{NH}_3$  in dry ether (129) gives a white solid, m.p.  $72-74^\circ$  (129),  $62-64^\circ$  (128), originally (81) (48) (128) regarded as chloralammonia  $\text{CCl}_3\text{CH}(\text{OH})\cdot\text{NH}_2$  but later (on discovery of double the expected mol. wt. (129) cf. (130)) thought to have structure  $\text{CCl}_3\text{CH}(\text{OH})\cdot\text{NH}\cdot\text{CH}(\text{NH}_2)\cdot\text{CCl}_3\cdot\text{H}_2\text{O}$ . — The prod. with  $\text{KCN}$  in conc. aq.  $\text{NH}_4\text{OH}$  gives (93% yield (131)) dichloroacetamide, m.p.  $98.5-99.0^\circ$  (131).]

[Note that chloral hydrate (3:1270) with  $\text{NH}_4\text{OAc}$  at  $100^\circ$  gives (132) a prod., cryst. from alc., m.p.  $97^\circ$ , regarded as a dimeric form [Beil. XXIII-15] of chloralimide,  $\text{CCl}_3\text{—CH=NH}$ ; this dimer is also accompanied (132) cf. (133) by two stereoisomeric trimers [Beil. XXVI-9-10] of chloralimide.]

With hydroxylamine. The behavior of  $\bar{\text{C}}$  with hydroxylamine differs according to the circumstances employed.

[ $\bar{\text{C}}$  as chloral hydrate (3:1270) with large excess  $\text{NH}_2\text{OH}\cdot\text{HCl}$  (4 moles) in a little aq. (134) or with  $\text{NH}_2\text{OH}\cdot\text{HCl}$  (1 mole) in pres. of conc. aq.  $\text{CaCl}_2$  (2 moles) at  $50-60^\circ$  (135) gives trichloroacetaldoxime, m.p.  $56^\circ$  (135),  $39-40^\circ$  (134), b.p.  $85^\circ$  at 20 mm. (135).]

[ $\bar{\text{C}}$  as chloral hydrate (3:1270) with  $\text{NH}_2\text{OH}\cdot\text{HCl}$  (3 moles) in aq.  $\text{Na}_2\text{CO}_3/\text{aq. NaOH}$  as directed (136) (137) gives (yields: 50% (137), 40% (136) (138)) the alkali-stable form of chloro-oximino-acetaldehyde oxime ("chloroamphiglyoxime") [Beil. III-605, III<sub>1</sub>- (216), III<sub>2</sub>-(303)], ndls. of monohydrate from boilg. aq., m.p.  $114^\circ$  (136) (138) cf. (137); note that this prod. in dry ether with  $\text{HCl}$  gas (136) or with fuming  $\text{HCl}$  (138) isomerizes to the acid-stable form ("chloroantiglyoxime") [Beil. III-606, III<sub>1</sub>-(216), III<sub>2</sub>-(303)], m.p.  $161^\circ$  (138),  $161^\circ$  dec. (136).]

[Note, however, that chloral hydrate (3:1270) (1 mole) with  $\text{NH}_2\text{OH}\cdot\text{HCl}$  (2 moles) powdered with dry  $\text{Na}_2\text{CO}_3$  (1 mole), allowed to stand in a desiccator some hours, then dissolved in aq. and extracted with ether gives (139) an addition product, cryst. from ether,  $\text{CHCl}_3$ , or  $\text{C}_6\text{H}_6$ , m.p.  $98^\circ$ , regarded as chloralhydroxylamine,  $\text{CCl}_3\text{CH}(\text{OH})\cdot\text{NH}\cdot\text{OH}$ .]

[For behavior of  $\bar{\text{C}}$  with  $\text{NH}_2\text{OH}\cdot\text{HCl}$  + aniline giving isatin see below under reaction of  $\bar{\text{C}}$  with primary aromatic amines.]

#### WITH HYDRAZINE

[ $\bar{\text{C}}$  as chloral hydrate (3:1270) with hydrazine hydrate in aq. (140), ether (141), or  $\text{AcOH}$  (142), or merely fused with hydrazine hydrochloride or sulfate (143), appears to give first the expected addition product, viz., chloralhydrazine,  $\text{CCl}_3\text{CH}(\text{OH})\cdot\text{NH}\cdot\text{NH}_2$ , ndls. from alc., m.p.  $100^\circ$  (141),  $85^\circ$  dec. (140); note, however, that this structure is not certain and that the material readily changes to a compound  $\text{C}_4\text{H}_2\text{ON}_2\text{Cl}_6$ , m.p.  $187^\circ$  cf. (140) (141) (142) (143).]

#### BEHAVIOR OF $\bar{\text{C}}$ WITH MISCELLANEOUS INORGANIC REACTANTS

With various compounds of phosphorus. [ $\bar{\text{C}}$  with  $\text{PCl}_5$  in acetone gives a product regarded (144) cf. (145) as  $\text{CCl}_3\text{CH} \begin{array}{c} \diagup \text{O} \diagdown \\ \diagdown \text{O} \diagup \end{array} \text{PCl}_2$ , b.p.  $238-242^\circ$ , accompanied by tetrachloroethylene (3:5460) and pentachloroethane (3:5880).]

[ $\bar{\text{C}}$  with  $\text{PCl}_5\text{Br}_2$  is claimed (146) to give 1,1-dibromo-2,2,2-trichloroethane [Beil. I-93, I<sub>7</sub>-(65)], b.p.  $93-95^\circ$  at 14-15 mm.,  $D_4^{19.5} = 2.295$ ,  $n_D^{25.7} = 1.52991$  (146).]

[ $\bar{C}$  with  $P_2S_5$  in s.t. at 160–170° gives (147) a complicated reaction mixture from which only trichloroethylene (3:5170) has been identified.]

With various salts of inorganic acids (for KCN see further below).

With alkali bisulfites (or sulfites) [ $\bar{C}$  or its hydrate (3:1270) with aq. alk. bisulfites (81) (149) reacts readily; for discussion of products see (81) (150) (151).]

With hydrogen peroxide. [ $\bar{C}$  with  $H_2O_2$  in ether (151), or  $\bar{C}$  with  $K_2S_2O_8 + H_2SO_4$  at ord. temp., gives (152) "dichloralperoxide hydrate," viz.,  $CCl_3.CH(OH)-O.O.CH(OH)-CCl_3$ , cryst. from  $C_6H_6$  or  $CHCl_3$ , m.p. 122° dec.]

## CHEMICAL BEHAVIOR OF $\bar{C}$ WITH ORGANIC REACTANTS

### BEHAVIOR OF $\bar{C}$ WITH HYDROCARBONS

With alkanes. [ $\bar{C}$  with aliphatic hydrocarbons in presence of  $AlCl_3$  reacts violently, but no definite products have been isolated (153).]

With aromatic hydrocarbons.  $\bar{C}$  with aromatic hydrocarbons in presence of  $H_2SO_4$  or other condensing agent (note that, when  $H_2SO_4$  is present in large excess, chloral hydrate (3:1270) is frequently substituted for  $\bar{C}$ ) reacts in either or both of two modes:  $\bar{C}$  with 1 mole of hydrocarbon giving trichloromethyl-aryl-carbinols,  $\bar{C}$  with 2 moles of hydrocarbon giving 1,1,1-trichloro-2,2-diarylethanes. Although reaction of  $\bar{C}$  with hydrocarbons cannot here be summarized for all possible cases, yet the following examples will exemplify both modes of reaction

[ $\bar{C}$  with  $C_6H_6 + AlCl_3$  (154) (156) or chloral hydrate (3:1270) with  $C_6H_6 + AlCl_3$  (153) cf. (158) (162) or with  $C_6H_6 +$  conc.  $H_2SO_4$  (155) gives trichloromethyl-phenyl-carbinol [Beil. VI-476, VI-(237)], m.p. 37° (155), b.p. 145° at 15 mm. (155) (corresp. acetate, m.p. 87.5° (155); corresp. benzoate, m.p. 97.5° (155); corresp. *p*-nitrobenzoate, m.p. 109° (156)) accompanied (155) by 1,1,1-trichloro-2,2-diphenylethane (3:1420), the latter also obtainable from  $C + C_6H_6$  with conc.  $H_2SO_4$  (157) or with  $AlCl_3$  in  $CS_2$  (80% yield (162)).]

[ $\bar{C}$  with toluene +  $AlCl_3$  (154) or chloral hydrate (3:1270) (3 moles) with toluene (1 mole) + conc.  $H_2SO_4$  (155) gives trichloromethyl-*p*-tolylcarbinol [Beil. VI-503, VI-(255)], m.p. 63–64° (154), 63° (155), 61.5–62.5° (159), 58–59° (160); b.p. 155° at 13.5 mm. (155), 154–156° at 13.5 mm. (154) (corresp. acetate, m.p. 107.5° (155), 105–106° (160); corresp. benzoate, m.p. 100.5° (155), 94–95° (160)). — On the other hand  $\bar{C}$  with toluene (2 moles) in pres. of  $H_2SO_4$  (161), or  $AlCl_3$  (153) in  $CS_2$  at 0° (162) gives (80% yield (162)) 1,1,1-trichloro-2,2-bis-(*p*-tolyl)ethane [Beil. V-619, V-(292), V-(522)], m.p. 89° (161) (162) (155), also obtained as by-product of the above carbinol (155); for study of loss of HCl with alc. KOH yielding 1,1-dichloro-2,2-di-(*p*-tolyl)ethylene [Beil. V-648, V-(559)], m.p. 92° (161), 85° (162) see (161) (162) (163).]

[For generally analogous behavior of  $\bar{C}$  with other aromatic hydrocarbons such as *tert*-butylbenzene (405), *m*-xylene (153) (163), ethylbenzene (155), naphthalene (164), anthracene (164), or phenanthrene (164) in presence of condensing agents see indic. refs.]

### BEHAVIOR OF $\bar{C}$ WITH ARYL HALIDES

With chlorobenzene. [That  $\bar{C}$  with chlorobenzene (3:7903) (1 mole) + conc.  $H_2SO_4$  gives the expected trichloromethyl-*p*-chlorophenyl-carbinol, b.p. 187–188° at 26 mm. (165) (corresp. acetate, m.p. 120–121° (165); corresp. benzoate, m.p. 128–129° (165)), has never been reported, this prod. having been obtd. only by condensation of *p*-chlorobenzaldehyde (3:0765) with  $CHCl_3$  (3:5030) in pres. of KOH (23.5% yield (165)).]

However,  $\bar{C}$  or chloral hydrate with chlorobenzene (2 moles) + conc.  $H_2SO_4$  gives the

extremely important 1,1,1-trichloro-2,2-bis-(*p*-chlorophenyl)ethane ("DDT") (3:3298) whose text should be consulted for further details.

With bromobenzene. [That  $\bar{C}$  with bromobenzene (1 mole) + conc.  $H_2SO_4$  gives the expected trichloromethyl-*p*-bromophenyl-carbinol, b.p. 183–187° at 18 mm. (166) (corresp. acetate, m.p. 145–147° (166)), has never been reported, this product having been obt'd. (29% yield (166)) only by reaction of  $\bar{C}$  with *p*-Br. $C_6H_4$ .MgCl.]

[However,  $\bar{C}$  or chloral hydrate (3:1270) with bromobenzene (2 moles) + conc.  $H_2SO_4$  + fung.  $H_2SO_4$  gives (167) (168) 1,1,1-trichloro-2,2-bis-(*p*-bromophenyl)ethane, m.p. 144° (167), 139–141° (168); note that this prod. with alc. KOH loses HCl, giving (82% yield (167) (168)) 1,1-dichloro-2,2-bis-(*p*-bromophenyl)ethylene, m.p. 123.5° (167), 119–120° (168).]

With iodobenzene. [The carbinol to be expected from  $\bar{C}$  with iodobenzene (1 mole) + conc.  $H_2SO_4$  has not been reported.]

[However,  $\bar{C}$  with iodobenzene (2 moles) + conc.  $H_2SO_4$  gives (155) 1,1,1-trichloro-2,2-bis-(*p*-iodophenyl)ethane, m.p. 172° (155).]

## BEHAVIOR OF $\bar{C}$ WITH ORGANIC HYDROXY COMPOUNDS

### With Alcohols

General. Since  $\bar{C}$  is an aldehyde, it may be expected (at least with the assistance of a condensing agent such as dry HCl) to react with 1 mole of an alcohol to yield the corresponding hemiacetal,  $CCl_3.CH(OH)R$ , with 2 moles of an alcohol to give the corresponding acetal,  $CCl_3.CH(OR)_2$ , particularly since both these types of products are well known.

However, the special influence of the  $-CCl_3$  group becomes apparent in this reaction and only the first type (hemiacetals) are usually obtained by direct condensation, the latter (acetals) being obtained indirectly. Moreover, members of the first group (hemiacetals) are formed with extreme ease (even in absence of condensing agents) so that, by analogy to the combination of chloral with water to give chloral hydrate (3:1276), they are generically designated as chloral alcoholates; e.g., chloral methylalcoholate, chloral ethylalcoholate, etc. Corresponding reaction of several molecules of chloral with multi-hydroxy alcohols can also occur as illustrated below.

The formation of these chloralalcoholates is profoundly influenced by conditions (especially the solvent (169)); furthermore, they readily dissociate into their original components on heating and, therefore, on heating in other alcohols (170) (171) or orthoformate esters of other alcohols (170) suffer reactions involving redistribution of the various alkyl radicals.

With monohydric alcohols. Although reaction of  $\bar{C}$  with all possible monohydric alcohols obviously cannot be included here, the following examples will serve to exemplify the reaction.

With methyl alcohol. [ $\bar{C}$  with MeOH (1:6120) (1 mole) gives (171) (172) (173) (174), trichloroacetaldehyde monomethylacetal (chloral methylalcoholate), hygroscopic ndla., m.p. abt. 50° (172), 38° (171), b.p. 116° (173), 106° (172), 98° (174) (corresp. carbamate, m.p. 121° (175)). — Note that trichloroacetaldehyde dimethylacetal,  $CCl_3.CH(OC_2H_5)_2$ ; [Beil. I-621, I<sub>2</sub>-(681)], b.p. 183.2° cor. (176), 68–69° at 10 mm. (177), is obt'd. by indirect means; note incidentally that this acetal is isomeric with butyrylchloral hydrate (3:1905) and with chloral ethylalcoholate (3:0860).]

With ethyl alcohol. [ $\bar{C}$  with EtOH (1:6130) gives trichloroacetaldehyde monoethylacetal (chloral ethylalcoholate) (3:0860), q.v. for details. For the corresp. acetal, viz., trichloroacetaldehyde diethylacetal,  $CCl_3.CH(OC_2H_5)_2$ , b.p. 201°, see its own text as 3:6317.

With *n*-propyl alcohol.  $\bar{C}$  with *n*-PrOH (1:6150) (178) (171) (170), or with NaO-*n*-Pr (179) or chloral hydrate (3:1270) with *n*-PrOH (1:6150) (170) gives (yields: 90% (178), 77-90% (170)) trichloroacetaldehyde *n*-propylhemiacetal (chloral *n*-propylalcoholate), liquid, b.p. 119-121° at 742.4 mm. (170), 120-122° (178),  $D_4^{25.7} = 1.2996$  (170),  $n_D^{25} = 1.4622$ . (Note that the corresp. trichloroacetaldehyde di-*n*-propylacetal is unreported.)

With isopropyl alcohol.  $\bar{C}$  with iso-PrOH (1:6135) (178) (171) gives trichloroacetaldehyde isopropylhemiacetal (chloral isopropylalcoholate), m.p. 47° (178), 45° (171); b.p. 108° (178) (note that the corresp. trichloroacetaldehyde di-isopropylacetal is unreported.)

With *n*-butyl alcohol.  $\bar{C}$  with *n*-BuOH (1:6180) gives (171) (179) (170) trichloroacetaldehyde *n*-butylhemiacetal (chloral *n*-butylalcoholate) (3:9843), m.p. 49-50° (180), 49° (171) (170), b.p. 120-130° at 742 mm. (170) (note that corresp. trichloroacetaldehyde di-*n*-butylacetal is unreported.)

With isobutyl alcohol.  $\bar{C}$  with iso-BuOH (1:6165) gives (180) trichloroacetaldehyde isobutylhemiacetal (chloral isobutylalcoholate), liquid, b.p. 122° without decompn. (180); note that trichloroacetaldehyde di-isobutylacetal, b.p. 211.8° at 760 mm. (181), has been prepared indirectly.)

With *sec*-butyl alcohol.  $\bar{C}$  with butanol-2 (1:6155) gives (180) (171) trichloroacetaldehyde *sec*-butylhemiacetal (chloral *sec*-butylalcoholate), m.p. 12° (171), b.p. 120-121° (180), note that the corresp. trichloroacetaldehyde di-*sec*-butylacetal is unreported.)

With *ter*-butyl alcohol.  $\bar{C}$  with *ter*-butyl alc. (1:6140) gives (171) trichloroacetaldehyde *ter*-butylhemiacetal (chloral *ter*-butylalcoholate), m.p. 43° (171) (note that the corresp. trichloroacetaldehyde di-*ter*-butylacetal is unreported.)

With other monohydric alcohols. (For analogous formn. of hemiacetals from  $\bar{C}$  with isooamyl alc. (1:6200) (180), with *ter*-AmOH (1:6160) (171), with allyl alc. (1:6145) (99), with *n*-octyl alc. (1:6235) (171), with benzyl alc. (1:6180) (171), with cinnamyl alc. (1:5920) (171), with methyl-neopentyl-carbinol (182), or with  $\beta,\beta,\beta$ -trichloro-*ter*-butyl alcohol ("Chloreton") (3:2662) (183) see indic. refs.)

With dihydric alcohols. With ethylene glycol.  $\bar{C}$  (1 mole) with ethylene glycol (1:6165) (1 mole) nt 0° for 2 weeks gives (181) cf. (185) trichloroacetaldehyde ( $\beta$ -hydroxyethyl)-hemiacetal ("chloral ethyleneglycolate"), m.p. 50-51° (181), 42° (185); note that this product with conc.  $H_2SO_4$  on stdg. or htg. loses 1  $H_2O$  with ring closure to the cyclic acetal, 2-(trichloromethyl)-1,3-dioxolane, m.p. 40° (181). — However,  $\bar{C}$  (2 moles) with ethylene glycol (1:6165) (1 mole) gives (186) cf. (185) ethylene glycol 1,2-bis-( $\beta,\beta,\beta$ -trichloro- $\alpha$ -hydroxyethyl) ether, which on distn. at ord. press. also gives (186) the above 2-(trichloromethyl)-1,3-dioxolane, m.p. 42° (186).]

With polyhydric alcohols. With glycerol. (For behavior of  $\bar{C}$  with glycerol (1:6510) see (186) (181).]

With erythritol. (For behavior of  $\bar{C}$  with erythritol (1:5825) see (186).]

With various carbohydrates.  $\bar{C}$  combines with various polyhydroxy compounds of the carbohydrate type to give products collectively designated as chloraloses. Such combinations can be effected with pentoses or hexoses, with various stereoisomers within any such group, and more than one molecule of chloral per mole of carbohydrate is sometimes involved. In the light of modern work these chloraloses are probably cyclic acetals. Although space cannot here be taken for an extensive record, the following comments will serve as starting points for further exploration.

The most important chloralose is that derived from d-glucose and often indexed as glucochloralose. Two forms of this compound are known, viz.,  $\alpha$ -glucochloralose and  $\beta$ -glucochloralose; for important studies of their structures see (187) (188). For study of  $\alpha$ -xylochloralose see (189).

For important (but older) factual data on chloraloses see (190) (191) (192).

## BEHAVIOR WITH ORGANIC ACIDS

*With Acids Containing No Other Functional Group*

[For behavior of  $\bar{C}$  with AcOH in pres. of  $AlCl_3$  see (153); with  $Hg(OAc)_2$  + ethylene in alc. soln. giving a prod. possibly having the structure  $CCl_3.CH(OC_2H_5)(OCH_2CH_2HgOAc)$  see (215).]

[Note that  $\bar{C}$  is able to add to its carbonyl group a reactive H atom derived from certain acids [e.g.,  $\bar{C}$  with malonic acid (1:0480) in AcOH at  $100^\circ$  for 40 hrs. (216) cf. (217), or in pyridine at  $100^\circ$  for 2 hrs. (67.5% yield (218)) cf. (219), or chloral hydrate (3:1270) + malonic acid (1:0480) + pyridine at  $100^\circ$  (220) gives (note loss of  $CO_2$ )  $\gamma,\gamma,\gamma$ -trichloro- $\beta$ -hydroxy-*n*-butyric acid [Beil. III-310, III<sub>1</sub>-(117), III<sub>2</sub>-(221)], m.p.  $118-119^\circ$  (217) (218),  $118.5^\circ$  (216) (note hydrate, m.p.  $52-54^\circ$  (218)); note also that by further elimination of  $H_2O$  (e.g., with  $Ac_2O$  +  $NaOAc$  (217)) this prod. yields  $\gamma,\gamma,\gamma$ -trichlorocrotonic acid [Beil. II-418, II<sub>1</sub>-(190), II<sub>2</sub>-(397)], m.p.  $113-114^\circ$  (217).]

[Similarly,  $\bar{C}$  adds one of the  $\alpha$  H atoms from succinic acid (1:0530): e.g.,  $\bar{C}$  with disodium succinate +  $Ac_2O$  yields an intangible intermediate which suffers two types of further change, on one hand losing  $H_2O$  to give trichloromethylparaconic acid ( $\beta$ -carboxy- $\gamma$ -trichloromethyl- $\gamma$ -butyrolactone) [Beil. XVIII-372], and on the other suffering hydrolysis of its  $-CCl_3$  group to give isocitric acid ( $\alpha$ -hydroxypropane- $\alpha,\beta,\gamma$ -tricarboxylic acid) [Beil. III-555, III<sub>2</sub>-(359)]; for details of execution of these reactions see (221).]

*With  $\alpha$ -Hydroxy Acids*

Condensation of  $\bar{C}$  (or its hydrate) with acids containing an  $\alpha$ -hydroxy group leads to the formation of products generically designated as "chloralides"; these are ether-esters comprising position-5 substitution products of the true parent 2-(trichloromethyl)-1,3-dioxolanone-4 (from  $\alpha$ -hydroxynacetic acid) and are not to be confused with the specific compound "chloralide" (3:3510) obtd. from  $\bar{C}$  with  $H_2SO_4$ . With true chloralides above the initial parent, two geometrically isomeric forms are possible.

With  $\alpha$ -hydroxyacetic acid. [ $\bar{C}$  with glycolic acid (1:0430) in a.t. at  $120-130^\circ$  for 2 days gives (224) 2-(trichloromethyl)-1,3-dioxolanone-4 ("glycolic acid chloralide") [Beil. XIX-103], m.p.  $41-42^\circ$ .]

(228), 70–71° (231), 59–60° (227); note that this disagreement of m.p.'s may be due to mixtures of possible *cis-trans* stereoisomers.)

With benzoic acid. [ $\bar{C}$  with benzoic acid (1:0770) in a.t. at 160–165° for 5 hrs. gives (231) 2-(trichloromethyl)-5,5-diphenyl-1,3-dioxolanone-4 ("benzoic acid chloralide"), m.p. 70°. Note that an analogous prod. has been reported (232) from chloral hydrate (3:1270) with thiobenzoic acid,  $(C_6H_5)_2C(SH)COOH$  in  $AcOH + HCl$  gas.]

With tartaric acid. [Since this acid is twice an  $\alpha$ -hydroxy acid it reacts with 2 moles of  $\bar{C}$  forming a dichloralide of compn.  $C_8H_4O_6Cl_2$ ; e.g.,  $\bar{C}$  with *d*-tartaric acid (1:0525) at 150° (224), or chloral hydrate (3:1270) with *d*-tartaric acid (1:0525) (227) (228) (229) (230) (231) or *d,l*-tartaric acid (1:0550) (227) (228) gives "tartaric acid dichloralide" [Beil. XIX-449], m.p. 213–215° (229); 164–166° (227), 161–162° (231), 161° (229), 160° (228), 159–161° (227); 128–130° (228), 122–124° (224), 116–118° (227). Note that this product should exist in three stereoisomeric forms (230), and the three groups of m.p.'s above given may represent this expectation.]

With mucic acid. This acid combines with 3 moles of chloral hydrate to give a prod. commonly called a "trichloralide", note, however, that it is undoubtedly a dichloralide which has further condensed at its two free OH groups with a third molecule of chloral [e.g., chloral hydrate (3:1270) with mucic acid (1:0845) +  $H_2SO_4$  gives (228) (229) a "trichloralide," m.p. 200–201° (228), 198° (229), 174–175° (229); doubtless these represent at least two stereoisomeric forms].

#### With Phenolic Acids (or Their Ethers)

In condensation of  $\bar{C}$  (or its hydrate) with phenolic acids, the latter behave like carboxy-substituted phenols; two series of products result according to whether *one* or *two* moles of carboxy-phenol are involved per mole of chloral. To assist in recognizing this analogy, the several products are here named as substituted carbinols or ethanes just as was done above in the behavior of  $\bar{C}$  with phenols (q.v.). Since the methyl ethers of these phenolic acids in general behave similarly, they are associated below with the corresponding phenolic acids.

With *o*-phenolic acids. With *o*-hydroxybenzoic acid. [Chloral hydrate (3:1270) with salicylic acid (1:0780) + conc.  $H_2SO_4$  gives (233) cf. (234) some 1,1,1-trichloromethyl-(4-hydroxy-3-carboxyphenyl)-carbinol, m.p. 180–182° (233), but main prod. is 1,1,1-trichloro-2,2-bis-(4-hydroxy-3-carboxyphenyl)ethane, m.p. 290–292° (corresp. diacetate, m.p. 207–209° (233)).]

With *o*-methoxybenzoic acid. [Chloral hydrate (3:1270) with *o*-methoxybenzoic acid (1:0685) + conc.  $H_2SO_4$  gives (yields: 45% (234), 25% (235)) 1,1,1-trichloro-(4-methoxy-3-carboxyphenyl)-carbinol, m.p. 224° (234), 216° (235), some sulfonation also occurring (235).]

With 2-hydroxy-3-methylbenzoic acid. [Chloral hydrate (3:1270) with *o*-cresotic acid [Beil. X-220, X<sub>1</sub>-(96)] + conc.  $H_2SO_4$  gives (236) 1,1,1-trichloro-2,2-bis-(4-hydroxy-3-methyl-5-carboxyphenyl)ethane, m.p. 283–285° (236); note that the corresp. carbinol to be expected from chloral hydrate + 1 mole *o*-cresotic acid is unreported.]

With 2-hydroxy-4-methylbenzoic acid. [Chloral hydrate (3:1270) with *m*-cresotic acid [Beil. X-233, X<sub>1</sub>-(100)] is complex and disputed; for discussion see (236) (237) (238) (239). — For behavior of  $\bar{C}$  with 2-methoxy-4-methylbenzoic acid see also (241).]

With 2-hydroxy-5-methylbenzoic acid. (Chloral hydrate (3:1270) with *p*-cresotic acid [Beil. X-227, X<sub>1</sub>-(98)] + conc.  $H_2SO_4$  gives (236) a prod. of compn.  $C_{12}H_8O_4Cl_2$  (2,4-bis-(trichloromethyl)-6-methyl-1,3-benzodioxin-8-carboxylic acid), m.p. 285–286° dec., derived from 2 moles chloral hydrate + 1 mole *p*-cresotic acid.)

With *2-hydroxy-3-naphthoic acid*. [For behavior of chloral hydrate (3:1270) with 2-hydroxy-3-naphthoic acid (1:0850) + conc.  $\text{H}_2\text{SO}_4$  see (242).]

With *m-phenolic acids* (or their ethers). Condensation of  $\bar{\text{C}}$  or its hydrate with *m-phenolic acids* leads generally to substituted phthalides.

With *m-hydroxybenzoic acid*. [Chloral hydrate (3:1270) with *m-hydroxybenzoic acid* (1:0825) + conc.  $\text{H}_2\text{SO}_4$  gives (243) (244) 3-(trichloromethyl)-6-hydroxyphthalide [Beil. XVIII-20], m.p. 199–200° (244), 197–198° (243). — Note that chloral hydrate (3:1270) with ethyl *m-methoxybenzoate* (1:4131) + conc.  $\text{H}_2\text{SO}_4$  gives (243) (245) 3-(trichloromethyl)-6-methoxyphthalide [Beil. XVIII-20], m.p. 135° (243) (245), which by alk. hydrolysis of the  $-\text{CCl}_3$  group gives (243) (245) 6-methoxyphthalide-3-carboxylic acid [Beil. XVIII-525], m.p. 170° (245), 169–170° (243).]

With *2-chloro-3-hydroxybenzoic acid*. [Chloral hydrate (3:1270) with 2-chloro-3-hydroxybenzoic acid (3:4395) + conc.  $\text{H}_2\text{SO}_4$  gives (246) 3-(trichloromethyl)-7-chloro-6-hydroxyphthalide, m.p. 195.5–196°.]

With *4-methyl-3-hydroxybenzoic acid*. [Chloral hydrate (3:1270) with 4-methyl-3-hydroxybenzoic acid [Beil. X-237] + conc.  $\text{H}_2\text{SO}_4$  gives (247) 3-(trichloromethyl)-5-methyl-6-hydroxyphthalide, m.p. 232° (247). — Similarly, chloral hydrate (3:1270) with 4-methyl-3-methoxybenzoic acid + conc.  $\text{H}_2\text{SO}_4$  gives (247) 3-(trichloromethyl)-5-methyl-6-methoxyphthalide, m.p. 132° (247).]

With *3,4,5-trihydroxybenzoic acid*. [Chloral hydrate (3:1270) with gallic acid (1:0876) + conc.  $\text{H}_2\text{SO}_4$  gives (236) according to conditions three different products; with excess of gallic acid prod. is 3-(trichloromethyl)-4,5,6-trihydroxyphthalide, m.p. 210–212° (236), for further reactions of which see (236) (248); with excess chloral, however, the reaction gives two other materials (236). — Note that chloral hydrate (3:1270) with 3,4,5-trimethoxybenzoic acid (gallic acid trimethyl ether) [Beil. X-481,  $\text{X}_1$ -(240)] + conc.  $\text{H}_2\text{SO}_4$  (249) (250) (251), or with methyl 3,4,5-trimethoxybenzoate (methyl gallate trimethyl ether) [Beil. X-484,  $\text{X}_1$ -(242)] (252), gives (56% yield (249)) 3-(trichloromethyl)-4,5,6-trimethoxyphthalide [Beil. XVIII-(339)], m.p. 76–77° (249), 71–72° (250), 70–71° (252) (note also that during condensation some demethylation may occur (253), avoided by (251)); this prod. by hydrolysis of the trichloromethyl group yields 4,5,6-trimethoxyphthalide-3-carboxylic acid [Beil. XVIII-(544)], m.p. 147–149° (249), 147–145° (250), 147° (251), 146–149° (254), 142–143° (252).]

With *p-phenolic acids* (or their ethers). With *p-hydroxybenzoic acid*. [Chloral hydrate (3:1270) (3 moles) with *p-hydroxybenzoic acid* (1:0840) (1 mole) + conc.  $\text{H}_2\text{SO}_4$  at room temp. for 3 days condenses giving (31% yield on the acid (255)) 2,4-bis-(trichloromethyl)benzodioxin-1,3-carboxylic acid-6, m.p. 225.5–226.5° (255); for further related reactions of this prod. see (256); for further generally similar work in benzodioxin series see (257) (258); note that neither the substituted carbinol nor the substituted ethane corresp. to the behavior of *o*-hydroxybenzoic acid (see above) under similar conditions is reported.]

With *p-methoxybenzoic acid*. [Chloral hydrate (3:1270) with *p-anisic acid* (1:0805) + conc.  $\text{H}_2\text{SO}_4$  reacts in a 1:1 ratio (note difference from 2:1 ratio in preceding paragraph) giving (259) cf. (235) trichloromethyl-(2-methoxy-5-carboxyphenyl)-carbinol, m.p. 198–199° (259); note that the earlier product (235) was impure.]

With *4-hydroxy-3,5-dimethoxybenzoic acid*. [Chloral hydrate (3:1270) with syringic acid (1:0830) + conc.  $\text{H}_2\text{SO}_4$  gives (86% yield (253)) 3-(trichloromethyl)-5-hydroxy-4,6-dimethoxyphthalide, m.p. 172–173° (253).]

With keto acids (see also below under behavior with esters of organic acids).

With *levulinic acid*. [ $\bar{\text{C}}$  (1 mole) with  $\beta$ -acetopropionic acid (levulinic acid) (1:0405)

## BEHAVIOR WITH DIAZOMETHANE

$\bar{C}$  (309) (330) (331) or chloral hydrate (3:1270) (332) gives (yields: 64% (330), 48% (309), 47.5% (332)) 3,3,3-trichloro-1,2-epoxypropene (3:5760) q.v.]

## BEHAVIOR WITH AMINES

With primary aromatic amines. With aniline.  $\bar{C}$  with aniline (333) (334), or chloral hydrate (3:1270) with aniline in aq. (334), gives 1,1,1-trichloro-2,2-dianilinoethane ( $\beta,\beta,\beta$ -trichloroethylidene)di-aniline [Beil. XII-187, XII-(168)], pr. from ether/alc., m.p. 107–108° (335), 107.5° (334), 100–101° (333). — Note that the addition product to be expected from 1 mole  $\bar{C}$  with 1 mole aniline has not itself been isolated (except as a molecular compound with chloral hydrate (336)) since it appears to react immediately with a second mole of aniline to give the above-indicated prod.]

With aniline + hydroxylamine. [Chloral hydrate (3:1270) (1 mole) with aniline (1 mole) +  $NH_2OH.HCl$  (3 moles) +  $HCl$  +  $Na_2SO_4$  in aq. solo. as directed gives (80–91% yield (337)) cf. (338) (339) isonitrosoacetanilide [Beil. XII-(275)], m.p. 175° dec. (337) (338) (339). — Note that this product with conc.  $H_2SO_4$  (337) (340) gives (71–78% yield (337)) indigo; for extension of the method to use of other amines (and ultimately substituted indigos) see (338) (341) (345).]

With other primary aromatic amines. The condensation of  $\bar{C}$  or of chloral hydrate (3:1270) with many other primary aromatic amines and diamines has been studied but cannot be detailed here [for extensive review and discussion see (336) (334) (335) (342) (343) (344) (403)].

With secondary aromatic amines. With *N*-alkylanilines. [Chloral hydrate (3:1270) with *N*-methylaniline on warming gives (346) trichloromethyl-(*p*-methylanilinophenyl)-carbinol [Beil. XIII-628], m.p. 112° dec.; similarly, chloral hydrate (3:1270) with *N*-ethylaniline on warming gives (346) trichloromethyl-(*p*-ethylaminophenyl)-carbinol [Beil. XIII-628], m.p. 98°.]

With *N*-alkyl-*o*-toluidines. [Chloral hydrate (3:1270) with *N*-methyl-*o*-toluidine +  $ZnCl_2$  gives (347) trichloromethyl-(4-methylamino-3-methylphenyl)-carbinol, m.p. 104–105°; similarly, chloral hydrate (3:1270) with *N*-ethyl-*o*-toluidine +  $ZnCl_2$  gives (349) trichloromethyl-(4-ethylamino-3-methylphenyl)-carbinol, m.p. 107° (for studies of nitration (348) and bromination (349) of these two products see indic. refs.).]

With tertiary aromatic amines. With *N,N*-dialkylanilines. [ $\bar{C}$  with *N,N*-dimethylaniline in phenol at room temp. (350) or chloral hydrate with *N,N*-dimethylaniline +  $ZnCl_2$  on stdg. (351) (352) gives trichloromethyl-(*p*-dimethylanilinophenyl)-carbinol [Beil. XIII-628], m.p. 111° dec. (352) (corresp. carbinyl acetate, m.p. 84–85° (352)) (for study of nitration of this prod. see (348)).]

## BEHAVIOR WITH ARYLEYDRAZINES

With phenylhydrazine. [ $\bar{C}$  with phenylhydrazine or chloral hydrate (3:1270) with aq. phenylhydrazine salts reacts (353) vigorously, but the products formed have not been unambiguously characterized (see also below).]

With *p*-nitrophenylhydrazine. [Chloral hydrate (3:1270) (large excess) with *p*-nitrophenylhydrazine in  $AcOH$  at 100° for 10 min. undergoes a series of reactions resulting (354) in a chlorine-free prod., m.p. 225°, regarded (354) as 1-(*p*-nitrophenyl)-3,5-dihydroxy-pyrazolone-4-(*p*-nitrophenylhydrazone).]

With 2,4-dinitrophenylhydrazine. [Chloral hydrate (3:1270) with 2,4-dinitrophenylhydrazine gives according to conditions either or both (355) glyoxylic acid *p*-nitrophenyl-

hydrazone, dihydrate from nq., m.p. 191° (355); anhydrous, m.p. 194–195° (355), 190° (356), or chloroglyoxal bis-(2,4-dinitrophenylhydrazine), m.p. 278° (355).]

With various halogenated hydrazines. Owing to the violence with which the product initially formed decomposes, the behavior of  $\bar{C}$  with phenylhydrazine (see also above) has been little studied. With halogenated phenylhydrazines the decomposition is more moderate and has been extensively examined. The nature of the products has been found to depend mainly upon the solvent medium: thus in alcohols the principal product is the corresponding substituted phenylhydrazone of the appropriate alkyl glyoxylate; in water or AcOH, however, loss of both  $H_2O$  and  $HCl$  occurs leading to formation of the corresponding  $\alpha,\alpha$ -dichloro- $\beta$ -aryldiazoethylenes.

[Chloral hydrate (1 mole) (3:1270) with 2,4-dichlorophenylhydrazine in ethyl alc. at 60° gives (100% yield (357)) ethyl glyoxylate 2,4-dichlorophenylhydrazone, yellow pr., m.p. 121.5°, note that other ales. (357) give corresp. esters. — However, chloral hydrate (1 mole) (3:1270) with 2,4-dichlorophenylhydrazine (1 mole) in AcOH at 80° (or in presence of NaOAc at 60°) gives (357)  $\alpha,\alpha$ -dichloro- $\beta$ -(2,4-dichlorobenzencazo)ethylene, red pr. from alc., m.p. 84.5°.]

[For completely analogous behavior of chloral hydrate (3:1270) with other halogenated phenylhydrazines, such as 2,5-dichlorophenylhydrazine (358), 2,4,5-trichlorophenylhydrazine (358), 2,4,6-trichlorophenylhydrazine (359), 2,4,6-tribromophenylhydrazine (359), 3-bromo-4-methylphenylhydrazine (360), or 3,5-dibromo-4-methylphenylhydrazine (360), see indie refs. — Note that a generally analogous behavior toward halogenated arylhydrazines is shown by butyrylchloral (3:5910) q.v. and by tribromoacetaldehyde (bromal).]

#### BEHAVIOR WITH AMIDES

$\bar{C}$  with compounds of the amide type readily undergoes an addition reaction leading to products of the general form  $CCl_2CH(OH).NH.CO.R$ .

##### With Aliphatic Monoamides

With formamide. [ $\bar{C}$  (1 mole) with formamide (1 mole) on stdg. gives (361) (362) an addition prod., chloralformamide,  $CCl_2CH(OH).NH.CHO$  [Beil. II-27, II<sub>1</sub>-(21), II<sub>2</sub>-(37)], m.p. 124–126° (363), 118° (362), 115–116° (361); note that this product has in the literature often been confused with the isomeric  $\beta,\beta,\beta$ -trichloroethyl carbamate,  $CCl_3-CH_2O.CO.NH_2$  ("Voluntal") [see also under  $\beta,\beta,\beta$ -trichloroethyl alcohol (3:5775)] Note also that chloralformamide with aq. NaOH +  $Ac_2O$  (362) or with aq. NaOH +  $BzCl$  (361) cf. (362) undergoes bimolecular condensation with loss of  $H_2O$  giving anhydrochloralformamide  $[CCl_2CH(NH.CHO)]_2O$ , m.p. 194.5–195° (362), 193° (364).]

With acetamide. [ $\bar{C}$  (1 mole) with acetamide (1 mole) (72) (172), or chloral hydrate (3:1270) (1 mole) with acetamide (1 mole), or chloral ammonia with  $AcCl$  or  $Ac_2O$  (128) gives chloralacetamide [Beil. II-179, II<sub>1</sub>-(81)], m.p. 158–159° (362), 158° (172), 156°–157° (72), 156° (128); this prod. with aq. NaOH +  $Ac_2O$  undergoes bimolecular loss of aq. yielding (362) cf. (369) anhydrochloralacetamide,  $[CCl_2CH(NH.CO.CH_3)]_2O$ , m.p. 212–213° (362), 207° (364). — For study of reduction of chloralacetamide see (365) (366).]

With higher monoamides. [For analogous condensation of  $\bar{C}$  with propionamide, isobutyramide, n-valeramide, n-caproamide, n-caprylamide, and phenylacetamide together with study of reduction of the several products see (367) cf. (369).]

##### With Aromatic Monoamides

With benzamide. [ $\bar{C}$  (1 mole) with benzamide (1 mole) (172) (362) cf. (369), or chloral hydrate (3:1270) with benzonitrile + dry  $HCl$  (368) gives chloralbenzamide [Beil. IX-

209, IX<sub>1</sub>-(101)], m.p. 150–151° (72), 150° (362), 146° (172) (368); this product with aq. NaOH + BzCl or Ac<sub>2</sub>O gives (362) by dehydrative bimolecular condensation anhydrochloralbenzamide, known (362) in two forms, higher-melting form, m.p. 199–200°, and lower-melting form, m.p. 137–138°. — For study of reduction of chloralbenzamide see (366) cf. (369).]

With toluamides. [For condensation of  $\bar{C}$  with *o*-, *m*-, and *p*-toluamides see (370); for the behavior of the products with PCl<sub>5</sub> see (371).]

With salicylamide. [ $\bar{C}$  with salicylamide on warming directly (372) or in CHCl<sub>3</sub> (373) gives chloralsalicylamide, entering at 117° and melting about 10° higher (372); for the corresp. anhydro compound (cf. above), m.p. 174–175°, see (369); for studies of chloral-salicylamide on chlorination (374), bromination (375), or nitration (375) see indic. refs.]

With amides of various substituted salicylic acids. [For behavior of  $\bar{C}$  with the amides of 3-chlorosalicylic acid (3:4745), 5-chlorosalicylic acid (3:4705), and 3,5-dichlorosalicylic acid (3:4035) see (374) (376) (377); for behavior of  $\bar{C}$  with amides of various nitrosalicylic acids (378) or various aminosalicylic acids (379) see indic. refs.]

With *o*-aminobenzamide (anthranilamide). [For behavior of  $\bar{C}$  with anthranilamide and its relatives see (380).]

#### With Amides of Dibasic Acids

Note that two series of products are formed.

With urea. [Chloral hydrate (3:1270) (1 mole) with urea (2 moles) in aq. soln. on stdg. 3 days at room temp. gives (66% yield (381)) (382) cf. (172) chloralurea, *N*-( $\beta,\beta,\beta$ -trichloro- $\alpha$ -hydroxyethyl)urea [Beil. III-59, III<sub>1</sub>-(27)], cryst. from MeOH/C<sub>6</sub>H<sub>6</sub> (381) or EtOH/C<sub>6</sub>H<sub>6</sub> 1:3 (382), m.p. 150° dec. (381) (382). — However, chloral hydrate (3:1270) (2 moles) with urea (1 mole) in aq. HCl at room temp. for 3 days gives (71% yield (381)) (382) cf. (383) dichloralurea [Beil. III-60, III<sub>1</sub>-(27), III<sub>2</sub>-(40)], cryst. from aq. alc., m.p. 196° (381), 194° dec. (382), 190° (172).]

With thiourea. [For behavior of  $\bar{C}$  with thiourea see (383).]

With various substituted ureas. *With monosubstituted ureas.* [Chloral hydrate (3:1270) (2 moles) with *N*-methylurea (1 mole) in aq. soln. at room temp. gives (384) *N*-methyl-*N'*-( $\beta,\beta,\beta$ -trichloro- $\alpha$ -hydroxyethyl) urea, m.p. 140° dec. (384). — Chloral hydrate (3:1270) with *N*-ethylurea behaves in analogous fashion (384). — Chloral hydrate (3:1270) (2½ moles) with *N*-phenylurea in aq. HCl gives (84% yield (382)) *N*-phenyl-*N'*-( $\beta,\beta,\beta$ -trichloro- $\alpha$ -hydroxyethyl)urea, m.p. 142° dec. (382). — For corresp. behavior of chloral hydrate (3:1270) with *N*-*o*-tolylurea, *N*-*p*-tolylurea, *N*-*m*-nitrophenylurea, and *N*-*p*-nitrophenylurea see (385).]

*With disubstituted ureas.* [Chloral hydrate (3:1270) with *N,N*-dimethylurea gives (384) cf. (386) *N,N*-dimethyl-*N'*-( $\beta,\beta,\beta$ -trichloro- $\alpha$ -hydroxyethyl)urea, cryst. from aq. as monohydrate, m.p. 74° dec. (384) (386), which becomes anhydrous on stdg., cryst. from alc., m.p. 157° dec. (384), 156° (386). — For analogous behavior of  $\bar{C}$  with *N,N*-diethylurea giving prod., m.p. 146° dec. (384), 142° (386), see indic. refs. —  $\bar{C}$  with *N,N*-diphenylurea gives analogous prod., m.p. 170° dec. (384).]

With amides of other dibasic acids. [For generally analogous behavior of  $\bar{C}$  with oxamide (384), malonamide (384) (369), succinamide (369), and their relatives see indic. refs.]

#### With Urethanes

With ethyl carbamate. [ $\bar{C}$  with ethyl carbamate ("urethane") in conc. HCl gives (387) (388) ethyl *N*-( $\beta,\beta,\beta$ -trichloro- $\alpha$ -hydroxyethyl)carbamate ("chloralurethane") [Beil. III-24, III<sub>1</sub>-(12), III<sub>2</sub>-(22)], m.p. 103° (362) (388). — This product on htg. alone or

in aq. at 100° regenerates (388) chloral and ethyl carbamate. — With AcCl under reflux it gives (80% yield (387)) the corresp. acetate, m.p. 47–49°, b.p. 165° at 15 mm. (387). — With aq. NaOH + Ac<sub>2</sub>O (362) (387) or with aq. KOH + BzCl (364) chloralurethane undergoes dehydrative bimolecular condensation yielding anhydro-chloralurethane [Beil. III<sub>1</sub>-12], which exists in both high-melting (161–162°) and low-melting (149–150°) forms (362).]

With other alkyl carbamates. [For generally analogous behavior of  $\bar{C}$  with methyl carbamate (362), *n*-propyl carbamate (389), isobutyl carbamate (389), isoamyl carbamate (362), and menthyl carbamate (362) see indic. refs.]

Ⓢ Preliminary tests for  $\bar{C}$ : Owing to the length of the text of this compound, a brief summary of the tests most significant as preliminary indications is given here; for details refer back as indicated and also see chloral hydrate (3:1270).

$\bar{C}$  reduces NH<sub>3</sub>/AgNO<sub>3</sub> and Fehling's soln. but only on warming (see above under oxdn of  $\bar{C}$ ). —  $\bar{C}$  gives fuchsin-aldehyde test with Schiff's reagent (but chloral hydrate (3:1270) does not). —  $\bar{C}$  with conc. H<sub>2</sub>SO<sub>4</sub> readily polymerizes (see above under polymerization of  $\bar{C}$ ). —  $\bar{C}$  with aq. or alc. alkali on warming undergoes hydrolytic cleavage to CHCl<sub>3</sub> (3:5050) + alkali formate (see above under behavior of  $\bar{C}$  with alkalis); therefore,  $\bar{C}$  with alc. alkali + aniline gives characteristic odor of phenyl isocyanide.

— Trichloroacetalaldioxime: m.p. 56° (135). [See above under behavior of  $\bar{C}$  with hydroxylamine.]

— Trichloroacetaldehyde phenylhydrazone: unreported. [See above under behavior of  $\bar{C}$  with arylhydrazines.]

— Trichloroacetaldehyde *p*-nitrophenylhydrazone: unreported. [See above under behavior of  $\bar{C}$  with arylhydrazines.]

— Trichloroacetaldehyde 2,4-dinitrophenylhydrazone: a prod. of m.p. 131° has been claimed (390) but could not be confirmed (391). [See also above under behavior of  $\bar{C}$  with arylhydrazines.]

— Trichloroacetaldehyde semicarbazone: unreported. [Note that chloral hydrate (3:1270) with semicarbazide in aq. (392) (394) cf. (393) or chloral ethylalcoholate (3:0860) with semicarbazide in alc. (392) gives an addn. prod., m.p. 90°, which on boilg. with aq. yields (392) glyoxylic acid semicarbazone [Beil. III-600, III<sub>1</sub>-(209) III<sub>2</sub>-(389)], m.p. 235–236° (392), 235–238° (393), 207° (395), 206–208° dec. (396), 202–203° (397), 202° dec. (394) (note that these results may represent two stereoisomeric forms (397)).]

Soc.* 1938, 1939, 1940, 1941, 1942, 1943, 1944, 1945, 1946, 1947, 1948, 1949, 1950, 1951, 1952, 1953, 1954, 1955, 1956, 1957, 1958, 1959, 1960, 1961, 1962, 1963, 1964, 1965, 1966, 1967, 1968, 1969, 1970, 1971, 1972, 1973, 1974, 1975, 1976, 1977, 1978, 1979, 1980, 1981, 1982, 1983, 1984, 1985, 1986, 1987, 1988, 1989, 1990, 1991, 1992, 1993, 1994, 1995, 1996, 1997, 1998, 1999, 2000, 2001, 2002, 2003, 2004, 2005, 2006, 2007, 2008, 2009, 2010, 2011, 2012, 2013, 2014, 2015, 2016, 2017, 2018, 2019, 2020, 2021, 2022, 2023, 2024, 2025, 2026, 2027, 2028, 2029, 2030, 2031, 2032, 2033, 2034, 2035, 2036, 2037, 2038, 2039, 2040, 2041, 2042, 2043, 2044, 2045, 2046, 2047, 2048, 2049, 2050, 2051, 2052, 2053, 2054, 2055, 2056, 2057, 2058, 2059, 2060, 2061, 2062, 2063, 2064, 2065, 2066, 2067, 2068, 2069, 2070, 2071, 2072, 2073, 2074, 2075, 2076, 2077, 2078, 2079, 2080, 2081, 2082, 2083, 2084, 2085, 2086, 2087, 2088, 2089, 2090, 2091, 2092, 2093, 2094, 2095, 2096, 2097, 2098, 2099, 2100, 2101, 2102, 2103, 2104, 2105, 2106, 2107, 2108, 2109, 2110, 2111, 2112, 2113, 2114, 2115, 2116, 2117, 2118, 2119, 2120, 2121, 2122, 2123, 2124, 2125, 2126, 2127, 2128, 2129, 2130, 2131, 2132, 2133, 2134, 2135, 2136, 2137, 2138, 2139, 2140, 2141, 2142, 2143, 2144, 2145, 2146, 2147, 2148, 2149, 2150, 2151, 2152, 2153, 2154, 2155, 2156, 2157, 2158, 2159, 2160, 2161, 2162, 2163, 2164, 2165, 2166, 2167, 2168, 2169, 2170, 2171, 2172, 2173, 2174, 2175, 2176, 2177, 2178, 2179, 2180, 2181, 2182, 2183, 2184, 2185, 2186, 2187, 2188, 2189, 2190, 2191, 2192, 2193, 2194, 2195, 2196, 2197, 2198, 2199, 2200, 2201, 2202, 2203, 2204, 2205, 2206, 2207, 2208, 2209, 2210, 2211, 2212, 2213, 2214, 2215, 2216, 2217, 2218, 2219, 2220, 2221, 2222, 2223, 2224, 2225, 2226, 2227, 2228, 2229, 2230, 2231, 2232, 2233, 2234, 2235, 2236, 2237, 2238, 2239, 2240, 2241, 2242, 2243, 2244, 2245, 2246, 2247, 2248, 2249, 2250, 2251, 2252, 2253, 2254, 2255, 2256, 2257, 2258, 2259, 2260, 2261, 2262, 2263, 2264, 2265, 2266, 2267, 2268, 2269, 2270, 2271, 2272, 2273, 2274, 2275, 2276, 2277, 2278, 2279, 2280, 2281, 2282, 2283, 2284, 2285, 2286, 2287, 2288, 2289, 2290, 2291, 2292, 2293, 2294, 2295, 2296, 2297, 2298, 2299, 2300, 2301, 2302, 2303, 2304, 2305, 2306, 2307, 2308, 2309, 2310, 2311, 2312, 2313, 2314, 2315, 2316, 2317, 2318, 2319, 2320, 2321, 2322, 2323, 2324, 2325, 2326, 2327, 2328, 2329, 2330, 2331, 2332, 2333, 2334, 2335, 2336, 2337, 2338, 2339, 2340, 2341, 2342, 2343, 2344, 2345, 2346, 2347, 2348, 2349, 2350, 2351, 2352, 2353, 2354, 2355, 2356, 2357, 2358, 2359, 2360, 2361, 2362, 2363, 2364, 2365, 2366, 2367, 2368, 2369, 2370, 2371, 2372, 2373, 2374, 2375, 2376, 2377, 2378, 2379, 2380, 2381, 2382, 2383, 2384, 2385, 2386, 2387, 2388, 2389, 2390, 2391, 2392, 2393, 2394, 2395, 2396, 2397, 2398, 2399, 2400, 2401, 2402, 2403, 2404, 2405, 2406, 2407, 2408, 2409, 2410, 2411, 2412, 2413, 2414, 2415, 2416, 2417, 2418, 2419, 2420, 2421, 2422, 2423, 2424, 2425, 2426, 2427, 2428, 2429, 2430, 2431, 2432, 2433, 2434, 2435, 2436, 2437, 2438, 2439, 2440, 2441, 2442, 2443, 2444, 2445, 2446, 2447, 2448, 2449, 2450, 2451, 2452, 2453, 2454, 2455, 2456, 2457, 2458, 2459, 2460, 2461, 2462, 2463, 2464, [For prepn. of  $\bar{C}$  (86% yield (1)) from 1,2,3-trichlorobutene-3 (2,3,4-trichlorobutene-1) (3:9964) with excess MeOH/KOH at 10-15° see (1) (2); for formn. (together with other products) from 1,2,3,4-tetrachlorobutane (3:1760) with MeOH/KOH at 10-18° see (1) (2); from chloroprene (3:7080) by addn. of ICl followed by treatment with alc. KOH (3:1)  $\bar{C}$  polymerizes completely within 24 hrs. at room temp., in about 49 min. at 85-90°; this is about 10 times as fast as chloroprene (3:7080) and 7000 times as fast as isoprene (1:8020). The polymer is a white opaque tough hard mass, non-plastic and lacking extensibility. It is insol. in and separates from liquid  $\bar{C}$  but is partly soluble in  $\text{CHCl}_3$  (1). The polymerization is inhibited by hydroquinone and accelerated by benzoyl peroxide (2).  $\bar{C}$  does not (1) react with maleic anhydride (1:0625) or with 1,4-naphthoquinone (1:9040).

3:5226 (1) Carothers, Berchet, *J. Am. Chem. Soc.* 55, 2004-2008 (1933). (2) Carothers, Berchet, U.S. 1,965,319, July 3, 1934; *Cent.* 1935, I 3724; C.A. 28, 5716 (1934). (3) Petrov, *J. Gen. Chem. (U.S.S.R.)* 13, 155-158 (1943); C.A. 38, 1466-1467 (1944).

[For prepn. of  $\bar{C}$  from chloroacetic acid (3:1370) with  $PCl_3$  (5) (40), or in  $HCl$  atm. under press. nt  $150^\circ$  (6), or with  $ZnCl_2$  (67% yield (7)) see indic. refs.; with  $P_2O_5 + HCl$  gas nt  $200^\circ$  see (8); with  $SOCl_2$  (yields: 95% (9), 55% (10), 50% (7)) (11) see indic. refs.; with benzoyl chloride (3:6240) (yield 71-76%) see (12); with oxalyl dichloride (3:5060) (80% yield) see (3); with phosgene (3:5000) over activated carbon nt  $200^\circ$  see (13); with benzotrichloride (3:6540) +  $ZnCl_2$  at  $80-90^\circ$  (80% yield) see (14); with  $Cl_2 + S_2Cl_2$  (95% yield (15)) or  $Cl_2 +$  lower chlorides of sulfur +  $FeCl_3$ ,  $SnCl_4$ , etc., at  $50-60^\circ$  (82% yield (16)) see indic. refs.]

[For prepn. of  $\bar{C}$  from chloroacetic acid anhydride (3:0730) with oxalyl dichloride (3:5060) see (3); from ketene with  $NOCl$  see (17); from  $\alpha,\beta$ -dichlorovinyl ethyl ether (3:5540) +  $HCl$  gas see (18); from  $\alpha,\beta$ -dichloroethylene +  $O_2$  in pres. of  $Br_2$  or conc.  $H_2SO_4$  see (19); from nectyl chloride (3:7065) with  $Cl_2$  in sunlight (20) or in  $CCl_4$  in u.v. light (21) or in pres. of  $I_2$  (22) see indic. refs.; from  $\alpha$ -chloroethyl chloroacetate on htg. with 0.02%  $ZnCl_2$  see (23); from 2-(chloroacetoxy)hexene-1 with  $HCl$  gas see (24), from  $CH_3Cl_2$  (3:5020) +  $AlCl_3$  +  $CO$  gas at  $200^\circ$  and 900 atm. see (41).]

$\bar{C}$  on htg. with  $Na_2CO_3$  (25) or with  $KNO_3$  (81% yield (26)) gives chloroacetic acid anhydride (3:0730) q.v., m.p.  $46^\circ$ . —  $\bar{C}$  treated at  $-5^\circ$  with  $III$  gas gives (68% yield (27)) chloroacetyl iodide, b.p.  $36.5^\circ$  at 4 mm. (27). [For behavior of  $\bar{C}$  with  $HBr$  gas see (40).]

$\bar{C}$  with  $MeOH$  yields (28) methyl chloroacetate (3:5585), b.p.  $131^\circ$ ;  $\bar{C}$  with  $EtOH$  (29) or with triethyl orthoformate (1:3241) at  $100-110^\circ$  (90% yield (30)) gives ethyl chloroacetate (3:5700), b.p.  $144^\circ$ .

[ $\bar{C}$  with ethylene +  $AlCl_3$  gives (small yield (31)) 1,4-dichlorobutanone-2, b.p.  $63-65^\circ$  at 3 mm. (31). —  $\bar{C}$  with  $C_6H_6$  +  $AlCl_3$  gives (32)  $\omega$ -chloroacetophenone (phenacyl chloride) (3:1212);  $\bar{C}$  with *m*-dichlorobenzene (3:5960) +  $AlCl_3$  gives (33) 2,4-dichlorophenacyl chloride [Beil. VII-283], m.p.  $57^\circ$  (33);  $\bar{C}$  with biphenyl +  $AlCl_3$  gives (77% yield (34)) *p*-phenylphenacyl chloride (3:3934), m.p.  $122-123^\circ$  (34);  $\bar{C}$  with naphthalene +  $AlCl_3$  in  $CS_2$  gives (35) cf. (36) chloromethyl  $\beta$ -naphthyl ketone.]

[ $\bar{C}$  with large excess (4 moles)  $McMgBr$  or  $McMgI$  gives (48-51% yield (37)) (38) 2-methylbutanol-3 (1:6170);  $\bar{C}$  with large excess  $CaH_2MgBr$  in ether gives (31% yield (39)) 1,2,2-triphenylethanol-1 [Beil. VI-721], m.p.  $87.5-88.5^\circ$  (39); note that the isomeric 1,1,2-triphenylethanol-1 [Beil. VI-(354)] has almost same m.p., viz.,  $89^\circ$ .]

$\bar{C}$  hydrolyzes with aq. yielding chloroacetic acid (3:1370) q.v. — For the amide, anilide, *p*-toluidide, and other deriva. corresp. to  $\bar{C}$  see chloroacetic acid (3:1370).

See also text.

[See also dichloromethyl chloroformate (3:5315).]

Colorless lachrymatory oil. — Note that  $\bar{\text{C}}$  cannot by distillation be completely separated from dichloromethyl chloroformate (3:5315); the constants listed above are on samples contg. (1) about 9% of the latter, or (3) about 7% of dichloromethyl chloroformate + 2% dimethyl carbonate.

A mixt. of  $\bar{\text{C}}$  with dichloromethyl chloroformate (3:5315) has been employed as a chem. warfare agent under the names "K-Stoff," "Palite" (6). — [For studies of physiological action see (4) (5); for action on plant tissue see (7).]

[For prepn. of  $\bar{\text{C}}$  from methyl chloroformate (3:5075) or from methyl formate (1:1000) with  $\text{Cl}_2$  under various conditions see (1) (2) cf. (6) (8) (9).]

$\bar{\text{C}}$  with aq. at ord. temp. or more rapidly on boilg. or  $\bar{\text{C}}$  with aq. alk. in cold undergoes hydrolysis (1) yieldg formaldehyde (1:0145) + 2 HCl +  $\text{CO}_2$ ; by detn. via oxidn. with  $\text{I}_2$  + NaOH of the formaldehyde so produced  $\bar{\text{C}}$  may be quant. estimated cf. (10) (6); note also that this hydrolysis to formaldehyde distinguishes  $\bar{\text{C}}$  from various other closely related compounds, e.g., methyl chloroformate (3:5075), dichloromethyl chloroformate (3:5315), trichloromethyl chloroformate ("Diphosgene") (3:5515), trichloromethyl trichloroacetate (3:0290), bis-(trichloromethyl) carbonate ("Triphosgene") (3:1915), or phosgene (3:5000).

$\bar{\text{C}}$  (1 mole) with NaI (2 moles) in dry acetone at 20° (11) liberates  $\text{I}_2$  also yieldg formaldehyde (1:0145) + CO, but the reaction is not quantitative proceeding only to about 70% theoretical (11); but  $\bar{\text{C}}$  with dry NaI at 90–100° gives (1) CO +  $\text{CO}_2$ . Note that  $\bar{\text{C}}$  with LiBr in dry acetone does not (11) liberate bromine; in this respect  $\bar{\text{C}}$  is like methyl chloroformate (3:5075) but different from dichloromethyl chloroformate (3:5315) and trichloromethyl chloroformate ("Diphosgene") (3:5515).

[ $\bar{\text{C}}$  with  $\text{FeCl}_3$  or  $\text{AlCl}_3$  dec. rapidly at 70° (1) (12) yieldg phosgene (3:5000) and formaldehyde (1:0145).]

[ $\bar{\text{C}}$  with methyl hydrogen sulfate gives (13) methyl chlorosulfonate, formaldehyde,  $\text{CO}_2$  + HCl;  $\bar{\text{C}}$  with chlorosulfonic acid at 100° for 4 hrs. gives (13) chloromethyl chlorosulfonate +  $\text{CO}_2$  + HCl;  $\bar{\text{C}}$  with dimethyl sulfate gives (78% yield (13)) methyl chlorosulfonate.]

[ $\bar{\text{C}}$  with alcohols or  $\bar{\text{C}}$  with alkali salts of phenols reacts as an acid chloride yielding (6) the corresp. alkyl or aryl chloromethyl carbonates (1).]

[ $\bar{\text{C}}$  with K phenylcyanamide also reacts as an acid chloride givg (14) chloromethyl N-cyano-N-phenylcarbamate, m.p. 48°.]

3:5275 (1) Kling, Florentin, Lassieur, Schmutz, *Compt. rend.* 169, 1046–1047 (1919); *Ann. chim.* (9) 13, 44–59 (1920). (2) Grignard, Rivat, Urbain, *Compt. rend.* 169, 1074–1077 (1919); *Ann. chim.* (9) 13, 246–248 (1920). (3) Herbst, *Kolloidchem. Beihefte*, 23, 330–331 (1927). (4) van Nieuwenberg, *Chem. Weekblad* 19, 328 (1922). (5) Fegler, *Compt. rend. soc. biol.* 100, 222–224

[For use as soil disinfectant of the mixt. of  $\bar{C}$  with 1,2-dichloropropene obtd. in manufacture of allyl chloride by chlorination of propylene see (15); for use of  $\bar{C}$  in prepn. of cellulose ethers see (16).]

Reactions involving unsaturated linkage of  $\bar{C}$ . [ $\bar{C}$  with  $Cl_2$  adds 1 mole halogen yielding (14) 1,1,2,3-tetrachloropropane (3:6035), b.p. 179–180° cor. st 756.6 mm. (14).] —  $\bar{C}$  with  $Br_2$  adds 1 mole halogen giving (72.7% yield (9)) (5) (3) (17) 1,2-dibromo-1,3-dichloropropane [Beil. I-112], b.p. 212° (3), 215–217° (9), 220–221° (17), 220–225° (5).

[ $\bar{C}$  with fuming  $HCl$  in s.t. at 150° blackens but does not add  $HCl$  (5).]

Reactions involving the one reactive chlorine atom of  $\bar{C}$ . Note that the 2 chlorine atoms in  $\bar{C}$  possess very different reactivities; that attached to the carbon directly connected with the double bond is inert, while the chlorine attached to the carbon in  $\beta$ -relationship to the unsaturated linkage is extremely reactive.

[ $\bar{C}$  with aq.  $KOH$  (1 mole) boiled for 30 hrs. (14), or boiled with 10% aq.  $Na_2CO_3$  (slight excess) for 2 hrs. (1), or shaken with aq. silver oxide at room temp. for 24 hrs. (small yield (12)) gives 3-chloropropen-2-ol-1 (1-chloropropen-1-ol-3) ( $\gamma$ -chloroallyl alcohol) (3:5820); note that the high-boilg. stereoisomer of  $\bar{C}$  gives (76% yield (1)) the high-boilg. stereoisomer of the resultant alc., while the low-boilg. stereoisomer of  $\bar{C}$  gives (81% yield (1)) the low-boilg. stereoisomer of the resultant alc.; note also that aq.  $NaOH$  effects from the resultant  $\gamma$ -chloroallyl alc. the removal of  $HCl$  and also causes polymerization (1) so that use of hydrolytic conditions as mild as possible is desirable.] — [For reactn. of  $\bar{C}$  with  $NaSH$  or  $Na_2S$  see (18).]

[ $\bar{C}$  with  $Na$  alcoholates,  $NaOR$ , replaces the reactive chlorine atom by the alkoxy residue yielding  $\omega$ -chloroallyl alkyl ethers of general formula  $RO-CH_2-CH=CHCl$ : e.g.,  $\bar{C}$  with  $NaOMe$  refluxed 4 hrs. gives (12) 1-chloro-3-methoxypropene-1, b.p. 107–108°,  $D_4^{27} = 1.032$ ,  $n_D^{27} = 1.431$  (12) (note proximity of h.p. to that of ord.  $\bar{C}$ ) (for study of kinetics of this reactn. see (19));  $\bar{C}$  with  $NaOEt$  refluxed for 4 hrs. (12) or  $\bar{C}$  with alc.  $KOH$  (5) yields 1-chloro-3-ethoxypropene-1 [Beil. I-439], b.p. 126–127°,  $D_4^{16} = 1.018$ ,  $n_D^{16} = 1.438$  (12); for corresp. reactns. of  $\bar{C}$  with  $Na$  derivs. of benzyl alc. (1:6480),  $\beta$ -phenylethyl alc. (1:6505),  $\gamma$ -phenyl- $n$ -propyl alc. (1:6520), and cinnamyl alc. (1:5920) together with physical consts. of prods. see (20).]

[ $\bar{C}$  with alkali metal phenolates replaces the reactive chlorine atom by the aryloxy residue yielding  $\omega$ -chloroallyl aryl ethers of general formula  $RO-CH_2-CH=CHCl$ : e.g.,  $\bar{C}$  with  $Na$  phenolate in abs. alc. refluxed  $\frac{1}{2}$  hr. (21), or  $\bar{C}$  with phenol (1:1420) + dry  $K_2CO_3$  in boilg. acetone (8), gives (yields: 75% (21), 72% (8))  $\omega$ -chloroallyl phenyl ether, b.p. 120–121° at 20 mm. (21), 122–127° at 27 mm. (8),  $D_4^{15} = 1.146$  (21),  $n_D^{20} = 1.5421$  (8),  $n_D^{15} = 1.5447$  (21); for corresp. reactn. with salts of  $o$ -cresol (1:1400) (21),  $m$ -cresol (1:1730) (21),  $p$ -cresol (1:1410) (21) (8), carvacrol (1:1760) (21), thymol (1:1430) (21),  $\beta$ -naphthol (1:1540) (21), hydroquinone (1:1590) (21), and several other phenols (21) see indie. refs. — Note that these  $\omega$ -chloroallyl aryl ethers upon treatment with  $Br_2$  do not add halogen to the unsatd. linkage but instead undergo cleavage: e.g.,  $\omega$ -chloroallyl phenyl ether (above) in  $CHCl_3$  with  $Br_2$  (1 mole) at 0° yields (22) phenol (1:1420) +  $p$ -bromophenol + 3-bromo-1-chloropropene-1 (see below) +  $\omega$ -chloroallyl  $p$ -bromophenyl ether, b.p. 153° at 13 mm.,  $D_4^{11} = 1.521$ ,  $n_D^{11} = 1.5785$  (22). — Note furthermore that these  $\omega$ -chloroallyl aryl ethers with  $HBr$  or  $HI$  do not add hydrogen halide to the unsaturated side chain but instead undergo cleavage similar to that with halogens: e.g.,  $\omega$ -chloroallyl phenyl ether in  $AcOH$  with  $HBr$  gas (1 mole) gives (70% yield (23)) 3-bromo-1-chloropropene-1, lachrymatory oil, b.p. 130° at 760 mm.,  $D_4^{25} = 1.670$ ,  $n_D^{25} = 1.5255$  (23); similarly action of  $HI$  yields (23) 1-chloro-3-iodopropene-1, lachrymatory oil, b.p. 162° at 760 mm. sl. dec., 58° at 19 mm.,  $D_4^{25} = 2.029$ ,  $n_D^{25} = 1.5993$  (23).]

[ $\bar{C}$  with phenols under suitable conditions can also react to effect direct nuclear alkenyla-

tion: e.g.,  $\bar{C}$  with phenol (1:1420) + Na in  $C_6H_6$  refluxed for 17 hrs. gives (17% yield (8)) *o*-( $\gamma$ -chloroallyl)phenol, b.p. 151–156° at 31 mm.,  $n_D^{25} = 1.5638$  (8) (soluble in alk.), accompanied by some  $\omega$ -chloroallyl phenyl ether (insol. alk.) (see above).]

[ $\bar{C}$  with phenol ethers undergoes Friedel-Crafts reactn. of the reactive halogen atom with resultant introduction of the  $\omega$ -chloroallyl group into the aromatic nucleus: e.g.,  $\bar{C}$  (1 mole) with anisole (1:7445) (10 moles) +  $AlCl_3$  gives (70% yield (24)) 1-( $\omega$ -chloroallyl)-4-methoxybenzene, h.p. 126° at 15 mm. (24);  $\bar{C}$  (1 mole) with pyrocatechol dimethyl ether (veratrole) (1:7560) (2 moles) + Zn dust (1 g.) ( $AlCl_3$  unsuitable) gives 1-( $\omega$ -chloroallyl)-3,4-dimethoxybenzene, b.p. 162° at 15 mm.,  $D_4^{14} = 1.168$ ,  $n_D^{14} = 1.551$  (24);  $\bar{C}$  with pyrogallol trimethyl ether (1:7145) similarly yields 1-( $\omega$ -chloroallyl)3,4,5-trimethoxybenzene, b.p. 174° at 15 mm.,  $D_4^{18} = 1.176$ ,  $n_D^{18} = 1.539$  (24). — Note that such  $\omega$ -chloroallyl aryl ethers (1 mole) upon treatment with KOH (3 moles) in an alcohol  $R'.OH$  (5 moles) give (by reactn. of the  $\omega$ -chlorine and rearr. or vice versa) substituted cinnamyl ethers of the type  $RO.C_6H_4.CH=CH.CH_2OR'$ , used for prepn. of various natural prods. (24).]

[ $\bar{C}$  with aromatic hydrocarbons undergoes Friedel-Crafts reactn. of the reactive halogen atom with resultant introduction of the  $\omega$ -chloroallyl group into the aromatic nucleus e.g.,  $\bar{C}$  with  $C_6H_6$  +  $AlCl_3$  yields (25)  $\gamma$ -chloroallylbenzene (1-chloro-3-phenylpropene-1) (3:8737) (see below); for analogous reactions of  $\bar{C}$  with toluene (1:7405), *o*-xylene (1:7430), *m*-xylene (1:7420), *p*-xylene (1:7415), ethylbenzene (1:7410), cumene (1:7440), pseudocumene (1:7470), mesitylene (1:7455), *p*-cymene (1:7505), etc., see (25). — Note that the resultant  $\gamma$ -chloroallyl hydrocarbons add  $Br_2$  normally (26) to the unsatd. linkage (diff. from  $\omega$ -chloroallyl aryl ethers (above) which undergo cleavage); e.g.,  $\gamma$ -chloroallylbenzene (above) with  $Br_2$  gives  $\gamma$ -chloro- $\beta,\gamma$ -dibromo-*n*-propylbenzene, h.p. 160° at 12 mm.,  $D_4^{10} = 1.727$ ,  $n_D^{10} = 1.611$  (26) (for use of this prod. in prepn. of hydrocinnamaldehyde (1:0225) see (35).)]

[The direct actn. of  $\bar{C}$  with  $NH_3$  appears to be unreported; however,  $\bar{C}$  with KSCN followed by alk. hydrolytic cleavage is claimed (27) to yield the expected  $\gamma$ -chloroallylamine. —  $\bar{C}$  with methylamine (3 moles) in  $C_6H_6$  gives (53% yield (28)) *N*-methyl- $\gamma$ -chloroallylamine [Beil. IV<sub>2</sub>-(668)], h.p. 125° (B.PkOH, m.p. 91° (28)), accompanied by a little *N*-methyl- $\beta$ -( $\gamma$ -chloroallyl)amine [Beil. IV<sub>2</sub>-(668)], b.p. 88° at 16 mm. (28). —  $\bar{C}$  with diethylamine reacts vigorously and on making alkaline gives (75% yield (29)) (12) *N,N*-diethyl- $\gamma$ -chloroallylamine [Beil. IV<sub>2</sub>-(668)], b.p. 57–58° at 17 mm. (12), 55° at 9 mm. (29) (B.HCl, pl. from acetone, m.p. 221° (29); B.PkOH, ndls. from aq., m.p. 78° (29), 91° (12); B. $H_2PtCl_6$ , m.p. 169–170° (12)). — For reactns. of  $\bar{C}$  with tertiary amines, e.g., with  $Me_3N$  (29),  $Et_3N$  (29), or pyridine (19), see indic. refs.]

[ $\bar{C}$  (1 mole) with aniline (2 moles) in  $C_6H_6$  under reflux ppts. aniline hydrochloride and from the solvent gives (68% yield (30)) *N*-phenyl- $\gamma$ -chloroallylamine, b.p. 137° at 13 mm.,  $D_4^{13} = 1.1456$ ,  $n_D^{13} = 1.590$  (30); for analogous reactns. of  $\bar{C}$  with *o*-toluidine and *m*-toluidine see (30)]

[ $\bar{C}$  with excess  $CaBr_2$  refluxed for 40 hrs. (12) or actn. of HBr on  $\omega$ -chloroallyl aryl ethers (23) (discussed above) gives (58% yield (12)) 3-bromo-1-chloropropene-1 (const. given above); similarly  $\bar{C}$  with excess powdered  $CaI_2$  shaken at room temp. for 20 hrs. gives (65% yield (12)) (14) 1-chloro-3-iodopropene-1 (const. given above).]

[ $\bar{C}$  with NaOAc in AcOH at 110° for 16 hrs. ppts. NaCl (70% theory (12)) and gives (50% yield (12))  $\gamma$ -chloroallyl acetate [Beil. II-136], b.p. 156–159° (10), b.p. 57° at 15 mm.,  $D_4^{17} = 1.140$ ,  $n_D^{17} = 1.444$  (12).]

$\bar{C}$  reacts very slowly if at all with most metals: e.g.,  $\bar{C}$  with Zn dust in boilg. acetone or  $\bar{C}$  with Mg in dry ether (even in pres. of  $I_2$ ,  $EtBr$ , or  $HgCl_2$ ) is inert (12); however,  $\bar{C}$  with Na in tetralin (1:7550) reacts violently giving only gaseous products (12), possibly including allene (propadiene-1,2) cf. (3) (31).

[ $\bar{C}$  reacts readily with aryl MgBr cpds., with replacement of its active halogen atom by the aryl radical: e.g.,  $\bar{C}$  with  $C_6H_5MgBr$  in toluene (26) or ether (32) gives (alm. 100% yield (26))  $\gamma$ -chloroallylbenzene (1-chloro-3-phenyl-propene-1 (3:8737), b.p. 76° at 13 mm. (32),  $D_4^{25} = 1.973$  (26),  $n_D^{25} = 1.545$  (26). — For analogous reactns. of  $\bar{C}$  with *o*-tolyl-, *p*-tolyl-, *p*-cumyl-, 2-cymyl-, *p*-bromophenyl-, and *p*-methoxyphenyl-MgX cpds. see (26); for corresp. reactn. of  $\bar{C}$  with  $\alpha$ -naphthyl MgBr see (34). — For reactn. of  $\bar{C}$  with *n*-propyl MgBr see (2).]

[For reactn. of  $\bar{C}$  with diethyl sodiomalonate giving (26% yield (4)) diethyl  $\gamma$ -chloroallylmalonate, with diethyl disodiummalonate giving (32% yield (4)) diethyl bis-( $\gamma$ -chloroallyl)malonate, or with diethyl sodio-ethyl-malonate giving (20% yield (4)) diethyl  $\gamma$ -chloroallyl-ethyl-malonate see indic. refs.]

[ $\bar{C}$  with alcohols gives corresp. esters (for studies of rate of alcoholysis see (1) (21)); for reactn. of  $\bar{C}$  with various carbohydrates (22) and with cellulose (23) see indic. refs.;  $\bar{C}$  + phenol yields (20) phenyl dichloroacetate, m.p. 48°, h.p. 247.5° cor. (20);  $\bar{C}$  with  $\beta$ -naphthol yields (20)  $\beta$ -naphthyl dichloroacetate, m.p. 92-93° (20).]

[ $\bar{C}$  on warming with  $AlCl_3$  yields (24) (25) 1,1,1,2,2,3,3-heptachloropropane (3:0200) + chloroform (3:5050) + CO + HCl]

[ $\bar{C}$  treated with dry HI gas at -5° gives (58% yield (5)) dichloroacetyl iodide, b.p. 54-54.5° at 15 mm. (5).]

$\bar{C}$  with aq. hydrolyzes very rapidly yielding dichloroacetic acid (3:6208) q.v.; for the amide, amide, *p*-toluidide, and other derivs. corresp. to  $\bar{C}$  see dichloroacetic acid (3:6208).

Care must be taken to avoid confusion of  $\bar{\text{C}}$  with the isomeric 1,1,1-trichloroethane (3:5085).  $\bar{\text{C}}$  is now comm. prod. in U.S. (14).

### MISCELLANEOUS PHYSICAL PROPERTIES

sol. nq.; e.g., 100 g. aq. at 0° dis. 0.460 g.  $\bar{\text{C}}$  (15). — [For soly. of aq. in  $\bar{\text{C}}$  at 0°, (16).]  
d press. see (10).]

[For soly. of  $\text{I}_2$  in  $\bar{\text{C}}$  see (17).]

Binary systems contg.  $\bar{\text{C}}$ . (See also below under uses of  $\bar{\text{C}}$ .)  $\bar{\text{C}}$  + 1,2-dichloroethane (ethylene dichloride) (3:5130): for t.p./compn. datn, eutectic f.p. -70° (11), and for  $D$  and vapor/liq. equil. (13), see indic. refs.

Azeotropes contg.  $\bar{\text{C}}$ .  $\bar{\text{C}}$  with  $\text{EtOH}$  (1:6130) forms a const.-boilg. mixt., b.p. 77.8° (4), 77.3° (6) at 760 mm., contg. 35 (6), 30 (1) wt. %  $\bar{\text{C}}$ .

Other physical props. [For study of thermal conductivity of  $\bar{\text{C}}$  see (18).]

### USES OF $\bar{\text{C}}$

$\bar{\text{C}}$  is now widely used as industrial solvent and in other ways [e.g., for use of  $\bar{\text{C}}$  (10%) 1,1,1-trichloroethane (3:5085) + 20% pet. hydrocarbons as dry-cleaners' solv. see (10); for use of  $\bar{\text{C}}$  + ethylene dichloride (3:5130) as hair wash see (20); for use of  $\bar{\text{C}}$  + *n*-heptane (1:8575),  $\bar{\text{C}}$  + cyclohexane (1:8105), or  $\bar{\text{C}}$  +  $\text{C}_6\text{H}_6$  (1:7400) as test mixts. for detn. of number of theoret. pl. in fractionating columns see (21); for use of  $\bar{\text{C}}$  in dewaxing of oils see (22)].

### PHYSIOLOGICAL ACTION AND TOXICITY

Full treatment of this topic is beyond the scope of this work [however, for lead references see (23) (24) (25) (26) (27) (27)]. — For study of  $\bar{\text{C}}$  as anthelmintic see (28)].

### PREPARATION OF $\bar{\text{C}}$

From vinyl chloride (3:7010). (See also below under acetylene.) [For prepn. of  $\bar{\text{C}}$  from vinyl chloride with  $\text{Cl}_2$  at 0-80° in light or at 180-250° in absence of light or solv. see (29) (30) (31) cf. (32); for study of photochemical addn. of  $\text{Cl}_2$  to vinyl chloride yielding  $\bar{\text{C}}$  see (33).]

From 1,2-dichloroethylene (3:5030). [For prepn. of  $\bar{\text{C}}$  from 1,2-dichloroethylene by addn. of  $\text{HCl}$  gas at 30-40° in pres. of  $\text{AlCl}_3$  (85% yield) see (34) (37) (note that 1,1,2,3,4-pentachlorobutane (3:0750) is also obtd. as a by-product (36)).]

From 1,1-dichloroethane (ethylidene (di)chloride) (3:5035). [For formn. of  $\bar{C}$  from ethylidene (di)chloride with  $SbCl_5$  (3 wt. parts) on refluxing see (36).]

From 1,2-dichloroethane (ethylene (di)chloride) (3:5130). [For prepn. of  $\bar{C}$  from ethylene (di)chloride with  $Cl_2$  in ultra-violet light at  $50^\circ$  (38) (39) or  $25^\circ$  (40), or with  $Cl_2$  + suitable cat. at not above  $60^\circ$  (41), or  $\bar{C}$  (as liquid) with  $Cl_2$  (7), or with  $Cl_2$  in pres. of  $AlCl_3/NaCl/FeCl_3$  at  $300-425^\circ$  as directed (42), or with  $SO_2Cl_2$  + trace dibenzoyl peroxide refluxed 2 hrs in dark (12) (yields: 80% (41), 70% (40) (12), 50% (42)), see indic. refs.]

From ethylene. [For prepn. or formn. of  $\bar{C}$  from ethylene with  $Cl_2$  + cat. see (43) (44) (45) (46) (47).]

From acetylene. [For prepn. of  $\bar{C}$  from acetylene with  $HCl$  +  $Cl_2$  + cat. (doubtless via formn. of vinyl chloride (and subsequent addn. of  $Cl_2$  as above) see (48) (30).]

From other sources. [For formn. of  $\bar{C}$  as by-prod. of prepn. of chloral (3:5210) see (49); for prepn. of  $\bar{C}$  from 2,2-dichloroethanol-1 (3:5745) with  $PCl_5$  (50), or from  $\alpha,\beta$ -dichloroethyl chloroformate by loss of  $CO$  under influence of  $AlCl_3$  (51), see indic. refs.; for formn. of  $\bar{C}$  from trichloroethylene (3:5170) with  $Hl$  for 2 weeks in sunlight see (68).]

## CHEMICAL BEHAVIOR OF $\bar{C}$

Dehydrochlorination.  $\bar{C}$  under suitable conditions may lose  $HCl$  in either or both of two modes yielding either or both 1,1-dichloroethylene (vinylidene (di)chloride) (3:5005) or a mixt. of the stereoisomeric 1,2-dichloroethylenes (3:5030). — [E.g.,  $\bar{C}$  with alc.  $KOH$  (52) (53) (54), or with excess aq.  $Ca(OH)_2$  at  $70-80^\circ$  (55) (56), or with aq. or alc.  $NH_3$  (57), or even with  $Na$  in ether (58) gives (yields 100% (57), 90% (55) (56)) 1,1-dichloroethylene (3:5005). — On the other hand,  $\bar{C}$  pyrolyzed at  $400^\circ$  over pumice contg.  $CuCl_2$  (59) is claimed to give mainly 1,2-dichloroethylene (3:5030). — Note also that  $\bar{C}$  with  $MeOH$  over  $Al_2O_3$  at  $290^\circ$  gives (60) a mixt. of both prods. together with  $MeCl$  (3:7905).]

[Note in this connection that  $\bar{C}$  with aq. +  $Zn$ ,  $Fe$ , or  $Al$  at  $100-120^\circ$  under press. yields (61) vinyl chloride (3:7010); perhaps this occurs by way of the above dichloroethylenes as intermediate.]

Halogenation of  $\bar{C}$ . Chlorination. ( $\bar{C}$  with  $Cl_2$  +  $AlCl_3$  at  $70-80^\circ$  yields (62) 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750).]

Fluorination. ( $\bar{C}$  with  $HgF_2$  under press. at  $140^\circ$  gives (63) 50% 1,2-dichloro-1-fluoroethane + 10% 2-chloro-1,1-difluoroethane; for behavior of  $\bar{C}$  with  $SbF_3$  +  $Br_2$  at  $160^\circ$ , with  $SbF_3$  +  $SbCl_5$ , or with  $SbF_3Cl_2$  see (63).]

Behavior of  $\bar{C}$  with other inorganic reactants. ( $\bar{C}$  with alkali hydroxide on fusion at  $250-300^\circ$  yields (64) salts of glycolic acid (1:0430).]

Behavior of  $\bar{C}$  with organic reactants. ( $\bar{C}$  with 1,2-dichloroethylene (3:5030) + 1%  $AlCl_3$  at  $35-40^\circ$  for 5 days yields (37) a mixt. of two stereoisomeric 1,1,2,3,4-pentachlorobutanes, viz. the liq. isomer (3:9068) and the solid isomer (3:0750). —  $\bar{C}$  + trichloroethylene (3:5170) + 1-2%  $AlCl_3$  at  $40^\circ$  for 7 days yields (37) 1,1,1,4,4-pentachlorobutene-2 (3:9054).]

( $\bar{C}$  with  $C_6H_6$  +  $AlCl_3$  gives (31% yield (65)) 1,1,2-triphenylethane, b.p.  $211^\circ$  at 14 mm., accompanied by diphenylmethane and 1,2-diphenylethylene (stilbene).]

( $\bar{C}$  with  $C_6H_5MgBr$  in toluene does not react even at  $100^\circ$  (66).]

Comment on Fujiwara reaction.  $\bar{C}$  does not respond to Fujiwara reactn. (pyridine +  $NaOH$ ) (23).

3:5350 3,4-DICHLOROBUTENE-1  $\text{C}_4\text{H}_2\text{Cl}_2$  Beil. S.N. 12  
(1,2-Dichlorobutene-3)

B.P. 115° (1)	$n_D^{20} = 1.4550$ (1)
45-45.5° at 40 mm. (1)	

[For prepn. of  $\bar{\text{C}}$  (together with other products) from butadiene-1,3 with  $\text{Cl}_2$ , either directly or in  $\text{CHCl}_3$ ,  $\text{CS}_2$  or lgr. soln., see (1) (2), the process can be controlled so as to yield little or no 1,2,3,4-tetrachlorobutane but rather a mixt. of  $\bar{\text{C}}$  and 1,4-dichlorobutene-2 (3:5725) in the ratio 2:1 (1) (2).]

$\bar{\text{C}}$  does not (1) rearr. to 1,4-dichlorobutene-2 (3:5725) even on htg at 90° in a s.t. — However,  $\bar{\text{C}}$  in the presence of a metal halide cat. (3) such as  $\text{AlCl}_3$  (4) rearr. by allylic transposition to 1,4-dichlorobutene-2.

$\bar{\text{C}}$  on htg. at 90° with 2 pts. solid  $\text{KOH}$  loses  $\text{HCl}$  yielding (1) (2) 1-chlorobutadiene-1,3 (3:7210), b.p. 85° (1) (2); under certain conditions, however,  $\bar{\text{C}}$  with  $\text{KOH}$  loses  $\text{HCl}$  to yield (5) 2-chlorobutadiene-1,3 (chloroprene) (3:7080).

$\bar{\text{C}}$  on htg. in alc. with  $\text{Zn}$  dust yields (1) butadiene-1,3.

$\bar{\text{C}}$  with  $\text{Cl}_2$  yields solely (1) the liq. isomer of 1,2,3,4-tetrachlorobutane (3:6082).

$\bar{\text{C}}$  treated directly with  $\text{O}_2$  at 0°, then with aq., yields (1)  $\alpha,\beta$ -dichloropropionaldehyde (3:9034), b.p. 73° at 50 mm. (1), + formaldehyde (1:0145). —  $\bar{\text{C}}$  on oxidn. with dil. alc.  $\text{KMnO}_4$  gives (1)  $\alpha,\beta$ -dichloropropionic acid (3:0555), m.p. 50° (1).

Colorless liq. with penetrating odor. — Insol. cold aq.; sol. alc., ether. — Sol. in cold conc.  $\text{H}_2\text{SO}_4$  with evoln. of  $\text{HCl}$  (1) (13).

[For prepn. of  $\bar{\text{C}}$  from methyl acetate (1:3005) with  $\text{Cl}_2$  in cold (1) (5) and in sunlight (2) (6), or with  $\text{SO}_2\text{Cl}_2$  in sunlight (6), see indic. refs.; from polyoxymethylene with  $\text{AcCl}$  (3:7065) in s.t. at 100° (6) or by htg. in pres. of  $\text{ZnCl}_2$  (61% yield on  $\text{AcCl}$  (4)) cf. (7) (8) (note that crude  $\bar{\text{C}}$  may be more or less contaminated with bis-(chloromethyl ether) (3:5245), b.p. 105°, and  $\text{Ac}_2\text{O}$  (1:1015), b.p. 140°, apparently produced by disproportionation of  $\bar{\text{C}}$  itself during the htg. (7).]

$\bar{\text{C}}$  on slight warming with aq. readily dissolves by virtue of hydrolysis, yielding (1) (5) (3) formaldehyde (1:0145),  $\text{AcOH}$  (1:1010), and  $\text{HCl}$ .

[ $\bar{\text{C}}$  with alcs. or Na alcoholates (10) presumably first yields alkoxyethylacetates: e.g.,  $\bar{\text{C}}$  with Na benzylate in  $\text{C}_6\text{H}_6$  refluxed for 4 hrs. gives (15% yield (4)) benzyloxyethyl acetate, b.p. 152–155° at 29 mm. (4); however, the usual type of prod. consists of a mixture of formaldehyde dialkylacetal and alkyl acetate (perhaps formed by interchange of radicals between the initial product and the alcohol (9)): e.g.,  $\bar{\text{C}}$  with benzyl alc. (1:6480) gives (9) (10) (13) formaldehyde dibenzylacetal, b.p. 188–190° at 13 mm., + benzyl acetate (1:3751), b.p. 217°;  $\bar{\text{C}}$  with *n*-propyl alc. (1:6150) gives (9) (13) formaldehyde di-*n*-propylacetal [Beil. I-575, I<sub>1</sub>-(301), I<sub>2</sub>-(639)], b.p. 137° at 760 mm., + *n*-propyl acetate (1:3075), b.p. 101.6°; for analogous behavior of  $\bar{\text{C}}$  with  $\text{MeOH}$  (1:6120) and  $\text{EtOH}$  (1:6130) see (10).]

[ $\bar{\text{C}}$  with Na phenolate does not yield phenoxymethyl acetate but instead (45% yield (11)) phenyl acetate (1:3571); this may be accounted for in a fashion completely analogous to that suggested above in the case of alcs., but no attempt was made (11) to verify the pres. of formaldehyde diphenylacetal (diphenoxymethane) although the latter [Beil. VI-150] is well known.]

$\bar{\text{C}}$  with  $\text{NH}_3$  in dry ether gives (12) (13) acetamide,  $\text{NH}_4\text{Cl}$  + formaldehyde (often in the form of hexamethylenetetramine (13)). —  $\bar{\text{C}}$  with aniline (1.5 moles) in dry ether gives (80% yield (12)) acetanilide, m.p. 114–115°, + 1,3,5-triphenyltrimethylenetriamine ("anhydroformaldehydeaniline") [Beil. XXVI-3], yel. pr., m.p. 140–141° (produced by actn. of the liberated formaldehyde upon the excess of aniline). — [ $\bar{\text{C}}$  (1 mole) with *N,N*-dimethylaniline (2 moles) +  $\text{ZnCl}_2$  at 110–120° gives (5) salt of 4,4'-bis-(dimethylamino)-diphenylmethane [Beil. XIII-239, XIII<sub>1</sub>-(71)], m.p. 91°.]

$\bar{\text{C}}$  with pyridine forms an unstable addn. cpd. (12);  $\bar{\text{C}}$  with quinoline forms (12) an addn. cpd., m.p. 214–216° dec., eas. sol. in abs. alc. but easily pptd. with dry ether (12).

[ $\bar{\text{C}}$  with *N*-potassio pyrrole in dry ether gives (18% yield (14)) *N*-pyrrylmethyl acetate, b.p. 59–63.5° at 3 mm.,  $D_4^{20} = 1.0916$ ,  $n_D^{20} = 1.4907$  (14).]

[For study of rate of reactn. of  $\bar{\text{C}}$  with  $\text{KI}$  in acetone at 20° and 25° see (2).]

$\tilde{C}$  is also sometimes designated as " $\alpha$ -epichlorohydrin" to distinguish it from the less common " $\beta$ -epichlorohydrin" =  $\beta$ -chlorotrimethylene oxide.

$\tilde{C}$  is liq. with odor suggesting chloroform. —  $\tilde{C}$  is spar. sol. aq. (see also below) but misc. with alc. or ether.

### MISCELLANEOUS PHYSICAL PROPERTIES

Solubility relations.  $\tilde{C}$  with aq. forms two layers: the lower layer conts. the following no. of g.'s  $\tilde{C}$  per 100 g. satd. soln.: at 25° 98.48 g., at 45° 97.43 g., at 70° 95.82 g., at 80.4° 94.17 g.; the upper layer conts. per 100 g. satd. soln.: at 30.2° 6.60 g., at 52.0° 7.53 g., at 65.0° 8.45 g., at 72.0° 9.34 g., at 80.2° 10.43 g. (5).

Binary azeotropes contg.  $\tilde{C}$ .  $\tilde{C}$  with aq. forms a homogeneous const. boilg. mixt., b.p. 88°, contg. 75%  $\tilde{C}$ ; at 25° this azeotrope seps. into two layers contg. respectively 98%  $\tilde{C}$  and 7%  $\tilde{C}$  (17).

[ $\tilde{C}$  with AcOH (1:1010) forms (9a) a const.-boilg. mixt., b.p. 115.05° at 760 mm., contg. 65.5 wt. %  $\tilde{C}$ ;  $\tilde{C}$  with tetrachloroethylene (3:5460) forms (9b) a const.-boilg. mixt., b.p. 110.12° at 760 mm., contg. 51.5 wt. %  $\tilde{C}$ .]

[Note that  $\bar{C}$  with EtOH (1:6130) (9c) or with formic acid (1:1005) (9d) forms no azeotropes.]

Ternary systems contg.  $\bar{C}$ . [For extensive study of system  $\bar{C}$  + AcOH + aq. see (5).]

### MISCELLANEOUS PHYSIOLOGICAL AND BIOCHEMICAL BEHAVIOR OF $\bar{C}$

[For study of toxicity of  $\bar{C}$  see (27); for effect on proteins see (28); for effect on wire worms see (29).]

### USES OF $\bar{C}$

The uses of  $\bar{C}$  both as solvent and as chemical intermediate (see below) are manifold and cannot here be reviewed in detail [however, for use of  $\bar{C}$  in stabilization of nitrate esters (30), in refining of mineral oil (31), or in treatment of cellulose fibers to improve dyeing with acid dyes (32) see indic. refs.].

### PREPARATION OF $\bar{C}$

[For prepn. of  $\bar{C}$  from 1,3-dichloropropanol-2 ("α-dichlorohydrin") (3:5935) with aq. Ca(OH)<sub>2</sub> (22) (16) (33), with aq. NaOH (4) (13) (17) (34) (37) cf. (35), with alc. NaOH (36), with ether + NaOH (38), with solid NaOH (39), or with aq. KOH (2) (1) (yields: 95% (33), 92.5% (36), 90% (13) (16) (34), 85% (17), 79% (2), 76-81% (38), 67-72% (22), 70% (17), 60% (4)) see indic. refs.; for patents on prepn. of  $\bar{C}$  from this source by use of various alk. materials see (40) (41) (33) (37); note that during this type of prepn. of  $\bar{C}$  some glycerol (1:6540) is also formed (38) (44).]

[For prepn. of  $\bar{C}$  from 2,3-dichloropropanol-1 ("β-dichlorohydrin") (3:6060) with aq. alk. see (42) (for studies of kinetics of this loss of HCl see (43)).]

[For formn. of  $\bar{C}$  from glycerol (1:6540) with PCl<sub>3</sub> (45), with HCl (1) (50), or S<sub>2</sub>Cl<sub>2</sub> (50) see indic. refs.]

[For formn. of  $\bar{C}$  from sodium salt of γ-chloro-β-hydroxy-*n*-propyl hydrogen sulfite (itself obtd. from  $\bar{C}$  + NaHSO<sub>3</sub>) on treatment with NaOH see (46).]

[For formn. of  $\bar{C}$  from 1-bromo-3-chloropropanol-2 (see below) by loss of HBr by actn. of conc. KOH see (1).]

### CHEMICAL BEHAVIOR OF $\bar{C}$ WITH INORGANIC REACTANTS

Reduction of  $\bar{C}$ . [ $\bar{C}$  with Na/Hg in moist ether is very slowly attacked and some allyl alc. (1:6145) (together with other prods.) is formed (47). — Note, however, that reactn. of  $\bar{C}$  with Nn in ether is very complicated and the prods. and mode of their formn. are disputed (48) (49) (44) (50) (51).] — (For behavior of  $\bar{C}$  with H<sub>2</sub> see below.)

Oxidation of  $\bar{C}$ . [ $\bar{C}$  on oxidn. with HNO<sub>3</sub> (*D* = 1.38) gives (52) β-chloro-α-hydroxypropionic acid (β-chlorolactic acid) [Beil. III-286, III<sub>1</sub>-(110), III<sub>2</sub>-(209)], cas. sol. aq., alc., ether, cryst. from C<sub>6</sub>H<sub>6</sub> (53), m.p. 77° (53), 77-78° (52) (for resolution of this prod. into opt. act. forms, *d*-form, m.p. 91.5°, see (54)). — Note that this prod. is also obtd. by oxidn. of 3-chloropropanediol-1,2 ("α-monochlorohydrin") (3:9038) q.v.]

Halogenation of  $\bar{C}$ . [ $\bar{C}$  with Cl<sub>2</sub> in diffuse light gives (55) γ,γ-dichloropropylene oxide [Beil. XVII-9], oil, b.p. 170°. —  $\bar{C}$  with Br<sub>2</sub> at 100° gives (56) (57) *x,x,x*-tribromo-γ-chloropropylene oxide [Beil. XVII-9], oil, which on shaking with aq. forms a crystn. tetrahydrate, m.p. 55° (56).]

Behavior of  $\bar{C}$  with water (or dil. acids). [ $\bar{C}$  with aq. at 100° (6) in s.t. (1) cf. (60) or on boilg. for 14 hrs. (58) adds H<sub>2</sub>O giving (80% yield (58)) 3-chloropropanediol-1,2 (α-

monochlorohydrin) (3:9038). This process is greatly facilitated by the pres. of dil. acids: e.g., for use of dil.  $H_2SO_4$  (yields: 85-90% (34) cf. (59), 80% (36)) or formic acid (66% yield (212)) see indic. refs.; for study of kinetics of this reactn. incl. influence of various acids and salts see (6) (19) (61) (62); for patent on use of dil. acids or acid-reacting salts see (63). — Note, however, that  $\bar{C}$  with aq. contg. 3-20%  $H_2SO_4$  at 100-250° under press. gives (72) acrolein (1:0115).]

Behavior of  $\bar{C}$  with halogen hydrides (HX). With HF. [ $\bar{C}$  with 30% HF soln. reacts vigorously yielding (64a) 3-chloropropanediol-1,2 ("α-monochlorohydrin") (3:9038) and other prods; note that  $\bar{C}$  with HIF under some circumstances appears to yield (64b) polymers.]

With HCl. [ $\bar{C}$  with conc. HCl shaken several hrs. at room temp. (3) (4) cf. (19) (65), or  $\bar{C}$  with HCl gas (51) in AcOH (11), gives (80% yield (4)) 1,3-dichloropropanol-2 ("α-dichlorohydrin") (3:5985).]

With HBr. [ $\bar{C}$  with const.-boilg. HBr ( $D = 1.48$ ) as directed (66) cf. (1) gives alm. quant. yield 1-bromo-3-chloropropanol-2 [Beil. I-365,  $I_1$ -(185),  $I_2$ -(385)], b.p. 197° at 760 mm. (66), 92° at 20 mm. (66),  $D_4^{20} = 1.726$  (67),  $n_D^{25} = 1.5140$  (67) (corresp. bis-(N-phenylcarbamate), m.p. 73° (68))] (See below under reactn. of  $\bar{C}$  with metal bromides.)

With HI. [ $\bar{C}$  with 66% HI (69) cf. (66) (1) gives 3-chloro-1-iodopropanol-2 [Beil. I-366,  $I_1$ -(186),  $I_2$ -(386)], b.p. 226° (1), 107° at 19 mm. (66), 110° at 9 mm (69).] (See also below under behavior of  $\bar{C}$  with metal iodides.)

Behavior of  $\bar{C}$  with oxygenated inorganic acids. [ $\bar{C}$  with conc.  $H_2SO_4$  (70) or 84%  $H_2SO_4$  in cold (71) gives a corresp. mono (acid sulfate) ester [Beil. I-474,  $I_2$ -(538)], but whether this  $HSO_4$  group is attached through oxygen to the first or second carbon atoms of  $\bar{C}$  is unknown.]

[ $\bar{C}$  with  $HNO_3$  at not above 20° as directed (73) gives 42% yield of a mononitrate ester of 3-chloropropanediol-1,2 ("α-monochlorohydrin");  $\bar{C}$  with fuming  $HNO_3$  at 0° gives (74) γ-chloropropylene glycol dinitrate [Beil. I-474];  $\bar{C}$  with mixed  $HNO_3 + H_2SO_4$  gives (75) a mixed nitrous/nitric ester [Beil. I-474] of 3-chloropropanediol-1,2 (3:9038).]

[For analogous reactns. of  $\bar{C}$  with  $H_3PO_4$  (71) (89) or with  $HClO_4$  in ether (76) see indic. refs.; for behavior of  $\bar{C}$  toward HOCl see (77).]

Behavior of  $\bar{C}$  with salts of inorganic acids. (For behavior with NaCN, etc., see below under organic reactants.)

With metal chlorides. [ $\bar{C}$  in dry ether adds anhydrous  $ZnCl_2$  giving (78)  $ClCH_2CH(OZnCl)CH_2Cl$ ;  $\bar{C}$  in dry ether adds anhydrous  $MgCl_2$  giving (78)  $ClCH_2CH(OMgCl)CH_2Cl$ ; both these cpds. on hydrolysis yield (78) 1,3-dichloropropanol-2 ("α-dichlorohydrin") (3:5985). — Note also that  $\bar{C}$  (2 g.) with  $MgCl_2$  (1 g.) + aq. (2 ml.) + abs. alc. (5 ml.) in st. at 125° for 6 hrs. (79) cf. (11) gives  $Mg(OH)_2 + 1,3$ -dichloropropanol (above);  $\bar{C}$  with alc.  $FeCl_3$  gives (11)  $Fe(OH)_3 + 1,3$ -dichloropropanol-2 (above).] (See also below under reactn. of  $\bar{C}$  with  $RMgX$  cpds.)

With metal bromides. [ $\bar{C}$  (1 mole) with  $MgBr_2$  (1 mole) in dry ether gives (80) similarly  $ClCH_2CH(OMgBr)CH_2Br$  which on hydrolysis yields (80) 1-bromo-3-chloropropanol-2 (props. given above under reactn. of  $\bar{C}$  with HBr).] (See also below under reactn. of  $\bar{C}$  with  $RMgX$  cpds.)

With metal iodides. [ $\bar{C}$  with dry KI in st. at 100° for several days (1), or  $\bar{C}$  with KI (2 moles) in abs. alc. at 80-85° for 11 hrs. (81), or  $\bar{C}$  with NaI (1 mole) in acetone refluxed 21 hrs. (82), gives (40% yield (82)) 3-iodo-1,2-epoxypropane ("α-epiodohydrin") [Beil. XVII-10], b.p. 167° (1), 64° at 24 mm. (82), 62° at 24 mm. (81).]

[ $\bar{C}$  with conc. aq.  $MgI_2$  soln. gives alm. quant. yield (179) 3-chloro-1-iodopropanol-2 for whose constants see above under behavior of  $\bar{C}$  with HI.]

With alkali sulfides. [For patents on behavior of  $\bar{C}$  with aq.  $Na_2S$  see (83) (84).] (See also below.)

With alkali sulfites. [ $\bar{C}$  with  $NaHSO_3$  in s.t. nt  $100^\circ$  (11) or htd. under reflux (85) (46) (80) or in cold (87) gives sodium salt of 3-chloro-2-hydroxy-*n*-propyl hydrogen sulfite [Beil. I-474, I<sub>2</sub>-(538)].]

[ $\bar{C}$  (1 mole) with conc. aq.  $Na_2SO_3$  (2 moles) htd. under reflux  $1\frac{1}{2}$ -2 hrs. (46) or  $\bar{C}$  with conc. aq.  $K_2SO_3$  (85) gives corresp. salts of "glycerol disulfonic acid."]

[For behavior of  $\bar{C}$  with  $Na_3PO_4$  (15), with  $Na_2HPO_4$  (88), or with  $Na_3AsO_3$  (90) see indic. refs.]

Behavior of  $\bar{C}$  with other non-nitrogenous inorganic reactants. [ $\bar{C}$  with  $PCl_3$  gives an addition prod. (91) which with aq. regenerates  $\bar{C}$  and also forms  $HI_3PO_3$ . —  $\bar{C}$  with  $PCl_5$  yields (1) 1,2,3-trichloropropane (3:5840) +  $POCl_3$ .]

[ $\bar{C}$  with  $S_2Cl_2$  gives (92) 67% 1,3-dichloropropanol-2 ("α-dichlorohydrin") (3:5085) + 33% α,α'-dichloroacetone (3:0503). —  $\bar{C}$  with  $SO_2Cl_2$  +  $AlCl_3$  in  $CCl_4$  gives (93) β,β'-dichloroisopropyl chlorosulfonate.]

[ $\bar{C}$  in alk. soln. treated with  $HS$  at  $0^\circ$  gives (94) β-chloro-α-hydroxy-*n*-propyl mercaptan, b.p.  $60^\circ$  at 1.3 mm.,  $D_4^{20} = 1.2081$ ,  $n_D^{20} = 1.5257$  (94); at  $50^\circ$ , however, further loss of  $HCl$  occurs yielding by ring closure (94) β-hydroxytrimethyleno sulfide, b.p.  $57^\circ$  at 1.3 mm.,  $D_4^{20} = 1.2130$ ,  $n_D^{20} = 1.5433$  (94). — Note, however, that  $\bar{C}$  treated directly at  $125^\circ$  with  $HS$  gives (95) bis-(β-chloro-α-hydroxy-*n*-propyl) sulfide, oil, undistillable without decn. oven at 2 mm. (95).]

[ $\bar{C}$  with  $AsCl_3$  gives (96) tris-(β,β'-dichloroisopropyl)arsine, b.p.  $88-93^\circ$  at 10 mm.,  $D_4^{10} = 2.145$  (96).]

Behavior of  $\bar{C}$  with  $NH_3$  and other inorganic nitrogen cpds. [ $\bar{C}$  satd. repeatedly with  $NH_3$  gas as directed (97) gives tris-(β-chloro-α-hydroxy-*n*-propyl)amino [Beil. IV-291], m.p.  $92-93^\circ$  (corresp.  $\bar{B} \cdot HCl$ , m.p.  $173^\circ$  (97)); note that from the reactn. prod. of  $\bar{C}$  with ethyl neocacetate treatment with excess alc.  $NH_3$  gives (98) 3-chloro-2-(1?)-aminopropanol-1 (2?) [Beil. IV-291].]

[ $\bar{C}$  in alc. with  $NH_3$  gas or  $\bar{C}$  in alc. with  $NaNH_2$ , or  $\bar{C}$  with aq.  $NH_4OH$  (11) (99) gives a reactn. prod. of undetermined constitution, useful in productn. (100) of vat dyo printing pastes.]

[ $\bar{C}$  with hydrazine hydrate at  $100^\circ$  for 30 min. or in alc. under reflux for 5 hrs. gives (101) γ-hydrazinoepihydrin which with  $ZnCl_2$  at  $100^\circ$  gives (101) pyrazole [Beil. XXIII-39, XXIII<sub>1</sub>-(15)], m.p.  $69.5-70^\circ$  (101).]

[For behavior of  $\bar{C}$  with basic potassium iminodisulfonate,  $KN(SO_3K)_2$ , leading to dipotassium epihydrin-*N,N*-disulfonate (102) (103), or with basic potassium hydroxyl-aminodisulfonate,  $KON(SO_3K)_2$ , leading to dipotassium epihydrinhydroxylamine-*N,N*-disulfonate (104), see indic. refs.]

## CHEMICAL BEHAVIOR OF $\bar{C}$ WITH ORGANIC REACTANTS

### BEHAVIOR OF $\bar{C}$ WITH HYDROXY AND MERCAPTO COMPOUNDS

With monohydric alcohols.  $\bar{C}$  with alcohols reacts to give by opening of the oxide ring the corresp. primary ethers of 3-chloropropanediol-1,2 ("α-monochlorohydrin") (3:9038).

[ $\bar{C}$  with  $MeOH$  (1:0120) in pres. of  $H_2SO_4$  (105) (86) (106) (107), or  $\bar{C}$  with  $MeOH$  at elev. temp. under press. (108), or  $\bar{C}$  with  $MeOH$  +  $BF_3$  (109), gives (yields: 88-90% (105), 89% (106), 74.5% (109)) γ-chloro-β-hydroxy-*n*-propyl methyl ether ("chloromethylia") [Beil. I<sub>2</sub>-(538)], b.p.  $173^\circ$  at 752 mm. (105),  $172^\circ$  (106),  $170.5-171.5^\circ$  (109),  $95^\circ$  at 20 mm. (106),  $D_4^{20} = 1.1618$  (109),  $n_D^{20} = 1.4474$  (109). — Note, however, that  $\bar{C}$  with  $MeOH$  in pres. of  $KOH$  gives (110) (111) glycerol α,α'-dimethyl ether (β,β'-dimethoxy-isopropyl alc.)

[Beil. I-512, I<sub>2</sub>-(590)], b.p. 167-168° at 760 mm., 65.5-66.0° cor. at 9 mm. (113),  $D_4^{20} = 1.0085$  (113),  $D_4^{25} = 1.012$  (111),  $n_D^{25} = 1.4183$  (111),  $n_D^{20} = 1.4192$  (113) (corresp. *p*-nitrobenzoate, m.p. 43° (112)).]

[ $\bar{C}$  with EtOH (1:6130) in pres. of  $H_2SO_4$  refluxed 6 hrs. (17) or 20 hrs. (106) gives (yields: 80% (106), 76% (17))  $\gamma$ -chloro- $\beta$ -hydroxy-*n*-propyl ethyl ether ("chloroethylin") [Beil. I-474, I<sub>2</sub>-(538)], b.p. 183-184° (106), 104-106° at 60 mm. (17), 95-100° at 20 mm. (106),  $D_4^{25} = 1.107$  (17),  $n_D^{25} = 1.442$  (17). — Note, however, that  $\bar{C}$  with EtOH + KOH gives (110) glycerol  $\alpha,\alpha'$ -diethyl ether ( $\beta,\beta'$ -diethoxyisopropyl alc.) [Beil. I-512], b.p. 191° at 760 mm. (13) (111), 103-109° at 60 mm. (111), 61.5-62.0° cor. at 2 mm. (113),  $D_4^{25} = 0.952$  (111) (13),  $D_4^{20} = 0.9514$  (113),  $n_D^{25} = 1.419$  (111) (13),  $n_D^{20} = 1.4200$  (113).]

[For corresp. behavior of  $\bar{C}$  with *n*-butyl alc. (1:6180) +  $H_2SO_4$  (106), with isoamyl alc. (1:6200) +  $H_2SO_4$  (106), see indie. refs. —  $\bar{C}$  with dodecanol-1 (lauryl alc.) (1:5900) +  $FeCl_3$  in s.t. at 160° for 18 hrs. (39% yield (114)) or with  $H_2SO_4$  (115) gives  $\gamma$ -chloro- $\beta$ -hydroxy-*n*-propyl *n*-dodecyl ether, b.p. 157° at 1 mm. (114),  $n_D^{25} = 1.4525$  (114). — (For attempts to effect analogous reactn. between  $\bar{C}$  and *ter*-butyl alcohol (1:6140) in pres. of  $H_2SO_4$  and for physical constants on higher members of di(alkoxy)isopropyl alc. series see (113) )]

[ $\bar{C}$  with ethylene chlorohydrin (3:5552) +  $H_2SO_4$  gives (70% yield (116))  $\gamma$ -chloro- $\beta$ -hydroxy-*n*-propyl  $\beta$ -chloroethyl ether, b.p. 123-125° at 18 mm. (116).]

With polyhydric alcohols. [ $\bar{C}$  with ethylene glycol (1:6465) +  $H_2SO_4$  gives (56% yield (117))  $\gamma$ -chloro- $\beta$ -hydroxy-*n*-propyl  $\beta$ -hydroxyethyl ether, b.p. 135-139° (117).]

[For presumably analogous behavior of  $\bar{C}$  with glycerol +  $H_2SO_4$  see (118); for behavior of  $\bar{C}$  with cellulose + 50% NaOH see (119).]

With mercaptans.  $\bar{C}$  with mercaptans behaves in general analogously to  $\bar{C}$  with monohydric alcs. +  $H_2SO_4$ .

[E.g.,  $\bar{C}$  with MeSH is unreported. —  $\bar{C}$  with EtSH at 50° for 4 hrs. gives (90% yield (95))  $\gamma$ -chloro- $\beta$ -hydroxy-*n*-propyl ethyl sulfide, b.p. 114-115° at 16 mm.; note, however, that  $\bar{C}$  with EtSH in aq. KOH (i.e., KSEt) reacts differently yielding (95) 1,2-epoxy-*n*-propyl ethyl sulfide, b.p. 67-68° at 15 mm.,  $D_4^{22} = 1.0196$ ,  $n_D^{22} = 1.4789$ . —  $\bar{C}$  with *n*-PrSH + activated carbon at 90° for 7 hrs. gives (95)  $\gamma$ -chloro- $\beta$ -hydroxy-*n*-propyl *n*-propyl sulfide, b.p. 95° at 4 mm.]

[ $\bar{C}$  (1 mole) with benzyl mercaptan (1 mole) at 130° for 7 hrs. gives (95)  $\gamma$ -chloro- $\beta$ -hydroxy-*n*-propyl benzyl sulfide, b.p. 154-156° at 4 mm.; note, however, that  $\bar{C}$  (1 mole) with benzyl mercaptan (2 moles) in alc. NaOH gives (46) bis-( $\beta,\beta'$ -dibenzylmercapto)-isopropyl alc., m.p. 59°.]

[ $\bar{C}$  with thiophenol at 130° for 5 hrs. gives (95)  $\gamma$ -chloro- $\beta$ -hydroxy-*n*-propyl phenyl sulfide, b.p. 141° at 4 mm.]

With monohydric phenols.  $\bar{C}$  with monohydric phenols reacts to give by opening of the oxide ring the corresp. primary aryl ethers of 3-chloropropanediol-1,2 ("α-monochlorohydrin") (3.903S).

[ $\bar{C}$  with phenol (1:1420) (2 moles) at 110° for 10 hrs. (17), or at 150-160° under press. (120) (121) cf. (122), gives (86% yield (17))  $\gamma$ -chloro- $\beta$ -hydroxy-*n*-propyl phenyl ether ("α-monochlorohydrin  $\gamma$ -phenyl ether") [Beil. VI-147, VI<sub>1</sub>-(85)], b.p. 155-156° at 16 mm. (123), 152-153° at 12 mm. (121), 125-126° at 2 mm. (17),  $D_4^{25} = 1.209$  (17),  $n_D^{25} = 1.540$  (17) (this prod. is also formed even in pres. of a very little NaOH (123)). —  $\bar{C}$  (1 mole) with phenol (1:1420) (1 mole) + aq. NaOH (1¼ moles) at ord. temp. for 24 hrs. gives (10% yield (17) (125)) (124) 3-phenoxy-1,2-epoxypropane (glycidol phenyl ether) [Beil. XVII-105, XVII<sub>1</sub>-(56)], b.p. 213-244° cor. (124), 133° at 23 mm. (124), 115-116° at 3-4 mm. (17),  $D_4^{25} = 1.10$  (17), this reactn. occurs so readily that this prod. has formerly been mistaken for glycerol  $\alpha,\gamma$ -diphenyl ether (see following). —  $\bar{C}$  with phenol (1:1420) +

alc. NaOEt under reflux (120) cf. (124) (127) yields glycerol  $\alpha,\alpha'$ -di(phenyl) ether ( $\beta,\beta'$ -diphenoxisopropyl alc.) [Beil. VI-149, VI-1-(86)], lfts. from alc., m.p. 82° (120) (127), 81-82° (124), 80-81° (17).]

$\bar{C}$  (1 mole) with *p*-nitrophenol (1 mole) + aq. NaOH ( $1\frac{1}{2}$  moles) at ord. temp. for some days gives (120) 3-(*p*-nitrophenoxy)-1,2-epoxypropane (glycidol *p*-nitrophenyl ether) [Beil. XVII-1-(61)], m.p. 67° cor. (126), 69° (127). —  $\bar{C}$  (1 mole) with 2,4-dinitrophenol (1 mole) in aq. KOH (1 mole) refluxed several days, or  $\bar{C}$  with Ag 2,4-dinitrophenolate in alc., gives (42-47% yield) (note that  $\bar{C}$  is in excess (128)) glycerol  $\alpha,\alpha'$ -bis-(2,4-dinitrophenyl)ether, m.p. 70° (128).]

$\bar{C}$  (1 mole) with *o*-cresol (1:1400) (1 mole) + very dil. aq. NaOH at ord. temp. 9 days gives (30% yield (123))  $\gamma$ -chloro- $\beta$ -hydroxy-*n*-propyl *o*-tolyl ether ("  $\alpha$ -monochlorohydrin  $\gamma$ -(*o*-tolyl) ether) [Beil. VI-1-(201)], oil, b.p. 165° at 14 mm. (corresp. *N*-phenylcarbamate, m.p. 113-114°);  $\bar{C}$  (1 mole) with *o*-cresol (1 mole) + excess aq. NaOH at ord. temp. 4 days gives (131) 3-(*o*-toloxy)-1,2-epoxypropane (glycidol *o*-cresyl ether) [Beil. XVII-105], oil, b.p. 134.5° at 14 mm. (131); note, however, that  $\bar{C}$  (1 mole) with *Nn o*-cresolate (2 moles) in alc. refluxed 24 hrs. gives (37% yield (120)) cf. (130) glycerol  $\alpha,\alpha'$ -bis-(*o*-tolyl)ether [Beil. VI-354], m.p. 36-37°, b.p. 226° at 13 mm. (129) (130). —  $\bar{C}$  (1 mole) with *m*-cresol (1:1730) (1 mole) + 20% aq. NaOH ( $1\frac{1}{4}$  mole) at ord. temp. for 50 days gives (67.6% yield (126))  $\gamma$ -chloro- $\beta$ -hydroxy-*n*-propyl *m*-tolyl ether ("  $\alpha$ -monochlorohydrin "  $\gamma$ -(*m*-tolyl) ether) [Beil. VI-1-(186)], b.p. 167.5° cor. at 13 mm. (corresp. *N*-phenylcarbamate, m.p. 108-108.5° cor.);  $\bar{C}$  (1 mole) with *m*-cresol (1 mole) + excess aq. NaOH at ord. temp. gives (126) 3-(*m*-toloxy)-1,2-epoxypropane (glycidol *m*-tolyl ether) [Beil. XVII-1-(51)], b.p. 139.5-140° cor. at 15 mm.; note, however, that  $\bar{C}$  (1 mole) with *Nn m*-cresolate (2 moles) in alc. refluxed several days gives (23% yield (129)) (130) glycerol  $\alpha,\alpha'$ -bis-(*m*-tolyl) ether [Beil. VI-378], b.p. 232° at 13 mm. (129) (130). —  $\bar{C}$  (1 mole) with *p*-cresol (1:1410) (1 mole) + 20% aq. NaOH ( $1\frac{1}{2}$  mole) at ord. temp. for 8 days gives (47% yield (123))  $\gamma$ -chloro- $\beta$ -hydroxy-*n*-propyl *p*-tolyl ether ("  $\alpha$ -monochlorohydrin "  $\gamma$ -(*p*-tolyl) ether) [Beil. VI-1-(201)], oil, b.p. 105° at 14 mm. (corresp. *N*-phenylcarbamate, m.p. 113-114°);  $\bar{C}$  (1 mole) with *p*-cresol (1 mole) + excess aq. NaOH at ord. temp. gives (124) cf. (120) 3-(*p*-toloxy)-1,2-epoxypropane, (glycidol *p*-cresyl ether) [Beil. XVII-105, XVII-1-(61)], b.p. 136° at 17 mm. (124); note, however, that  $\bar{C}$  (1 mole) with *Na p*-cresolate in alc. under reflux gives (120) (124) glycerol  $\alpha,\alpha'$ -bis-(*p*-tolyl) ether [Beil. VI-395], m.p. 88° (120) (124).]

[The analogous behavior of  $\bar{C}$  with other monohydric phenols cannot be detailed here; however, for  $\bar{C}$  with  $\alpha$ -naphthol (1:1500) (120) (126) (132),  $\beta$ -naphthol (1:1640) (126) (127) (132), carvacrol (1:1760) (126), thymol (1:1430) (126), guaiacol (1:1405) (126) (127) see indie. refs.]

With dihydric phenols. [ $\bar{C}$  (1 mole) with pyrocatechol (1:1520) (1 mole) + KOH (1 mole) condenses with ring closure yielding (133) (134) 5-(hydroxymethyl)-2,3-benzodioxane-1,4, m.p. 96°, b.p. 160° at 17 mm. (133) (134).]

[For behavior of  $\bar{C}$  with 4-acetylresorcinol (resacetophenone) see (135).]

#### BEHAVIOR OF $\bar{C}$ WITH ETHERS

[ $\bar{C}$  with dimethyl ether +  $\text{BF}_3$  at -35° after reactn. and distn. gives (86.6% yield (136)) *tris*-( $\beta$ -chloro- $\beta'$ -methoxy-isopropyl) borate, accompanied by a little  $\gamma$ -chloro- $\beta$ -hydroxy-*n*-propyl methyl ether (for constants see above under behavior of  $\bar{C}$  with monohydric alcs.). —  $\bar{C}$  with diethyl ether +  $\text{BF}_3$  at 20-25° overnight followed by treatment with aq. 2*N*  $\text{Na}_2\text{CO}_3$  gives mainly (136)  $\gamma$ -chloro- $\beta$ -hydroxy-*n*-propyl ethyl ether (for constants see above under behavior of  $\bar{C}$  with monohydric alcs.) accompanied by ethyl alcohol (1:6130); direct distillation of the reaction mixt. without  $\text{Na}_2\text{CO}_3$  treatment, however,

gives (136) *tris*-( $\beta$ -chloro- $\beta$ -ethoxyisopropyl) borate, b.p. 210–216° at 12 mm.,  $D_4^{22} = 1.148$  (126).]

[ $\bar{C}$  with  $\alpha$ -halogen-methyl alkyl ethers in pres. of  $HgCl_2$  gives (137) (105) (by ring opening and addn.) mixed formals; e.g.,  $\bar{C}$  with chloromethyl methyl ether (3:7085) +  $HgCl_2$  gives formaldehyde  $\beta, \beta'$ -dichloroisopropyl methyl acetal, etc.]

#### BEHAVIOR OF $\bar{C}$ WITH CARBONYL COMPOUNDS

With aldehydes. [ $\bar{C}$  with aldehydes condenses to yield the corresp. 2-alkyl-4-(chloromethyl)-1,3-dioxolanes; (however, the prod. to be expected from  $\bar{C}$  with formaldehyde (1:0145), viz. 4-(chloromethyl)-1,3-dioxolane [Beil. XIX-8, XIX-1-(610)], b.p. 126° at 750 mm. (138), has not been so reported, but rather from 3-chloropropanediol-1,2 ("  $\alpha$ -monochlorohydrin") (3:9038)]; for behavior of this prod. with solid KOH at 110° involving loss of HCl and formn. (94% yield (139)) (140) of the formal of propen-1-diol-2,3, b.p. 93–95° at 758 mm. (139),  $n_D^{20} = 1.4336$  (139), see indic. refs.]

[ $\bar{C}$  with acetaldehyde (1:0100) +  $SnCl_4$  in  $CCl_4$  at 18–25° gives (45% yield (141)) 4-(chloromethyl)-2-methyl-1,3-dioxolane ("acetaldehyde  $\gamma$ -chloropropylene acetal") [Beil. XI-XI-1-(610)], h.p. 158–162° at 760 mm. (141). —  $\bar{C}$  with propionaldehyde (1:0110) +  $SnCl_4$  in  $CCl_4$  gives (64% yield (141)) (142) 4-(chloromethyl)-2-ethyl-1,3-dioxolane, h.p. 65–70° at 18 mm. (142). — For analogous reactions of  $\bar{C}$  with *n*-butyraldehyde, octanal-1, decanal-1, and dodecanal-1 see (142); with crotonaldehyde see (141).]

With ketones.  $\bar{C}$  with ketones condenses in completely analogous fashion to yield the corresp. 2,2-dialkyl-1,3-dioxolanes. [E.g.,  $\bar{C}$  (converted to 3-chloropropanediol-1,2 ("  $\alpha$ -monochlorohydrin") (3:9038) although this may be unnecessary) gives (60% yield (58)) 4-(chloromethyl)-2,2-dimethyl-1,3-dioxolane ("acetone-glycerol  $\alpha$ -chlorohydrin"), b.p. 157° at 767 mm.,  $D_4^{20} = 1.1079$ ,  $n_D^{25} = 1.43750$  (58). —  $\bar{C}$  with benzophenone (1:5150) +  $SnCl_4$  in  $CCl_4$  at 13–25° gives (73% yield (141)) 4-(chloromethyl)-2,2-diphenyl-1,3-dioxolane, m.p. 44.5°, b.p. 159–167° at 2–3 mm. (141). — For analogous behavior of  $\bar{C}$  with phenacyl bromide, camphor, and cyclopentadecanone see (141).]

#### BEHAVIOR OF $\bar{C}$ WITH ORGANIC ACIDS

(For salts, acid chlorides, acid anhydrides, see below.)

With aliphatic monobasic acids. [ $\bar{C}$  with AcOH (1:1010) in s.t. at 180° for 24 hrs. (143) cf. (1) gives a mixt. of both glycerol  $\alpha$ -chlorohydrin  $\alpha'$ -acetate (3:6775) and glycerol  $\alpha$ -chlorohydrin  $\beta$ -acetate (3:6517);  $\bar{C}$  with AcOH + a little  $FeCl_3$  at room temp. for 24 hrs. gives (90% yield (144)) a prod. supposed originally (144) to be glycerol  $\alpha$ -chlorohydrin  $\alpha'$ -acetate (3:6775); note, however, that later workers (36) could obtain only 25% yield unless mixt. stood 15 days at room temp. or 2 days at 80° and regarded the product as glycerol  $\alpha$ -chlorohydrin  $\beta$ -acetate (3:6517). —  $\bar{C}$  with aliphatic monobasic acids contg. at least 4 carbon atoms +  $AlCl_3$  (145) or  $\bar{C}$  with aliphatic, alicyclic, or aromatic acids (contg. no sulfonic acid groups) + pyridine (146) gives corresp. mono esters (probably mixt. of  $\alpha$ - and  $\beta$ -) of 3-chloropropanediol-1,2 (3:9038).]

[ $\bar{C}$  with trichloroacetic acid (3:1150) undergoes ring closure (similar to that of  $\bar{C}$  with carbonyl cpds. above) giving (147) 4-(chloromethyl)-2-hydroxy-2-(trichloromethyl)-1,3-dioxolane, b.p. 99–101° at 0.11 mm.,  $n_D^{23} = 1.4892$ .]

[ $\bar{C}$  with thiolacetic acid ( $CH_3CO.SH$ ) at 60° for 12 hrs. gives (76% yield (148))  $\gamma$ -chloro- $\beta$ -hydroxy-*n*-propyl thiolacetate, b.p. 100–101° at 1 mm.,  $D_4^{20} = 1.2806$ ,  $n_D^{20} = 1.5186$ ; on longer hgt., e.g., 35 hrs. at 60°, or even at ord. temp. on 2 weeks stgd. in diffuse light, largely reart. to  $\beta$ -chloro- $\beta$ -mercapto-isopropyl acetate, b.p. 69–70° at 1 mm.,  $D_4^{20} = 1.2308$ ,  $n_D^{20} = 1.4555$  (148).]

With HCN (or its salts).  $\bar{C}$  with excess anhydrous HCN in s.t. at 75–85° for 90 hrs. (149) (150) cf. (151) (152), or  $\bar{C}$  with anhydrous HCN + some solid KCN in s.t. at ord. temp. for 3–4 days (153), or  $\bar{C}$  with aq.  $\text{Ca}(\text{CN})_2$  (154), gives (yields: 85% (153), 72% (150), 70% (151), 65% (149))  $\gamma$ -chloro- $\beta$ -hydroxy-*n*-butyronitrile [Beil. III-310], b.p. 250° dec. (151), 140° at 20 mm. (151), 134–135° at 15 mm. (153), 110–111° at 2 mm. (151),  $D_{20}^{25} = 1.233$  (153),  $n_D^{25} = 1.4735$  (153). — Note, however, that  $\bar{C}$  with aq. or alc. KCN splits out KCl giving (155) (85) 3-cyano-1,2-epoxypropane ("epicyanhydrin") [Beil. XVIII-261], m.p. 162°.]

#### BEHAVIOR OF $\bar{C}$ WITH SALTS OF ORGANIC ACIDS

$\bar{C}$  with dry KOAc first at 110°, later at 150° (156) cf. (157), or at 120–135°, later 150° (18) (158), gives 3-acetoxy-1,2-epoxypropane (glycidyl acetate) [Beil. XVII-106], b.p. 168–169° (157), 167–168° (143), 162–164° at 750 mm. (158), accompanied by other prods. (for study of polymerization of this prod. see (18) (158).)]

$\bar{C}$  with aq. K cyanate on boilg. (159) (160) or  $\bar{C}$  with free isocyanic acid (from btg. cyanuric acid) in cold (160) adds yielding 5-(chloromethyl)oxazolidone-2 [Beil. XXVII-145, XXVII<sub>1</sub>-(200)], pr. from aq.,  $\text{C}_6\text{H}_6$ , or  $\text{Ac}_2\text{O}$ , m.p. 106° (161) (159), 105° (159).

[For behavior of  $\bar{C}$  with disodium methyl phosphate (162) or with disodium glycerophosphate (163) see indic. refs.]

#### BEHAVIOR OF $\bar{C}$ WITH ACID CHLORIDES

$\bar{C}$  with acid chlorides yields corresp. esters of  $\beta,\beta'$ -dichloroisopropyl alc. ("glyceml  $\alpha$ -dichlorohydrin") (3:5985) as exemplified by the following illustrations.

With aliphatic acid chlorides.  $\bar{C}$  with  $\text{AcCl}$  (3:7065) (164) in s.t. at 100° for 2 hrs. (165) or 30 hrs. (160) gives (73% yield (164))  $\beta,\beta'$ -dichloroisopropylacetate (3:6318). —  $\bar{C}$  with propionyl chloride (3:7170) in s.t. at 135° for 3 hrs. gives (167)  $\beta,\beta'$ -dichloroisopropyl propionate [Beil. II<sub>2</sub>-(221)], h.p. 208°,  $D_{20}^{20} = 1.2222$  (167). —  $\bar{C}$  with *n*-butyryl chloride (3:7370) in s.t. at 100° (166) or with exclusion of aq. in flask at 75° for 8 hrs. (167) gives  $\beta,\beta'$ -dichloroisopropyl *n*-butyrate [Beil. II-271, II<sub>2</sub>-(246)], h.p. 226–227° at 738 mm. (166), 223.5° (167),  $D_{20}^{20} = 1.1792$  (167),  $n_D^{20} = 1.4540$  (167). —  $\bar{C}$  with isovaleryl chloride (3:7560) gives (166) (168)  $\beta,\beta'$ -dichloroisopropyl isovalerate [Beil. II-312, II<sub>2</sub>-(275)], h.p. 245° at 737 mm. (166), 127–140° at 36 mm. (168),  $D_{20}^{20} = 1.444$  (168),  $n_D^{20} = 1.450$  (168). —  $\bar{C}$  with stearoyl chloride (3:9960) in s.t. at 130° for 3½ hrs. gives (167)  $\beta,\beta'$ -dichloroisopropyl stearate [Beil. II<sub>2</sub>-(352)], m.p. 39.5°.]

#### BEHAVIOR OF $\bar{C}$ WITH ACID ANHYDRIDES

With anhydrides of aliphatic acids.  $\bar{C}$  with  $\text{Ac}_2\text{O}$  (1:1015) in s.t. at 180° for 4 hrs. (166) or  $\bar{C}$  with  $\text{Ac}_2\text{O} + \text{FeCl}_3$  at ord. temp. for 24 hrs. (144) gives (90% yield (144))  $\beta,\beta'$ -dichloroisopropyl acetate (3:6318).]

With anhydrides of aromatic acids.  $\bar{C}$  with phthalic anhydride (1:0725) + dimethylaniline at 100° is claimed (169) to give the monomolecular neutral phthalate [Beil. XIX-165] of 3-chloropropanediol-1,2.]

#### BEHAVIOR OF $\bar{C}$ WITH ORGANO METALLIC COMPOUNDS (OR THEIR EQUIVALENTS)

Behavior with Grignard compounds. With  $\text{RMgX}$  cpds. from alkyl or alkaryl halides  $\bar{C}$  with  $\text{MeMgI}$  in dry ether evolves gas ( $\text{CH}_4$ ?) and after acidification yields (171) 3-chloro-1-iodopropanol-2 (for constants see above under behavior of  $\bar{C}$  with HI).]

[The reactn. of  $\bar{C}$  with  $\text{EtMgBr}$  may give three different prods. (or mixtures of them) according to circumstances: the first of these is 1-bromo-3-chloropropanol-2 (for constants

see above under behavior of  $\bar{C}$  with  $HBr$ ; the second is the expected 1-chloropentanol-2 (3:8225); the third is cyclopropanol, b.p. 100-103° (80) (172),  $D_4^{20} = 0.9110$  (80),  $n_D^{20} = 1.4129$  (80) (corresp. *p*-nitrobenzoate, m.p. 72.0-72.5°; 3,5-dinitrobenzoate, m.p. 108-109°; *N*-phenylcarbamate, m.p. 101.5-102.0°; *N*-(*p*-nitrophenyl)carbamate, m.p. 159-160°; *N*-( $\alpha$ -naphthyl)carbamate, m.p. 100.5-101.5° (172)). — Note that  $\bar{C}$  with  $EtMgBr$  gives (16-19% yield (67) (173)) 1-chloropentanol-2 (3:8225), while  $\bar{C}$  with  $MgEt_2$  gives 70-83% yield (80). — For review of earlier work on this rather complex system see (80) (173) (67).]

[For behavior of  $\bar{C}$  with 15 other  $RMgX$  epds. leading in general to chlorohydrins of type  $RCH_2CH(OH)CH_2Cl$  see (173).]

With  $RMgX$  epds. from *aryl halides*. [ $\bar{C}$  with  $C_6H_5MgBr$  gives (18% yield (173)) (132) (174) (175) 3-chloro-1-phenyl-propanol-2 [Beil. VI-503], b.p. 254-257° (174), 153-154° at 28 mm. (174) (175), 142-144° at 23 mm. (173),  $D_4^{25} = 1.1528$  (173),  $n_D^{25} = 1.5470$  (173) (corresp. 3,5-dinitrobenzoate, m.p. 120-121° (173)). — For analogous behavior of  $\bar{C}$  with  $RMgX$  epds. from  $\alpha$ -bromonaphthalene and from *p*-bromanisole (*p*-bromophenyl methyl ether) see (132).]

Behavior with various sodio derivatives. [ $\bar{C}$  with diethyl sodiomalonate in abs. alc. at 50° does not split out  $NaCl$  but rather by ring opening, addn. of reactant, and elimination of  $EtOH$  ppts. (176) (177) cf. (178) the monosodium enolate (m.p. 172° dec. (176)) of  $\alpha$ -carbethoxy- $\delta$ -chloro-*n*-valero- $\gamma$ -lactone [Beil. XVIII-373, XVII-478], set free (yields: 78% (177), 50% (176)) by acidification as an oil, b.p. 180-182° at 12 mm. (176), 175-180° at 12 mm. (177). — Note that this lactone with excess alc.  $NH_3$  gives on evapn. (176) (179)  $\gamma$ -chloro- $\beta$ -hydroxy-*n*-propylmalondiamide [Beil. III-450], m.p. 117-118°.]

[ $\bar{C}$  with ethyl sodioacetacetate in abs. alc. at 50° does not split out  $NaCl$  but rather by ring opening, etc., as in preceding case gives after acidification (yields: 50% (176), 74% (177))  $\alpha$ -aceto- $\delta$ -chloro-*n*-valero- $\gamma$ -lactone [Beil. XVII-421, XVII-(230)], b.p. 108° at 16 mm. (177), 163° at 12 mm. (176).]

[ $\bar{C}$  with ethyl sodio-benzoylacetate in abs. alc. behaves in analogous fashion yielding after acidification (180)  $\alpha$ -benzoyl- $\delta$ -chloro-*n*-valero- $\gamma$ -lactone [Beil. XVII-497], m.p. 103-106°.]

#### BEHAVIOR OF $\bar{C}$ WITH AMINES

With primary amines. With *aliphatic primary amines*. This reactn. appears not to have been thoroughly studied (however, for reactn. of  $\bar{C}$  with  $MeNH_2$  (181) and use of prod. in prepn. of vat dye printing pastes (182) see indie. refs.).

With *cyclic primary amines*. [ $\bar{C}$  (1 mole) with cyclohexylamine (3½ moles) under reflux gives (18% yield (82))  $\beta,\beta'$ -bis-(cyclohexylamino)isopropyl alc., m.p. 72-73°.]

With *aromatic primary amines*. [ $\bar{C}$  (1 mole) with aniline (2 moles) in toluene refluxed 95 hrs. gives (yield not stated (71)) 3-(phenylamino)-1,2-epoxypropane ("glycidanilide"). —  $\bar{C}$  (1 mole) with aniline (3 moles) at 140° is claimed (183) to yield  $\beta,\beta'$ -bis-(phenylamino)isopropyl alc. [Beil. XII-553], m.p. 53-54°, but later workers could obtain only viscid oils (184) or a further reactn. prod. supposed (185) to be  $\beta$ -(phenylamino)- $\beta'$ -(di-phenylamino)isopropyl alc., m.p. 350° dec. (185).]

[ $\bar{C}$  (1 mole) with *p*-toluidine (2 moles) might be expected to yield 3-(*p*-tolylamino)-1,2-epoxypropane, but no such cpd. appears to have been recorded. — However,  $\bar{C}$  (1 mole) with *p*-toluidine (1 mole) in *dl.* alc. (186) (184) (52) (but not in  $C_6H_6$  (184)) opens ring to yield by addn.  $\beta$ -chloro- $\beta'$ -(*p*-tolylamino)isopropyl alc., m.p. 85° (184), 81-82° (186); this prod. on litg with *p*-toluidine (184) or  $\bar{C}$  (1 mole) with *p*-toluidine (2 moles) at 155° (186) gives  $\beta,\beta'$ -bis-(*p*-tolylamino)isopropyl alc., m.p. 116° (184), 113.5° (186).]

[ $\bar{C}$  with *p*-phenetidine hydrochloride in aq. soln. at ord. temp. especially in sunlight gives (40% yield (187)) cf. (188) *N,N'*-bis-( $\gamma$ -chloro- $\beta$ -hydroxy-*n*-propyl)phenetidine.]

[For behavior of  $\bar{C}$  with  $\beta$ -naphthylamine in xylene under reflux (189), with arsanic acid (190), or with *p*-aminophenol (or its ethers) (191) see indio. refs.]

With heterocyclic primary amines.  $\bar{C}$  with  $\alpha$ -aminopyridine gives (63% yield (192)) by addn. to oxide ring and subsequent ring closure a prod., m.p. 190°, regarded as "1,2-divinylene-5-hydroxytetrahydropyrimidine."

With phenylhydrazine.  $\bar{C}$  with  $1\frac{1}{2}$  pts. phenylhydrazine in ether at not above 15° for 10 days ppt. phenylhydrazine hydrochloride and leaves in the ether 4-hydroxy-1-phenylpyrazolidine [Beil. XXIII-348], m.p. 103-104° (193); this prod. with phenylhydrazine hydrochloride on warming in  $C_6H_6$  (193) or  $\bar{C}$  with 2 pts. phenylhydrazine in  $C_6H_6$  refluxed 8-9 hrs. (194) gives (58% yield (194)) 1-phenylpyrazole [Beil. XXI-49, XXIII- (15)], b.p. 246.5° cor. at 765.4 mm. (194), m.p. 11-11.5° (191),  $D_4^{20} = 1.1127$  (195),  $n_D^{20} = 1.5066$  (195).]

With secondary amines. With aliphatic secondary amines.  $\bar{C}$  with  $Me_2NH$  presumably gives (196)  $\beta$ -chloro- $\beta'$ -(dimethylamino)isopropyl alc., but no constants are reported in the literature, either for it or for its ring-closure derivative, 3-(dimethylamino)-1,2-epoxypropane, cf. (196); note further that the prod. to be expected from  $\bar{C}$  + 2  $Me_2NH$ , viz.,  $\beta, \beta'$ -bis-(dimethylamino)isopropyl alc. [Beil. IV-290] (197), although known, has not been prepd. from  $\bar{C}$ , but only by other means.]

$\bar{C}$  with eq.  $Et_2NH$  gives (196) (198) cf. (199) 3-(diethylamino)-1,2-epoxypropane [Beil. XVIII-583], b.p. 155-159° at 760 mm. (198), 55-60° at 15 mm. (196), 40-50° at 8 mm. (198),  $D_4^{18} = 0.8876$  (196). —  $\bar{C}$  (1 vol.) with  $Et_2NH$  ( $3\frac{1}{2}$  vols.) refluxed 2-3 hrs. gives (82% yield (200))  $\beta, \beta'$ -bis-(diethylamino)isopropyl alc., b.p. 114° nt 9 mm. (corresp. B.2PkOH, m.p. 163° (200).]

$\bar{C}$  with di-*n*-propylamine (2 moles) gives (70% yield (215)) 1,3-bis-(di-*n*-propylamino)propanol-2, b.p. 99-191° at 3 mm.,  $D_4^{20} = 0.8624$ ,  $n_D^{20} = 1.4483$  (215).]

With aromatic secondary amines.  $\bar{C}$  with *N*-methylaniline gives (198) cf. (199) 3-(*N*-methylanilino)-1,2-epoxypropane, b.p. 160-162° at 30 mm. (198), 132-135° at 8 mm. (198); note, however, that  $\bar{C}$  (1 mole) with *N*-methylaniline (1 mole) at 100° for 4 hrs. (82) gave none of the preceding epd. but a very small yield (2%) of  $\beta, \beta'$ -bis-(*N*-methylanilino)isopropyl alc., m.p. 82°, accompanied by other prods.]

$\bar{C}$  with diphenylamine at 160-170° under press. splits out  $HCl$  and ring-closes with loss of  $H_2O$  yielding (201) 1-phenyl-3-hydroxy-1,2,3,4-tetrahydroquinoline [Beil. XXI- (205)], m.p. 79°, b.p. 200° at 5 mm.]

With heterocyclic secondary amines.  $\bar{C}$  with piperidine gives (196) (198) by elimination of  $HCl$  3-(piperidino)-1,2-epoxypropane, b.p. 86.5-88° at 15 mm. (196), 72-77° at 8 mm. (198),  $D_4^{16} = 0.9669$  (196).]

With tertiary amines.  $\bar{C}$  with tertiary amines gives quaternary salts, but this reaction is often followed by opening of the oxide ring and addn. of reactant.

With aliphatic tertiary amines.  $\bar{C}$  with alc.  $Et_3N$  (1 mole) in s.t. at 100° gives (202) a little of the corresp. quat. salt, viz., triethyl-( $\beta, \gamma$ -epoxy-*n*-propyl)ammonium chloride [Beil. XVIII-583]; note, however, that  $\bar{C}$  with alc.  $Et_3N$  (1 mole) in s.t. at 100° for 6 hrs. gives also (202) (203) 2-hydroxytrimethylene-1,3-bis-(triethyl-ammonium chloride) [Beil. IV-290] together with other prods.]

[For behavior of  $\bar{C}$  with *N,N*-dimethyl-"stenyl" amine see (204).]

With heterocyclic tertiary amines. [For study of behavior of  $\bar{C}$  with pyridine see (205) (200); with quinoline see (207).]

#### BEHAVIOR OF $\bar{C}$ WITH OTHER NITROGENOUS REACTANTS

(Note that in the following examples reaction occurs by opening of the oxide ring and that elimination of chlorine, if it occurs at all, is effected only in a subsequent ring closure.)

$\bar{C}$  (1 mole) with disodium cyanamide (1 mole) in aq. soln. at ord. temp. for 24 hrs. presumably first yields the sodium deriv. of *N*-( $\gamma$ -chloro- $\beta$ -hydroxy-*n*-propyl)cyanamide, but this immediately ring-closes giving (33% yield (208)) 5-(chloromethyl)-2-amino-oxazoline, m.p. 142°.]

$\bar{C}$  (1 mole) with *p*-toluenesulfonanilide (1 mole) + a few drops pyridine at 120° reacts vigorously giving (56% yield (209)) *N*-( $\gamma$ -chloro- $\beta$ -hydroxy-*n*-propyl)-*N*-phenyl-*p*-toluenesulfonamide, m.p. 96-97°; note that this prod. in boilg. alc. on treatment with NaOH loses HCl and ring-closes (92% yield (209)) to the corresp. *N*-( $\beta$ , $\gamma$ -epoxy-*n*-propyl)-*N*-phenyl-*p*-toluenesulfonamide, m.p. 77°.

$\bar{C}$  (1 wt. pt.) with phthalimide (1 wt. pt.) at 140-150° for 3 hrs. gives (35% yield on phthalimide (210)) cf. (211) (212) *N*-( $\gamma$ -chloro- $\beta$ -hydroxy-*n*-propyl)phthalimide [Beil. XXI-1-(369)], m.p. 95.0-96.5° (210), 95-97° (213). — Note that *N*-( $\beta$ , $\gamma$ -epoxy-*n*-propyl)phthalimide ("phthalimidoepihydrin"), m.p. 93-94° (213), has been prepd. (75% yield (213)) from 3-bromo-1,2-epoxypropane ("epibromohydrin") with K phthalimide, and in  $\text{CHCl}_3$  with HCl gas or even directly with conc. HCl opens the oxide ring to give (213) the above *N*-( $\gamma$ -chloro- $\beta$ -hydroxy-*n*-propyl)-phthalimide, m.p. 96-97° (213).]

### COLOR REACTION OF $\bar{C}$

Color reaction with pyridine (and pyridine bases).  $\bar{C}$  in MeOH with pyridine and/or various "pyridine bases" gives specific color reactions; these can be used for detection of "pyridine bases," e.g., in denatured alcohol and probably vice versa; for detailed study see (214).

**3:5360 1,2-DICHLOROBUTENE-2**  
(low-boilg. stereoisomer)

B.P. 116-118° at 765 mm. (2)

111.5-112.5° at 742 mm. (1)

$D_4^{20} = 1.1544$  (2)  $n_D^{20} = 1.4642$  (2)

$D_4^{18} = 1.1550$  (2)  $n_D^{18} = 1.4576$  (2)

$D_4^{16} = 1.1488$  (1)  $n_D^{16} = 1.45513$  (1)

[See also high-boilg. stereoisomer (3:5615).]

[For prepn. of  $\bar{C}$  (together with its stereoisomer (3:5615)) from 1,2,3-trichlorobutane (3:5935) with KOH at 150° (2), or from 2,2-dichlorobutane (3:7415) or 2,3-dichlorobutane (3:7615) with alc. KOH (5), see indic. refs.; for formn. of  $\bar{C}$  (together with its stereoisomer and also 2,4-dichlorobutene-2 (3:5550)) from 2-chlorobutene-2 (3:7105) by actn. of  $\text{Cl}_2$  at 350° see (3).]

$\bar{C}$  with 1 mole  $\text{Cl}_2$  + 1.5 moles  $\text{NaHCO}_3$  at 0° gives (100% yield (4)) 1,2,2,3-tetrachlorobutane (3:9078).

$\bar{C}$  on hydrolysis by htg. with 2 pts. aq. + 1 mole powdered  $\text{CaCO}_3$  at 70° for 4 hrs. gives (1) a mixt. of about equal parts of 2-chlorobuten-2-ol-1 (3:8240) and (by allylic transposition) 3-chlorobuten-3-ol-2 (3:9115).

$\bar{C}$  on oxidn. with  $\text{KMnO}_4$  in acetone gives (1) chloroacetic acid (3:1370) +  $\text{AcOH}$  (1:1010) +  $\text{HCl}$ . —  $\bar{C}$  in  $\text{CCl}_4$  at -17° treated with  $\text{O}_2$  followed by aq. gives acetaldehyde (1:0100).

**3:5360** (1) Tishchenko, *J. Gen. Chem. (U.S.S.R.)* 7, 658-662 (1937); *Cent.* 1937, II 371; *C.A.* 31, 5754 (1937). (2) Tishchenko, Churbakov, *J. Gen. Chem. [For prepn. of  $\bar{\text{C}}$  from trichloroacetic acid (3:1150) with  $\text{PCl}_3$  (1) (7) (8), with  $\text{PCl}_3$  +  $\text{ZnCl}_2$  (25% yield (9)), with  $\text{SOCl}_2$  (yield: 12% (9), 30% (23)) in  $\text{C}_6\text{H}_6$  (60% yield (3)) or in pyridine (90% yield (10)), with  $\text{P}_2\text{O}_5$  +  $\text{HCl}$  gas (11), with benzotrichloride (3:6540) +  $\text{ZnCl}_2$  at 100° (77% yield (12)), with benzoyl chloride (3:6240) (51-56% yield (13)) see indic. refs.]

[For formn. of  $\bar{\text{C}}$  from trichloroacetic acid at 300° (together with  $\text{CO}$ ,  $\text{CO}_2$  +  $\text{HCl}$ ) see (14); from acetyl chloride (3:7065) with 3 moles  $\text{PCl}_5$  see (11); from hexachloroethane (3:4835) with  $\text{SO}_2$  at 150° see (15); from pentachloroethane (3:5880) or *sym.*-tetrachloroethane (3:5750) in ultra-violet light and  $\text{O}_2$  see (16); from tetrachloroethylene (3:5460) with  $\text{SO}_3$  (15), with  $\text{H}_2\text{SO}_4$  +  $\text{HNO}_3$  (together with other products) (17), with ozone (18) (19), with oxygen in pres. of  $\text{Br}_2$  or conc.  $\text{HNO}_3$  (20), with oxygen by chlorine sensitized photo-oxidation (21) cf. (30) (31), or with oxygen in ultra-violet light (16) see indic. refs.; from diethyl ether on protracted chlorination in sunlight, from decachlorodiethyl ether (3:1676) on distn. see (22), or from distn. of pentachloroethyl trichloroacetate see (22), from  $\text{CCl}_4$  (3:5100) +  $\text{AlCl}_3$  +  $\text{CO}$  gas at 200° and 250 atm. (37% yield) see (32).]

[ $\bar{\text{C}}$  on htg. (13) or on htg. with  $\text{AlCl}_3$  (23) yields carbon tetrachloride (3:5100) +  $\text{CO}$ ;  $\bar{\text{C}}$  on htg. at 600° yields (24) carbon tetrachloride (3:5100) + hexachloroethane (3:4835) +  $\text{CO}$  + phosgene (3:5000).]

[ $\bar{\text{C}}$  on treatment at -5° with dry  $\text{HBr}$  gas gives (70% yield (24)) trichloroacetyl bromide, b.p. 143°;  $\bar{\text{C}}$  similarly treated with dry  $\text{HI}$  gas gives (71.5% yield (6)) trichloroacetyl iodide, b.p. 74-74.2° at 30 mm. (6).]

$\bar{C}$  with MeOH should yield readily methyl trichloroacetate (3:5800), b.p. 153.8°;  $\bar{C}$  with EtOH yields (1) ethyl trichloroacetate (3:5950), b.p. 168°. (For study of rate of reactn. see (2).)

$\bar{C}$  with pure freshly distilled  $AlCl_3 + C_6H_6$  yields (25) (26) triphenylvinyl alcohol ( $\omega, \omega$ -diphenylacetophenone) [Beil. VII-522, VII<sub>1</sub>-(291)], m.p. 137°; with moist  $AlCl_3 + C_6H_6$ , however,  $\bar{C}$  gives instead (25) (27) (28)  $\omega, \omega, \omega$ -trichloroacetophenone (3:6874), b.p. 256-257° (25). —  $\bar{C}$  with  $Me_2Zn$  yields (29) pentamethylethyl alcohol [Beil. I-418, I<sub>1</sub>-(207), I<sub>2</sub>-(447)]. —  $\bar{C}$  with  $EtMgBr$  in ether at 10° gives (33) 1,1,1-trichlorobutanol-2 (3:5955).

$\bar{C}$  hydrolyzes readily with aq. yielding trichloroacetic acid (3:1150); for the amide, anilide, *p*-toluidide, and other derivs. corresp. to  $\bar{C}$  see trichloroacetic acid (3:1150).

$\bar{C}$  when pure is colorless liq. —  $\bar{C}$  turns dark on exposure to light. —  $\bar{C}$  on long exposure to light, acids, or metals resinifies to a dark mass, m.p. above 350°, which fumes in air and dis. in fumg.  $HNO_3$ , but does not react with fumg.  $H_2SO_4$ ,  $NH_2OH$ , or phenylhydrazine

nor hydrolyze with 50% KOH (13). — [For stabilization of  $\bar{C}$  by means of addn. of 1%  $\text{CaCO}_3$  (14) or 0.1% aq. (15) see indic. refs.]

$\bar{C}$  is sol. in 10 pts. aq. (7) but does not form crystn. hydrates with it (9) (for prepn. of anhydrous  $\bar{C}$  using  $\text{CaSO}_4$  see (16));  $\bar{C}$  is volatile with steam (9); sol. in alc., ether,  $\text{CHCl}_3$ .

$\bar{C}$  has very pronounced lachrymatory properties; for studies of this property see (17) (18).

$\bar{C}$  forms azeotropes with several org. liqs. (19); e.g.,  $\bar{C}$  with toluene (1:7405) forms a const.-boilg. mixt., h.p. 109.2° at 760 mm., contg. 28.5%  $\bar{C}$ ;  $\bar{C}$  with isohutyl alc. (1:6165) forms a const.-boilg. mixt., b.p. 105.8° at 760 mm., contg. 36%  $\bar{C}$ ;  $\bar{C}$  with ethyl *n*-butyrate (1:3127) forms a const.-boilg. mixt., h.p. 117.2° at 760 mm., contg. 53%  $\bar{C}$ ;  $\bar{C}$  with isohutyl acetate (1:3115) forms a const.-boilg. mixt., h.p. 116.7°, contg. 30%  $\bar{C}$ .

[For prepn. of  $\bar{C}$  from acetone (1:5400) with  $\text{Cl}_2$  (188) (9) (20) (21) (22) (23) (24) (25) (yield is poor and contaminated with higher chlorination prods. especially 1,1-dichloropropanone-2 (*unsym.*-dichloroacetone) (3:5430) whose b.p. is very close to that of  $\bar{C}$ ); with  $\text{Cl}_2$  in pres. of  $\text{CaCO}_3$  (yield 82% (3)) (26) (27) (28); with  $\text{Cl}_2$  in vapor-phase chlorination (29) (30) (21) in pres. of  $\text{NiCl}_2$  (38); by electrolysis in  $\text{HCl}$  (97% yield (32)) (36) using Pt electrodes (with graphite or lead electrodes resultant  $\bar{C}$  is reduced) even using alternating current (35% yield (33)); with  $\text{Cl}_2\text{O}$  (34); with  $\text{HOCl}$  (22) (27) (35); with  $\text{EtOCl}$  (3:7022) (1); with *N*-chlorourea in aq. soln. (37); or with  $\text{SO}_2\text{Cl}_2$  (72% yield (189)) see indic. refs.]

[For prepn. of  $\bar{C}$  from acetone (1:5400) with benzenediazonium chloride (solid) in pres. of  $\text{CaCO}_3$  (39) (40), or with aq. solns. of other diazonium chlorides (especially those with negative substituents such as those from *p*-nitroaniline, *p*-chloroaniline, or 2,4-dichloroaniline) in pres. of  $\text{CuCl}_2 + \text{NaOAc}$  (41), see indic. refs.]

[For prepn. of  $\bar{C}$  from 1-chloropropanol-2 (propylene  $\alpha$ -chlorohydrin) (3:7747) by oxidn. with  $\text{K}_2\text{Cr}_2\text{O}_7 + \text{H}_2\text{SO}_4$  (42) (43) (44) (45),  $\text{CrO}_3 + \text{dil. H}_2\text{SO}_4$  (43),  $\text{CrO}_3/\text{AcOH}$  (43),  $\text{HNO}_3$  (43) (44) (45),  $\text{HOCl}$  (42), or  $\text{Ca}(\text{OCl})_2$  (46) see indic. refs.; from 3-chloro-2-methylpropene-1 (methallylchloride) (3:7145) (10), or from 1-chloro-2-methylbutene-2 (3:7485) (47), or from 1,3-dichloro-2-methylpropene-1 (3:5590) (48), or from 1,4-dichloro-2-methylbutene-2 (3:9204) (49) with  $\text{O}_3$  see indic. refs.]

[For prepn. of  $\bar{C}$  from ethyl  $\gamma$ -chloroacetoacetate (3:6375) (50) or from  $\alpha$ -chloroacetoacetanilide (51) by hydrolytic cleavage with  $\text{HCl}$  see indic. refs.; from 1,3-dichloropropene-2 (3:5280) by soln. in conc.  $\text{H}_2\text{SO}_4$  and distn. with aq. see (52); from allyl chloride (3:7035) with  $\text{HgO} + \text{HOCl}$  see (53); from 1,2-epoxypropane (propylene oxide) (1:6115) with  $\text{Cl}_2$  at 0° see (54); from diketene +  $\text{Cl}_2$  in cold followed by treatment with aq. see (55).]

[For use of  $\bar{C}$  in refining of mineral oils see (56); in prepn. of photosensitizing cyanine dyes see (57).]

Pyrolysis. [ $\bar{C}$  passed through tube at 450° pyrolyzes into acetaldehyde (1:0100), acetone (1:5400), crotonaldehyde (1:0150) +  $\text{HCl}$  (58).]

Reduction. [ $\bar{C}$  on reduction with  $\text{Zn} + \text{HCl}$  (7) or on electrolysis in  $\text{HCl}$  soln. using graphite or lead electrodes (32) yields acetone (1:5400);  $\bar{C}$  on reduction with  $\text{AlEt}_3$  etherate as directed (59) gives (70% yield) 1-chloropropanol-2 (3:7747), b.p. 78–81° at 80 mm. (59);  $\bar{C}$  on phytochemical reduction using yeast (60) gives (25% yield) 1-chloropropanol-2 (3:7747); for polarographic study of oxidn.-reductn. potential of  $\bar{C}$  see (61).]

Oxidation.  $\bar{C}$  on oxidn. with  $\text{KMnO}_4$  (49) (62),  $\text{HNO}_3$ ,  $\text{CrO}_3$ , etc. (62), yields chloroacetic acid (3:1370) and  $\text{AcOH}$  (1:1010). —  $\bar{C}$  with moist silver oxide yields (7) glycolic acid (1:0430), acetic acid (1:1010), and formic acid (1:1005).

Halogenation. [ $\bar{C}$  with  $\text{Cl}_2$  even in cold gives (26) more highly chlorinated acetones; e.g.,  $\bar{C}$  with  $\text{Cl}_2$  at 30–40° yields (63) 1,1,3-trichloropropanone-2 (3:5957) and 1,1,1-trichloropropanone-2 (3:5620);  $\bar{C}$  with  $\text{Cl}_2$  at 50–70° yields (63) cf. (64) *sym.*-tetrachloro-

acetone (3:6050), *unsym.*-tetrachloroacetone (3:6085), and pentachloroacetone (3:6205);  $\bar{C}$  with  $Cl_2$  at 50–100° in light (63) (65) or under press. (66) yields hexachloroacetone (3:6312). — Note that  $\bar{C}$  with  $Ca(OCl)_2$  undergoes both chlorination and subsequent cleavage yielding (46)  $CHCl_3$  (3:5050).]

[ $\bar{C}$  with  $Br_2$  (3 moles) at 100° yields (67) 3,3,3-tribromo-1-chloropropanone-2 [Beil. I-658], b.p. 215°, 13.0° at 25 mm.]

Reactions of the halogen atom of  $\bar{C}$  (see also further below under formn. of heterocyclic systems).  $\bar{C}$  with excess aq. alkali presumably yields propanone-2-ol-1 (acetol) (1:5455) and therefore reduces Fehling's soln.; the halogen atom of  $\bar{C}$  is so reactive that  $\bar{C}$  slowly neutralizes 1 equiv. alk. (68);  $\bar{C}$  with  $NaOEt$  in abs. alc. yields acetol ethyl ether (ethoxyacetone) [Beil. I-822, I<sub>1</sub>-(418), I<sub>2</sub>-(867)], h.p. 128° at 760 mm. (for study of rate of reaction see (69)).

[ $\bar{C}$  with phenol (1:1420) + anhydrous  $K_2CO_3$  in acetone stirred 24 hrs. at room temp. or refluxed 3 hrs. (70) (note that in pres of  $KI$  yield jumps to 92.5% (191)), or  $\bar{C}$  with sodium phenolate in phenol (71) (72) or in toluene (73), gives (yields: 21–23% (70), 16% (73)) phenoxyacetone (1:5534), b.p. 117–124° at 19 mm. (70) (note that  $\bar{C}$  + phenol + aq.  $NaOH$  gives only black resin (73)) (for application of this type of reactn. to other monohydric phenols such as tetralol-2 (5,6,7,8-tetrahydronaphthol-2) (74) (75) or *p*-*tert*-butylphenol (1:1510) (75) or  $\beta$ -naphthol (1:1540) (191) see indic. refs.). — Note that  $\bar{C}$  with phenol (3 moles) + fuming  $HCl$  at 100° reacts in a dif. sense to give (50% yield (76)) a *tris*-(hydroxyphenyl)propane of undetd. struct.; for formn. of resins from  $\bar{C}$  + phenol see (77) (78).]

[ $\bar{C}$  with  $KI$  in aq.  $MeOH$  (79) (80) or in acetone (5) gives (75% yield (80)) iodoacetone [Beil. I-660, I<sub>1</sub>-(345), I<sub>2</sub>-(719)], oil, b.p. 58.4° at 11 mm. (79) (oxime, pr. from pet. eth., m.p. 64.5° (79)); for study of rate of this reactn. in acetone at 0° and 10° see (5). —  $\bar{C}$  with  $K_2SO_3$  (or  $Na_2SO_3$ ) yields (81) salts of acetonesulfonic acid [Beil. IV-19, IV<sub>2</sub>-(530)]. — For study of rate of reactn. of  $\bar{C}$  with aq.  $Na_2S_2O_3$  see (82). —  $\bar{C}$  with  $Na_2S$  in acetone yields (83) (84) *bis*-(acetylonyl) sulfide, m.p. 49° (83), b.p. 126° at 14 mm. (83), 125° at 18 mm. (84) (earlier work (85) using alc. as solvent could not be checked (83) (84).)]

[ $\bar{C}$  with aq.  $NaSCN$  stirred 10 hrs. at 25° (86), or  $\bar{C}$  with  $Ba(SCN)_2$  directly (87) or in alc. (88) (89) cf. (90), gives (95% yield (86)) thiocyanacetone (acetylonyl thiocyanate) [Beil. III-179, III<sub>1</sub>-(72), III<sub>2</sub>-(125)], oil, b.p. 73.5–74.5° at 1 mm. (86),  $D_4^{25} = 1.1892$  (86) (for use of this prod. as anti-oxidant for rubber (91), as stabilizer for cellulose (92), or as 1% soln. in petroleum as insecticide (93) see indic. refs.); note that thiocyanacetone, although insensitive to dil. aq.  $HCl$  (87), with  $HCl$  gas in cold (86) or conc.  $HCl$  on boilg (89) adds 1 mole  $HCl$  and ring-closes to 2-chloro-4-methylthiazole, oil, b.p. 167–167.5° at 754 4 mm., 69° at 14 mm. (86); note also that thiocyanacetone with aq.  $NaHCO_3$  (94) (or  $\bar{C}$  + aq.  $KSCN$  +  $NaHCO_3$  (86)) yields 2-hydroxy-4-methylthiazole (4-methylthiazolone-2) ("α-methylrhodime") [Beil. XXVII-158, XXVII<sub>1</sub>-(264)], ndls. from aq. or ether, m.p. 105–106° (94), 102–103° (86).]

[ $\bar{C}$  with  $Na$  salts of sulfonic acids gives the corresp. alkyl- (or aryl)sulfonylacetones: e.g.,  $\bar{C}$  with  $Na$  methanesulfinate gives (95) methanesulfonylacetone, m.p. 54° (95) (96);  $\bar{C}$  with  $Na$  benzenesulfinate in alc. gives on refluxing (95% yield (97)) benzenesulfonylacetone [Beil. VI-307, VI<sub>1</sub>-(145)], lfts. from alc., m.p. 57° (97);  $\bar{C}$  with  $Na$  *p*-toluenesulfinate yields (97) *p*-toluenesulfonylacetone [Beil. VI-421, VI<sub>1</sub>-(210)], m.p. 51° (97) (98); many other analogous cases are known.]

[ $\bar{C}$  with tertiary amines gives the corresp. quaternary ammonium chloride salts: e.g.,  $\bar{C}$  with dry  $Me_3N$  in abs. ether (99) or abs. alc. (100) (101) yields trimethyl-acetylonyl-ammonium chloride [Beil. IV-315, IV<sub>2</sub>-(763)], very hygroscopic white solid;  $\bar{C}$  with pyridine gives corresp. salt (for study of rate in abs. alc. at 55.6° see (102)). —  $\bar{C}$  with triphenyl-

phosphine in  $C_6H_6$  at  $75-80^\circ$  for 15 hrs. yields (103) triphenyl-acetonyl-phosphonium chloride, m.p.  $234^\circ$  dec. (103). —  $\bar{C}$  with hexamethylenetetramine in  $CHCl_3$  grad. ppts. an addn. prod. (poor yield (104)), ndls., m.p.  $122^\circ$  (104).]

[ $\bar{C}$  with dry  $NH_3$  may yield (9) a little aminoacetone (acetonylamine) [Beil. IV-314, IV<sub>1</sub>-(450), IV<sub>2</sub>-(763)], but the reactn. is unsatisfactory and other methods (105) are preferred for prepn. of the latter;  $\bar{C}$  (in excess) with aq. soln. (30%) of  $Me_2NH$  yields (106) dimethylaminoacetone [Beil. IV-314], misc. with aq., alc., ether, b.p.  $123^\circ$  (106);  $\bar{C}$  (1 mole) with  $Et_2NH$  (2 moles) in ether yields (106) diethylaminoacetone [Beil. IV-316], h.p.  $155-156^\circ$  (106). — Many analogous cases are recorded.]

Reactions of  $\bar{C}$  involving the H atoms of its  $-CH_2Cl$  grouping.  $\bar{C}$  with salicylaldehyde (1:0205) in alc. KOH refluxed for 15 min. (107) (108), or in alc. NaOH refluxed 2 hrs. (109), or  $\bar{C}$  + Na salt of salicylaldehyde in dry  $C_6H_6$  under reflux (110), gives (yields: 60-85% (107), 75% (109), 60% (108)) 2-(acetyl)coumarone (2-acetobenzofuran) [Beil. XVII-338], colorless lfts. from alc., m.p.  $76^\circ$  (107),  $75-76^\circ$  (109),  $74-75^\circ$  (108) (110) (corresp. oxime, ndls. from dil. alc., m.p.  $150^\circ$  (111), phenylhydrazone, cryst. from alc., m.p.  $153-154^\circ$  (107), semicarbazone, ndls. from dil. alc., m.p.  $217^\circ$  (107)). —  $\bar{C}$  with *p*-dimethylaminobenzaldehyde in AcOH with HCl gas yields (112)  $\alpha$ -chloro- $\alpha$ -(*p*-dimethylaminobenzal)acetone, yel. lfts. from alc., m.p.  $115^\circ$  (112) (corresp. phenylhydrazone, m.p.  $206-208^\circ$  (112), semicarbazone, m.p.  $202-203^\circ$  (112)), accompanied by a little  $\alpha$ -chloro- $\alpha'$ -bis-(*p*-dimethylaminobenzal)acetone, cryst. from 1:1 abs. alc. +  $C_6H_6$ , m.p.  $225^\circ$  (112). —  $\bar{C}$  with diazotized aniline in pres. of NaOAc at  $0^\circ$  yields (113) (49) cf. (114) 1-(benzeneazo)-1-chloroacetone [Beil. XV-342], yel. ndls. from boilg. alc., m.p.  $136-137^\circ$  (113),  $135-136^\circ$  (49).

Reactions of  $\bar{C}$  involving the keto group.  $\bar{C}$  with satd. aq.  $NaHSO_3$  soln. yields (51) a crystn.  $NaHSO_3$  cpd. cf. (7).

[ $\bar{C}$  with HCN as directed gives (yields: 94% (119), 87-90% (192)) (21) (115) (116)  $\beta$ -chloro- $\alpha$ -hydroxyisobutyronitrile (chloroacetone cyanohydrin) [Beil. III-317], oil, b.p.  $110^\circ$  at 22 mm. (117)  $108-110^\circ$  at 20 mm. (192),  $103-104^\circ$  at 16 mm. (115),  $D_4^{25} = 1.2027$  (117),  $n_D^{20} = 1.4520$  (192),  $n_D^{15} = 1.45362$  (117); this prod. on distillation at ord. press. or even on stdg. in the air readily dissociates into the original components; on saponification with HCl, however, it gives (62% yield (192)) (5) (115)  $\beta$ -chloro- $\alpha$ -hydroxyisobutyric acid [Beil. III-317, III<sub>1</sub>-(120), III<sub>2</sub>-(224)], ndls. from  $C_6H_6$ , m.p.  $110^\circ$  (118)  $109-110^\circ$  (192). —  $\bar{C}$  (1 mole) with aq. KCN (1 mole) gives 43% yield (119) of a cpd.,  $C_3H_5O_2N_2$ , m.p.  $183^\circ$ , formerly supposed to be  $\alpha$ -aceto- $\beta$ -hydroxy- $\beta$ -methylglutaro(di)nitrile [Beil. III-883] but now (119) regarded as 2,4-dicyano-2,5-dimethyl-5-hydroxytetrahydrofuran (for mechanism of its formn. and review of earlier literature see (119)).]

[ $\bar{C}$  forms acetals or similar cpds.: e.g.,  $\bar{C}$  with triethyl orthoformate (1:3241) in EtOH + a drop of  $H_2SO_4$  gives (yields: 90% (120), 87% (80)) cf. (190) chloroacetone diethylacetal [Beil. I-654, I<sub>2</sub>-(718)], h.p.  $161-162^\circ$  u.c. (120)  $81-82^\circ$  at 50 mm. (190),  $52-53^\circ$  at 14 mm. (80),  $D_4^{25} = 1.002$  (120); for acetals from  $\bar{C}$  with glycerol (1:6540) (121) or pyrocatechol (1:1520) (122) see indic. refs.]

[ $\bar{C}$  with phenyl isocyanide + AcOH in ether gives (123)  $\alpha$ -acetoxy- $\beta$ -chloroisobutyranilide;  $\bar{C}$  with phenyl isocyanide + BzOH in ether gives (123)  $\alpha$ -benzoyloxy- $\beta$ -chloro-isobutyranilide.]

[ $\bar{C}$  with  $RMgX$  cpds. (1 mole) in ether in general reacts normally with the ketonic group to give addn. prods. which with aq. yields the corresp. tertiary alcs.: e.g.,  $\bar{C}$  with  $MeMgBr$  gives (38% yield (124)) (125) 1-chloro-2-methylpropanol-2 ( $\alpha$ -isobutylene chlorohydrin) (3:7752) (accompanied as a result of reactn. of a second  $MeMgBr$  and rearr. (126) (127) by some 2-methylbutanol-2 (1:6160)); for corresp. reactn. of  $\bar{C}$  with  $EtMgBr$  yielding

1-chloro-2-methylbutanol-2 (3:8175) see (123); for corresp. reacta. of  $\bar{C}$  with  $n\text{-C}_4\text{H}_9\text{MgBr}$ ,  $n\text{-C}_4\text{H}_9\text{MgBr}$ ,  $\text{iso-C}_4\text{H}_9\text{MgBr}$ ,  $\text{iso-C}_5\text{H}_{11}\text{MgBr}$ ,  $n\text{-C}_6\text{H}_{13}\text{MgBr}$ , and  $n\text{-C}_7\text{H}_{15}\text{MgBr}$  see (129); for corresp. reacta. of  $\bar{C}$  with *tert*-butylethynyl  $\text{MgBr}$  (130), with *n*-amylethynyl  $\text{MgBr}$  (131), or with ethynyl  $\text{bis-MgBr}$  (132) see iadic. refs. —  $\bar{C}$  with  $\text{C}_6\text{H}_5\text{MgBr}$  yields (133) 1-chloro-2-phenylpropanol-2 [Beil. VI-507]; note, however, that if the initial addn. cpd. is htd. at 130–140° prior to hydrolysis rearr. occurs and the prod. then (134) is phenylacetone (1:5118). — For reacta. of  $\bar{C}$  with *o*-xetyl  $\text{MgI}$  see (70).]

[ $\bar{C}$  with abs. diazomethane (free from  $\text{MeOH}$ ) in dry ether yields (135) 1-chloro-2-methyl-2,3-epoxybutane, b.p. 124° (135).]

Condensation reactions of  $\bar{C}$  (usually yielding heterocyclic compounds). [ $\bar{C}$  with acetaldehyde (1:0100) +  $\text{NH}_4\text{OH}$  in pres. of  $\text{Cu}(\text{OAc})_2$  gives (49% yield (136)) 2,4-(or 5)-dimethylimidazole [Beil. XXIII-79, XXIII-(25)], b.p. 266° at 733 mm., m.p. 92° (136) ( $\bar{B}.\text{HCl}$ , m.p. 205,  $\bar{B}.\text{PhOH}$ , m.p. 142–143° (136)).]

[ $\bar{C}$  with methyl acetoacetate (1:1705) +  $\text{NH}_4\text{OH}$  at  $-1^\circ$  gives (16% yield (137)) 3-carbomethoxy-2,5-dimethylpyrrole [Beil. XXII-29], cryst. from alc., m.p. 119.5°;  $\bar{C}$  with ethyl acetoacetate (1:1710) + excess conc. aq.  $\text{NH}_4\text{OH}$  (138) (140) or in ether with  $\text{NH}_3$  gas (139) gives (yields: 44% (139), 20% (138)) 3-carbomethoxy-2,5-dimethylpyrrole [Beil. XXII-29, XXII-(496)], m.p. 116–117° (138) (other by-prods. also being formed (139));  $\bar{C}$  with ethyl acetoacetate (1:1710) + prim. amines similarly gives *N*-substituted analogs; e.g., use of aq.  $\text{MeNH}_2$  gives (141) 3-carbomethoxy-1,2,5-trimethylpyrrole [Beil. XXII-29, XXII-(496)], m.p. 48° (141); use of aniline gives (139) (141) 3-carbomethoxy-2,5-dimethyl-1-phenylpyrrole [Beil. XXII-30, XXII-(496)], m.p. 43°, b.p. 225° at 40 mm.; for corresp. use of *p*-toluidine see (141).]

[ $\bar{C}$  with ethyl axaloacetate [Beil. III-780, III-(273), III-(479)] in ether treated with  $\text{NH}_3$  gas yields (139) 4-carbomethoxy-5,6-dihydroxy-2-(or 3)-methylpyridine [Beil. XXVII-259], m.p. 223° (139) (much oxamide and other by-prods. also being formed).]

[ $\bar{C}$  with diethyl acetonediacarboxylate (1:1772) in ether (142) (143) (139) or  $\text{C}_6\text{H}_6$  (144) with dry  $\text{NH}_3$  gas gives (yields: 49% (143), 38% (142)) ethyl (3-carbomethoxy-4-methylfuryl-2)acetate [Beil. XVII-333], ad, b.p. 168° at 20 mm. (139).]

[ $\bar{C}$  htd. with amides yields corresp. azazoles: e.g.,  $\bar{C}$  with acetamide htd. 8–10 hrs. at 120° under reflux gives (7% yield (145)) (146) 2,4-dimethylloxazole [Beil. XXVII-17], liq. with odor like pyridine, very vol. aq., b.p. 108° (145) (146);  $\bar{C}$  with benzamide + powdered  $\text{CaCO}_3$  at 115–120° for 8 hrs. gives (15% yield (147)) (148) 2-phenyl-4-methylloxazole [Beil. XXVII-58], b.p. 238–241° (148), 92–95° at 5 mm. (147) ( $\bar{B}.\text{HCl}$ , m.p. 72°,  $\bar{B}.\text{PhOH}$ , m.p. 111° (147)); for corresp. reactn. of  $\bar{C}$  with *m*-nitrobenzamide see (147).]

[ $\bar{C}$  with thioamides yields corresp. thiazoles: e.g.,  $\bar{C}$  with thioformamide in abs. alc. refluxed for 1 hr. (149) or  $\bar{C}$  with formamide +  $\text{P}_2\text{S}_5$  (150) gives (35–47% yield (149)) 4-methylthiazole [Beil. XXVII-16], b.p. 131° (150), 130° (149), 70–71° at 59 mm. (151) ( $\bar{B}.\text{PhOH}$ , m.p. 181° (151);  $\bar{B}.\text{EtI}$ , m.p. 144.5° (149));  $\bar{C}$  with thioacetamide without solvent (152) (153) in aq. or alc. (152) (149) or  $\bar{C}$  with acetamide +  $\text{P}_2\text{S}_5$  (150) yields 2,4-dimethylthiazole [Beil. XXVII-18], b.p. 144–145.5° cor. at 719 mm. (152), 113–141° at 762 mm. (153), 113° (150) (151),  $D_4^0 = 1.0562$  ( $\bar{B}.\text{PhOH}$ , m.p. 137–138° (152),  $\bar{B}.\text{EtI}$ , m.p. 212° dec. (149));  $\bar{C}$  with thioacetamide in alc. gives (155) (147) 4-methyl-2-phenylthiazole [Beil. XXVII-58], m.p. 29.5° (156), b.p. 282° at 762 mm. (156), 275–277° at 750 mm. (147), 111° at 6 mm. (147); many other analogous cases are recorded.)]

[ $\bar{C}$  with aq. thiourea (157) (158) (159) or  $\bar{C}$  with  $\text{NH}_4\text{SCN}$  (160) (161) or  $\bar{C}$  with  $\text{NH}_4\text{SCN}$  +  $\text{NH}_4\text{OH}$  (162) (56) gives (70–75% yield (157)) 2-amino-4-methylthiazole [Beil. XXVII-159], m.p. 44–45° (157), 42° (159), b.p. 231–232° ol. dec. (162), 130–133° at 18 mm. (157), 117–120° at 8 mm. (157);  $\bar{C}$  with *N*-methylthiourea gives (163) (161) (158) 2-(methyl-

amino)-4-methyl-thiazolo [Beil. XXVII-159], pr. from alc., m.p. 71.5-72.5° cor. (163), 64° (164) (B.II Cl, m.p. 228° cor. (163));  $\bar{C}$  with phenylthiourea gives (158) (164) 2-(anilino)-4-methylthiazolo [Beil. XXVII-159], ndls. from alc., m.p. 117-118° (164), 115° (158).]

[ $\bar{C}$  with *O*-methyl thiocarbamate on warming gives (89) 2-methoxy-4-methylthiazolo, b.p. 50-60° at 18 mm. (89) (B.II Cl, m.p. 78°; B.II Cl<sub>2</sub>, m.p. 123-124° (89)) (accompanied by its dimer);  $\bar{C}$  with *O*-ethyl thiocarbamate + KOAc yields (89) 2-ethoxy-4-ethylthiazolo, b.p. 71-72° at 15 mm. (89).]

[ $\bar{C}$  with solid ammonium dithiocarbamate in abs. alc. stood at room temp. for 12 hrs. then refluxed 1 hr. gives (85% yield (151)) 2-mercapto-4-methylthiazolo [Beil. XXVII-161], cryst. from isopropyl ether/alc. or dil. alc., m.p. 80-90° (165), 88.9-88.5° (151); note that in ether these reactants yield (166) an intermediate *S*-acetyl dithiocarbamate, m.p. 80-82° (166), which on stdg. changes to the above 2-mercapto-4-methyl-thiazolo; for use of the latter (or its metal salts) as vulcanization accelerators see (167).]

[ $\bar{C}$  with 1-phenylthiosemicarbazide in abs. alc. readily dis. at room temp. yielding on addn. of pyridino (108) 2-(phenylhydrazino)-4-methylthiazolo, m.p. 170° (acetyl deriv., m.p. 179° (108)); for analogous reactions of  $\bar{C}$  with the three 1-(tolyl)thiosemicarbazides (106), the three 1-(nitrophenyl)thiosemicarbazides (170), see Indic. refs.]

[ $\bar{C}$  with acetone thiosemicarbazone in CHCl<sub>3</sub> gives on warming (171) the corresp. deriv. of 4-methylthiazolone 2, viz., 2-keto-4-methyl-2,3-dihydrothiazolo-2-isopropylidenehydrazone; for analogous reactn. of  $\bar{C}$  with acetophenone thiosemicarbazone and benzaldehyde thiosemicarbazone see (171).]

⑥ Color reactn. with KOH:  $\bar{C}$  with excess very conc. aq. KOH gives crimson red color (5) (22).

— Acetonyl acetate (acetol acetate) (acetoxycetone) [Beil. II-155, II<sub>1</sub>-(72), II<sub>2</sub>-(168)]; b.p. 174-175° at 760 mm. (172), 137-138° at 230 mm. (172),  $D_4^{20} = 1.0749$ ,  $n_D^{20} = 1.4150$  (Beil.). [From  $\bar{C}$  + KOAc in MeOH (173) or abs. EtOH (172) after 2 hrs. reflux (82% yield (173)).]

— Acetonyl benzoate (acetol benzoate) (benzoyloxyacetone) [Beil. IX-148]; m.p. 23.5-24° (174), 25° (175); b.p. 188-190° at 60 mm. (170). [From  $\bar{C}$  with KOBz on htg. together (54% yield (170)) or in alc. soln. (174).]

⑦ 1-( $\beta$ -Naphthoxy)acetone (acetonyl  $\beta$ -naphthyl ether); cryst. from alc., m.p. 78.4° cor. (177), 78° (178), 69-73° (101), 69-72° (70). [From  $\bar{C}$  + Na  $\beta$ -naphtholate on htg. in  $\beta$ -naphthol (178) or from  $\bar{C}$  +  $\beta$ -naphthol (1:1640) + dry K<sub>2</sub>CO<sub>3</sub> refluxed in acetone (21% yield (70)) (note that by addn. of KI yield jumps to 85% (191)).]

⑧ 1-(*N*-phthalimido)acetone (*N*-acetonylphthalimido) [Beil. XXI-477, XXI<sub>1</sub>-(371)]; lfs or ndls. from aq., m.p. 124° (105). [From  $\bar{C}$  + K phthalimido at 120° for 20 min. (176) or refluxed 1 hr. in xylene (97% yield (180)).]

⑨ 1-(*N*-3-antrophthalimido)acetone (*N*-(acetonyl)-3-antrophthalimide; ndls. from alc., m.p. 152-153° (181). [From  $\bar{C}$  with K 3-antrophthalimide on htg. (181).]

⑩ Methylglyoxal dioxime (methylglyoxime) [Beil. I-764, I<sub>1</sub>-(398), I<sub>2</sub>-(822)]; pr. from alc., m.p. 150° (182). [From  $\bar{C}$  with aq. soln. contg. NH<sub>2</sub>OH.HCl (3 moles) + Na<sub>2</sub>CO<sub>3</sub> (2 moles) followed by acidification and ether extraction (182); note that by careful regulation of conditions chloroacetone oxime has been obt'd. (82% yield (183)), but since it is an oil, b.p. 171° at 727 mm. with slight decompn., it has no value as a ⑩ for  $\bar{C}$ .]

⑪ 1-( $\beta$ -Phenylhydrazino)acetone phenylhydrazono [Beil. XV-412]; yel. cryst. from MeOH, m.p. 162.5° (184). [From  $\bar{C}$  with phenylhydrazine (3 moles) in abs. alc. at -10 to -18° (184).]

⑫ Chloroacetone *o*-nitrophenylhydrazone: m.p. 83° (135).

- ③ Chloroacetone 2,4-dinitrophenylhydrazone: yel. ndls. from alc., m.p. 124.0–125.5° (185) (51), 124° (39). [From  $\bar{C}$  (0.5 g.) with 2,4-dinitrophenylhydrazine (1.0 g.) in alc. (12 ml.) + conc. HCl (1.5 g.) under reflux (185); note that this prod. on protracted (13 hrs.) boilg. in alc. disproportionates yielding (185)  $\bar{C}$  + 2,4-dinitrophenylhydrazine (both sol. hot alc.) accompanied by the spar. sol. methylglyoxal-bis-(2,4-dinitrophenyl)-osazone, cryst. from pyridine, m.p. 298° (185), for various other reactans. see (185).]
- ④ Chloroacetone semicarbazone: m.p. 147–148° dec. (39), 141–142° (47), 136–137° (48), 165° (50), 163–165° (44). [From  $\bar{C}$  with aq. semicarbazide HCl on addn. of solid  $\text{NaHCO}_3$  at room temp. (186); note that this prod. is reactive and on boilg. with aq. dissolves to a bright yel. soln. which soon becomes colorless and on ppts. hydrazine dicarboxylic acid diamide leaving in the filtrate hydroxypropanone semicarbazone, m.p. abt. 192° dec. (186); these changes (which doubtless occur slowly even on standing in water at room temp.) probably account for the divergent values of m.p. reported above.]
- ⑤ Condensation prod. ( $\text{C}_{17}\text{H}_{20}\text{O}_4\text{N}_2\text{S}$ ) of  $\bar{C}$  with *N*-methyl- $\beta$ -carbobyhydrazidopyridinium *p*-toluenesulfonate: cryst. from 1:1 alc./ether, m.p. 135° cor. (187). [From  $\bar{C}$  + indicated react. in abs. alc. on refluxing 15 min. (187).]

(other prods. are also formed) or by electrolysis in HCl (9) see indic. refs.; from ethyl  $\alpha,\alpha$ -dichloroacetate [Beil. III-663, III<sub>1</sub>-(233), III<sub>2</sub>-(427)] by ketonic cleavage with dil. HCl in s.t. at 170–180° for 4–6 hrs. (14) or by refluxing 4–5 hrs. with HCl (15) cf. (4) see indic. refs.; for formn. of  $\bar{C}$  from isopropyl alc. (1:6135) with Cl<sub>2</sub> see (16); from methylacetylene with HOCl (42% yield) see (17); from 1,1-dichloro-2-methylpropene-2 (3:7480) with O<sub>3</sub> see (18); from homocaspic acid [Beil. IV-494, IV<sub>1</sub>-(541), IV<sub>2</sub>-(912)] by oxidn. with sodium *N*-chloro-*p*-toluenesulfonamide see (19).]

[ $\bar{C}$  on reduction with Al(OEt)<sub>3</sub> + anhydrous acetaldehyde in dry ether gives (45% yield (20)) 1,1-dichloropropanol-2 (3:5755), h.p. 146–148°. —  $\bar{C}$  on reduction by yeast gives (54% yield (21)) levorotatory 1,1-dichloropropanol-2.]

$\bar{C}$  on oxidn. with conc. HNO<sub>3</sub>, CrO<sub>3</sub>, or KMnO<sub>4</sub> yields (22) dichloroacetic acid (3:6208).

[ $\bar{C}$  with Br<sub>2</sub> (1 mole) (1) yields 3-bromo-1,1-dichloropropanone-2 [Beil. 1-657], b.p. 111° at 25 mm. (1);  $\bar{C}$  with excess Br<sub>2</sub> at 100° yields (1) 3,3-dibromo-1,1-dichloropropanone-2 [Beil. 1-658], b.p. 120° at 25 mm. (1); for study of rate of bromination of  $\bar{C}$  and influence of catalysts thereon see (4).]

[ $\bar{C}$  with PCl<sub>5</sub> htd. at b.p. of mixt. for 2 days yields (2) 1,1,2,2-tetrachloropropane (3:5825), b.p. 153°.]

[ $\bar{C}$  with aq. in s.t. at 200° for 6 hrs. yields (23) lactic acid (1:0400). —  $\bar{C}$  with aq. alk. yields (presumably via cleavage of the expected methylglyoxal) acetic acid (1:1010) and formic acid (1:1005); by virtue of this result  $\bar{C}$  readily reduces Fehling's soln. (24). —  $\bar{C}$  with aq. 10% K<sub>2</sub>CO<sub>3</sub> on boilg. loses HCl yielding (25) acrylic acid (1:1020).]

$\bar{C}$  with satd. aq. NaHSO<sub>3</sub> soln. readily yields (1) (5) an addo. prod. crystg. as a trihydrate.

[ $\bar{C}$  with conc. aq. HCN slowly dis. on protracted refluxing yielding (10) the corresp. cyanohydrin ( $\beta,\beta$ -dichloro- $\alpha$ -hydroxy-isobutyronitrile) [Beil. III-318], an oil, which on htg. dissociates into its components; this prod., however, on hydrolysis with strong HCl yields (10) the corresp. acid,  $\beta,\beta$ -dichloro- $\alpha$ -hydroxyisobutyric acid (3:2145), pr. from alc./ether or cryst. from C<sub>6</sub>H<sub>6</sub>, m.p. 82–83° (10) (20). — Note also that  $\bar{C}$  with *p*-benzylisocyanide + aq. on stdg. yields (20)  $\beta,\beta$ -dichloro- $\alpha$ -hydroxy-isobutyranilide, pr. from CHCl<sub>3</sub>, m.p. 132–133° (26).]

[ $\bar{C}$  in excess MeOH (5 moles) with ethyl iminoformate hydrochloride (1 $\frac{1}{4}$  moles) 4–8 days at room temp. yields (27) *unsym.*-dichloroacetone dimethylacetal, b.p. 170–171° at 767 mm., 63° at 0 mm. —  $\bar{C}$  in excess EtOH with ethyl iminoformate as above yields (27) *unsym.*-dichloroacetone diethylacetal, b.p. 183–184° at 767 mm., 76° at 8 mm.)]

[ $\bar{C}$  with *o*-nitrobenzaldehyde in alc. treated dropwise with aq. 5% NaOH condenses yielding (28)  $\omega,\omega$ -dichloro-*o*-nitrobenzalacetone, pptd. as oil by addn. of aq., colorless pr. from C<sub>6</sub>H<sub>6</sub>, m.p. 106–107° (28). — By similar procedure  $\bar{C}$  with *m*-nitrobenzaldehyde gives (28)  $\omega,\omega$ -dichloro-*m*-nitrobenzalacetone, colorless pr. from C<sub>6</sub>H<sub>6</sub>, m.p. 116–117°;  $\bar{C}$  with *p*-nitrobenzaldehyde similarly gives (30% yield (28))  $\omega,\omega$ -dichloro-*p*-nitrobenzalacetone, colorless pr. from C<sub>6</sub>H<sub>6</sub> or ether, m.p. 125°.]

[ $\bar{C}$  with diazotized aniline in pres. of NaOAc yields (29) dichloro-*bis*-(benzeneazo)-methane, yel.-or. cryst. from hot alc., m.p. 81–82°;  $\bar{C}$  with diazotized *p*-toluidine in pres. of NaOAc yields (29) dichloro-*bis*-(*p*-tolueneazo)methane, or. cryst. from C<sub>6</sub>H<sub>6</sub>, m.p. 159–160°.]

$\bar{C}$  (1 mole) treated with aq. soln. of excess NH<sub>2</sub>OH.HCl (6 moles) + Na<sub>2</sub>CO<sub>3</sub> (3 moles), stood 24 hrs., and acidified yields (15) methylglyoxal dioxime (methylglyoxime) [Beil. 1-764, I<sub>1</sub>-(396), I<sub>2</sub>-(822)], pr. from alc. or aq., m.p. 157°, 153° (15) (30); the same prod. also results if a satd. soln. hydroxylamine sulfate is used (30) in place of free hydroxylamine.

$\bar{C}$  (1 g.) in abs. alc. (20 g.) with *p*-benzylhydrazine (2.5 g.) stood for 1 $\frac{1}{2}$  days, then warmed with aq. (100 ml.), yields (31) as insol. residue (1 g.) methylglyoxal *bis*-(*p*-benzyl)osazone [Beil. XV-156, XV<sub>1</sub>-(38)], yel. ndls. from dil. alc., m.p. 148° (31).]

⑤ 1,1-Dichloropropanone-2 semicarbazone: m.p.  $163^\circ$  (32). [From  $\bar{C}$  in alc. with aq. semicarbazide.HCl (1 mole) without addn. of NaOAc, the semicarbazone pptg. immediately; note, however, that on stdg. the filtrate ppts. a small amt. of methylglyoxal bis-semicarbazone, m.p.  $251^\circ$ , also formed (together with equiv.  $\bar{C}$ ) on boilg. the semicarbazone with aq. (32).]

See also Note 1.				
See also Note 2.				

Note 1. For vap. press. of  $\bar{C}$  from 33-118° see (14). Note 2. For  $D_4^t$  over range  $t = 15-90^\circ$  see (14).

Colorless liq. widely used as solvent, etc. (see also below). —  $\bar{C}$  is pract. insol. aq., but detailed studies do not appear to be recorded. —  $\bar{C}$  is miscible with alc., ether,  $\text{CHCl}_3$ ,  $\text{C}_6\text{H}_6$ , and many other org. solvents.

### GENERAL

[For study of  $\bar{C}$  as solvent for detn. of mol. wts. by raising of b.p. (ebullioscopic const. =  $55.0^\circ$  per mole solute/100 g.  $\bar{C}$ ) see (23). — For study of thermal conductivity see (24). — For soly. in  $\bar{C}$  of gaseous  $\text{HCl}$ ,  $\text{H}_2\text{S}$ , or  $\text{NH}_3$  see (11). — For study of influence of  $\bar{C}$  upon inflammability of mixts. of air with  $\text{CH}_4$  (25) (10) (26) (27), with  $\text{CO}$  (10) (28), with  $\text{H}_2$  (10), or acetylene (10) see indic. refs.]

Binary systems contg.  $\bar{C}$ . [System  $\bar{C} + \text{CCl}_4$  for f.p./compn. data see (18); for  $n_D^{25}$ /compn. and use in anal. of the system see (22); for vap. press. and liq./vapor compn. of system see (29). — System  $\bar{C} + 1,1,2,2\text{-tetrachloroethane}$  (3:5750): for f.p./compn. data see (17). — System  $\bar{C} + \text{pentachloroethane}$  (3:5880): for f.p./compn. data (eutectic, f.p.  $-54.8^\circ$  contg. 58.4 wt. %  $\bar{C}$ ) see (18). — System  $\bar{C} + \text{isopropyl alc.}$  (1:6135); for  $D_{25}^{25}$ /compn. and  $n_D^{25}$ /compn. data see (30)]

$\bar{C}$  forms binary azeotropes with many alcohols [e.g.,  $\bar{C}$  with  $\text{MeOH}$  (1:6120) forms a const.-boilg. mixt., b.p.  $63.75^\circ$  at 760 mm., contg. 36.5 wt. %  $\bar{C}$  (3);  $\bar{C}$  with  $\text{EtOH}$  (1:6130) forms a const.-boilg. mixt., b.p.  $70.75^\circ$  at 760 mm., contg. 37 wt. %  $\bar{C}$  (3);  $\bar{C}$  with  $n\text{-propyl alc.}$  (1:6150) forms a const.-boilg. mixt., b.p.  $94.05^\circ$  at 760 mm., contg. 52 wt. %  $\bar{C}$  (31);  $\bar{C}$  with  $\text{isopropyl alc.}$  (1:6135) forms a const.-boilg. mixt., b.p.  $81.7^\circ$  at 760 mm., contg. 30 wt. %  $\bar{C}$  (31),  $\bar{C}$  with  $n\text{-butyl alc.}$  (1:6180) forms a const.-boilg. mixt., b.p.  $108.95^\circ$  at 760 mm., contg. 71 wt. %  $\bar{C}$  (3);  $\bar{C}$  with  $\text{isocamyl alc.}$  (1:6200) forms a const.-boilg. mixt., b.p.  $110.1^\circ$  at 760 mm., contg. 80 wt. %  $\bar{C}$  (31);  $\bar{C}$  with  $\text{ethylene glycol}$  (1:6465) forms a const.-boilg. mixt., b.p.  $119.1^\circ$  at 760 mm., contg. 94 wt. %  $\bar{C}$ ].

$\bar{C}$  forms binary azeotropes with many other org. cpds. [e.g.,  $\bar{C}$  with  $\text{formic acid}$  (1:1005) forms a const.-boilg. mixt., b.p.  $88.15^\circ$  at 760 mm., contg. 50 wt. %  $\bar{C}$  (32);  $\bar{C}$  with  $\text{AcOH}$  (1:1010) forms a const.-boilg. mixt., b.p.  $107.35^\circ$  at 760 mm., contg. 61.5 wt. %  $\bar{C}$  (218);  $\bar{C}$  with  $\text{propionic acid}$  (1:1025) forms a const.-boilg. mixt., b.p.  $119.15^\circ$  at 760 mm., contg. 91.5 wt. %  $\bar{C}$  (4);  $\bar{C}$  with  $\text{isobutyric acid}$  (1:1030) forms a const.-boilg. mixt., b.p.  $120.5^\circ$ , contg. 97 wt. %  $\bar{C}$  (33)]

Uses of  $\bar{C}$ .  $\bar{C}$  because of its solvent properties, b.p., unflammability, and immiscibility with aq., etc., finds wide use. — [Other examples of its utility include the following: for use as dry-cleaning solvent see (34), cf. (35) (36) (222); for use with lower aliph. alcs. as solv. for cellulose ethers see (37); for use in dewaxing of lubricating oil see (38); for use in liq.  $\text{HCN}$  to diminish inflammability and explosiveness see (39); for use as a component of comml. tear-gas mixts. see (40).]

[For study of use of  $\bar{C}$  as an anesthetic (41), as fumigation agt. (with  $\text{CCl}_4$ ) for grain or flour (42), for sterilization of surgical catgut (43), of antiseptic action (compared with  $\text{CHCl}_3$  (44)) (45) see indic. refs.]

[For examples of studies of use of  $\bar{C}$  as anthelmintic especially with reference to book-worm and similar parasites see (46)–(57) incl.; for comparison of anthelmintic action of  $\bar{C}$  with that of  $\text{CCl}_4$  (58) (59) or of chenopodium oil (60) see indic. refs.; for patent prepn. of  $\bar{C}$  for use as anthelmintic see (61).] (For toxicity see below.)

[For use of  $\bar{C}$  as the "booster" liquid in detn. of aq. by distn. especially in molasses and other sugar industry products see (62) (63) (64) (65) (66) (67). — For use of  $\bar{C}$  in prepn. of anhydrous  $\text{Na}_2\text{O}_2$  by removal of moisture by distn. see (68).]

[For brief general surveys of  $\bar{C}$  see (69) (70).]

Physiological actn. and/or toxicity of  $\bar{C}$ . [For studies from various viewpoints on toxicity of  $\bar{C}$  see (57), (71)–(82) incl., also especially (219) (220) (224).]

Determination of  $\bar{C}$ .  $\bar{C}$  is usually detd. by some form of decn. followed by volumetric or gravimetric detn. of resultant chloride ion [e.g., for methods involving decn. of  $\bar{C}$  with  $\text{Na} + \text{AmOH}$  in xylene (83) (84), with  $\text{Na} + \text{ethanolamine}$  in dioxane soln. (55) (223), or with  $\text{Na}$  in liq.  $\text{NH}_3$  (86) (note that some cyanide formn. occurs) see indic. refs.; for methods involving thermal decn. see (57) (215)].

[For detn. of  $\bar{C}$  by means of a recording ultra-violet photometer (the R. + H. Tri-Per Analyzer) see (88).]

### PREPARATION OF $\bar{C}$

From various polychloroethanes or polychloroethylenes. [For prepn. of  $\bar{C}$  from hexachloroethane (3:4835) by pyrolysis at  $565^\circ$  (89-94% conversion (59)), by passing over porcelain chips in hot tube (90) (note that  $\text{CCl}_4$  (3:5100) is also formed), or by passing with  $\text{H}_2$  over  $\text{Ni}$  at  $270^\circ$  (91) see indic. refs.; for prepn. of  $\bar{C}$  from hexachloroethane (3:4835) by treatment with granulated  $\text{Zn}$  in boilg. alc. (7), with  $\text{Zn} + \text{dil. H}_2\text{SO}_4$  at room temp. for several days (100% yield (5)) (92) (116), or even with  $\text{Zn} + \text{aq. above } 80^\circ$  (33), with alc.  $\text{KSH}$  (94), with molecular  $\text{Ag}$  at  $280^\circ$  in s.t. (95), with  $\text{SbF}_3$  at  $300-325^\circ$  under press. (96), with acetylene over activated carbon at  $200-400^\circ$  (97) cf. (123), with aniline at  $170^\circ$  at ord. press. (7), with  $\text{N}/10$  abs.  $\text{EtOH}/\text{NaOH}$  at  $25^\circ$  (216), or with alc. free  $\text{NaOEt}$  in ether under press. at  $140^\circ$  (217) see indic. refs.]

[For prepn. of  $\bar{C}$  from pentachloroethane (3:5880) by elimination of 1  $\text{HCl}$  in various ways: e.g., by passing over bone char at  $280^\circ$  (98), or over  $\text{NiCl}_2$  at  $330^\circ$  (99), by htg. with  $\text{AlCl}_3$  at  $70-100^\circ$  (100% yield (101)) (100) or under reflux (102), with liq.  $\text{NH}_3$  at  $-18$  to  $-34^\circ$  under reduced press. (103) (104), with  $\text{MeOH}$  over  $\text{Al}_2\text{O}_3$  at  $290^\circ$  ( $\text{MeCl}$  (3:7005) is also formed) (105), with acetylene over cat. at  $200-300^\circ$  (vinyl chloride (3:7010) is also formed) (106), with alc.  $\text{KOH}$  (107) (108), or in alc. with 2  $\text{N}$  aq.  $\text{NaOH}$  in cold (98% yield) (109) see indic. refs.]

[For prepn. of  $\bar{C}$  from 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) (see also below under prepn. of  $\bar{C}$  from acetylene) on pyrolysis at  $700^\circ$  (110), with air over pumice +  $\text{CuCl}_2$  at  $430-450^\circ$  (111), or with  $\text{Cl}_2$  over activated carbon contg. 30%  $\text{CuCl}_2$  at  $300-320^\circ$  (112) see indic. refs.]

[For prepn. of  $\bar{C}$  from 1,2-dichloroethane (ethylene dichloride) (3:5130) with  $\text{Cl}_2$  over cat. at  $300-500^\circ$  see (113); from ethane or its chloro deriva. with  $\text{Cl}_2 + \text{fused metal chlorides}$  such as  $\text{AlCl}_3$ , etc., at  $250-500^\circ$  see (114).]

[For formn. of  $\bar{C}$  from trichloroethylene (3:5170) on pyrolysis at  $700^\circ$  (110) or with anhyd.  $\text{FeCl}_3$  on htg. see (115).]

From various polychloromethanes. [For prepn. of  $\bar{C}$  from  $\text{CCl}_4$  (3:5100) through tube at  $1300-1400^\circ$  see (116) (117); for formn. of  $\bar{C}$  (together with other prods.) from  $\text{CCl}_4 + \text{H}_2$  through hot tube over pumice at low red heat (118) or through tube at  $600-650^\circ$  (119), or in dark electric discharge (120), see indic. refs. — Note also that  $\bar{C}$  has been found (121) as a by-prod. of prepn. of  $\text{CCl}_4$  (3:5100) by actn. of  $\text{Cl}_2$  on  $\text{CS}_2$ .]

[For formn. of  $\bar{C}$  from  $\text{CHCl}_3$  (3:5050) +  $\text{H}_2$  in dark electric discharge see (120).]

From acetylene with  $\text{Cl}_2$  (see also above under prepn. of  $\bar{C}$  from 1,1,2,2-tetrachloroethane (acetylene tetrachloride)). [For prepn. of  $\bar{C}$  from acetylene with  $\text{Cl}_2 + \text{inert gas}$  over cat. at  $250-400^\circ$  see (122) (123) (124) (125); from acetylene with  $\text{Cl}_2$  at  $700-900^\circ$  in absence of extraneous substances (126); from acetylene with  $\text{Cl}_2$  see (127) (128); from acetylene with  $\text{Cl}_2$  in halogenated solv. at  $175-260^\circ + \text{AlCl}_3$ , etc., see (129).]

From miscellaneous sources. [For prepn. of  $\bar{C}$  from  $\text{CO} + \text{HCl}$  over cat. at  $230-240^\circ$  under high press. ( $\text{CHCl}_3$  is also formed) see (130); from *unsym.*-heptachloropropene (3:0200) by dissociation into  $\bar{C} + \text{CHCl}_3$  over  $\text{Cu}_2\text{Cl}_2$  at  $250^\circ$  see (131); from chloral (3:5210) by long boilg. with  $\text{AlCl}_3$  see (132) cf. (133) (134); from tetrachloroethyl chloro-

formate with  $\text{AlCl}_3$  see (135); from trichloroacetic acid (3:1150) over  $\text{ThO}_2 + \text{kaolin}$  at 230–250° see (136); from pentachloropropionic acid (3:4895) on htg. in aq. (137), or from its ferric salt in light (139) cf. (140), or from pentachloropropionyl chloride (3:0470) with  $\text{AlCl}_3$  (1 mole) at 60° (138) see indic. refs.]

### PURIFICATION OF $\bar{\text{C}}$

Comml.  $\bar{\text{C}}$  conts. some impurity which readily chlorinates (15); note also that  $\bar{\text{C}}$ , especially if exposed to light and air, may contain phosgene (3:5000), trichloroacetyl chloride (3:5420), trichloroacetic acid (3:1150), and other prods.; cf. below under oxidation of  $\bar{\text{C}}$ . — [For purification of  $\bar{\text{C}}$  by treatment with  $\text{Cl}_2$  followed by illumination (15), by treatment with aq. alk. at elev. temp. (for removal of 1,1,2-trichloroethane (3:5330) or 1,1,1,2-tetrachloroethane (3:5555)) (141), by refluxing with finely divided metals + dil. acid (142) or with 1% Al or  $\text{AlCl}_3$  (143), or by passing vapor over kaolin at 250° (144), see indic. refs.]

### STABILIZATION OF $\bar{\text{C}}$

To increase the resistance of  $\bar{\text{C}}$  to photooxidation (see below) and other changes, the addition of very small amts. of various stabilizers has been recommended. — [For example, for study of control of photooxidation of  $\bar{\text{C}}$  by use of inhibitors such as thymol (1:1430), ether, alcohol, thiourea, etc., see (145). — For stabilization of  $\bar{\text{C}}$  by addn. of small amts. of paraffin hydrocarbons (e.g., gasoline) (146), various phenols (such as hydroquinone monomethyl or monobenzyl ether) (147), oil-sol. azo dyes contg. phenolic groups (148), mercaptans (such as *n*-butyl mercaptan) (149), various org. tertiary amines such as triethylamine (150) or picoline (151), various phenols, amines, and aminophenols (152), or a wide variety of org. *N* cpds. (221) see indic. refs.]

### CHEMICAL BEHAVIOR OF $\bar{\text{C}}$

**Pyrolysis.** [ $\bar{\text{C}}$  on pyrolysis over heated Pt wire gives (153) (154) hexachloroethane (3:4835) + hexachlorobenzene (3:4939) +  $\text{Cl}_2$ .]

**Hydrogenation.** [Note that  $\bar{\text{C}}$  does not add  $\text{H}_2$  even in pres. of Ni at 300–350° (99);  $\bar{\text{C}}$  with excess  $\text{H}_2$  over Ni at 220° dec. (163) to carbon +  $\text{HCl}$ .]

**Oxidation.**  $\bar{\text{C}}$  can be oxidized especially in the presence of light and moisture giving according to conditions trichloroacetyl chloride (3:5420), phosgene (3:5000), trichloroacetic acid (3:1150), or various mixtures of these prods.; for inhibition of this oxidation see above under stabilization of  $\bar{\text{C}}$

[For extensive studies of photochem. oxidn. of  $\bar{\text{C}}$  giving 87% trichloroacetyl chloride accompanied by phosgene see (15) (155) (156); for oxidn. of  $\bar{\text{C}}$  on stdg. with aq. in light for 4 months yielding trichloroacetic acid see (157) cf. (158); for oxidn. of  $\bar{\text{C}}$  to trichloroacetyl chloride with  $\text{O}_3$  (159) (160), with peracetic acid (acetyl hydrogen peroxide) (161), with conc.  $\text{HNO}_3 + \text{conc. H}_2\text{SO}_4$  in freezing mixt. (162), with  $\text{SO}_3$  at 150° (164), or with  $\text{N}_2\text{O}_5$  (194) see indic. refs.; for patents on photochem. oxidn. of  $\bar{\text{C}}$  to trichloroacetyl chloride (3:5420) see (165) (166).]

[ $\bar{\text{C}}$  on oxidn. with  $\text{K}_2\text{Cr}_2\text{O}_7/\text{H}_2\text{SO}_4$  is completely converted to  $\text{CO}_2 + \text{H}_2\text{O} + \text{HCl}$  (167);  $\bar{\text{C}}$  passed with air over  $\text{CuO}$  at 450° gives only traces (168) of phosgene.]

**Reaction with halogens.** [ $\bar{\text{C}}$  dislvd. in dichlorodifluoromethane ("Freon") with  $\text{F}_2$  at –80° (169), or  $\bar{\text{C}}$  with  $\text{F}_2$  at 0° directly (170) but not in  $\text{CCl}_4$  soln. (169) cf. (172), or  $\bar{\text{C}}$  in vapor phase at 130° with  $\text{F}_2$  diluted with  $\text{N}_2$  (171), gives (20% yield (171)) 1,2-difluoro-1,1,2,2-tetrachloroethane, m.p. 26.5° (96) (169), accompanied by various other prods. such as fluoropentachloroethane, m.p. 99.0–99.5° (in s.t.), b.p. 136–138° (170), and 1,4-difluoro-octachlorobutane (170) (169), m.p. 4–5° (170), h.p. 152.2° at 20 mm.,  $D_4^{20} = 1.9272$ ,  $n_D^{20} = 1.5256$  (170).]

[ $\bar{C}$  with dry  $Cl_2$  in direct sunlight (90), or  $\bar{C}$  in  $CCl_4$  at  $22^\circ$  (173) or in vapor phase at  $40^\circ$  and low press. (155) in light and absence of  $O_2$ , or  $\bar{C}$  with  $SO_2Cl_2$  in pres. of dibenzoyl peroxide (174) adds  $Cl_2$  yielding hexachloroethane (3:4835) q.v.; note, however, that  $\bar{C} + Cl_2 +$  light in pres. of  $O_2$  undergoes photooxidation to trichloroacetyl chloride (see above under oxidation of  $\bar{C}$ ). —  $\bar{C}$  with  $Cl_2$  at  $700-800^\circ$  (175), or  $\bar{C}$  with  $Cl_2$  over act. carbon at  $600-650^\circ$  (176), undergoes cleavage of  $C-C$  bond yielding  $CCl_4$  (3:5100); for study of this reactn. see (177).]

[ $\bar{C}$  with  $Br_2$  in sunlight adds 1 mole  $Br_2$  yielding (178) (179) (110) 1,2-dibromo-1,1,2,2-tetrachloroethane, m.p.  $197.5^\circ$  dec. (in s. cap. tube) (180),  $200-205^\circ$  dec. (110),  $190^\circ$  dec. (138). — Note, however, that this photochem. addn. is inhibited by its reactn. prod. (181), that, although accelerated by small amts.  $O_2$ , pres. of large amts.  $O_2$  lead to a halogen catalyzed photooxidation (181), that in  $CCl_4$  soln. resultant equilibrium mixt. conts. only 30% addn. prod. (182). — For extensive study of this reactn. see (181); for studies of its rate see (183) (184); for extensive study of photochem. dissoc. of prod. see (179). — For study of reactn. of  $\bar{C}$  with radio-bromine see (185).]

[ $\bar{C}$  does not add  $I_2$ . — For soly. of  $I_2$  in  $\bar{C}$  see (186); for use of such solns. in detn. of iodine number of unsatd. oils and fats see (187) (188).]

Behavior of  $\bar{C}$  with other inorganic materials. [ $\bar{C}$  with  $Cl_2O$  in  $CCl_4$  at  $-20^\circ$  gives (189) hexachloroethane (3:4835).]

[ $\bar{C}$  with  $NO_2$  in s.t. at  $100-120^\circ$  for 3 hrs. (190), or at  $100-110^\circ$  for 3 hrs. (5), or at  $80^\circ$  for 3 hrs. or  $60^\circ$  for 6 hrs. (191), or at 10–12 atm. press. at  $60-80^\circ$  for 3–6 hrs. (191), or  $\bar{C}$  with fuming  $HNO_3$  at ord. temp. stood several days (5) cf. (192), adds 2 moles  $NO_2$  yielding 1,2-dinitro-1,1,2,2-tetrachloroethane [Beil. I-102, I<sub>1</sub>-(33)], cryst. from alc., m.p.  $142-143^\circ$  (s. cap. tube) (5).]

[ $\bar{C}$  with nitryl chloride ( $ClNO_2$ ) yields (193) 1-nitro-1,1,2,2,2-pentachloroethane, lts. from alc., m.p.  $192^\circ$  (s. cap. tube) (193).]

[ $\bar{C}$  with  $N_2O_5$  undergoes vigorous oxidn. (presumably to trichloroacetyl chloride) (194).]

[ $\bar{C}$  with  $NH_3$  at  $700-800^\circ$  splits off all its halogen as  $NH_4Cl$  (195) cf. (196).]

[For behavior of  $\bar{C}$  with various common metals see (197); note that  $\bar{C}$  is not attacked by molecular Ag even at  $300^\circ$  (95); note that  $\bar{C}$  with Na or K or their mixture may (like many other polychloro compds.) explode under certain conditions (for an extensive study see (198)).]

Behavior of  $\bar{C}$  with organic reactants. [ $\bar{C}$  (1 mole) with  $CHCl_3$  (3 moles) +  $AlCl_3$  (0.2 mole) refluxed 15–20 hrs. gives (85–93% yield (199)) (101) (16) (200) (201) (202) (214) *unsym.*-heptachloropropane (3:0200); for study of equilibrium of system  $\bar{C} + CHCl_3 +$  *unsym.*-heptachloropropane see (131).]

[ $\bar{C}$  with 1,1,2,3,3-pentachloropropene-1 (3:6075) +  $AlCl_3$  gives (201) cf. (214) 1,1,3,4,5,5,6,6,6-nonachloropentene-1.]

[ $\bar{C}$  with  $NaOEt$  at  $100-120^\circ$  yields (203) ethyl dichloroacetate (3:5850) + Na diethoxyacetate + other prods., presumably via ethyl  $\alpha,\beta,\beta$ -trichlorovinyl ether,  $\alpha,\alpha$ -dichloro- $\beta,\beta$ -diethoxyethylene, triethyl dichloroorthoacetate, etc., cf. (204).]

[ $\bar{C}$  (1 mole) with  $NaSC_6H_5$  (2 moles) in alc., refluxed 48 hrs., gives (yield not stated (205))  $\alpha,\beta$ -dichloro- $\alpha,\beta$ -bis-(thiophenyl)ethylene, ndls. from alc., m.p.  $71-72^\circ$  (205). —  $\bar{C}$  with disodium salt of dithiopyrocatechol in alc. at  $110-120^\circ$  in s.t. for 7 hrs. gives small

yield (206) of  $C_6H_4$    $C_6H_4$ , golden ndls., m.p.  $234^\circ$  (206).]

[ $\bar{C}$  with paraformaldehyde (1:0080) + conc.  $H_2SO_4$  as directed (207) gives  $\alpha,\alpha$ -dichloro- $\beta$ -hydroxypropionic acid, m.p.  $88-89^\circ$  (s. cap. tube).]

[ $\bar{C}$  with dibenzoyl peroxide on refluxing either with or without  $AlCl_3$  gives (40% yield

(20S))  $\alpha, \alpha, \beta$ -trichloro- $\beta$ -pbcnylethylene ( $\alpha, \alpha, \beta$ -trichlorostyrene) [Beil. V-477,  $V_2$ -(367)], b.p. 87–89° at 3 mm.,  $D_4^{25} = 1.40$ ,  $n_D^{25} = 1.5758$  (20S), accompanied by chlorobenzene (3:7903),  $CO_2$ , and under certain conditions by hexachloroethane (3:4835).]

[ $\bar{C}$  with large excess  $EtMgBr$  in boilg. ether evolves ethylene and on subsequent treatment with aq. gives a mixt. of ethylene + acetylene; for explanation see (209). —  $\bar{C}$  with  $n$ -butyllithium in pet. eth. gives violent explosion (210).]

[For study of reactn. of  $\bar{C}$  with pyridine or piperidine at 16–18° see (211).]

Ⓢ Color test with  $NH_4OH/Cu_2Cl_2$ :  $\bar{C}$  (1–2 drops) in small glass-stoppered bottle filled with conc. aq.  $NH_4OH$ , treated with powdered  $Cu_2Cl_2$ , stopper quickly inserted (to force out air and excess liquid), shaken, and allowed to stand, gives in 3 days a pale amethyst color (212); note, however, that  $\bar{C}$  on stdg. with metallic  $Cu$  + conc. aq.  $NH_4OH$  develops rich port-wine red color in aq. layer and brown coating on the copper (213). — Note also that neither of these tests should be regarded as conclusive (see (212) (213)).

## 3:5475 1,2,2-TRICHLOROPROPANE

B.P. 123° (1) (2)  
123-125° (3)

 $D_{25}^{25} = 1.318$ 

[For prepn. as a by-product of the chlorination of propane see (2); for formn. of  $\bar{C}$  (47%) in chlorination of 1,2-dichloropropane (3:5200) see (3).]

$\bar{C}$  with alc. KOH splits out HCl and gives two stereoisomeric 1,2-dichloropropenes, viz., 3:5110 and 3:5150.

# CHAPTER XIII

## DIVISION B. LIQUIDS WITH BOILING POINTS REPORTED AT ORDINARY PRESSURE

### Section 1. $D_4^{20}$ greater than 1.1500

(3:5500-3:5999)

3:5500 *cis*-2,3-DICHLOROBUTENE-2  $\text{C}_4\text{H}_6\text{Cl}_2$  Beil. S.N. 11

B.P. 124-126° at 758 mm. (1)

$D_4^{20} = 1.1618$  (1)  $n_D^{20} = 1.4590$  (1)  
 $D_4^{18} = 1.1620$  (1)  $n_D^{18} = 1.4616$  (1)

[See also *trans* stereoisomer (3:7395).]

[For prepn. of  $\bar{C}$  (accompanied by its *trans* stereoisomer (3:7395)) from 2,2,3-trichlorobutane (3:5680) with solid KOH (1 mole) at 135-140° see (1).]

$\bar{C}$  on oxdn. with 3% aq.  $\text{KMnO}_4$  yields (1) acetic acid (1:1010).

$\bar{C}$  in  $\text{CCl}_4$  at -20° treated with 7%  $\text{O}_3$ , then hydrolyzed, yields (1) acetic acid (1:1010) + acetaldehyde (1:0100).

3:5500 (1) Tishchenko, Churbakov, *J. Gen. Chem. (U.S.S.R.)* 6, 1553-1558 (1936); *Cent.* 1937, I 3785; *C.A.* 31, 2165 (1937).

3:5515 TRICHLOROMETHYLENE CARBOXYMATE  $\text{C}_2\text{O}_2\text{Cl}_4$  Beil. III - 18  
 $\text{2 O.CO.Cl}$  III<sub>1</sub>-(8)  
III<sub>2</sub>-(16)

B.P.		M.P.			
127.5-128°	(1) cor. (2)	-57°	$D_{21}^{21} = 1.632$	(7)	$n_D^{26} = 1.456$ (1)
127°	at 760 mm. (3)				
126-127°	at 745 mm. (4)		$D_{15}^{15} = 1.655$	(3)	$n_D^{22} = 1.45664$ (8)
	(5)				
127.2°	at 725 mm. (6)				
49°	at 50 mm. (3)				
45°	at 26 mm. (7)				
20°	at 10.3 mm. (1)				
0°	at 2-4 mm. (1)				

Colorless oily liq. with irritating and suffocating odor, but (when pure) not especially lachrymatory. — Ord. samples may cont. triphosgene (3:1915).

[For prepn. from methyl formate (1:1000) or methyl chloroformate (3:5075) by chlorination see (8) (3) (9) (2) (1); for prepn. from *bis*-(trichloromethyl) carbonate (triphosgene) (3:1915) see (1); for German prepn. in World War I see (10).]

$\bar{C}$  (when pure) boils with no decompn. (1); however, above 300° (2) or on contact with activated carbon, charcoal, or iron oxide at ord. temp. (1)  $\bar{C}$  decomposes to phosgene

(3:5000). —  $\bar{C}$  on contact with alumina (1),  $AlCl_3$  (5), or  $FeCl_3$  (3) decomposes in a different mode yielding  $CCl_4$  (3:5100) +  $CO_2$ .

$\bar{C}$  with aq. hydrolyzes slowly in the cold but rapidly at  $100^\circ$  yielding only  $HCl$  +  $CO_2$  (1) (3);  $\bar{C}$  on warming with aq.  $Na_2CO_3$  yields  $NaCl$  +  $CO_2$  (3).

$\bar{C}$  on treatment at  $20^\circ$  for 5 min. with  $NaI$  in acetone evolves  $CO$  and separates  $I_2$  to 98.8% of amt. expressed by reaction:  $Cl_3C.O.CO.Cl + 2NaI \rightarrow 2CO + 4NaCl + I_2$  (11) [cf. chloromethyl chloroformate (3:5275), dichloromethyl chloroformate (3:5315), and triphosgene (3:1915)].

$\bar{C}$  with aq.  $NH_4OH$  reacts vigorously yielding urea +  $NH_4Cl$ . —  $\bar{C}$  with excess aniline in either aq. or non-aq. soln. is converted to  $N,N'$ -diphenylurea (carbanilide), m.p.  $233^\circ$ , + aniline hydrochloride (3). [Note that with insufficient aniline a mixt. of phenyl isocyanate +  $N$ -phenylcarbamyl chloride may form (3).]

$\bar{C}$  on addn. in cold to conc. soln. of phenol (1 mole) in aq.  $NaOH$  separates an oil (which soon solidifies) of phenyl trichloromethyl carbonate [Beil. VI<sub>1</sub>-(88)], ndls. from ether, m.p.  $70.5^\circ$  (12),  $66^\circ$  (3); this product upon warming with aq. sodium phenolate (or  $\bar{C}$  warmed with excess sodium phenolate in one operation) yields diphenyl carbonate (1:2335), cryst. from alc., m.p.  $78^\circ$  (12). [For corresponding reactions with  $p$ -cresol (1:1410),  $\beta$ -naphthol (1:1540),  $p$ -chlorophenol (3:0475), and  $p$ -nitrophenol see (13).]

$\bar{C}$  with pyridine yields a yel. double quaternary ammonium salt  $C_6H_5N(Cl).CO(Cl)-N.C_6H_5$  which by aq. is decomposed to pyridine hydrochloride +  $CO_2$  (14).

[For use of  $\bar{C}$  in prepn. of acid chlorides of carboxylic or sulfonic acids see (15); similarly  $\bar{C}$  htd. with anhydrous  $NaOAc$  gives  $Ac_2O$  +  $NaCl$  +  $CO_2$  (2); for actn. on methyl hydrogen sulfate yielding methyl chlorosulfonate + phosgene +  $CO_2$  see (16).]

[For use of  $\bar{C}$  for introduction of a second  $-CO.Cl$  group into acid chlorides see (17).]

### 3:5540 $\alpha,\beta$ -DICHLOROVINYL ETHYL ETHER

Beil. I - 724

( $\alpha,\beta$ -Dichloro- $\alpha$ -ethoxyethylene)

I<sub>1</sub>-(377)

I<sub>2</sub>-(780)

B.P.  $128.2^\circ$  cor. (1)

$125-127^\circ$  (4)

$122-126^\circ$  (2)

$D_4^{25} = 1.1972$  (3)

$D_4^{20} = 1.2037$  (3)

$n_D^{16.5} = 1.45584$  (3)

$\bar{C}$  has the possibility of existing in two geometrically isomeric forms, but only this one has as yet been recognized.

[For prepn. of  $\bar{C}$  from trichloroethylene (3:5170) with alc.  $KOH$  (4), with alc.  $NaOEt$  (yield: 81% (5), 70% (2)), or with alc.  $NaOH$  +  $CaO$  (6) see indic. refs.; from 1,1,1,2-tetrachloroethane (3:5555) with  $NaOEt$  see (1).]

[ $\bar{C}$  with calcd. amt. aq. (7), or with conc.  $HCl$  (8) yields ethyl chloroacetate (3:5700);

$\bar{C}$  on boilg. with aq. to complete soln. yields (9) chloroacetic acid (3:1370);  $\bar{C}$  on htg. with aq. in s.t. at  $180^\circ$  yields (1) glycolic acid (1.0430), EtCl (3:7015) + HCl.]

[ $\bar{C}$  with HCl gas yields (10) an addn. prod. which on htg. decomposes to chloroacetyl chloride (3:5235) + EtCl (3:7015);  $\bar{C}$  with monobasic org. acids yields (2) on htg. ethyl chloroacetate (3:5700) + corresp. acid chloride; with succinic acid the products are (2) ethyl chloroacetate (3:5700) + succinic anhydride (1:0710).]

[ $\bar{C}$  with alcohols yields mainly (2) (11) the corresp. alkyl chloroacetate + EtCl (some ethyl chloroacetate + alkyl chloride are also formed (2));  $\bar{C}$  htd. with excess NaOEt yields (1) sodium salt of ethoxyacetic acid (1:1070).]

[ $\bar{C}$  with phenols yields exclusively (2) the corresp. aryl chloroacetate + EtCl; e.g.,  $\bar{C}$  with  $\beta$ -naphthol (1:1540) yields (2)  $\beta$ -naphthyl chloroacetate, m.p.  $95^\circ$  (2).]

$\bar{C}$  with aniline in aq. or aq. alc. soln. yields (12) ethyl *N*-phenylaminoacetate (90%) [Beil. XII-470, XII<sub>1</sub>-(263)], m.p.  $58^\circ$ , and phenylaminoacetanilide (10%) [Beil. XII-556, XII<sub>1</sub>-(285)], m.p.  $112^\circ$

[ $\bar{C}$  readily absorbs  $Cl_2$  at ord. temp.; if moisture is carefully excluded, the prod. breaks up (13) (14) on keeping or on htg. into dichloroacetyl chloride (3:5290) + EtCl (3:7015); if, however, moisture is given access or aq. added, then on keeping or htg. the prod. breaks up (13) (14) and on distn. gives alm. theoretical yield of ethyl dichloroacetate (3:5850) + HCl.]

[ $\bar{C}$  readily absorbs  $Br_2$ ; with complete exclusion of aq. the products are (13) (14) bromo-chloro-acetyl chloride, b.p.  $138-139^\circ$  (13), and EtBr; in pres. of aq. the products are ethyl chloro-bromo-acetate, b.p.  $174^\circ$ ,  $D_4^{22} = 1.5890$  (13), + HCl + HBr; some bromo-chloro-acetyl bromide, b.p.  $158-160^\circ$ ,  $47-49^\circ$  at 15 mm. (15), and  $C_2H_5Cl$  (3:7015) are also (15) formed. —  $\bar{C}$  on treatment with  $Br_2$  in the cold, then immediately followed by alc. KOH, gives good yield (3) of  $\beta$ -bromo- $\alpha,\beta$ -dichlorovinyl ethyl ether, b.p.  $177^\circ$  at 754 mm.,  $D_4^{20} = 1.6565$ ,  $n_D^{17} = 1.50427$  (3).]

[ $\bar{C}$  treated with ICl, stood 30 min. (17), filtered from  $I_2$ , then htd. to  $50^\circ$  to expel  $C_2H_5Cl$  gives (16) (17) chloro-iodo-acetyl chloride; addn. of aq. to latter yields by hydrolysis (16) (17) chloro-iodo-acetic acid, colorless lts from li. pet., m.p.  $90^\circ$  (16).]

<sup>23</sup> see (10). —  $\bar{C}$  with di-n-butyl ether (1:7553): for b.p., vapor-liq. equil., and  $D$  see (10). —  $\bar{C}$  with  $\beta,\beta'$ -dichloro-diethyl ether (3:6235): for b.p., vapor-liq. equil., and  $D$  see (10). (see below under azeotropes).

$\bar{C}$  with chlorinated hydrocarbons.  $\bar{C}$  with 1,2-dichloroethane (3:5150): for b.p., vapor-liq. equil., and  $D$  see (31) (see also note — (For use of ethylene dichloride in dehydration of  $\bar{C}$  see (32))

### AZEOTROPES CONTAINING $\bar{C}$

Binary azeotropes.  $\bar{C}$  with water forms a constant-boiling mixt. b.p. 55.3° (26) (8), 97.8° at 760 mm. (23) (32). contg. 45.8 wt. %  $\bar{C}$  (41) 51.5 wt. %  $\bar{C}$  (32)  $\bar{C}$ : constants for this azeotropic mixt. at other press. include the following: b.p. 96-96.2° (26); at 735 mm., b.p. = 95.5° (25) (11), contg. 51.5 wt. %  $\bar{C}$  at 504 mm., b.p. = 86.4° (23); at 430 mm., b.p. = 81.55°, contg. 49.2 wt. %  $\bar{C}$ . Note that compn. changes only slightly (25) with press. — For study of this (11) (23) or of HCl (11) see infra. refs.

$\bar{C}$  with toluene (1:7201) gives a constant-boiling mixt. b.p. 74.4°, contg. 68 mole %  $\bar{C}$  (10). —  $\bar{C}$  with di-n-butyl ether (1:7553) gives a constant-boiling mixt. b.p. 68 mole %  $\bar{C}$  (10). —  $\bar{C}$  with  $\beta,\beta'$ -dichloro-diethyl ether (3:6235) gives a constant-boiling mixt. b.p. 123.2°, contg. 91.8 mole %  $\bar{C}$  (10).

Ternary azeotropes:  $\bar{C}$  with aq. +  $C_6H_6$  (1:7430) gives a constant-boiling mixt. b.p. 67.0-67.3° (29). —  $\bar{C}$  with aq. + ethylene dichloride (3:6235) gives a constant-boiling mixt. b.p. 69.6° (29). —  $\bar{C}$  with aq. + 1,1,2-trichloroethane (3:6235) gives a constant-boiling mixt. b.p. 70.8-71.5° (29).

### MANIPULATORY PHYSICAL PROPERTIES OF $\bar{C}$

[For sepn. of  $\bar{C}$  from gas mixts. by adsorption (7) on  $Mg(ClO_4)_2$  see (34).]

### USES OF $\bar{C}$

The manifold uses of  $\bar{C}$ , based upon both its physical and its chemical properties, cannot here be reviewed in detail; however, some examples include the following:

[For use in sepn. of benzofuran from hydrocarbon mixts. (33), in demerolization of naphthenes from mineral lubricating oils (35), in refining of rosin (36) and pine lignin (38) (39), as solv. for various resins (37), as solv. for cellulose and cellulose ethers (42), for addn. to rayon spinning baths (43) see infra. refs.]

### PHYSIOLOGICAL AND BIOCHEM. BEHAVIOR OF $\bar{C}$

[For study of pharmacol. of  $\bar{C}$  (or its phosphoric esters, etc.) see (44), for poisoning by  $\bar{C}$  see (45) (46); for study of toxicity of vapor of  $\bar{C}$  see (45) (46).]

[For effect of  $\bar{C}$  upon amylase (47) (48) or lipase (49) see infra. refs.; for effect of  $\bar{C}$  of yeast of depressed enzymatic activity see (50).]

### DETERMINATION OF $\bar{C}$

[For colorimetric detn. of  $\bar{C}$  by reaction with diazotized sulfanilic acid in aq. soln. see (106) (note that method involves oxidn. of  $\bar{C}$  by the reagt. to chloroacetaldehyde (3:7212) and color forms with latter); for detn. of  $\bar{C}$  in aq. solns. by refractometry (11) (23) (32) (33) (34) (35) (36) (37) (38) (39) (40) (41) (42) (43) (44) (45) (46) (47) (48) (49) (50) (51) (52) (53) (54) (55) (56) (57) (58) (59) (60) (61) (62) (63) (64) (65) (66) (67) (68) (69) (70) (71) (72) (73) (74) (75) (76) (77) (78) (79) (80) (81) (82) (83) (84) (85) (86) (87) (88) (89) (90) (91) (92) (93) (94) (95) (96) (97) (98) (99) (100) (101) (102) (103) (104) (105) (106) (107) (108) (109) (110) (111) (112) (113) (114) (115) (116) (117) (118) (119) (120) (121) (122) (123) (124) (125) (126) (127) (128) (129) (130) (131) (132) (133) (134) (135) (136) (137) (138) (139) (140) (141) (142) (143) (144) (145) (146) (147) (148) (149) (150) (151) (152) (153) (154) (155) (156) (157) (158) (159) (160) (161) (162) (163) (164) (165) (166) (167) (168) (169) (170) (171) (172) (173) (174) (175) (176) (177) (178) (179) (180) (181) (182) (183) (184) (185) (186) (187) (188) (189) (190) (191) (192) Colorless liq. — miscible with aq. (see also below) and most org. solv.

## MISCELLANEOUS PHYSICAL PROPERTIES

### BINARY SYSTEMS CONTAINING $\bar{C}$

$\bar{C}$  + water. For values of  $D_4^{20}$  and  $n_D^{20}$  (also  $n_D^{20}$ ,  $n_F^{20}$ ,  $n_D^{20}$ ) over whole range 0-100%  $\bar{C}$  see (5) cf. (22) (23); for thermal anal. of systems see (26). — For study of salting-out of  $\bar{C}$  from its aq. solns. (11) or its isolation by ether extraction of aq. solns. satd. with NaCl or  $\text{Na}_2\text{CO}_3$  (27) see indic. refs. — For concn. of  $\bar{C}$ , i.e., dehydration of its aq. solns. by distn. of the water with  $\text{C}_6\text{H}_6$  (28), with 1,2-dichloroethane (ethylene dichloride) (3:5130) (29), or with cyclohexanol (1:6415) (30) see indic. refs. — See also below under azeotropes.

Note that boilg. aq. solns. of  $\bar{C}$  undergo slow decompn., e.g., about 10% in 8 hrs. (23), 50% in 5 hrs. (107) cf. (11) (presumably by loss of HCl and evoln. of ethylene oxide (1:6105), b.p. 10.7°, and/or (38) acetaldehyde (1:0100), b.p. 20.2°.

$\bar{C}$  with hydrocarbons.  $\bar{C}$  with  $\text{C}_6\text{H}_6$  (1:7400): for b.p., vapor-liq. equil., and  $n_D^{25}$  see (10). —  $\bar{C}$  with toluene (1:7405): for b.p., vapor-liq. equil., and  $n_D^{25}$  see (10) (see also below under azeotropes).

$\bar{C}$  with alcohols.  $\bar{C}$  with butanol-1 (1:6180): for b.p., vapor-liq. equil., and  $n_D^{25}$  see (10). —  $\bar{C}$  with isobutyl alc. (1:6165): for b.p., vapor-liq. equil., and  $n_D^{25}$  see (10).

$\bar{C}$  with ethers.  $\bar{C}$  with di-isopropyl ether (1:6125): for b.p., vapor-liq. equil., and

3:5550 1,3-DICHLOROBUTENE-2  
(2,4-Dichlorobutene-2)

B.P. 127-129°	at 756 mm. (1)	$D_4^{20} \div 1.1591$ (1) (3)	$n_D^{20} = 1.47239$ (1)
127-128.5°	at 753 mm. (2)	1.1582 (2)	1.4695 (2)
61-63°	at 70 mm. (1)		
56-57°	at 55 mm. (3)		$n_D^{20} = 1.46988$ (1)
53-54°	at 55 mm. (2)		1.4694 (3)
53-54°	at 50 mm. (1)		

Colorless liq. with characteristic odor (1). —  $\bar{C}$  is formed (5-10% (4) (5) (11)) cf. (10) in synthesis of chloroprene (3:7080). — [For use in mfg. of unsatd. cellulose ethers see (6); in mfg. of unsatd. ethers of alcohols and phenols for use as solvents, disinfectants, etc., see (7) (8).]

[For prepn. of  $\bar{C}$  readily and in quantity (1) from vinylacetylene by shaking with an excess (4 moles) of HCl contg. CuCl see (1); from methyl vinyl ketone in 33% yield (together with other products) with PCl<sub>5</sub> at -10° see (2), from 2-chlorobutene-2 (3:7105) (together with other products) by actn. of Cl<sub>2</sub> at 350° see (9); for formn. of  $\bar{C}$  (together with other products) from trimethylethylene + Cl<sub>2</sub> see (11).]

$\bar{C}$  passed over silica gel or clay at 245-275° loses HCl yielding (4) 17-18% 3-chlorobutadiene-1,3 ("Chloroprene") (3:7080).

$\bar{C}$  on hydrolysis with steam (12), or aq. alk. (5) (12), or aq. K<sub>2</sub>CO<sub>3</sub> (2), aq. Na<sub>2</sub>CO<sub>3</sub> (70-80% yield (4)) or CaCO<sub>3</sub> (3) gives 3-chlorobuten-2-ol-1 (3:8207) q.v., b.p. 161-162°. — [Note that  $\bar{C}$  with alc. alk. does not hydrolyze or lose HCl but instead gives the corresp. ethers (see details under 3-chlorobuten-2-ol-1 (3:8207)).]

$\bar{C}$  with Cl<sub>2</sub> yields (13) (14) (15) a mixt. of 2,3,4-trichlorobutene-1 (3:9064), 1,2,3,3-tetrachlorobutane (3:9080), and 1,2,2,3,4-pentachlorobutane (3:9070).

Colorless liq. — miscible with aq. (see also below) and most org. solv.

## MISCELLANEOUS PHYSICAL PROPERTIES

### BINARY SYSTEMS CONTAINING $\bar{\text{C}}$

$\bar{\text{C}}$  + water. For values of  $D_4^{20}$  and  $n_D^{20}$  (also  $n_D^{20}$ ,  $n_D^{20}$ ,  $n_D^{20}$ ) over whole range 0-100%  $\bar{\text{C}}$  see (6) cf (22) (23); for thermal anal. of systems see (26). — For study of salting-out of  $\bar{\text{C}}$  from its aq. solns. (11) or its isolation by ether extraction of aq. solns. satd. with NaCl or  $\text{Na}_2\text{CO}_3$  (27) see indic. refs. — For concn. of  $\bar{\text{C}}$ , i.e., dehydration of its aq. solns. by distn. of the water with  $\text{C}_6\text{H}_6$  (28), with 1,2-dichloroethane (ethylene dichloride) (3:5130) (29), or with cyclohexanol (1:6415) (30) see indic. refs. — See also below under azeotropes.

Note that boilg. aq. solns. of  $\bar{\text{C}}$  undergo slow decompn., e.g., about 10% in 8 hrs. (23), 50% in 5 hrs. (107) cf (11) (presumably by loss of HCl and evoln. of ethylene oxide (1:6105), b.p. 10.7°, and/or (38) acetaldehyde (1:0100), b.p. 20.2°.

$\bar{\text{C}}$  with hydrocarbons.  $\bar{\text{C}}$  with  $\text{C}_6\text{H}_6$  (1:7400): for b.p., vapor-liq. equil., and  $n_D^{25}$  see (10). —  $\bar{\text{C}}$  with toluene (1:7405): for b.p., vapor-liq. equil., and  $n_D^{25}$  see (10) (see also below under azeotropes).

$\bar{\text{C}}$  with alcohols.  $\bar{\text{C}}$  with butanol-1 (1:6180): for b.p., vapor-liq. equil., and  $n_D^{25}$  see (10). —  $\bar{\text{C}}$  with isobutyl alc. (1:6165): for b.p., vapor-liq. equil., and  $n_D^{25}$  see (10).

$\bar{\text{C}}$  with ethers.  $\bar{\text{C}}$  with di-isopropyl ether (1:6125): for b.p., vapor-liq. equil., and

$n_D^{25}$  see (10). —  $\bar{C}$  with *di-n-butyl ether* (1:7950): for b.p., vapor-liq. equil., and  $n_D^{25}$  see (10). —  $\bar{C}$  with  $\beta,\beta'$ -dichloro-diethyl ether (3:6025): for b.p., vapor-liq. equil., and  $n_D^{25}$  see (10) (see below under azeotropes).

$\bar{C}$  with chlorinated hydrocarbons.  $\bar{C}$  with 1,2-dichloroethane (ethylene dichloride) (3:5130): for b.p., vapor-liq. equil., and  $D$  see (31) (see also below under azeotropes). (For use of ethylene dichloride in dehydration of  $\bar{C}$  see (30).)

#### AZEOTROPES CONTAINING $\bar{C}$

Binary azeotropes.  $\bar{C}$  with water forms a const.-boilg. mixt., b.p. 97.85° nt 760 mm. (26) (8), 97.8° at 760 mm. (23) (32), contg. 45.8 wt. % (8), 43.5 wt. % = 14.7 mole % (32)  $\bar{C}$ : constants for this azeotropic mixt. at other press. include the following: at 771 mm., b.p. 96-96.2° (26); at 735 mm., b.p. = 95.8° (33) (11), contg. 42.5 wt. %  $\bar{C}$  (33) (11); at 504 mm., b.p. = 86.4° (23); at 400 mm., b.p. = 80.55°, contg. 40.5 wt. %  $\bar{C}$  (23). — Note that compn. changes only slightly (23) with press. — For study of influence of NaCl (11) (23) or of HCl (11) see indic. refs.

$\bar{C}$  with toluene (1:7405) gives a const.-boilg. mixt., b.p. 106.9°, contg. 27 mole %  $\bar{C}$  (10). —  $\bar{C}$  with *di-n-butyl ether* (1:7950) gives a const.-boilg. mixt., b.p. 123.0°, contg. 68 mole %  $\bar{C}$  (10). —  $\bar{C}$  with  $\beta,\beta'$ -dichlorodiethyl ether (3:6025) gives a const.-boilg. mixt., b.p. 123.2°, contg. 91.8 mole %  $\bar{C}$  (10).

Ternary azeotropes:  $\bar{C}$  with aq. +  $C_6H_6$  (1:7400) gives a const.-boilg. mixt., b.p. 67.0-67.3° (20). —  $\bar{C}$  with aq. + ethylene dichloride (3:5130) gives a const.-boilg. mixt., b.p. 69.6° (29). —  $\bar{C}$  with aq. + 1,1,2-trichloroethylene (3:5170) gives a const.-boilg. mixt., b.p. 70.8-71.5° (29).

#### MISCELLANEOUS PHYSICAL PROPERTIES OF $\bar{C}$

[For sepn. of  $\bar{C}$  from gas mixts. by adsorption (?) on  $Mg(ClO_4)_2$  or other perchlorates see (34).]

#### USES OF $\bar{C}$

The manifold uses of  $\bar{C}$ , based upon both its physical and its chemical characteristics, cannot here be reviewed in detail; however, some examples include the following.

[For use in sepn. of butadiene from hydrocarbon mixts. (35), in dewaxing and removing naphthenes from mineral lubricating oils (36), in refining of rosin (37), in extraction of pine lignin (38) (39), as solv. for various resins (40), as solv. for cellulose acetate (41) or cellulose ethers (42), for addn. to rayon spinning baths (43) see indic. refs.]

#### PHYSIOLOGICAL AND BIOCHEM. BEHAVIOR OF $\bar{C}$

[For study of pharmacol. of  $\bar{C}$  (or its phosphoric esters, etc.) see (44); for reports of poisoning by  $\bar{C}$  see (45) (46); for study of toxicity of vapor of  $\bar{C}$  see (403).]

[For effect of  $\bar{C}$  upon amylase (47) (48) or lipase (49) see indic. refs.; for use of  $\bar{C}$  in prod. of yeast of depressed enzymatic activity see (50).]

#### DETERMINATION OF $\bar{C}$

[For colorimetric detn. of  $\bar{C}$  by reactn. with diazotized sulfanilic acid in alk. soln. at 25° see (106) (note that method involves oxidn. of  $\bar{C}$  by the reagt. to chloroacetaldehyde (3:7212) and color formn. with latter); for detn. of  $\bar{C}$  in aq. solns. by refractometry see (11) (25) (6) (23).]

PREPARATION OF  $\bar{C}$ 

From ethylene. With hypochlorous acid, e.g., from  $Cl_2 + aq.$  —  $\bar{C}$  is usually prepd. from ethylene by addn. of HOCl; the HOCl may be obtained by use of  $Cl_2 + aq.$  (sometimes in the pres. of alk. acceptors for the simultaneously formed HCl), by use of organic hypochlorites, or other org. cpds. which hydrolyze to give HOCl.

[For scientific papers discussing prepn. of  $\bar{C}$  from ethylene + HOCl ( $Cl_2 + aq.$ ) see (401) (11) (51) (52) (53) (54) (55) (56) (57) (58) (59); for very old work see (60); for examples of patents employing this method see citations (61)–(82) cf. (402), inclusive; for study of metal-corrosion problems involved in this method of prepn. of  $\bar{C}$  see (83).]

With organic hypochlorites (e.g., *ter*-butyl hypochlorite (3:7165)). [For patents on prepn. of  $\bar{C}$  from ethylene + *ter*-butyl hypochlorite see (84) (85).]

With *N*-chlorourea. [For prepn. of  $\bar{C}$  from ethylene with *N*-chlorourea in 5%  $H_2SO_4$  contg.  $CuCl_2$  at  $0^\circ$  (yield: 60–70%  $\bar{C}$  accompanied by 2% ethylene dichloride (3:5130)) see (86).]

From ethylene glycol (1:6465). [For prepn. of  $\bar{C}$  from ethylene glycol satd. with HCl gas and htd. in s.t. (12) (90), or treated at  $160^\circ$  (87) (4) or  $180^\circ$  (88) with stream of HCl (yields: 70–80% (88), 60% (87)), see indie. refs.; note that ethylene glycol with excess conc. HCl in s.t. at  $100^\circ$  gives no  $\bar{C}$  (89) but only ethylene dichloride (3:5130), while mere distn. with conc. HCl (9 moles) gives (15) only 12%  $\bar{C}$ .)]

[For prepn. of  $\bar{C}$  from ethylene glycol with  $S_2Cl_2$  (2.5 wt. pts. (91)) on refluxing (yields: 82.5% (92), 72.8% (91)) (93) (94) (95) see indie. refs.; for formn. of  $\bar{C}$  from glycol with  $SiCl_4$  see (96).]

From ethylene glycol esters. [For patents on prepn. of  $\bar{C}$  from ethylene glycol diformate (1:3402) with HCl gas at  $100^\circ$  via formn. of  $\beta$ -chloroethyl formate and subsequent alcoholysis of latter with MeOH/HCl (97), or from ethylene glycol diacetate (1:3511) with EtOH + HCl at  $125$ – $135^\circ$  under press. (EtOAc is also formed) (98), see indie. refs.]

From ethylene oxide (1:6106). [For formn. of  $\bar{C}$  from ethylene oxide with liq. HCl (99) or with  $S_2Cl_2$  (100) (other prods. are also formed) see indie. refs.]

From other miscellaneous sources. [For formn. of  $\bar{C}$  from 1,2-dichloroethane (ethylene dichloride) (3:5130) by conversion with  $SO_3$  below  $45^\circ$  to  $\beta$ -chloroethyl chlorosulfonate (see below) and subsequent hydrolysis to  $\bar{C}$  (101); from *bis*-( $\beta$ -chloroethyl) sulfate (see below) by refluxing with aq. (102); from  $\beta$ -chloroethyl trichloroacetate (3:6410) by shaking with aq. (103); from  $\beta$ -chloroethyl vinyl ether (3:7464) on distn. with aq. + trace of HCl (acetaldehyde is also formed) (104); from chloroacetaldehyde (3:7212) by reduction of carbonyl group with EtOMgBr (105) see indie. refs.]

CHEMICAL BEHAVIOR OF  $\bar{C}$ 

Pyrolysis of  $\bar{C}$ . [ $\bar{C}$  in s.t. at  $184^\circ$  for 10 hrs. yields (107) 1,2-dichloroethane (ethylene dichloride) (3:5130) and acetaldehyde (1:0100) (the latter partially as aldehyde resin); for study of rate of decompn. of  $\bar{C}$  at  $365^\circ$  see (108).]

## BEHAVIOR WITH INORGANIC REACTANTS

Reduction of  $\bar{C}$ . [ $\bar{C}$  with Na/Hg + aq. (109), or  $\bar{C}$  in aq. soln. in pres. of alk. with  $H_2$  at atm. press. + cat. (110), yields ethyl alcohol (1:6130); in latter method reduction is facilitated by NaOH, less so by  $Ca(OH)_2$  or  $CaCO_3$ ; using Pd/ $CaCO_3$  yield of EtOH is 91%; using Ni yield of EtOH is 80% accompanied by 20% ethylene glycol (1:6465) (110).]

Oxidation of  $\bar{C}$ .  $\bar{C}$  on oxidn. with  $CrO_3$  yields (111) chloroacetic acid (3:1370).

Behavior with  $\text{H}_2\text{O}$ .  $\bar{\text{C}}$  on boilg. with aq. undergoes gradual decomposition: e.g., 10% in 8 hrs. (23), 50% in 5 hrs. (107) cf. (11), presumably by loss of  $\text{HCl}$  and formation of ethylene oxide (1:6105), acetaldehyde (1:0100) etc. — [Note that  $\bar{\text{C}}$  with aq. vapor over  $\text{ZnCl}_2 + \text{ZnO}$  at 250–255° yields (112) acetaldehyde (1:0100).]

Behavior with inorganic acids. (See also below under behavior with salts of inorganic acids.)

With  $\text{H}_2\text{SO}_4$ .  $\bar{\text{C}}$  with conc.  $\text{H}_2\text{SO}_4$  readily dissolves and according to conditions yields either  $\beta$ -chloroethyl hydrogen sulfate or *bis*-( $\beta$ -chloroethyl) ether. (Note that  $\bar{\text{C}}$  with  $\text{SO}_2\text{Cl}_2$  (see below) gives *bis*-( $\beta$ -chloroethyl) sulfate.)

[For study of rate and extent of formn. of  $\beta$ -chloroethyl  $\text{HSO}_4$  with conc. or fuming  $\text{H}_2\text{SO}_4$  at 25° see (14); for reactn. of harium salt of this prod. with aniline see (113).]

$\bar{\text{C}}$  with conc.  $\text{H}_2\text{SO}_4$  (17% by wt. of  $\bar{\text{C}}$ ) refluxed 6 hrs. gives (114) *bis*-( $\beta$ -chloroethyl) ether (3:6025).

With  $\text{HNO}_3$ .  $\bar{\text{C}}$  with  $\text{HNO}_3/\text{H}_2\text{SO}_4$  (115) (116) gives (92% yield (115))  $\beta$ -chloroethyl nitrate,  $\text{ClCH}_2\text{CH}_2\text{ONO}_2$ , h.p. 149–150°; for use of this prod. in explosives see (115) (117); for use as ignition accelerator in Diesel engine fuels see (118) (119) (120).]

With  $\text{HNO}_2$ .  $\bar{\text{C}}$  with  $\text{HNO}_2$  (from  $\text{NaNO}_2 + \text{HCl}$ ) at  $-5^\circ$  gives (70% yield (121)) (122) (123)  $\beta$ -chloroethyl nitrite  $\text{ClCH}_2\text{CH}_2\text{ONO}$ , b.p. 90–91° (121), 89–89.5° (122),  $D_4^{20} = 1.212$  (122),  $n_D^{20} = 1.4125$  (122). (This prod. is not to be confused with the isomeric chloro-nitro-ethanes Beil. I-101.)]

Behavior with salts of inorganic acids. (For behavior with  $\text{NaCN}$ , anhyd.  $\text{Na}_2\text{CO}_3$ ,  $\text{NaSCN}$ , etc., see further below under organic reactants; for behavior with  $\text{NaSH}$  see further below under alkali reactants.)

With alkali iodides.  $\bar{\text{C}}$  with  $\text{NaI}$  in hot alc. (124) (125) or boiling acetone (126) for 16 hrs. (127) (better 4 hrs. (20)), or with  $\text{KI}$  in alc. at room temp. for 24 hrs. (128) gives (95% yield (127))  $\beta$ -iodoethanol (ethylene glycol iodohydrin), b.p. 176–177° dec. (124), 86–87° at 25 mm. (20), 85–88° at 25 mm. (127), 85° at 25 mm. (124), 61° at 7 mm. (4),  $D_4^{20} = 2.1968$  (4),  $n_D^{20} = 1.57134$  (24). [For study of rate of reaction of  $\bar{\text{C}}$  with  $\text{KI}$  in dry acetone at 50° and 60° see (16).]

With alkali sulfides (for alkali sulfhydrates, e.g.,  $\text{NaSH}$ , see below). — [ $\bar{\text{C}}$  with aq.  $\text{K}_2\text{S}$  (129) or with aq.  $\text{Na}_2\text{S}$  (11) (130) (131) (132) at 30–35° for 1 hr. (33) splits out 2  $\text{NaCl}$  giving (yields: 90–95% (11), 79–86% (33)) *bis*-( $\beta$ -hydroxyethyl) sulfide (“thiodiglycol”) [Beil. I-470, I<sub>1</sub>-(244), I<sub>2</sub>-(525)], b.p. 164–166° at 20 mm (33), 130° at 2 mm. (131), 104° at 0.005 mm. (132), f.p. =  $-16^\circ$  (132),  $D_4^{20} = 1.1821$  (132), 1.1819 (132),  $n_D^{20} = 1.52031$  (132), misc. with aq., readily sol. alc., acetone,  $\text{EtOAc}$ , or  $\text{CHCl}_3$ , but spar. sol. ether,  $\text{C}_6\text{H}_6$ , or  $\text{CCl}_4$  (131) (corresp. dibenzoate, m.p. 65° (133), di-(*p*-nitrobenzoate), m.p. 107.7° (134), *bis*-(*N*-phenylcarbamate), m.p. 128.5–129.5° (131)). — Note that this prod. (“thiodiglycol”) with  $\bar{\text{C}}$  at 100° for 13 hrs. (131) adds to form *tris*-( $\beta$ -hydroxyethyl)sulfonium chloride  $(\text{HOCH}_2\text{CH}_2)_3\text{SCl}$ , non-hygroscopic ndls., m.p. 126–127° (132), 125–126° (131). Note also that  $\bar{\text{C}}$  (1 mole) +  $\text{Na}_2\text{S}$  + 1-chloropropanol-2 (propylene chlorohydrin) (3:7747) yields (135) a mixed deriv., viz.,  $\beta$ -hydroxyethyl  $\beta$ -hydroxy-*n*-propyl sulfide.]

With alkali selenide.  $\bar{\text{C}}$  with aq.  $\text{Na}_2\text{Se}$  yields (136) *bis*-( $\beta$ -hydroxyethyl) selenide.]

With alkali disulfide.  $\bar{\text{C}}$  with aq.  $\text{Na}_2\text{S}_2 + \text{S}$  gives (46% yield (137)) (138) *bis*-( $\beta$ -hydroxyethyl) disulfide [Beil. I-471, I<sub>2</sub>-(528)], h.p. 155° at 30 mm.,  $D_4^{20} = 1.3375$  (137).]

With  $\text{NaHSO}_3$ .  $\bar{\text{C}}$  with solid  $\text{NaHSO}_3$  in a.t. at 170–180° for several hrs. gives (139) the salt of 2-hydroxyethanesulfonic acid-1 (“isethionic acid”).]

With  $\text{Na}_3\text{PO}_4$ .  $\bar{\text{C}}$  with satd. aq.  $\text{Na}_3\text{PO}_4$  as directed (140) cf. (3) gives (30% yield (140)) di-sodium  $\beta$ -hydroxyethyl phosphate, *cryst.* from aq. alc. as hexahydrate, m.p. 61° (140).]

With  $\text{Na}_3\text{AsO}_3$ .  $\bar{\text{C}}$  with aq. alk.  $\text{Na}_3\text{AsO}_3$  (from  $\text{As}_2\text{O}_3$  in aq. alk.) as directed (141) (142) (143) cf. (144) (145) gives  $\beta$ -hydroxyethylarsonic acid (also known as  $\beta$ -hydroxyethylarsinic acid) =  $\text{HOCH}_2\text{CH}_2\text{AsO}(\text{OH})_2$ , very sol. aq. but forming spar. sol. monohydrated calcium salt (141)]

With  $\text{Na}_2\text{SnO}_3$ .  $\bar{\text{C}}$  with aq. alk.  $\text{Na}_2\text{SnO}_3$  (from  $\text{SnCl}_2 + \text{aq. NaOH}$ ) gives (146) salt of  $\beta$ -hydroxyethylstannonic acid =  $\text{HOCH}_2\text{CH}_2\text{SnO}(\text{OH})_2$ .

Behavior with acid halides of inorganic acids. With thionyl chloride ( $\text{SOCl}_2$ ).  $\bar{\text{C}}$  with  $\text{SOCl}_2$  (small excess) in cold gives (83% yield (147))  $\beta$ -chloroethylsulfenyl chloride =  $\text{ClCH}_2\text{CH}_2\text{OS}(\text{O})\text{Cl}$ , h.p. 93–95° at 40 mm., 84–85° at 20 mm.,  $D_4^{20} = 1.5010$ , which upon attempted distn. at ord. press. dec. into  $\text{SO}_2 +$  ethylene (di)chloride (3:5130) (147). — However,  $\bar{\text{C}}$  (excess) with  $\text{SOCl}_2$  at elevated temp. (147) or  $\bar{\text{C}}$  (1 mole) with  $\text{SOCl}_2$  (1 mole) in cold (148) gives (75% yield (148)) cf. (156) *bis*-( $\beta$ -chloroethyl) sulfite =  $(\text{ClCH}_2\text{CH}_2\text{O})_2\text{SO}$ , b.p. 133° at 12 mm. (148), 117.5–118° at 4 mm. (147),  $D_4^{20} = 1.422$ ,  $n_D^{20} = 1.481$  (148).]

With sulfuryl chloride ( $\text{SO}_2\text{Cl}_2$ ).  $\bar{\text{C}}$  with  $\text{SO}_2\text{Cl}_2$  in cold gives (149) (70% yield (122))  $\beta$ -chloroethyl chlorosulfonate =  $\text{ClCH}_2\text{CH}_2\text{O}\cdot\text{SO}_2\text{Cl}$  [Beil. I-2-(336)], b.p. 101° at 23 mm.,  $D_4^{20} = 1.552$ ,  $n_D^{20} = 1.4537$  (122). — However,  $\bar{\text{C}}$  with  $\text{SO}_2\text{Cl}_2$  under reflux (121) (or  $\beta$ -chloroethyl chlorosulfonate +  $\beta$ -chloroethyl nitrite (above) (122)) gives (50% yield (121)) *bis*-( $\beta$ -chloroethyl) sulfate =  $(\text{ClCH}_2\text{CH}_2\text{O})_2\text{SO}_2$  [Beil. I-2-(336)], b.p. 154–154.5° at 8 mm. (121), 130° at 3.5 mm. (122), m.p. + 11° (121),  $D_4^{20} = 1.4801$  (121),  $n_D^{20} = 1.4622$  (121), 1.4620 (122)].

With phosphoryl chloride ( $\text{POCl}_3$ ).  $\bar{\text{C}}$  with  $\text{POCl}_3$  at 0° (150) or in  $\text{CCl}_4$  at room temp. (151) gives (46–47% yield (151))  $\beta$ -chloroethylphosphoryl dichloride =  $\text{ClCH}_2\text{CH}_2\text{OP}(\text{O})\text{Cl}_2$  [Beil. I-2-(337)], b.p. 108–110° at 15 mm. (151). —  $\bar{\text{C}}$  with  $\text{POCl}_3$  in pyridine at –20° gives (140) the salt of mono-( $\beta$ -chloroethyl)phosphoric acid =  $\text{ClCH}_2\text{CH}_2\text{OP}(\text{O})(\text{OH})_2$  [Beil. I-1-(170), I-2-(336)]. —  $\bar{\text{C}}$  with  $\text{POCl}_3$  in  $\text{CCl}_4$  refluxed 16 hrs. gives (60% yield (152) cf. (140)) tri-( $\beta$ -chloroethyl) phosphate =  $(\text{ClCH}_2\text{CH}_2\text{O})_3\text{PO}$  [Beil. I-2-(337)], h.p. 180–182° at 2–3 mm.,  $D_4^{20} = 1.423$  (152). — For patent on reaction of  $\bar{\text{C}}$  with  $\text{POCl}_3$  see (153).]

With boron trifluoride ( $\text{BF}_3$ ).  $\bar{\text{C}}$  with  $\text{BF}_3$  forms a molecular compound (154)  $\text{BF}_3 \cdot 2\bar{\text{C}}$  which can be distilled in vac. without decompn.; b.p. 59° at 2 mm.,  $D_4^{20} = 1.4009$ ,  $n_D^{17} = 1.40841$  (154)].

With silicon tetrachloride ( $\text{SiCl}_4$ ).  $\bar{\text{C}}$  (4 moles) with  $\text{SiCl}_4$  (1 mole) yields (155) (96) tetra-( $\beta$ -chloroethyl) orthosilicate,  $(\text{ClCH}_2\text{CH}_2\text{O})_4\text{Si}$  [Beil. I-337, I-2-(337)], h.p. 195–200° at 15 mm. (156), 170–180° at 8 mm. (96) (also obtd. (156) from  $\text{SiCl}_4 + \beta$ -chloroethyl nitrite (above)).]

Behavior with alkalis.  $\bar{\text{C}}$  with alkalis (or appropriate acid acceptors) loses  $\text{HCl}$  to yield according to conditions either ethylene glycol (1:6465) or ethylene oxide (1:6105).

[E.g.,  $\bar{\text{C}}$  with aq.  $\text{NaOH}$  on htg. hydrolyzes to ethylene glycol (1:6465), for general articles on this process see (54) (157) (158) (22); for studies of kinetics of the reaction see (404) (18) (159) (160) (161); for examples of patents on hydrolysis of  $\bar{\text{C}}$  to ethylene glycol by use of aq. alkali or alkaline-earth hydronides, carbonates, or bicarbonates see (162) (163) (63) (164) (165) (166) (167).]

$\bar{\text{C}}$  added dropwise to 70% aq.  $\text{NaOH}$  (168) (169) or hot  $\text{CaO}$  (170) gives ethylene oxide (1:6105), h.p. +10.7°; for patents on this conversion see (171) (172) (173) (174) (175).]

Behavior with alkali sulfhydryte.  $\bar{\text{C}}$  with  $\text{NaSH}$  (from  $\text{Na}_2\text{S} \cdot 9\text{H}_2\text{O}$  satd. with  $\text{H}_2\text{S}$  (137)) at 55–65° (137) (176) or  $\bar{\text{C}}$  with  $\text{NaSH}$  in alc. for 36 hrs. at room temp. (177) gives (yields: 55% (176), 50–55% (137), 26–30% (177))  $\beta$ -hydroxyethyl mercaptan (“monothioethylene glycol”) =  $\text{HOCH}_2\text{CH}_2\text{SH}$  [Beil. I-470, I-2-(523)], h.p. 157–158° dec. at 742

mm. (178), 61° at 18 mm. (179), 58° at 18 mm. (137), 55° at 13 mm. (178), 52° at 12 mm. (177);  $D_4^{20} = 1.1143$  (178);  $n_D^{20} = 1.4996$  (178) (corresp. *bis*-(*N*-phenyl)carbamate, m.p. 146° (178); corresp. metallic mercaptide derivs. many of which have m.p.'s (178).]

**Behavior with ammonia** (for amines see below under behavior with organic reactants).  $\bar{C}$  with aq.  $NH_4OH$  gives (180) a mixt. of three hydroxyamines, viz.,  $\beta$ -hydroxyethylamine (2-aminoethanol-1) [Beil. IV-274, IV<sub>1</sub>-(424), IV<sub>2</sub>-(717)]; *bis*-( $\beta$ -hydroxyethyl)amine ("diethanolamine") [Beil. IV-283, IV<sub>2</sub>-(729)]; and *tris*-( $\beta$ -hydroxyethyl)amine ("triethanolamine") [Beil. IV-285, IV<sub>2</sub>-(729)]. — Although all three of these products are now extremely important industrial compounds, they are usually manufactured from ethylene oxide with  $NH_3$  and details lie beyond the scope of this text. — However, for a useful monograph see (181).]

**Behavior with hydrazine** ( $NH_2NH_2$ ).  $\bar{C}$  with 1 mole hydrazine loses HCl yielding (182)  $\beta$ -hydroxyethylhydrazine + hydrazine hydrochloride;  $\bar{C}$  with 2-3 moles hydrazine yields (182) ethylene oxide accompanied by a little *N,N*-*bis*-( $\beta$ -hydroxyethyl)hydrazine.]

#### BEHAVIOR OF $\bar{C}$ WITH ORGANIC REACTANTS

**Behavior with hydrocarbons.**  $\bar{C}$  with  $C_6H_6$  +  $AlCl_3$  (followed by aq.) is claimed (183) to yield  $\beta$ -phenylethyl alc. (1:6505), but this has subsequently been denied (184) where 1,2-diphenylethane (bibenzyl) (1:7149) and resin were the only prods. ohnd. (See also below under behavior of  $\bar{C}$  with organometallic cpds.)]

**Behavior with organic hydroxyl compounds.** With *alcohols* (see also below under carbohydrates).  $\bar{C}$  (anhydrous) with sodium alkoxides (from prim. or sec. aliphatic or arom. alcs. + Na) on htg. splits out NaCl giving the corresp. mono ethers of ethylene glycol.

[E.g.,  $\bar{C}$  with NaOMe gives (35% yield (185))  $\beta$ -hydroxyethyl methyl ether (1:6405) q.v.;  $\bar{C}$  with NaOEt gives (60% yield (185))  $\beta$ -hydroxyethyl ethyl ether (1:6410) q.v.;  $\bar{C}$  with NaOPr gives (40% yield (185))  $\beta$ -hydroxyethyl *n*-propyl ether (1:6414) q.v.;  $\bar{C}$  with NaOisPr gives (25% yield (185))  $\beta$ -hydroxyethyl isopropyl ether (1:6413) q.v.;  $\bar{C}$  with NaOBn gives (30% yield (185))  $\beta$ -hydroxyethyl *n*-butyl ether (1:6430) q.v.;  $\bar{C}$  with NaOis-Bu gives (36% yield (185))  $\beta$ -hydroxyethyl isohutyl ether (1:6235-A);  $\bar{C}$  with NaOAm gives (30% yield (185))  $\beta$ -hydroxyethyl *n*-amyl ether, b.p. 181° at 745 mm. (185).]  $\bar{C}$  with  $NaOCH_2C_6H_5$  similarly gives (186) (187) ethylene glycol monobenzyl ether (1:6533) q.v.]

With *carbohydrates* (or their relatives).  $\bar{C}$  with *d*-glucose + HCl yields (188) cf. (189) 2-chloroethyl-*d*-glucoside.]

$\bar{C}$  with "acetobromoglucose" +  $Ag_2CO_3$  (190) (193) in  $C_6H_6$  (189) (191) gives (yields: 69% (189), 45-50% (190)) tetra-acetyl- $\beta$ -*d*-( $\beta$ -chloroethyl)glucoside (tetra-acetyl- $\beta$ -*d*-glucosido-ethylene chlorohydrin), m.p. 119-120° (192), 118.5-119.5° (189), 114° cor. (190) (191). — For isomerization of this prod. (in boilg.  $CHCl_3$  for 6½ hrs.) to tetra-acetyl- $\alpha$ -*d*-( $\beta$ -chloroethyl)glucoside, m.p. 82-83°, see (194).]

$\bar{C}$  with "acetobromogalactose" +  $Ag_2CO_3$  (190) (194) in  $C_6H_6$  (191) gives (77% yield (194)) tetra-acetyl- $\beta$ -*d*-( $\beta$ -chloroethyl)galactoside, m.p. 117° cor. (190) (191), 115.5-116.5° (194).]

[For analogous prepn. from  $\bar{C}$  of triacetyl- $\beta$ -*d*-( $\beta$ -chloroethyl)xyloside, m.p. 137° cor., or of hepta-acetyl- $\beta$ -*d*-( $\beta$ -chloroethyl)lactoside, m.p. 78-80°, see (190) (191).]

[For condens. of  $\bar{C}$  with mannitol (1:5830) or sorbitol (1:5820) see (195).]

[For use of  $\bar{C}$  in degradation ("depolymerization") of cellulose or starch see (196) (197); for use of  $\bar{C}$  + NaOH in introduction of  $\beta$ -hydroxyethyl groups into cellulose see (198).]

With *aliphatic mercaptans*.  $\bar{C}$  with salts of alkyl or alkaryl mercaptans gives the corresp. S-monoethers of monothioethylene glycol.

[E.g.,  $\bar{C}$  with NaSMe in abs. alc. (199) (200) or ether (201) (202) or less advantageously

$\bar{C}$  with KSMc in aq. alc. (201) gives (yields 74–82% (199), 78% (201), 40% (199))  $\beta$ -hydroxyethyl methyl sulfide (*2-methylmercaptethanol*) [Beil. I-470 (524)], b.p. 80–85° at 30 mm. (201), 68–70° at 30 mm. (201), 68–70° at 30 mm. (201). —  $\bar{C}$  with MeI in dry ether.

iodide, hygroscop. cryst. from MeOH/ether, m.p. 60–62° (202). —  $\bar{C}$  with EtSH in alc./NaOEt (203), in alc. KOH (132), or even in conc. aq. KOH (204) gives (yield 70–74% (203))  $\beta$ -hydroxyethyl ethyl sulfide [Beil. I-470, I-7(525)], h.p. 184° (204) (132), 182–184° u.e. (203),  $D_4^{20} = 1.0166$  (132),  $n_D^{20} = 1.48669$  (132).]

[ $\bar{C}$  with *n*-BuSH in hot aq. NaOH refluxed 1 hr. gives (81% yield (205))  $\beta$ -hydroxyethyl *n*-butyl sulfide [Beil. I-7(525)], h.p. 92–93° at 3 mm.,  $D_4^{25} = 0.9693$ ,  $n_D^{20} = 1.4800$  (205). —  $\bar{C}$  with allyl mercaptan in conc. aq. KOH gives (50% yield (206))  $\beta$ -hydroxyethyl allyl sulfide [Beil. I-7(525)], h.p. 91° at 12 mm.,  $D_4^{20} = 1.0283$  (206). —  $\bar{C}$  with  $\text{NaSCH}_2\text{C}_6\text{H}_5$  in aq. soln. gives (100% yield (179))  $\beta$ -hydroxyethyl benzyl sulfide, b.p. 169° at 18 mm.]

[ $\bar{C}$  with ethylene dithioglycol ( $\text{HSC}_2\text{H}_4\text{CH}_2\text{SH}$ ) + powdered NaOH htd. 1 hr. gives (177) ethylene dithioglycol bis-( $\beta$ -hydroxyethyl ether) =  $\text{HOCH}_2\text{CH}_2\text{—S—CH}_2\text{CH}_2\text{—S—CH}_2\text{CH}_2\text{OH}$  [Beil. I-7(533)], lts., m.p. 62–63°.]

**With phenols.** [ $\bar{C}$  with phenol (1:1420) in aq. NaOH (207) or alc. NaOEt (208), or  $\bar{C}$  with  $\text{NaOC}_6\text{H}_5$  on htg. (17) (209), or  $\bar{C}$  with  $\text{KOC}_6\text{H}_5$  at 150° for 6 hrs. (210), or  $\bar{C}$  with phenol salt refluxed 8 hrs. (211) gives (yields: 84% (17), 79% (207), 55–62% (211), 50% (209))  $\beta$ -hydroxyethyl phenyl ether ( $\beta$ -phenoxyethanol) (1:6518) q.v., b.p. at 80 mm. = 165° (211), 163–166° (208), 163–167° (210), h.p. 128–130° at 20 mm. (17), 134–135° at 18 mm. (209). — (Note that  $\bar{C}$  with  $\text{NaOC}_6\text{H}_5$  in pres. of  $\text{Et}_3\text{N}$  gave only 12.5% yield (212) of  $\beta$ -phenoxyethanol.)]

[Similarly  $\bar{C}$  with aq. sodium *o*-nitrophenolate in s.t. at 125° for 20 hrs. gives (213)  $\beta$ -(*o*-nitrophenoxy)ethanol, oil, b.p. 180–182° at 4 mm., m.p. 35–36° (215) (corresp. acetate, oil; corresp. benzoate, m.p. 75–76° (213));  $\bar{C}$  with *m*-nitrophenol with 40% aq. KOH at 100° for 2 hrs. (213), or with 2 *N* NaOH refluxed 4 hrs. (214), gives  $\beta$ -(*m*-nitrophenoxy)ethanol, m.p. 90–91° (213), 88° (214), 87–88° (216);  $\bar{C}$  with sodium *p*-nitrophenolate in 50% alc. in s.t. at 120° for 23 hrs. (213), or in boilg. AmOH (216) (217), gives  $\beta$ -(*p*-nitrophenoxy)ethanol, m.p. 101–102° (213), 94–95° (216), 92–94° (215) (corresp. acetate, m.p. 85–87°, corresp. benzoate, m.p. 116° (213)).]

[Analogous condensations of  $\bar{C}$  with other monohydric phenols include the following: for  $\bar{C}$  with *o*-cresol (1:1400) (218), with  $\beta$ -naphthol (1:1540) (218), with *m*-methoxyphenol (1:1765) (219) (220) (221), with methyl *p*-hydroxybenzoate (1:1549) (222), with *p*-bromophenol (218), with *p*-acetylaminophenol (213), with *m*-diethylaminophenol (212), with 8-hydroxyquinoline (212) see indie. refs.]

[Analogous condensations of  $\bar{C}$  with polyhydric phenols include the following: with pyrocatechol (1:1520) (223), resorcinol (1:1530) (224) (218), 4-acetylresorcinol (219), 4-ethylresorcinol (219) see indie. refs.]

**With thiophenols.** [ $\bar{C}$  with thiophenol in alc. NaOEt (225) (203) or in 10% aq. KOH (226) gives (76% yield (203))  $\beta$ -hydroxyethyl phenyl sulfide, b.p. 245° (203), 144.5° at 26 mm. (203), 134–135° at 7 mm. (225), 115–116° at 2 mm. (226),  $D_4^{20} = 1.1431$  (226),  $n_D^{20} = 1.5897$  (225),  $n_D^{20} = 1.5917$  (226). —  $\bar{C}$  with *p*-tolyl mercaptan in conc. aq. NaOH at 100° for 2 hrs. gives (83% yield (133)) (227)  $\beta$ -hydroxyethyl *p*-tolyl sulfide, h.p. 282–283° dec., 174° at 30 mm. (133).]

[For analogous condens. of  $\bar{C}$  with *o*-nitrophenyl mercaptan (228), *m*-nitrophenyl mercaptan (228), *p*-nitrophenyl mercaptan (228) (229), *o*-carboxythiophenol (230), and many other thiophenols (231) see indie. refs.]

**Behavior of  $\bar{C}$  with organic ethers (or epoxy cpds.).** [ $\bar{C}$  with ethylene oxide (1:6105) + conc.  $\text{H}_2\text{SO}_4$  gives (30–35% yield (232)) 2-( $\beta$ -chloroethoxy)ethanol-1 (3:9185) accompanied

by other prods.: for behavior of  $\bar{C}$  with epichlorohydrin (3:5358) or with  $\alpha$ -ethyl- $\alpha$ -methyl-ethylene oxide see (232). —  $\bar{C}$  with  $\alpha,\beta$ -dichlorodiethyl ether (3:9150) stood 24 hrs. at room temp., then htd. 1 hr., gives (27% yield (233)) acetaldehyde bis-( $\beta$ -chloroethyl) acetal. (see below). —  $\bar{C}$  with bis-( $\alpha$ -chloroethyl) sulfide gives (234)  $\beta$ -trithioacetaldehyde, m.p. 125°. — For behavior of  $\bar{C}$  with 2,3-dichlorodioxane (3:9105) see (235); with 1,4-dithiane see (131).]

Behavior of  $\bar{C}$  with carbonyl compounds.  $\bar{C}$  with aldehydes or their polymers. [ $\bar{C}$  with paraformaldehyde (1:0080) + dry HCl gas gives (yields: 65% (237), 55% (236)) (238) (239) chloromethyl  $\beta$ -chloroethyl ether [Beil. I-581, I<sub>2</sub>-(645)], b.p. 145-147° (237), 46° at 10 mm. (236);  $D_4^{20} = 1.2817$  (237), 1.2814 (236);  $n_D^{20} = 1.4578$  (236), 1.4592 (237). — Note that this prod. with  $\bar{C}$  (239), or  $\bar{C}$  (8 wt. pts.) + paraformaldehyde (1 wt. pt.) +  $\text{CaCl}_2$  + HCl gas refluxed 5 min. (35) gives formaldehyde bis-( $\beta$ -chloroethyl)acetal [Beil. I-575], b.p. 218-219° (239), 218.1° at 760 mm. (240), b.p. 93-94° at 11 mm. (38), now an industrial prod. in U.S. because of its use in manufact. of self-sealing gasoline tanks (240).]

[ $\bar{C}$  with acetaldehyde (1:0100) (241) (233) or paraldehyde (1:0170) (236) + HCl gas gives according to circumstances either  $\alpha$ -chloroethyl  $\beta$ -chloroethyl ether (3:9150) q.v. or acetaldehyde bis-( $\beta$ -chloroethyl)acetal, b.p. 194-196° dec. (233), 109-110° at 30 mm. (20), 106° at 17 mm.,  $D_4^{19} = 1.1712$ ,  $n_D^{16.2} = 1.4532$  (233).]

[ $\bar{C}$  with propionaldehyde (1:0110) + HCl gas gives (51% yield (236))  $\beta$ -chloroethyl  $\alpha$ -chloro-*n*-propyl ether, b.p. 60° at 10 mm.,  $D_4^{20} = 1.1399$ ,  $n_D^{20} = 1.4496$  (236).]

[ $\bar{C}$  with *n*-butyraldehyde (1:0130) + HCl gas gives (70% yield (236))  $\beta$ -chloroethyl  $\alpha$ -chloro-*n*-butyl ether, b.p. 71° at 10 mm.,  $D_4^{20} = 1.1009$ ,  $n_D^{20} = 1.4471$  (236).]

$\bar{C}$  with diketene. [ $\bar{C}$  with diketene (242) gives (243)  $\beta$ -chloroethyl acetoacetate.]

Behavior of  $\bar{C}$  with organic acids.  $\bar{C}$  with organic acids under appropriate conditions behaves conventionally as a substituted ethyl alcohol yielding the corresponding  $\beta$ -chloroethyl esters. Since the number of possibilities is enormous, no attempt can be made here to list all such cases; only a few typical examples must suffice. Note, moreover, that, because during ordinary esterification hydrolysis of the chlorine atom of  $\bar{C}$  may occur, many esters of  $\bar{C}$  are best made from its reaction with acyl halides q.v.

[ $\bar{C}$  with anhydrous formic acid (1:1003) in pres. of anhydr.  $\text{Na}_2\text{SO}_4$  (244) or of HCl gas (245) gives  $\beta$ -chloroethyl formate, b.p. 132° at 764 mm. (245), 127-129° at 768 mm. (244),  $D_4^{20} = 1.2214$  (244); for study of rate of esterification of  $\bar{C}$  by formic acid under various circumstances see (246).]

[ $\bar{C}$  with anhydr. oxalic acid (1:0535 on satn. with HCl gas and htd. at 100° gives (245) di-( $\beta$ -chloroethyl) oxalate (3:0572), m.p. 45°.]

[ $\bar{C}$  with 2-hydroxy-5-methylbenzoic acid (*p*-cresotinic acid) + conc.  $\text{H}_2\text{SO}_4$  gives  $\beta$ -chloroethyl *p*-cresotinate, b.p. 136-139° at 10 mm. (247).]

[ $\bar{C}$  with *p*-aminobenzoic acid + conc.  $\text{H}_2\text{SO}_4$  gives (248) (249)  $\beta$ -chloroethyl *p*-aminobenzoate.]

Behavior of  $\bar{C}$  with salts of organic acids.  $\bar{C}$  with sodium salts of organic acids on htd. eliminates NaCl yielding the corresp.  $\beta$ -hydroxyethyl esters; however, not infrequently secondary reactions of this product then occur or can readily be caused to occur, such as loss of water, ring closure, etc.

[ $\bar{C}$  with aq. NaCN at 45-50° for 5 hrs. (250) (251), or with alc. NaCN at 100° for 6 hrs. (58) (27), or with KCN in 50% alc. (252) or boilg. alc. (253) (254), gives (yields: 86% (27), 85-95% (251), 79-80% (250), 71% (253))  $\beta$ -hydroxyethyl cyanide ( $\beta$ -hydroxypropionitrile = hydracrylonitrile = ethylene cyanohydrin) [Beil. III-298, III<sub>1</sub>-(113), III<sub>2</sub>-(213)], b.p. 116-118° at 20 mm. (250), 110° at 15 mm. (27) (253), 107-109° at 12 mm. (250).]

[ $\bar{C}$  (1 mole) with  $\text{NaHCO}_3$  (1 mole solid) or with  $\text{Na}_2\text{CO}_3$  ( $\frac{1}{2}$  mole solid) as directed (255) is claimed to give (80% yield) monomeric ethylene glycol carbonate  $(\text{CH}_2)_2\text{O}_2\text{CO}$ .]

[ $\bar{C}$  (1 mole) with KSCN (1 mole) in excess  $\bar{C}$  (1.5 moles as solv.) on warming does not yield the expected  $\beta$ -hydroxyethyl thiocyanate, since this prod. spontaneously undergoes bimolecular self-condensation evolving COS and producing (45% yield (256)) 1-( $\beta$ -hydroxyethyl)imidazolidithione-2, m.p. 167–168° dec.; for behavior of this prod. with ethereal HCl see (257).]

[ $\bar{C}$  with NaOBz at 145° (258) or  $\bar{C}$  with NaOBz + a little  $Et_2NH$  at 130° for 4 hrs. (259), or  $\bar{C}$  with KOBz as directed (260), gives (yields: 85% (259), 33% (260)) ethylene glycol monobenzoate ( $\beta$ -hydroxyethyl benzoate), m.p. 36.5–37.5° (261), 36–37° (260) cf. (259); b.p. 173° at 21 mm. (259), 156° at 14 mm. (260), 150–151° at 10 mm. (261) (corresp. p-toluenesulfonate, m.p. 74–75° (262)).]

[ $\bar{C}$  with Na p-nitrobenzoate + a little  $Et_2NH$  at 130° for 4 hrs. (259), or  $\bar{C}$  with K p-nitrobenzoate in  $C_6H_6$  in s.t. at 100° (263), gives (yields: 83% (259), 60% (263)) ethylene

indic. refs.]

Behavior of  $\bar{C}$  with acid chlorides of organic acids.  $\bar{C}$  with acid chlorides of organic acids behaves as a substituted primary alcohol splitting out H from its OH with Cl from the acid chloride to yield the corresp.  $\beta$ -chloroethyl esters. No attempt can be made here to list all possible cases, but the following text will furnish ample illustrative examples.

With acid chlorides of aliphatic acids. [ $\bar{C}$  with acetyl chloride (3:7085) gives (yields: 90% (267), 82% (248)) (268)  $\beta$ -chloroethyl acetate (3:5735) q.v. —  $\bar{C}$  with trichloroacetyl chloride (3:5420) + pyridine in ether gives (45% yield (103)) (275)  $\beta$ -chloroethyl trichloroacetate (3:6510) q.v. —  $\bar{C}$  with sorbly chloride ( $CH_2CH=CH-CH=CH-CO.Cl$ ) [Beil. I-484, I-(453)] gives alm. quant (269)  $\beta$ -chloroethyl sorbate, b.p. 115° at 15 mm. (269). — For studies of rate of reactn. of  $\bar{C}$  with various acyl chlorides in dioxane soln. at 15°, 25°, and 35° see (270). —  $\bar{C}$  with malonyl (di)chloride (3:9030) gives bis-( $\beta$ -chloroethyl) malonate, b.p. 164° at 15 mm. (271).]

With various chloroformates.  $\bar{C}$  with carbonyl chloride (phosgene) (3:5000) at room temp. gives (61% yield (274))  $\beta$ -chloroethyl chloroformate (3:5780) q.v. [ $\beta$ -chloroethyl chloroformate (3:5780) below] is formed.]

(274)  $\beta$ -chloroethyl trichloromethyl carbonate =  $ClCH_2CH_2O.CO.O.CCl_3$ , h.p. 115° at 16 mm., 110° at 12 mm.,  $D_4^{20} = 1.5664$ ,  $n_D^{20} = 1.4748$  (274).]

[ $\bar{C}$  with  $\beta$ -chloroethyl chloroformate (3:5780) gives (70% yield (121)) di-( $\beta$ -chloroethyl) carbonate (3:6790) q.v.]

With acid chlorides of aromatic acids. [ $\bar{C}$  with benzoyl chloride on htg. gives (yields: 90% (276), 84.5% (277), 55% (263))  $\beta$ -chloroethyl benzoate (3:8860) q.v.]

Behavior of  $\bar{C}$  with organic esters of inorganic acids. [ $\bar{C}$  with  $Me_2SO_4$  at 120° as directed gives (60% yield (126))  $\beta$ -chloroethyl methyl ether ( $\beta$ -methoxyethyl chloride) (3:7265) q.v.]

[ $\bar{C}$  with  $Et_2SO_4$  + solid NaOH on htg. gives (278) ethylene glycol monoethyl ether ("Cellosolve") (1:6410); note, however, that  $\bar{C}$  with  $EtOH$  + conc.  $H_2SO_4$  at 145° gives (279)  $\beta$ -chloroethyl ethyl ether (3:7463).]

[ $\bar{C}$  (1 mole) with ethyl metaphosphate (1 mole) stood 4 days at room temp. (280) cf. (281) gives  $\beta$ -chloroethyl ethyl hydrogen phosphate (isolated as harium salt); however,  $\bar{C}$  + ethyl metaphosphate in  $CHCl_3$  refluxed 3 hrs. gives (140)  $\beta$ -chloroethyl dihydrogen phosphate (isolated as harium salt).]

$\bar{C}$  with organic hypochlorites (or mixtures which yield them) gives ethers [e.g.,  $\bar{C}$  with *tert*-butyl hypochlorite (3:7165) + ethylene gives (60.8% yield (282))  $\beta, \beta'$ -dichlorodiethyl

ether (3:6025). —  $\bar{C}$  with *N,N*-dichlorobenzenesulfonamide + butene-1 in  $\text{CHCl}_3$  at  $-15^\circ$  gives (283) (probably via formn. and addn. of  $\beta$ -chloroethyl hypochlorite) 1-chloro-2-( $\beta$ -chloroethoxy)butane, b.p.  $195.5^\circ$ ,  $D_4^{20} = 1.1223$ ,  $n_D^{20} = 1.453$ ; the use of butene-2 or of 2-methylpropene (isobutylene) gives analogous products (283) cf. (284).]

Behavior of  $\bar{C}$  with organometallic compounds (or their equivalents). [ $\bar{C}$  with  $\text{KC}_6\text{H}_5$  splits out  $\text{KCl}$  yielding (285)  $\beta$ -phenylethyl alc. (1:6505).]

$\bar{C}$  with arom.  $\text{RMgX}$  cpds. reacts in analogous fashion yielding the corresp. alcohols [e.g.,  $\bar{C}$  with  $\text{C}_6\text{H}_5\text{MgBr}$  (287) (288) or  $\text{C}_6\text{H}_5\text{MgCl}$  (289) gives (95% yield (286))  $\beta$ -phenylethyl alc. (1:6505);  $\bar{C}$  with *o*-tolyl  $\text{MgBr}$  gives (20–24% yield (290)) (287)  $\beta$ -(*o*-tolyl)-ethanol;  $\bar{C}$  with *m*-tolyl  $\text{MgBr}$  gives (20–24% yield (290))  $\beta$ -(*m*-tolyl)ethanol;  $\bar{C}$  with *p*-tolyl  $\text{MgBr}$  gives (yields: 80% (291), 20–24% (290)) (287)  $\beta$ -(*p*-tolyl) ethanol; many other analogous cases are known].

[Note that  $\bar{C}$  with  $\text{C}_2\text{H}_5\text{MgBr}$  gives (292)  $\text{ClCH}_2\text{CH}_2\text{OMgBr}$  which may then be reacted with  $\text{RMgBr}$  types as above (292).]

[ $\bar{C}$  with diethyl malonate in alc.  $\text{NaOEt}$  (i.e., diethyl disodiomalonnate) might be expected to yield diethyl *bis*-( $\beta$ -hydroxyethyl)malonnate; this compd., however, is unknown since it loses 2  $\text{EtOH}$ , ring-closing to (271) the spiro-dilactone of *bis*-( $\beta$ -hydroxyethyl)malonic acid [Beil. XIX<sub>1</sub>-(680)], m.p.  $109\text{--}110^\circ$ .] — [Note also that  $\bar{C}$  (1 mole) with diethyl malonate (1 mole) + 1%  $\text{HCl}$  gas undergoes transesterification yielding (405) both  $\beta$ -chloroethyl ethyl malonate, b.p.  $105\text{--}106^\circ$  at 3 mm., and *bis*-( $\beta$ -chloroethyl) malonate, b.p.  $142\text{--}143^\circ$  at 3 mm.]

[ $\bar{C}$  with ethyl acetoacetate + alc.  $\text{NaOEt}$  (i.e., ethyl sodio-acetoacetate) boiled 5 hrs. gives a prod. (probably lactone of  $\alpha$ -( $\beta$ -hydroxyethyl)acetoacetic acid) which with 10%  $\text{HCl}$  after 5 hrs. boiling gives (40% yield (293)) pentanone-4-ol-1 ( $\gamma$ -aceto-*n*-propyl alc.) [Beil. I-831, I<sub>1</sub>-(422), I<sub>2</sub>-(873)], b.p.  $115\text{--}116^\circ$  at 20 mm. (204),  $D_4^{20} = 1.0071$  (205),  $n_D^{20} = 1.439$  (294) (corresp. semicarbazone, m.p.  $167\text{--}168^\circ$  (296)): note that this prod. (which is an important intermediate in the prepn. of the antimalarial "Atabrine" (297)) is best prepd. from ethylene oxide + ethyl sodioacetoacetate which gives first (60% yield (294)) the lactone of  $\alpha$ -( $\beta$ -hydroxyethyl)acetoacetic acid, b.p.  $142\text{--}143^\circ$  at 30 mm.,  $n_D^{20} = 1.4562$ , which with warm  $\text{HCl}$  ring-opens and splits off  $\text{AcOH}$  giving (66% yield (294)) desired  $\gamma$ -aceto-*n*-propyl alc. (above).]

[ $\bar{C}$  + sodium phenobarbital (Na deriv. of 5-ethyl-5-phenylbarbituric acid) gives (60% yield (298)) 1-( $\beta$ -hydroxyethyl)phenobarbital, m.p.  $145.0\text{--}145.5^\circ$  cor. (note that this prod. is *not* obtd. from  $\bar{C}$  + Ag salt of phenobarbital). —  $\bar{C}$  with theobromine (3,7-dimethylxanthine) in aq.  $\text{NaOH}$  in s.t. at  $125^\circ$  for 6 hrs. gives (47–57% yield (366)) (367) 1-( $\beta$ -hydroxyethyl)theobromine, m.p.  $194^\circ$  (367),  $193^\circ$  (366).]

Behavior of  $\bar{C}$  with amines. With primary aliphatic amines. [ $\bar{C}$  (1 mole) with aq.  $\text{MeNH}_2$  (1 mole) at  $110^\circ$  for 12–24 hrs gives (80% yield (299))  $\beta$ -(methylamino)ethanol [Beil. IV-276, IV<sub>2</sub>-(718)], h.p.  $159^\circ$  (300) (301),  $155\text{--}156^\circ$  at 760 mm. (273) (corresp. 3,5-dinitrobenzoate, m.p.  $195\text{--}196.5^\circ$  (302); corresp.  $\text{B.PkOH}$ ,  $148^\circ$  (303); corresp. reaction prod. with  $\alpha$ -naphthyl isothiocyanate, viz., *N*-( $\beta$ -hydroxyethyl)-*N*-methyl-*N'*-( $\alpha$ -naphthyl) thiourea, m.p.  $125^\circ$  (303)). —  $\bar{C}$  with excess aq.  $\text{MeNH}_2$  on standing in s.t. at  $100^\circ$  for several hrs. (304) or  $\bar{C}$  with  $\beta$ -(methylamino)ethanol (above) in aq. at  $120^\circ$  (299) gives methyl-*bis*-( $\beta$ -hydroxyethyl)amine (*N*-methyl-diethanolamine) [Beil. IV-284, IV<sub>2</sub>-(729)], b.p.  $115^\circ$  at 5 mm. (240) (note that this prod. is new commercial chem. in U.S. (240)).]

[ $\bar{C}$  with  $\text{EtNH}_2$  as above should give  $\beta$ -(ethylamino)ethanol [Beil. IV-282, IV<sub>2</sub>-(727)], b.p.  $167\text{--}169^\circ$  cor. at 751 mm.,  $D_4^{20} = 0.914$ ,  $n_D^{20} = 1.444$ , and (305) ethyl-*bis*-( $\beta$ -hydroxyethyl)amine (*N*-ethyl-diethanolamine) [Beil. IV-284], although both these prods. are usually prepd. from ethylene oxide.]

[For analogous reactn. of  $\bar{C}$  with *n*-heptadecylamine yielding *N*-( $\beta$ -hydroxyethyl)-*n*-

heptadecylamine see (306) (307); with cyclohexylamine yielding *N*-( $\beta$ -hydroxyethyl)-cyclohexylamine see (308).]

With primary aromatic amines  $\bar{C}$  (1 mole) with aniline (1 mole) refluxed a short time (299) (309) (310) (311) (312) (313) gives (yields: 70% (309), 40% (311)) *N*-( $\beta$ -hydroxyethyl)aniline ( $\beta$ -phenylaminoethanol) [Beil. XII-182], b.p. 286° cor. (299),  $n_D^{20} = 1.5740$  (317) (note that by reactn. of a second mole of  $\bar{C}$  some *N,N*-bis-( $\beta$ -hydroxyethyl)aniline (see below) may also form, and that some *N,N'*-diphenylethylenediamine, m.p. 63.4–64.2°, may also appear (311)), note also that *N*-( $\beta$ -hydroxyethyl)aniline on dehydration, e.g. by htg. in xylene with  $P_2O_5$  (310), reacts bimolecularly giving in small yield *N,N'*-diphenylpiperazine, m.p. 160–162° (310) —  $\bar{C}$  (2 moles) with aniline (1 mole) especially in pres. of anhydr.  $Na_2CO_3$  (310) or NaOH (314) or aq. at 110° (299) gives *N,N*-bis-( $\beta$ -hydroxyethyl)aniline (*N*-phenyldiethanolamine) [Beil. XII-183, XII-(167)], m.p. 58° (315), 53.5–54° (310); note that this prod. on htg. at 200° under reduced press. (314) or htg. with  $P_2O_5$  in xylene (310) or htg. with 70%  $H_2SO_4$  at 160° (316) loses water and ring-closes to *N*-phenylmorpholine [Beil. XXVII-6], m.p. 53° (299), 52° (310).]

$\bar{C}$  (1 mole) with *o*-toluidine (2 moles) at 120–130° for several hrs. (318) (313) gives  $\beta$ -(*o*-tolylamino)ethanol, b.p. 172° at 12 mm. (318), 145–150° at 3 mm. (317),  $n_D^{20} = 1.5675$  (317); note that in pres. of  $Na_2CO_3$  the main (318) prod. (because of bimolecular condens. of this prod.) is *N,N'*-di-*o*-tolylpiperazine [Beil. XXIII-8], m.p. 174°. —  $\bar{C}$  with *p*-toluidine on htg. gives (319)  $\beta$ -(*p*-tolylamino)ethanol [Beil. XII-907], b.p. 177–178° at 14 mm. (319), m.p. 42–43° (317); note, however, that analogous bimolecular ring closure of this prod. readily occurs on htg. yielding (320) *N,N'*-di(*p*-tolyl)piperazine [Beil. XX(II)-9], m.p. 190°.]

$\bar{C}$  with *o*-methoxyaniline (*o*-anisidine) at 100° for 48 hrs. gives (75–80% yield (321)) (299)  $\beta$ -(*o*-methoxyphenylamino)ethanol [Beil. XIII-367], b.p. 303° cor. (299) (corresp.  $HCl$ , m.p. 131°;  $H.PkOH$ , m.p. 140° (321)), note that this prod. with 5 pts. conc.  $HCl$  in *s.t.* at 160–180° gives by a remarkable elimination of  $MeOH$  and monomolecular ring closure (38% yield (321)) (299) "phenmorpholine" [Beil. XXVII-31], b.p. 268° cor. (299), 127–128° at 12 mm. (321). —  $\bar{C}$  with *p*-ethoxyaniline (*p*-phenetidine) gives on htg. (319)  $\beta$ -(*p*-ethoxyphenylamino)ethanol, m.p. 67°, b.p. 190° at 11 mm. (319) cf. (322).]

Many other cases, analogous to the above examples, are also known but cannot be included here.

With secondary aliphatic amines. Because of the great importance of  $\beta$ -(dialkylamino)-ethanols in the prepn. and study of physiologically active compounds, much study has been given to their prepn. from  $\bar{C}$  (and otherwise). From the resulting mass of data, the following examples are cited.

$\bar{C}$  with  $Me_2NH$  gives (323)  $\beta$ -(dimethylamino)ethanol [Beil. IV-276, IV-(425), IV-(719)], b.p. 135° cor. at 758 mm.,  $D_4^{20} = 0.8556$ ,  $n_D^{20} = 1.4300$  (324) (corresp. *p*-nitrobenzoyl ester, m.p. 55° (325)). —  $\bar{C}$  with  $Et_2NH$  on htg. (326) under reflux for 8 hrs. (327) or in pres. of NaOH under press. at 160° for 3 hrs. (328) gives (yields: 83% (328), 68–70% (327))  $\beta$ -(diethylamino)ethanol [Beil. IV-282, IV-(727)], b.p. 163° at 760 mm. (329), 160° at 741 mm., 160° at 80 mm., 96° at 73 mm., 53° at 10 mm. (330), 42–44° at 8 mm. (329);  $D_4^{20} = 0.8501$  (329);  $n_D^{20} = 1.4409$  (329), 1.4389 (330) (corresp. *N*-(*p*-nitrophenyl)carbamate, m.p. 59–60° cor. (329)).]

$\bar{C}$  with di-*n*-propylamine under reflux gives (70% yield (331))  $\beta$ -(di-*n*-propylamino)-ethanol [Beil. IV-282], b.p. 99–92° at 22 mm. (331) (corresp. *p*-nitrobenzoyl ester hydrochloride, m.p. 133.5–134.5° (325)). —  $\bar{C}$  with di-*n*-butylamine on htg. gives (332) (333)  $\beta$ -(di-*n*-butylamino)ethanol, b.p. 225–230° at 760 mm., *sl. dec.* (332), 226–228° at 738 mm. (332), 90–91° at 7 mm. (333);  $D_4^{20} = 0.8624$  (325);  $n_D^{20} = 1.4444$  (325) (corresp. *p*-nitrobenzoyl ester hydrochloride, m.p. 92.5–93.5° (325) (332)). —  $\bar{C}$  with di-(*sec*-butyl)amine

isocyanate but always by indirect means; note also that on short boilg. with aq. or alc. alk. it loses HCl and by ring closure yields 3-phenyloxazolidone [Beil. XXVII-136], lfts. from alc., m.p. 124° (272), 122° (309).]

⑥  $\beta$ -Chloroethyl *N*-(*p*-bromophenyl)carbamate: pl. from lgr.; m.p. 88–89° (400). [From  $\bar{C}$  with *p*-bromobenzazide (400).]

⑦  $\beta$ -Chloroethyl *N*-( $\alpha$ -naphthyl)carbamate [Beil. XII-1236]: m.p. 102–103° (373), 101° (391) (93), 100–101° (309). [From  $\bar{C}$  with  $\alpha$ -naphthyl isocyanate (391) (373); also from  $\beta$ -chloroethyl chloroformate (3:5780) with  $\alpha$ -naphthylamine (309): note also that with dil. KOH (309) this prod. loses HCl ring-closing to 3-( $\alpha$ -naphthyl)-oxazolidone-2 [Beil. XXVII-136], m.p. 125° (309), while with conc. KOH it merely undergoes hydrolysis of chlorine yielding *N*-( $\beta$ -hydroxyethyl)- $\alpha$ -naphthylamine, m.p. 52° (309).]

—  $\beta$ -Chloroethyl *N*-( $\beta$ -naphthyl)carbamate [Beil. XII-1292]: m.p. 98° (309). [Prepd. indirectly from  $\beta$ -chloroethyl chloroformate (3:5780) with  $\beta$ -naphthylamine (309); for behavior with dil. and conc. KOH analogous to preceding case see (309).]

⑧  $\beta$ -Chloroethyl *N*-carbamidocarbamate ( $\beta$ -chloroethyl allophanate) [Beil. III<sub>2</sub>-(56)]: m.p. 182.5° (392), 181–182° (388). [From  $\bar{C}$  with vapors of isocyanic acid (392) or from  $\beta$ -chloroethyl chloroformate (3:5780) with urea (388).]

— *N*-( $\beta$ -hydroxyethyl)phthalimide = ( $\beta$ -(*N*-phthalimido)ethanol) [Beil. XXI-469, XXI<sub>1</sub>-(368)]: m.p. 129.5° cor. (394), 127–128° (395), 126.5–127.6° (357), 126–127° (396), 125–120° (397) (note that m.p. given by (393) is incorrect). [From  $\bar{C}$  with K phthalimide in a.t. at 150° for 4 hrs. (393): note that the m.p. of 88–89° reported by the only worker (393) using this method is not far from that (81° (395)) of *N*-( $\beta$ -chloroethyl)phthalimide leaving some question as to which prod. was really obt'd.].

⑨ *N*-( $\beta$ -hydroxyethyl)tetrachlorophthalimide: m.p. 208–209° (398). [From  $\bar{C}$  with K tetrachlorophthalimide in a.t. at 200° for 6 hrs. (398).]

—  $\beta$ -Chloroethyl triphenylmethyl ether: m.p. 132° (399). [From  $\bar{C}$  with  $\alpha$ -bromo-triphenylmethane (399).]

3:5552 (1) — 1952 1953 1954 1955 1956 1957 1958 1959 1960 1961 1962 1963 1964 1965 1966 1967 1968 1969 1970 1971 1972 1973 1974 1975 1976 1977 1978 1979 1980 1981 1982 1983 1984 1985 1986 1987 1988  40-50° at 10 mm. (2)

Liquid, insol. aq., sol. alc. or ether. —  $\bar{C}$  readily polymerizes (see below).

### PREPARATION OF $\bar{C}$

[For prepn. of  $\bar{C}$  from acrolein (1:6115) with dry  $HCl$  gas at -10 to -15° (yields: 87% (5), 65% (4), (6) (7) (8) (9) (10) see indic. refs.; note that since  $HCl$  is present much of the prod. may appear as the trimer (see below), for prepn. of  $\bar{C}$  from its trimer (see below) by distillation at ord. press. see (1), for prepn. of  $\bar{C}$  from 1,2-dichloropropene-1 (3:5280) by cat. vapor-phase hydration see (20).]

tives) formerly (4) regarded as *cis* and *trans* stereoisomers of  $\bar{C}$  may very probably be  $\bar{C}$  and its synionic isomer (3:7480).

[For prepn. of  $\bar{C}$  from 1,2,3-trichloro-2-methylpropane (3:5885) by dehydrochlorination with quinoline (73-85% yield) see (7).]

[For prepn. of  $\bar{C}$  from 1,1-dichloro-2-methylpropene-2 (3:7480) by hgt. under reflux see (2); for formn. of  $\bar{C}$  (together with other products) from 2-methylpropene-1 (isobutylene) (60% yield (5)) (1) +  $Cl_2$ , or from 3-chloro-2-methylpropene-1 (isohutenyl chloride) (3:7145) with  $Cl_2$  (1 mole) +  $NaHCO_3$  (1.5 moles) at 0° (2) see indic. refs.; for formn. of  $\bar{C}$  (20% yield (6)) (together with other products) from 1,3-dichloro-2-methylpropanol-2 (3:5977) + strong oxygen acids see (6); for formn. of  $\bar{C}$  (46% yield (3)) from 1,3-dichloro-2-methylpropanol-2 (3:5977) by hgt. with  $P_2O_5$  for 2 hrs. at 110-115° see (3).]

$\bar{C}$  on hydrolysis with aq. +  $CaCO_3$  (2) (4) or aq. +  $MgO$  (4) gives (2) (3) (46% yield (4)) 1-chloro-2-methylpropen-1-ol-3 (3-chloro-2-methylallyl alc.) (3:8340) q.v.

$\bar{C}$  with  $O_3$  followed by hydrolysis yields (2) (3) (5) chloroacetone (3:5425).

$\bar{C}$  treated with  $Cl_2$  in the dark at 0° for 37 hrs. yields (4) 1,1,2,3-tetrachloro-2-methylpropane (3:6165) + other products.

$\bar{C}$  with cuprous cyanide refluxed 9-10 hrs. gives (67% yield (7)) 4-chloro-3-methylbuten-3-nitrile-1, h.p. 70-73° at 10 mm.,  $D_4^{20} = 1.0856$ ,  $n_D^{20} = 1.4643$  (7); this product on hydrolysis with hot conc.  $HCl$  for 2 hrs. gives (7) 4-chloro-3-methylbuten-3-oic acid-1, m.p. 35° (corresp. phenylhydrazide, m.p. 147-148°).

3:5590 (1) Pogorshelski, *J. Russ. Phys.-Chem. Soc.* 36, 1129-1184 (1904); *Cent.* 1905, 1 668, (2) Tishchenko, *J. Gen. Chem. 3:5605 3,3,3-TRICHLORO-2-METHYLPROPENE-1  $C_4H_5Cl_3$  Beil. S.N. 11  
(1,1,1-Trichloro-2-methylpropene-2)

B.P. 132° (1)

$D_4^{20} = 1.293$  (1)

$n_D^{20} = 1.479$  (1)

Note:  $\bar{C}$  readily undergoes allylic transposition so that in reactns. of  $\bar{C}$  products derived from the isomeric 1,1,3-trichloro-2-methylpropene-1 (3:5025) may be expected (1) (2) (3) (4).

[For prepn. of  $\bar{C}$  (yield: 30-43% (4), 15% (1)) from  $\beta,\beta,\beta$ -trichloro-*ter*-butyl alc. ("Chlore-tone") (3:2662) by hgt. to 200° with  $P_2O_5$  and dimethylaniline (1) or quinoline (4) see indic. refs.] [A 57% yield of the isomeric 1,1,3-trichloro-2-methylpropene-1 (3:5025) together with some  $\alpha$ -chloroisohutyric acid (3:0235) is separated from  $\bar{C}$  by redistillation (1).]

$\bar{C}$  on hydrolysis by hoihg. 1 dny with aq.  $Na_3PO_4$  gives (60% yield (2)) 3,3-dichloro-2-methylpropen-2-ol-1, h.p. 78-79°,  $D_4^{20} = 1.298$ ,  $n_D^{20} = 1.493$  (*p*-nitrobenzoate, m.p. 91°, *N*-phenylcarbamate, m.p. 64° (2)).

$\bar{C}$  on hgt. with  $NaOAc$  +  $AcOH$  gives (2) 3,3-dichloro-2-methylpropen-2-yl acetate, b.p. 79° at 12 mm.,  $D_4^{20} = 1.257$ ,  $n_D^{20} = 1.4718$  (2). [With hoihg.  $NaOH$  this regenerates the corresp. alc. (2).]

$\bar{C}$  with  $NaOEt$  gives in the cold 70% yield (2) of 3,3-dichloro-2-methylpropen-2-yl ethyl ether, h.p. 56° at 12 mm.,  $D_4^{20} = 1.1285$ ,  $n_D^{20} = 1.4610$  (2).

$\bar{C}$  in AcOH treated with  $O_3$ , then hydrolyzed, gives (70% yield)  $\alpha, \alpha, \alpha$ -trichloroacetone (3:5620), b.p. 133-134° (1).

[For behavior of  $\bar{C}$  with  $PCl_5$ , with HF, or with HF + anisole see (4).]

⑥ 2,3-Dibromo-1,1,1-trichloro-2-methylpropane: m.p. 34° (1). [From  $\bar{C}$  +  $Br_2$  without solvent; crude prod. recrystd. from alc. at -10° (1); cf., however, (4).]

⑦ 3,3-Dichloro-2-methylpropen-2-yl  $\beta$ -nitrobenzoate: m.p. 01° (2). [From  $\bar{C}$  on boilg. with dil. alc. soln. of K  $\beta$ -nitrobenzoate (2).]

3:5605 (1) Jacob, *Bull. soc. chim.* (5) 7, 581-586 (1940). (2) Kirmann, Jacob, *Bull. soc. chim.* (5) 7, 586-593 (1940). (3) Kirmann, Jacob, *Compt. rend.* 203, 1528-1529 (1936). (4) Price, Marshall, *J. Org. Chem.* 8, 532-535 (1943)

3:5615 1,2-DICHLOROBUTENE-2  
(high-boilg. stereoisomer)

B.P. 132-134° at 762 mm. (1)  
125-127° (2)

$D_4^{20} = 1.1597$  (2)  $n_D^{20} = 1.4590$  (2)  
 $D_4^{18} = 1.1601$  (2)  $n_D^{18} = 1.4635$  (2)  
 $D_4^{16} = 1.1771$  (1)  $n_D^{16} = 1.4710$  (1)

[See also low-boilg. stereoisomer (3:5360).]

[For prepn. of  $\bar{C}$  (together with its stereoisomer (3:5360)) from 1,2,3-trichlorobutane (3:5935) with KOH at 150° (2), or from 2,2-dichlorobutane (3:7415) or 2,3-dichlorobutane (3:7615) with alc. KOH (5), see indic. refs.; for formn. of  $\bar{C}$  (together with its stereoisomer and also 2,4-dichlorobutene-2 (3:5550)) from 2-chlorobutene-2 (3:7105) by actn. of  $Cl_2$  at 350° see (3).]

$\bar{C}$  with 1 mole  $Cl_2$  + 1.5 moles  $NaHCO_3$  at 0° gives (100% yield (4)) 1,2,2,3-tetrachlorobutane (3:9078).

$\bar{C}$  on hydrolysis by htg. with 2 pts. aq. + 1 mole powdered  $CaCO_3$  at 70° for 4 hrs. gives (1) a mixt. of about equal parts of 2-chlorobuten-2-ol-1 (3:8240) and (by allylic transposition) 3-chlorobuten-3-ol-2 (3:9115).

$\bar{C}$  on oxidn. with  $KMnO_4$  in acetone gives (1) chloroacetic acid (3:1370) + AcOH (1:1010) + HCl. —  $\bar{C}$  in  $CCl_4$  at -17° treated with  $O_3$  followed by aq. gives acetaldehyde (1:0100).

3:5615 (1) Tishchenko, *J. Gen. Chem. (U.S.S.R.)* 7, 658-662 (1937); *Cent.* 1937, II 371; *C.A.* 31, 5754 (1937). (2) Tishchenko, Churbakov, *J. Gen. Chem. (U.S.S.R.)* 8, 1232-1246 (1938); *Cent.* 1939, II 4222; *C.A.* 33, 4190 (1939). (5) Tishchenko, Churbakov, *J. Gen. Chem. (U.S.S.R.)* 7, 663-666 (1937); *Cent.* 1937, II 371; *C.A.* 31, 5764 (1937).

3:5620 1,1,1-TRICHLOROPROPANONE-2  
( $\alpha, \alpha, \alpha$ -Trichloroacetone;  
methyl trichloromethyl ketone)

B.P. 134° (1) (3)  
133-134° (2)  
60° at 54 mm. (1)  
57° at 48 mm. (1)  
27.5-28° at 10 mm. (3)

$D_4^{20} = 1.435$  (3)  $n_D^{20} = 1.4602$  (3)  
 $D_4^{17.1} = 1.4380$  (3)

Limpid colorless liq. with faintly camphoraceous odor. — Insol. aq., but volatile with steam (3). —  $\bar{C}$  is not lachrymatory.

[For prepn. from 1,1,1-trichloro-2-methylpropene-2 (3:5605) with  $O_3$  in AcOH, followed by hydrolysis (76% yield) see (2); from corresp. alc., 1,1,1-trichloropropanol-2 (3:0846), by oxidn. with  $K_2Cr_2O_7/H_2SO_4$  see (3); from 2-trichloromethyl-2,4,4-trimethyl-1,3-dioxolone-5 (Beil. XIX-1-(656)) by hydrolytic cleavage with AcOH/HCl (60% yield) see (1); for formn. of  $\bar{C}$  (together with other prodn.) from propanol-2 (1:6135) with  $Cl_2$  (4), from chloroacetone (3:5425) with  $Cl_2$  at  $30-40^\circ$  (5), or from trichloroacetyl chloride (3:5420) with MoZnI (1) see indic. refs. — Note that the prod. from chloral + diazomethane, formerly supposed (6) to have been  $\bar{C}$ , has since been shown (7) (8) to be 3,3,3-trichloro-1,2-epoxypropane (3:5700) ("γ,γ,γ-trichloropropylene oxide").]

[ $\bar{C}$  on reduction with  $Al(C_2H_5)_3.H_2O$  in ether (9) or with fused  $Al(OEt)_3$  in abs. alc. under  $H_2$  or  $N_2$  (10) gives yields: 67% (10), 65% (9)] 1,1,1-trichloropropanol-2 (3:0846).]

[ $\bar{C}$  resists further chlorination; e.g.,  $\bar{C}$  with  $SO_2Cl_2$  (1 mole) on protracted htg. at  $180^\circ$  yields (3) 1,1,1,3-tetrachloropropanone-2 (3:6085), b.p.  $71-72^\circ$  at 13 mm., hydrate, m.p.  $65^\circ$  (3).]

[ $\bar{C}$  with diazomethane in dry ether gives (83% yield (3)) 1,1,1-trichloro-2-methyl-2,3-epoxypropane, b.p.  $51^\circ$  at 10 mm., m.p.  $53-54^\circ$  (3).]

⑤ Cleavage with aq. alkali:  $\bar{C}$  with aq. alk. even in cold splits almost instantly (1) (2) into chloroform (3:5050) and acetic acid (1:1010).

⑥ 1,1,1-Trichloropropanone-2 semicarbazone: m.p.  $140^\circ$  dec. (on Hg bath) (1) (11).

[From  $\bar{C}$  with semicarbazide HCl in pres. of NaOAc, or with free semicarbazide (11).]

 $134-135^\circ$ 

(4)

 $133-135^\circ$  at 760 mm. (14)

 $30^\circ$  at 10 mm. (2)

Colorless mobile liq. with penetrating odor. —  $\bar{C}$  fumes in air and gradually deposits hydrated oxalic acid (1:0445) (17). —  $\bar{C}$  as such is insol. in aq. but rapidly hydrolyzes with formn. of HCl and ethyl hydrogen oxalate, the latter in turn being converted to oxalic acid (1:0445) + EtOH.

[For prepn. of  $\bar{C}$  from diethyl oxalate (1:1055) with  $PCl_5$  (yields: 80–90% (5), 84% (6), 80% (7), (8) (9) (10) (11) (34) see indic. refs.; note that this mode of prepn. has been shown (4) to comprise two distinct and successive reactions: first the formn. of ethyl  $\alpha,\alpha$ -dichloro- $\alpha$ -ethoxyacetate,  $Cl_2C(OEt).COOEt$  [Beil. II-543, II<sub>1</sub>-(236)], b.p. abt. 85° at 10 mm.,  $D_4^{20} = 1.23155$  (2); and second, the pyrolysis of this product by repeated distillation (13) or increased temp. (especially in the pres. of catalysts such as salts of Fe or Pt (5) (12)) yielding  $\bar{C}$  + ethyl chloride (3:7015).]

[For prepn. of  $\bar{C}$  from ethyl hydrogen oxalate [Beil. II-535, II<sub>1</sub>-(232), II<sub>2</sub>-(504)] with  $SOCl_2$  (yields: 78% (14), 72% (15)) or with  $PCl_5$  (3) see indic. refs. (note that the initial ethyl hydrogen oxalate is readily obtd. from anhydrous oxalic acid (1:0535) with diethyl oxalate (1:1055) by htg. 3 hrs. (32% yield (15)) (18) or by distn. with EtOH and  $CCl_4$  as directed (61% yield (16))); for prepn. of  $\bar{C}$  from K ethyl oxalate with  $POCl_3$  or  $PCl_5$  (17) (3) or with  $SOCl_2$  (60–70% yield (24)) see indic. refs. (note that K ethyl oxalate can readily be prepd. in 95–97% yield from diethyl oxalate (1:1055) by digestion with aq. KOAc (24)).]

[For prepn. of  $\bar{C}$  from oxalyl (di)chloride (3:5060) with EtOH (1:6130) by reactn. of one acid chloride group but not the other (60% yield) see (25).]

[ $\bar{C}$  on passing through tube at 200° loses CO yielding (19) ethyl chloroformate (3:7295).]

[ $\bar{C}$  with EtOH (1:6130) reacts normally yielding (17) diethyl oxalate (1:1055); for reactn. of  $\bar{C}$  with cellulose see (25).]

[ $\bar{C}$  with diethyl sodiomalonate in ether gives (20) (12) a mixt. of triethyl oxalomalonate [Beil. III-850, III<sub>1</sub>-(292)] and tetraethyl dioxalomalonate [Beil. III<sub>2</sub>-(199)];  $\bar{C}$  with ethyl sodio-cyanoacetate in ether gives (21) (22) diethyl oxalo-cyanoacetate [Beil. III-850], m.p. 98° (22), 96° (21);  $\bar{C}$  with diethyl methyl sodio-malonate gives (23) diethyl oxalo-methyl-malonate; many other analogous condensations cannot be included here.]

[ $\bar{C}$  with aromatic hydrocarbons in the pres. of  $AlCl_3$  undergoes reactn. of the Friedel-Crafts type, and this procedure has been widely studied as a means of introduction of the  $-CO.COOC_2H_5$  group: e.g.,  $\bar{C}$  with  $C_6H_6$  +  $AlCl_3$  in nitrobenzene +  $CS_2$  gives (26) ethyl benzoylformate (ethyl phenylglyoxylate) [Beil. X-657, XI<sub>1</sub>-(314)], b.p. 256–257°; for corresp. analogous reactn. with toluene (1:7405) (27), *m*-xylene (1:7420) (27), cumene (1:7440) (9), pseudocumene (1:7470) (27), or mesitylene (1:7455) (27) (1) see indic. refs.]

$\bar{C}$  with  $NH_3$  in alc. gives (17) ethyl oxamate,  $NH_2.CO.CO.OC_2H_5$  [Beil. II-544, II<sub>1</sub>-(236), II<sub>2</sub>-(509)], lfts. from hot alc., m.p. 114°. — Similarly  $\bar{C}$  with aniline should yield ethyl oxanilate,  $C_6H_5.NH.CO.CO.OC_2H_5$  [Beil. XII-282, XII<sub>1</sub>-(206)], tbs. or pr. from alc., ndls. from hot aq., m.p. 66–67°;  $\bar{C}$  with phenylhydrazine should yield  $\beta$ -(ethoxalyl)-phenylhydrazine,  $C_6H_5.NH.NH.CO.CO.OC_2H_5$  [Beil. XV-264], lfts. from alc., m.p. 119°.

$\bar{C}$  with urea (2 moles) reacts vigorously at room temp. as a normal acid chloride yielding (28) ethyl oxalurate,  $NH_2.CO.NH.CO.CO.OC_2H_5$  [Beil. III-65, III<sub>2</sub>-(54)], ndls. from ether, m.p. 184–185°. — Note, however, that  $\bar{C}$  with *N*-phenylurea on htg. evolves CO +  $C_2H_5Cl$  (3:7015) and yields (29) a mixt. of ethyl  $\alpha$ -phenylallophanate,  $C_6H_5.NH.CO.NH.COOC_2H_5$  [Beil. XI-359, XII<sub>1</sub>-(234)], ndls. from boilg. alc., m.p. 106° (30), and *N*-phenyl-parabanic acid (oxalyl *N*-phenylurea) [Beil. XXIV-454, XXIV<sub>1</sub>-(405)], lfts. from alc., m.p. 208° (29). —  $\bar{C}$  with *N,N'*-diphenylurea in  $C_6H_6$  on htg. evolves  $C_2H_5Cl$  (3:7015) and yields (29) *N,N'*-diphenylparabanic acid (oxalyl *N,N'*-diphenylurea) [Beil. XXIV-455, XXIV<sub>1</sub>-(405)], ndls. from alc., m.p. 204°. —  $\bar{C}$  with *N,N'*-dimethylurea (2 moles)

reacts vigorously giving (80% yield (31)) *N,N'*-dimethylparahanic acid [Beil. XXIV-453, XXIV<sub>1</sub>-(404)], m.p. 154°.

[ $\bar{C}$  with  $RMgX$  cpds. gives (32) disubstituted glycolic acids ( $R_2C(OH)COOH$ ) and/or ethoxalyl esters of disubstituted ethyl glycolates,  $R_2C(O.CO.COOC_2H_5)$  ( $COOC_2H_5$ ); similarly  $\bar{C}$  with diethylcadmium gives (63% yields (33)) ethyl  $\alpha$ -ethyl- $\alpha$ -hydroxy-n-butyrate (ethyl  $\alpha,\alpha$ -diethylglycolate).]

3:5633 3-CHLORO-2-PROPENE-1  
(1-Chloro-2-(chloromethyl)- $\gamma,\gamma$ -dichloroisobutylene)

B.P. M.P.  
138-138.3° (9) -15°  
30-31° at 9 mm. (1)

Colorless oil with faintly halogen-

[For prepn. of  $\bar{C}$  from *tris*-(chloromethyl)acetic acid (itself obtd. in quant. yield by conc.  $\text{HNO}_3$  oxidn. (9) of 3-chloro-2,2-bis-(chloromethyl)propanol-1 = pentaerythrityl tri-chlorohydrin (9)) by combine decarboxylation and dehydrochlorination in boilg. quinoline (75-85% yield) see (9).]

[For formn. of  $\bar{C}$  (40% yield (2) together with other products (2) (3)) from 2-methylpropene-1 (isobutylene) with  $\text{Cl}_2$  (2) (3) or from 3-chloro-2-methylpropene-1 (isobutenyl chloride) (3:7145) with  $\text{Cl}_2$  (1 mole) +  $\text{NaHCO}_3$  (1.5 moles) at  $0^\circ$  see (2) (4) see indic. refs.; for formn. of  $\bar{C}$  (together with other products) from 1,2,3-trichloro-2-methylpropane (3:5885) by pyrolysis at 450-550° see (5); for formn. of  $\bar{C}$  (together with 1,3-dichloro-2-(chloromethyl)propene-1 (3:9066)) from 1,3-dichloro-2-nitro-2-(chloromethyl)propane with  $\text{Na/Hg}$  see (1); for prepn. of  $\bar{C}$  (80% yield (6) together with 20% yield 1,3-dichloro-2-methylpropene-1 (3:5590)) from 1,3-dichloro-2-methylpropanol-2 (3:5977) by actn. of strong oxygen acids see (6).]

$\bar{C}$  on cat. hydrogenation using Pt black yields (1) 1,3-dichloro-2-methylpropane (3:7060), but  $\bar{C}$  in alc. on bodg. with Zn dust gives (75% yield (3)) isobutylene, b.p.  $-6^\circ$ .

$\bar{C}$  with  $\text{O}_3$  gives (2)  $\alpha,\alpha'$ -dichloroacetone (3:0563).

$\bar{C}$  treated with  $\text{Cl}_2$  in the dark at  $0^\circ$  yields (5) 1,2,3-trichloro-2-chloromethylpropane (3:6335). —  $\bar{C}$  treated with  $\text{Br}_2$  in  $\text{CHCl}_3$  yields (1) 1,2-dibromo-3-chloro-2-(chloromethyl)propane, colorless odorless oil, b.p.  $140^\circ$  at 10 mm. (1); note, however, failure to react with  $\text{Br}_2$  recorded later (3).

$\bar{C}$  with aq. alk. as specified (7) yields 2,3-epoxy-2-chloromethylpropanol-1, b.p.  $55^\circ$  at 1 mm. (7). [For similar reactns. cf. (8).]

$\bar{C}$  on hydrolysis with aq.  $\text{CaCO}_3$  refluxed 2 hrs. gives (36% yield (9)) 2-(hydroxymethyl)propen-2-ol-1, b.p.  $125-126^\circ$  at 18 mm.,  $D_4^{20} = 1.0791$ ,  $n_D^{20} = 1.4758$  (9).

3:5635 2-CHLOROPROPEN-2-OL-1  
(2-Chloropropen-1-ol-3;  
 $\beta$ -chloroallyl alcohol)

$\text{C}_3\text{H}_5\text{OCl}$  Beil. I-439  
I<sub>1</sub>—  
I<sub>2</sub>—

B.P.  $136-140^\circ$  cor. (1)  
 $136^\circ$  (2)

$D_4^{20} = 1.164$  (2)

Note that  $\bar{C}$  is the true  $\beta$ -chloroallyl alcohol; care must be taken to avoid confusion with 3-chloropropen-2-ol-1 ( $\gamma$ -chloroallyl alcohol) (3:5820) whose derivatives have often been designated in the literature as  $\beta$ -chloroallyl derivatives; see also the warning note under  $\gamma$ -chloroallyl chloride (3:5290).

[For prepn. of  $\bar{C}$  from 2,3-dichloropropene-1 (3:5190) by hydrolysis of the reactive halogen atom with hot dil. aq. alk. see (2); from 2-chloro-3-iodopropene-1 by hydrolysis of the iodine atom with hot dil. aq.  $\text{KOH}$  or with silver oxide see (1); from butadiene-1,2-(allene) with  $\text{HOCl}$  see (3).]

Colorless liq. with faint odor;  $\bar{C}$  does not have the violent vesicant action on skin shown by the isomeric  $\gamma$ -chloroallyl alc. (3:5820).

$\bar{C}$  readily dissolves in conc.  $H_2SO_4$  with evolution of  $HCl$  gas; after pouring onto ice and distilling acetol (hydroxyacetone) (1:5455) is obt'd. (2).

[ $\bar{C}$  with  $PBr_3$  yields (2) 3-bromo-2-chloropropene-1 ( $\beta$ -chloroallyl bromide) [Beil. I-201, I<sub>1</sub>-(171)], b.p.  $121^\circ$  (2),  $110-120^\circ$  (4).]

[ $\bar{C}$  yields by suitable treatment (no details (2))  $\beta$ -chloroallyl acetate [Beil. II-136], b.p.  $145^\circ$  (2). — For esters of  $\bar{C}$  with monocarboxylic acids (5), saturated polycarboxylic acids (6), and halogenated acids (7), and for copolymerization of certain esters of  $\bar{C}$  with styrene (8) see indic. refs.]

Colorless liq.; for constant-boilg. mixt. of  $\bar{C}$  with various org. epds. see Beil. II<sub>2</sub>-(191) or (4) (15) (16) — [For insecticidal actn. see (17); for use in refining of mineral oil see (18).]

[For prepn. of  $\bar{C}$  from chloroacetic acid (3:1370) with EtOH + dry HCl gas (10) cf. (72.5% yield (22)) or  $\text{H}_2\text{SO}_4$  (70% yield (23)) (19) or anhydrous  $\text{MgCl}_2$  (20) see indic. refs.; from chloroacetyl chloride (3:5235) with EtOH (5) or with triethyl orthoformate (1:3241) at 100-110° (90% yield (21)) see indic. refs.; from  $\alpha,\beta$ -dichlorovinyl ethyl ether (3:5540) with org. acids see (24) (25).]

[For formn. of  $\bar{C}$  from ethyl hydroxyacetate (ethyl glycolate) with  $\text{PCl}_5$  see (26); from ethyl aminoacetate hydrochloride with  $\text{NaNO}_2$  + excess HCl see (27); from ethyl diazoacetate with HCl (27) (28) or with  $\text{HgCl}_2$  (70% yield (11)) see indic. refs.; from dichloroacetaldehyde monoethyl hemiacetal (3:5310) with alc. KCN at 20° (38% yield) see (29); from ethyl  $\alpha$ -chloroacetoacetate (3:6207) with diethyl sodiomalonate see (30).]

$\bar{C}$  refluxed with KF yields KCl + ethyl hydroxyacetate (+ some ethyl fluoroacetate) (31);  $\bar{C}$  with  $\text{MgI}_2$  in ether (32) or KI in alc. (3) (34) or in acetone at ord. temp. (35) yields ethyl iodoacetate, b.p. 180°. [For studies on rate of reactn. of  $\bar{C}$  with KI in acetone see (36) (37) (38); with NaI or LiI in acetone see (38).]

[ $\bar{C}$  with Al/Hg + a trace of alc. (39) or with Mg + trace of  $\text{I}_2$  in ether (40) or  $\bar{C}$  with Mg + trace  $\text{HgCl}_2$  in ether (41) yields ethyl  $\gamma$ -chloroacetoacetate (3:6375), b.p. 205°;  $\bar{C}$  with NaCN (25) or KCN (42) yields ethyl cyanoacetate,  $\bar{C}$  with ethyl sodioacetoacetate gives (56-62% yield (23)) diethyl acetosuccinate.]

[ $\bar{C}$  with 2 moles  $\text{MeMgBr}$  (but not  $\text{MeMgI}$ ) in ether gives (yield: 60% (43), 38% (44)) 1-chloro-2-methylpropanol-2 (3:7752) (note, however, that  $\bar{C}$  with a large excess  $\text{MeMgBr}$  (4 moles) gives (40% yield (45)) 2-methylbutanol-3 (1:6170) (3,5-dinitrobenzoate, m.p. 74-75°): for reactn. of  $\bar{C}$  with  $\text{EtMgBr}$  yielding (46) 3-(chloromethyl)-pentanol-3 [Beil. 1-412], with isopropyl  $\text{MgCl}$  (47), or with phenyl  $\text{MgBr}$  (3 moles) yielding (48) chloromethyl-diphenyl-carbinol [Beil. VI-685] see indic. refs.]

[For use of  $\bar{C}$  with Zn (or Zn + Cu (49)) + ketones to give by Reformatsky reactn. (50)  $\beta$ -hydroxy-esters see indic. refs.]

$\bar{C}$  treated with aq. benzenediazonium chloride + NaOAc gives (15% yield (6)) ethyl  $\gamma$ -chloro- $\beta$ -phenylhydrazono-acetoacetate, m.p. 92-93° (6).

$\bar{C}$  with  $\text{Me}_2\text{N}$  in alc. followed by treatment with 100% hydrazine hydrate as directed (51) (52) gives 83-89% yield (51) betaine hydrazide hydrochloride,  $(\text{CH}_3)_2\text{N}(\text{Cl}).\text{CH}_2$ -

CO.NH.NH<sub>2</sub> (Girard's reagent for ketones), m.p. 102°. [For corresp. reactn. using pyridine instead of Me<sub>2</sub>N see (52).]

$\bar{C}$  shaken in cold with 2 vols. conc. aq. NH<sub>4</sub>OH gives (53) (54) (28) (29) (78-84% yield (55)) chloroacetamide, cryst. from aq., m.p. 110-120° (55), 120° (28). —  $\bar{C}$  htd. at 100° for ½ hr. with 2 moles aniline, cooled, aniline hydrochloride extracted with aq. gives (100% yield (56)) (57) (58) ethyl anilinoacetate (phenylglycine ethyl ester) [Beil. XII-470, XII-(263)], cryst. from dil. alc. (56) (57) or lgr. (58), m.p. 58° (58), 57-58° (57), 57° (56). [This prod. on boilg. with excess aniline yields (57) anilinoacetanilide (phenylglycine anilide) [Beil. XII-556], m.p. 110-111° (57).] —  $\bar{C}$  ltd. with aq. benzylamine yields (59) chloroacet-N-benzylamide, m.p. 93.0-93.6° cor. (59).

[ $\bar{C}$  with ethyl carbamate ("urethane") + Na in dry ether as directed gives (51-57% yield (60)) triethyl N-tricarboxylate = N(COOC<sub>2</sub>H<sub>5</sub>)<sub>3</sub> [Beil. III-28], b.p. 146-147° at 12 mm. (60).]

$\bar{C}$  htd. as directed (60) with K tetrachlorophthalimide yields N-(carbethoxymethyl)-tetrachlorophthalimide, ndls. from CHCl<sub>3</sub> on pouring into 2 vols. MeOH, m.p. 180-181° (60);  $\bar{C}$  with Na phthalimide yields (61) N-(carbethoxymethyl)phthalimide, m.p. 112-113° (61);  $\bar{C}$  with K 3-nitrophthalimide yields (62) N-(carbethoxymethyl)-3-nitrophthalimide, ndls. from alc., m.p. 70-80° (62).

$\bar{C}$  on hydrolysis (e.g., by boilg. 10 min. with N/10 aq. Ba(OH)<sub>2</sub> (14)) yields ethyl alcohol (1:6130) and chloroacetic acid (3:1370). [For studies on the kinetics of hydrolysis of  $\bar{C}$  under various conditions see Beil. II-2-(191-192) and (2) (14) (63) (64) (65).]

Note: Care must be taken not to confuse  $\bar{C}$  with tetrachloroethylene (3:5460) or with 1,1,1,2-tetrachloroethane (unsym.-acetylene tetrachloride (3:5555)).

Colorless liq. with odor similar to that of chloroform. — [For vapor press. of  $\bar{C}$  at intervals over range 20-145° see (25); for study of thermal conductivity see (26).]

$\bar{C}$  is very spar. sol. aq.: e.g., 100 g.  $H_2O$  at 20° dis. 0.283 g.  $\bar{C}$ ; at 55-56° dis. 0.336 g.  $\bar{C}$  (27); 1 g.  $\bar{C}$  is sol. at 25° in 350 g. aq. (101); for soly. of  $H_2O$  in  $\bar{C}$  at 0°, 25°, and 30° as

detd. by Karl Fischer reagent. see (28). —  $\bar{C}$  is easily volatile with steam (for use in detn. of  $H_2O$  see below).

### MISCELLANEOUS PHYSICAL PROPERTIES

[For soly. in  $\bar{C}$  of dry gaseous  $HCl$  (14) (15),  $H_2S$  (14), or  $O_2$  (29) see indic. refs.; for soly. in  $\bar{C}$  at 11–25° of  $I_2$  (30) and use of such solns. in detn. of iodine number (31) see indic. refs.; for adsorption by activated carbon of  $I_2$  from solns. in  $\bar{C}$  see (32).]

[For study of influence of vapors of  $\bar{C}$  on the explosion limits of mixtures of air with hydrogen (33), acetylene (33), methane (33) (34) (35), or carbon monoxide (33) (36) see indic. refs.]

[For prepn. of and comparison with  $\bar{C}$  of *sym.*-dideuterio-1,1,2,2-tetrachloroethane,  $Cl_2C(D)_2$ , see (9).]

Binary systems contg.  $\bar{C}$ . [For f.p./compn. data and/or diagrams on systems  $\bar{C}$  + 1,2-dichloroethane (ethylene dichloride) (3:5130) (18);  $\bar{C}$  + 1,1,2-trichloroethane (3:5330) (18);  $\bar{C}$  + pentachloroethane (3:5880), eutectic, f.p. –73°, contg. 40.1%  $\bar{C}$  (18);  $\bar{C}$  + *cis*-dichloroethylene (3:5042) (37);  $\bar{C}$  + *trans*-dichloroethylene (3:5028) (37);  $\bar{C}$  + *p*-dichlorobenzene (3:0980) (38);  $\bar{C}$  + 1,2-dibromoethane (ethylene dibromide) (18);  $\bar{C}$  + 1,1,2,2-tetrabromoethane (acetylene tetrabromide) (18);  $\bar{C}$  + succinonitrile (18); or  $\bar{C}$  + succinic acid (1:0530) (18) see indic. refs. — For study of system  $\bar{C}$  + naphthalene (1:7200) at 30° under press. up to 1000 atm. see (39).]

$\bar{C}$  with various org. cpds. forms binary azeotropes [e.g.,  $\bar{C}$  with anhydrous formic acid (1:1005) forms a const.-boilg. mixt., h.p. 99.25° at 760 mm., contg. 32 wt. %  $\bar{C}$  (40); note that  $\bar{C}$  with  $AcOH$  (1:1010) does *not* form a const.-boilg. mixt. (41) (the data listed by "Int. Crit. Tables" for such an azeotrope is actually for the mixt.  $AcOH$  + tetrachloroethylene);  $\bar{C}$  with propionic acid (1:1025) forms a const.-boilg. mixt., b.p. 140.4° at 760 mm., contg. abt. 40 wt. %  $\bar{C}$  (42); for other azeotropes see Beil. II<sub>2</sub> (56). — Note that no record of formn. of azeotropes of  $\bar{C}$  with  $MeOH$  or  $EtOH$  can be found.]

Ternary systems contg.  $\bar{C}$ . [For soly. data and diagrams of system  $\bar{C}$  + acetone (1:5400) + aq. see (43).]

### USES OF $\bar{C}$

$\bar{C}$  is widely used in industry as a solvent and as an intermediate in the manufacture of various other chlorinated solvents, notably trichloroethylene (3:5170); for additional examples of special uses see also below.

$\bar{C}$  is frequently employed as solvent in certain types of Friedel-Crafts reactions or phthalic anhydride condensations [for study of use of  $\bar{C}$  as solvent in Friedel-Crafts condensation of phenol with high-mol.-wt. acyl chlorides see (44)].

[For use of  $\bar{C}$  as swelling agent for rubber (45), in prod. of films from rubber hydrochloride (46), in prod. of cellulose acetate by pptn. from  $\bar{C}$  with hydrocarbons (47) (note that acetylcelluloses give with  $\bar{C}$  crystalline addition prods. (48)), together with aliphatic monohydric alcs. as solv. for cellulose alkyl ethers (49), in prepn. of transparent cellulose acetate plastics (50) see indic. refs. — For soly. of various polymers in  $\bar{C}$  see (56).]

[For use of  $\bar{C}$  as catalyst in condensation of phenol with formaldehyde (51) or furfural (52) see indic. refs.]

[For use of  $\bar{C}$  with petroleum naphtha as a dry-cleaning fluid (53), for use of  $\bar{C}$  as a rust remover (54), as means of removing mud barriers in oil wells (55), or as an immersion fluid in opt. crystallog. (21) see indic. refs.]

[For use of  $\bar{C}$  (57) (58) or stable aq. emulsions of  $\bar{C}$  (59) as weed killers see indic. refs.]

[For studies of use of  $\bar{C}$  in detn. of theobromine in cacao see (60) (61) (62) (63).]

[For use of  $\bar{C}$  as anti-moth prod. (64), as a component of insecticides (65), together with

$\text{CS}_2$  and chlorobenzene (3:7903) as insecticide (66), or together with 20% trichloroethylene (3:5170) as a fumigant and insecticide (67) see indic. refs.]

[For studies on antiseptic, bactericidal, and disinfectant action of  $\bar{\text{C}}$  see (68) (69) (70).]

$\bar{\text{C}}$  is also employed for the detn. of  $\text{H}_2\text{O}$  by distillation; note that besides being non-inflammable  $\bar{\text{C}}$  is also much denser than water which for some applications of this method is advantageous. — [For general discussion and examples of this procedure see (226) (70) (71) (72) (73) (74) (75); for comparison of results with those obt'd. by oven drying see (76); for application to detn. of  $\text{H}_2\text{O}$  in liquid and solid fuels (77) (78), in glycerol (79) (80), in liquid glue (81), in cereal (82), in dried apples (83), in cooking salt (84) see indic. refs.]

### TOXICITY AND PHYSIOLOGICAL ACTION OF $\bar{\text{C}}$

$\bar{\text{C}}$  is the most toxic of the group of chlorinated hydrocarbons (85) and produces marked pathological alterations in gastrointestinal tract, liver, and kidneys. — [Detailed discussion of this aspect of  $\bar{\text{C}}$  is beyond the scope of this treatment except to cite references (229) (227) (232) and (85)–(99), incl. (note that articles on this topic prior to 1930 are omitted).]

[For discussion of fate of  $\bar{\text{C}}$  in body see (100). — Note also that  $\bar{\text{C}}$  (in sharp contrast to the closely related tetrachloroethylene (3:5460)) has no efficacy as anthelmintic for hookworms (101).]

[For actn. of  $\bar{\text{C}}$  on alc. fermentation see (102) (103); for actn. on invertase see (104).]

### DETERMINATION OF $\bar{\text{C}}$

Some methods for the deto. of  $\bar{\text{C}}$  involve conversion of all of its halogen to chloride ion and subsequent volumetric or gravimetric detn. of the latter; e.g., for methods based on initial pyrolytic decomposition see (105) (89) (106) (107); for methods based on debalogenation of  $\bar{\text{C}}$  with Na + ethanolamine in dioxane see (108) (230) (note that use of Na in liq.  $\text{NH}_3$  causes some cyanide formn. (109)). — For detn. of  $\bar{\text{C}}$  by means of elimination of 1 HCl with cold alc. KOH see (110). — For detn. of  $\bar{\text{C}}$  by means of the Fujiwara color reactn. with NaOH/pyridine see (111). — Note that  $\bar{\text{C}}$  does not respond to the R + H "Tri-Per-Analyzer" (a recording ultra-violet photometer) (112). — For further comments on detection of  $\bar{\text{C}}$  see below under color tests.

### PREPARATION OF $\bar{\text{C}}$

$\bar{\text{C}}$  is one of a large family of "chlorinated solvents" now available from industrial sources. — The most-studied method of prepn. is that from acetylene by controlled addition of chlorine, although variants of this method are employed and other starting prods. (see below) are sometimes used. —  $\bar{\text{C}}$  is also obtained as a by-prod. of the manufacture of the comml. mixt. (3:5030) of the two stereoisomeric 1,2-dichloroethylenes, *cis* (3:5042) and *trans* (3:5025), 1,1,2-trichloroethane (3:5330), etc.

From acetylene by addition of chlorine. Under suitable controls to avoid explosion and with the assistance of a wide variety of catalysts  $\bar{\text{C}}$  is manufactured from acetylene by reaction with  $\text{Cl}_2$ . — [For a concise review of the general nature and difficulties of this general method see (113).]

[For important general articles on this synthesis see (114)–(122) incl. — For examples of patents employing this method see refs. (123)–(138) incl.; for special test of Cer. 204,833 (131) see (118) (120); for test of Cer. 154,677 (133) see (119) (120).]

From acetylene by other means. [For prepn. of  $\bar{\text{C}}$  from acetylene with excess  $\text{SbCl}_5$  (139) (234) with  $\text{SbCl}_3 + \text{SbCl}_5$  (140), with  $\text{NOCl}$  (4 moles) at  $350^\circ$  (141), with aq.  $\text{NaOCl}$  soln. (142), with  $\text{S}_2\text{Cl}_2 + \text{Fe}$  powder in cold (143) (144) see indic. refs.]

From ethylene. [For formn. of  $\bar{C}$  from ethylene +  $Cl_2$  (as hy-prod. of prepn. of ethylene chlorohydrin (3:5552)) (145), from ethylene +  $Cl_2$  (as hy-product of prepn. of 1,1,2-trichloroethane (3:5330)) (146) (147), from ethylene +  $Cl_2$  (as hy-prod. of a three-part process for combined prepn. of  $\bar{C}$  + ethyl chloride) (198) see indic. refs.]

From dichloroethylenes. [For prepn. of  $\bar{C}$  from *cis*-dichloroethylene (3:5042) in vapor phase at 95° in light of 4360 Å with  $Cl_2$  (in absence of  $O_2$ ) (149), or in liq. phase with  $SO_2Cl_2$  (1½ moles) in pres. of trace of dibenzoyl peroxide refluxed 3 hrs. in dark (85% yield (150)), see indic. refs.]

[For prepn. of  $\bar{C}$  from *trans*-dichloroethylene (3:5028) in vapor phase at 80–95° in light of 4358 Å with  $Cl_2$  see (151).]

[For prepn. of  $\bar{C}$  from ord. mixt. (3:5030) of both stereoisomeric dichloroethylenes with  $Cl_2$  (13) in light of 4360 Å (152) see indic. refs.]

From trichloroethylene. [For formn. of  $\bar{C}$  (together with other prods.) from trichloroethylene (3:5170) +  $AlCl_3$  +  $HCl$  gas at 50° see (153).]

From 1,2-dichloroethane (ethylene (di)chloride). [For prepn. of  $\bar{C}$  from ethylene (di)chloride (3:5130) with  $Cl_2$  (148) in u.v. light see (154).]

From miscellaneous starting points. [For formn. of  $\bar{C}$  usually together with other prods. from dichloroacetaldehyde (3:5180) with  $PCl_5$  (1), from "β-chlorovinyl iodochloride" ( $ClCH=CH.ICl_2$ ) on warming (15), from 1,1,2-trichloro-2-iodoethane on distn. at ord. press. (155), from 1,2-di-iodoethylene with  $Cl_2$  (156), or from 1,1,2-trichloroethane (3:5330) with  $Cl_2$  +  $AlCl_3$  at 70–80° (231) see indic. refs.]

### STABILIZATION OF $\bar{C}$

[For patents on stabilization of  $\bar{C}$  by addition of small amts. of phenols, aminophenols, etc. (157), or by addn. of less than 0.1% alkylamines (158) see indic. refs.]

### CHEMICAL BEHAVIOR OF $\bar{C}$

Pyrolysis without catalyst.  $\bar{C}$  on protracted reflux (20 days (159)) or techn.  $\bar{C}$  on repeated distn. (160) leaves a residual high-boilg. fraction ("Tetranachlauf") consisting mainly of 1,1,2,3,4,4-hexachlorobutane (3:3155), ndls. from alc., m.p. 107° (159) (160), presumably formed by elimination of 1 Cl atom from each of 2 moles of  $\bar{C}$ . — [ $\bar{C}$  htd. in s.t. at 300° for 15 hrs. yields (139) trichloroethylene (3:5170);  $\bar{C}$  in s.t. at 360° for 100 hrs. yields (139) hexachlorobenzene (3:4939).]

Pyrolysis in pres. of various catalysts or  $HCl$  acceptors.  $\bar{C}$  on suitable hgt. particularly in the pres. of dehydrohalogenating catalysts or acceptors of the hydrogen chloride formed loses 1 mole  $HCl$  yielding trichloroethylene (3:5170). (For elimination of  $HCl$  by chemical means such as alk.,  $NH_3$ , etc., see below.)

[E.g.,  $\bar{C}$  over pumice at 700° (161), over pumice contg.  $Cu_2(PO_4)_3$  at 450–500° (162), over  $ThO_2$  below 390° (163) cf. (164), over  $BaCl_2$  at 300° (165), over bone char at 300–310° (166), over activated carbon at 200–300° (167), 260° (168) (note yield diminishes with increasing temp. (233)) or 500° (169), or over suitable cat. (148) loses  $HCl$  yielding trichloroethylene (3:5170). — Note also that pure  $\bar{C}$  on long exposure to u.v. light loses  $HCl$  bimolecularly yielding (159) 1,1,2,3,4,4-hexachlorobutene-2 (3:1945), m.p. 80°.]

[ $\bar{C}$  + acetylene over cat. at 250° loses  $HCl$  yielding (167) trichloroethylene (3:5170) + vinyl chloride (3:7010);  $\bar{C}$  with  $MeOH$  over  $Al_2O_3$  at 280° loses  $HCl$  yielding (170) trichloroethylene (3:5170) + methyl chloride (3:7005).]

Dehydrogenation. [ $\bar{C}$  with air over pumice contg.  $CuCl_2$  at 430–450° (171), or with  $Cl_2$  over activated carbon contg.  $CuCl_2$  at 300–320° (172), or with hexachloroethane (3:4835) over cat. at 200–400° (173) loses its two hydrogenations yielding tetrachloroethylene (3:5460).]

(Partial) dehalogenation.  $\bar{C}$  with  $H_2$  over Ni at 300–320° (174), or  $\bar{C}$  with Fe or Al + aq. (175) (176) or Zn + aq. (176) (177), or  $\bar{C}$  with acetylene over hydrogenating cat. (such as Ni) on activated carbon at 350° (178) preferably in pres. of aq. vapor (179) or on electrolytic reductn. in pres. of  $ZnCl_2$  (235) (236) loses 1 chlorine from each carbon atom yielding a mixt. (3:5030) of the two stereoisomeric 1,2-dichloroethylenes. — Note that  $\bar{C}$  with Zn in alc. yields (180) acetylene.]

Oxidation.  $\bar{C}$  with air in ultra-violet light yields (181) (182) dichloroacetyl chloride (3:5290) (or in pres. of aq. dichloroacetic acid (3:6208)), accompanied by small amts. of oxalic acid and an octachlorobutane, m.p. 81°. (Note also that pure  $\bar{C}$  on long exposure to u.v. light loses HCl bimolecularly yielding (159) 1,1,2,3,4,4-hexachlorobutene-2 (3:1945), m.p. 80°.)]

[For behavior of  $\bar{C}$  with  $CrO_3/H_2SO_4$  (183) or over hot CuO (184) see indic. refs.]

#### BEHAVIOR WITH HALOGENS

Fluorination.  $\bar{C}$  with  $F_2$  gas at 50° for 14 hrs. gives (185) 1-fluoro-1,1,2,2-tetrachloroethane, b.p. 115.5–116.5°,  $D_4^{20} = 1.6218$ ,  $n_D^{20} = 1.4487$ , and 1,2-difluoro-1,1,2,2-tetrachloroethane, b.p. 92–93°, m.p. 24–25°, together with various other prods. — For fluorination of  $\bar{C}$  with  $SbF_3 + SbCl_5$  see (186)].

Chlorination.  $\bar{C}$  with  $Cl_2$  (139) in  $CCl_4$  sola. (187), in u.v. light (188) or X-radiation (189), or over activated carbon at 300–400° (190) (191), or in liq. phase at 60–70° (192), or with Fe at 20–80° (192), or with  $AlCl_3$  at 20–100° (192), or under reflux at 120° (80% yield (193)), or  $\bar{C}$  with anhydr.  $FeCl_3$  on hgt. in s.t. (194), or even  $\bar{C}$  with aq. bleaching powder (192) yields hexachloroethane (3:4835).]

#### BEHAVIOR WITH $H_2SO_4$

$\bar{C}$  with fuming  $H_2SO_4$  (65%  $SO_3$ ) in pres. of  $HgSO_4$  at 50–60° readily gives (198) (yields: 70–73% (195), 32% (196), 30% (197)) glyoxal sulfate,  $O_2SO_2CH-CHO_2SO_2$ , [Berl. 17- (818)], adls. from  $ClSO_3H$ , m.p. 176–177° (198), ndls. with 1 AcOH, m.p. 121–122° from AcOH, the solv. of crystn. being lost completely in vac. over NaOH (199).

#### BEHAVIOR WITH ALKALINE REACTANTS

$\bar{C}$  under influence of many alk. reactants loses 1 mole HCl; this reactn. is used for the manufacture of trichloroethylene (3:5170) (see also above under pyrolysis of  $\bar{C}$ ) and also by titration of the HCl or estimation of chloride ion formed as a diagnostic test for  $\bar{C}$  (see below)

$\bar{C}$  on hgt. with aq. alk. or alk. carbonates (200) in pres. of tetraethylene glycol as promoter (228) or with aq.  $Ca(OH)_2$  or alk. carbonates (200) (201) (234) (114) (for test of Ger. 171,900 (200) see (202) (120)), or  $\bar{C}$  with alc. KOH (203) cf. (122) or alc. NaOEt (203), loses 1 mole HCl yielding trichloroethylene (3:5170); note that in use of alc. alkali, distn. gives the const.-boil. mixt. of EtOH with trichloroethylene, b.p. 70–71°, from which latter is separated by washing with aq. and subsequent drying over  $CaCl_2$  (203).

$\bar{C}$  with EtOH/NaOH or EtOH/NaOEt (204) cf. (205), or  $\bar{C}$  with 1 N EtOH/KOH in xylene (110), instantly and quant. splits out 1 HCl at room temp.; note that this does not occur with *cis*-dichloroethylene (3:5042), *trans*-dichloroethylene (3:5028), trichloroethylene (3:5170) or tetrachloroethylene (3:5460), chloroform (3:5050), or carbon tetrachloride (3:5100), but does occur in analogous fashion with pentachloroethane (3:5880) (110). — [For rate of reactn. of  $\bar{C}$  with KOH in 95% EtOH at 90° see (206).]

Note, however, that  $\bar{C}$  in acetone with excess standard alk. refluxed 3 hrs., then residual alk. titrated back, uses 5 equivalents of alk. (207); this surprising result is presumably to

be attributed to hydrolysis of  $\bar{C}$  to glyoxal followed by disproportionation of latter to sodium glycolate; cf. (208).

$\bar{C}$  with solid KOH on htg. yields (203) dichloroethylene (3:5030), trichloroethylene (3:5170), tetrachloroethylene (3:5460), together with a spontaneously inflammable gas which may be chloroacetylene (3:7000). —  $\bar{C}$  with anhyd. KOH in xylene at 80° under  $N_2$  gives (209) a little dichloroacetylene (3:5010) (may be carried out as a lecture experiment (209)).

#### BEHAVIOR OF $\bar{C}$ WITH $NH_3$ AND AMINES

[ $\bar{C}$  with excess  $NH_3$  gas in pres. of aq. (210), or with aq.  $NH_4OH$  htd. under press. (210) (120), or with liq.  $NH_3$  at -40° (211) (212), or with dry pyridine on reflux (182) loses HCl giving (yields: 92% (211) 92-96% (210)) trichloroethylene (3:5170).]

[ $\bar{C}$  htd. with aniline + aq.  $Ca(OH)_2$  at 140-190° under press. yields (213) a mixt. of the calcium salt of *N*-phenylglycine and *N*-phenylglycine anilide, cf. (122); since this reaction really involves conversion of  $\bar{C}$  by loss of HCl to 1,1,2-trichloroethylene (3:5170) and reactn. of latter with aniline see 3:5170 for details.]

$\bar{C}$  with excess phenylhydrazine on stdg. at ord. temp. evolves  $N_2$ , ppts. phenylhydrazine hydrochloride, and yields  $C_6H_6$  (110); the full mechanism of this behavior seems never to have been established, but the same three prods. are also similarly ohtd. from pentachloroethane (3:5880) and hexachloroethane (3:4835).

[For rate of reactn. of  $\bar{C}$  with piperidine in 95% EtOH at 90° see (206).]

#### BEHAVIOR OF $\bar{C}$ WITH METALS

[For survey of action of  $\bar{C}$  on various common metals (214) (215) in pres. of moisture (223) see indio. refs.]

$\bar{C}$  with Na or K or their alloys may (like many other polychloro compounds) explode under certain conditions [for extensive studies of this behavior including sensitivity to mechanical shock see (216) (217)].

#### BEHAVIOR OF $\bar{C}$ WITH METAL SALTS

[ $\bar{C}$  with  $AlCl_3$  at 110° undergoes partial rearr. (218) to the isomeric 1,1,1,2-tetrachloroethane (3:5555). —  $\bar{C}$  with freshly prepared anhyd.  $AlBr_3$  on htg. below h.p. of  $\bar{C}$  yields (219) 1,1,2,2-tetrabromoethane (acetylene tetrahydride) [Beil. I-94, I<sub>1</sub>-(30), I<sub>2</sub>-(66)].]

$\bar{C}$  with *N*/15  $AgNO_3$  in 95% EtOH shows no reactn. even after 12 hrs. at 90° (206) cf. (80).

#### MISCELLANEOUS

[ $\bar{C}$  does not react with excess Hg di-*p*-tolyl (220). —  $\bar{C}$  with excess  $C_6H_5MgBr$  yields 1,1,2,2-tetraphenylethane [Beil. V-739, V<sub>1</sub>-(371), V<sub>2</sub>-(673)] (221) cf. (222).]

#### COLOR REACTIONS OF $\bar{C}$

⊕ With cyclopentanol (1:6412).  $\bar{C}$  (1 drop) with cyclopentanol (2 ml.) + trace solid NaOH, boiled 25 secs., cooled, acidified with AcOH or 85%  $H_2SO_4$ , stood 1 min., shaken gives (224) green color. [Note that this same response is also shown by 1,1,2-trichloroethylene (3:5170) but not by methylene dichloride (3:5020),  $CHCl_3$  (3:5050),  $CCl_4$  (3:5100), ethylene dichloride (3:5130), pentachloroethane (3:5880), *cis*-(3:5042) or *trans*-(3:5028) 1,2-dichloroethylene, or tetrachloroethylene (3:5460); for sensitivity for  $\bar{C}$  see (224).]

With pyridine + NaOH (Fujiwara reagt.) [For detn. of  $\bar{C}$  with Fujiwara reagt. see (111); for relative sensitivity of Fujiwara reagt. to  $\bar{C}$  as compared to  $CHCl_3$  (3:5050),

$\text{CCl}_4$  (3:5100), 1,1,2-trichloroethane (3:5330), trichloroethylene (3:5170), and tetrachloroethylene (3:5460) see [100].]

With  $\text{NH}_4\text{OH}/\text{CuCl}$ . Note that  $\bar{\text{C}}$  with  $\text{NH}_4\text{OH}/\text{CuCl}$  does not give blue color within 5 min. (225) (dif. from pentachloroethane (3:5580) q.v.).

### 3:5755 1,1-DICHLOROPROPANOL-2

( $\beta$ , $\beta$ -Dichloroisopropyl alcohol;  
dichloromethyl methyl-carbinol)

Beil. I - 363

I<sub>1</sub>—

I<sub>2</sub>-(383)

B.P. 146-148° at 755 mm. (1)

$D_{25}^{25} = 1.3334$  (1)

Moderately sol. aq., very sol. alc., ether.

[For prepn. of  $\bar{C}$  from dichloroacetaldehyde (3:5180) with MeMgBr in dry ether (57.4% yield) see (1); from 1,1-dichloropropanone-2 (unsym.-dichloroacetone) (3:5430) with anhydrous acetaldehyde + Al(OEt)<sub>3</sub> in dry ether (45% yield) see (2).] — [Note that the levorotatory stereoisomer of  $\bar{C}$ , b.p. 146-148°,  $[\alpha]_D^{25} = -0^\circ$ , has been obtd. (54% yield) from unsym.-dichloroacetone (3:5430) by reduction with yeast (3).]

[For behavior of  $\bar{C}$  with NaOEt in alc. or ether see (4).]

[ $\bar{C}$  with paraformaldehyde +  $ZnCl_2$  gives (23.5% yield (5)) formaldehyde bis-( $\beta,\beta$ -dichloroisopropyl)acetal (Beil. I-575), h.p.  $81^\circ$  at 0.2 mm. (4).]

—  $\beta,\beta$ -Dichloroisopropyl benzoate: oil, h.p.  $92-94^\circ$  at 0.15-0.17 mm. (4). [From  $\bar{C}$  with  $BzCl$  refluxed 4 hrs. at  $150^\circ$  (80% yield (4)).]

—  $\beta,\beta$ -Dichloroisopropyl carbamate: unreported. [Note, however, that the corresp. deriv. of levorotatory  $\bar{C}$  (obtd. with carbamyl chloride in ether) has m.p.  $61-63^\circ$  (3).]

3:5755 (1) Wohl, Roth, *Ber.* **40**, 217-218 (1907). (2) Nord, *Ger.* 434,728, Oct. 5, 1926; *Cent.* 1926, II 2845. (3) Sen, *J. Indian Chem. Soc.* **1**, 1-8 (1924/25); *Cent.* 1925, I 537; *C.A.* **19**, 816 (1925); *Biochem. Z.* **151**, 51-53 (1924); *Cent.* 1924, II 2272; *C.A.* **19**, 3277 (1925). (4) Wohl, *Ber.* **41**, 3606-3608 (1908).

3:5760 3,3,3-TRICHLORO-1,2-EPOXYPROPANE  $C_3H_3OCl_3$  Beil. S.N. 2362  
( $\omega,\omega,\omega$ -Trichloropropylene oxide)  $Cl_3C-CH-CH_2$   

B.P. $149^\circ$ at 764 mm. (1)	$D_{44}^{25} = 1.4921$ (4)	$n_D^{25} = 1.4737$ (4)
$149^\circ$ at 750 mm. (2)		
$40^\circ$ at 11 mm. (1)	$D_{44}^{20} = 1.495$ (5)	$n_D^{20} = 1.4768$ (5)
$44-45^\circ$ at 13 mm. (2)		
$41-42^\circ$ at 10 mm. (3)	$D_{44}^{19} = 1.4962$ (5)	
$39-40^\circ$ at 11 mm. (4)		

Colorless mobile liq. with sweetish not unpleasant odor suggesting epichlorohydrin (3:5358). [Note that  $\bar{C}$  was at first (1) erroneously supposed to be 1,1,1-trichloroacetone (3:5620).]

[For prepn. of  $\bar{C}$  from chloral (3:5210) (1) (2) (4) or chloral hydrate (3:1270) (3) with diazomethane in ether (yields: 64% (2), 48% (4), 47.5% (3)) see indic. refs.]

$\bar{C}$  does not (2) react with aq. *o*-nitrophenylhydrazine HCl or with aq. semicarbazide.

[ $\bar{C}$  with 5 pts. conc. aq. HCl evolves heat and by opening of epoxy ring yields (2) 1,1,1,3-tetrachloropropanol-2 (3:9030), h.p.  $95-96^\circ$  at 17 mm. (2). —  $\bar{C}$  with  $Ac_2O$  + trace sublimed  $FeCl_3$  gives (2) in analogous fashion 3,3,3-trichloro-1,3-diacetoxypropane, b.p.  $126-128^\circ$  at 16 mm. (2).]

[ $\bar{C}$  with alcohols gives (3) corresp. alkoxymethyl-hemiacetals of chloral.]

[ $\bar{C}$  with  $MeMgI$  in dry ether at  $-15^\circ$  gives (59% yield (4)) 1,1,1-trichloro-3-iodopropanol-2, ndls. from pet. ether, m.p.  $54-55^\circ$  (4). —  $\bar{C}$  with  $MeLi$  in dry ether at  $-75^\circ$  gives (85% yield (4)) 1,1,1-trichlorobutanol-2 (3:5955).]

3:5760 (1) Schlotterbeck, *Ber.* **42**, 2561 (1909). (2) Arndt, Amende, *Ber.* **61**, 1121-1122 (1928). (3) Meerwein, Bersin, Burnelcit, *Ber.* **62**, 1002-1003, 1006-1009 (1929). (4) Gilman, Abbott, *J. Org. Chem.* **8**, 227-228 (1943). (5) von Auwers, *Ber.* **62**, 1319 (1929).

3:5765 METHYL  $\beta$ -CHLOROPROPIONATE  $C_4H_7O_2Cl$  Beil. II - 250  
 $ClCH_2CH_2CO.O.CH_3$   $\Pi_1$ —  
 $\Pi_2$ -(227)

B.P. $148-150^\circ$ at 760 mm. (1)	$D_{44}^{20} = 1.1634$ (7)	$n_D^{20} = 1.4265$ (7)
$148^\circ$ (2)		
$40-42^\circ$ at 10 mm. (3)	$D_{44}^{12} = 1.1874$ (1)	$n_D^{12} = 1.4319$ (1)

[For prepn. of  $\bar{C}$  from  $\beta$ -chloropropionic ac. (3:0470) by esterification with  $MeOH$  +  $HCl$  see (2) (3); from acrylic acid chloride (3:7153) +  $MeOH$  see (2) (4), from methyl

acrylate (1:3025) by addn. of  $\text{HCl}$  see (1), from acrylonitrile +  $\text{HCl}$  to  $\beta$ -chloropropionitrile followed by reactn. with  $\text{MeOH}$  (96% yield (5)) see (5).]

[Note that the b.p. of  $155\text{--}157^\circ$  reported by (4) has been characterized as erroneous (2) (1).]

$\bar{\text{C}}$  on litg. with diethylaniline at abt.  $200^\circ$  gives (1) (78% yield (3)) methyl acrylate (1:3025), b.p.  $80^\circ$  (1).

[For study of acid hydrolysis of  $\bar{\text{C}}$  see (6).]

### PREPARATION OF $\bar{\text{C}}$

[For prepn. of  $\bar{\text{C}}$  from 1-chloro-2-methylpropene-1 ( $\beta,\beta$ -dimethylvinyl chloride = "isocrotyl chloride") (3:7120) by addn. of  $\text{HOCl}$  with  $\text{Cl}_2$  + aq., aq.  $\text{HOCl}$ , or even alkyl or alkaryl hypochlorites as directed see (2) cf. (5) (3).]

[For prepn. of  $\bar{\text{C}}$  from  $\alpha,\alpha$ -dichloroacetone (3:5430) with  $\text{MeMgBr}$  in ether see (1).]

[For prepn. of  $\bar{\text{C}}$  from ethyl dichloroacetate (3:5850) with  $\text{MeMgBr}$  (74% yield (4)) or  $\text{MeMgI}$  (63% yield (6)) cf. (4) or from methyl dichloroacetate (3:5655) with  $\text{MeMgBr}$  (7) see indic. refs.]

CHEMICAL BEHAVIOR OF  $\bar{C}$ 

With inorganic reagents.  $\bar{C}$  does not (1) react with aq. HCl. —  $\bar{C}$  cannot (4) be hydrolyzed to the corresp. aldehyde, viz.,  $\alpha$ -hydroxyisobutyraldehyde [Beil. I-829, I<sub>2</sub>-(871)], either by aq., aq.  $\text{Na}_2\text{CO}_3$ , aq.  $\text{CaCO}_3$ , or aq.  $\text{PbO}$ .

[ $\bar{C}$  with 5 N ahs. alc.  $\text{NH}_3$  in s.t. nt  $100^\circ$  as directed gives (8) 2,2,5,5-tetramethyldihydropyrazine, m.p.  $83-84^\circ$  (8) (9).]

With organic reactants. [For behavior of  $\bar{C}$  with  $\text{MeNH}_2$  yielding a prod. of compn.  $\text{C}_{16}\text{H}_{32}\text{N}_4$  see (8).]

[ $\bar{C}$  with  $\text{Me}_2\text{NH}$  in  $\text{C}_6\text{H}_6$  in s.t. at  $130^\circ$  not only introduces the dimethylamino group for one chlorine but also ring-closes with loss of HCl giving (52% yield (8)) 1-(dimethylamino)-2-methyl-1,2-epoxypropane ( $\alpha,\alpha$ -dimethyl- $\alpha'$ -(dimethylamino)ethylene oxide), h.p.  $28-30^\circ$  at 13 mm.,  $D_{25}^{25} = 0.8725$ ,  $n_D^{25} = 1.4216$  (8).]

—  $\alpha$ -Hydroxyisobutyraldehyde di- $\beta$ -naphthylacetal [ $(\text{CH}_3)_2\text{C}(\text{OH})\text{CH}(\text{O.C}_{10}\text{H}_7)_2$ ]: [This cpd. which might be expected from  $\bar{C}$  with sodium  $\beta$ -naphtholate is unreported; note that 1,3-dichloro-2-methylpropanol-2 (3-5977) with sodium  $\beta$ -naphtholate gives the corresp. di- $\beta$ -naphthyl ether, m.p.  $151-152^\circ$ .]

— unsym.-Dichloro-*ter*-butyl acetate: unreported.

— unsym.-Dichloro-*ter*-butyl benzoate: unreported.

— unsym.-Dichloro-*ter*-butyl *p*-nitrobenzoate: unreported.

— unsym.-Dichloro-*ter*-butyl 3,5-dinitrobenzoate: unreported.

— unsym.-Dichloro-*ter*-butyl carbamate: m.p.  $122^\circ$  (7). [Prepd. from unsym.-dichloro-*ter*-butoxy  $\text{MgBr}$  by treatment with phosgene (3:5000) followed by  $\text{NH}_4\text{OH}$  (7).]

52-51°	at 10 mm. (10)		

Colorless when pure, but slightly brown if distilled at ord. press. — Sol. in 12 pts. aq., vol. with steam; miscible with alc. or ether. — Solid is very hygroscopic.

$\bar{C}$  is an important pharmaceutical. — [Although full consideration of its pharmacology is beyond the scope of this text, for studies and reviews of this aspect see (11) (12) (13) (14) (40).] —  $\bar{C}$  in the organism is in part excreted (15) (15) as urochloralic acid [Beil. I-620].

### PREPARATION OF $\bar{C}$

$\bar{C}$  is readily obtd. from trichloroacetaldehyde (chloral) (3:5210) by various types of reducing actions which are able to effect reduction of the aldehyde group without serious interference with the halogen atoms.

By use of various alcoholates. [For prepn. of  $\bar{C}$  from chloral (3:5210) with  $Al(OEt)_3$  in abs. EtOH (yields: 85% (17), 84% (3), 80% (18)) (5) (10) (19) cf. (23) see indic. refs.; with Al isopropylate in isopropyl alc. (20) in pres. of acetaldehyde (yield 72-87% (21)) see indic. refs.; with  $C_2H_5OMgBr$  (9),  $(CH_3)_2CHOMgBr$  (9), or other metallic isopropylates (22) see indic. refs.]

By use of  $RMgX$ . [For formn. of  $\bar{C}$  from chloral (3:5210) during reaction with  $MeMgBr$  (24), with  $EtMgBr$  (25) (4), with iso- $AmMgBr$  (4), with cyclohexyl  $MgBr$  (26), and various other  $RMgBr$  cpds. (7) (25) (yields: 65% (25), 50-60% (4), 42-52% (26)) see indic. refs.]

By use of metal alkyls. [For formn. of  $\bar{C}$  from chloral (3:5210) by use of  $ZnEt_2$  (2) (27) or  $AlEt_3$  cpd. with ether (88.5% yield (8)) see indic. refs.; note, however, that  $SnEt_4$  is not (8) effective.]

By phytochemical agents. [For prepn. of  $\bar{C}$  from chloral (3:5210) by reduction with fermenting yeast see (28) (5).]

By misc. methods. [For formn. of  $\bar{C}$  from urochloralic acid [Beil. I-620] by hydrolysis with dil. mineral acid see (1); for formn. of  $\bar{C}$  in small amts. from EtOH +  $Cl_2$  see (29).]

### CHEMICAL BEHAVIOR OF $\bar{C}$

#### WITH INORGANIC REACTANTS

**Oxidation.**  $\bar{C}$  reduces Fehling's soln. on warming (2). —  $\bar{C}$  with fuming  $HNO_3$  is oxidized to trichloroacetic acid (1) (2).

**Behavior with alkalis.** [ $\bar{C}$  in conc. aq. NaOH first dissolves then gives a white ppt. of Na deriv. (33). —  $\bar{C}$  with aq. KOH dissolves and soon afterward reacts vigorously yielding (2) various prods. including chloroacetic acid (3:1370),  $\beta,\beta,\beta$ -trichloroethoxyacetic acid [Beil. III-233], m.p. 69.5° (2), and formic acid (1:1005).]

**Behavior with inorganic acid chlorides.** [ $\bar{C}$  with  $PCl_3$  evolves HCl and yields (27) *tris*-( $\beta,\beta,\beta$ -trichloroethyl) phosphite, b.p. 263°, no formation of 1,1,1,2-tetrachloroethane (3:5555) being evident. —  $\bar{C}$  with  $PCl_5$  at 140° evolves HCl yielding (27) *tris*-( $\beta,\beta,\beta$ -trichloroethyl) phosphate, m.p. 73-74° (sublimes without decn.) accompanied by a trace of 1,1,1,2-tetrachloroethane (3:5555).]

[ $\bar{C}$  with  $SOCl_2$  gives (30) *bis*-( $\beta,\beta,\beta$ -trichloroethyl) sulfite, b.p. 139.5-140° at 5 mm., m.p. 6-7°. —  $\bar{C}$  with  $SO_2Cl_2$  in pyridine at 100° gives (30) *bis*-( $\beta,\beta,\beta$ -trichloroethyl) sulfate, m.p. 118.5-119.5° cor., also obtd. (30) by oxidn. of the preceding sulfite with acid  $KMnO_4$  in acetone.]

**Behavior with  $AlBr_3$ .** [ $\bar{C}$  with  $AlBr_3$  in  $CS_2$  (31) (32) undergoes replacement of chlorine by bromine yielding acc. to conditions  $\beta$ -bromo- $\beta,\beta$ -dichloroethanol, m.p. 17.5 (32), m.p. 17.5° (32), or  $\beta,\beta$ -dibromo- $\beta$ -chloroethanol, m.p. 50°, b.p. 80° at 8 mm. (32).]

## WITH ORGANIC REACTANTS

(See also below under derivatives.) — [ $\bar{C}$  with diazomethane in heptane (33), *n*-BuOH (34), or acetone (33) (but not in ether (33)), yields  $\beta,\beta,\beta$ -trichloroethyl methyl ether, b.p. 35–36° at 16 mm. (33).]

[ $\bar{C}$  with 2,3-dichlorodioxane-1,4 (3:9105) gives (50% yield (18)) 2-chloro-3-( $\beta,\beta,\beta$ -trichloroethoxy)dioxane-1,4, m.p. 77–78°.]

[ $\bar{C}$  with  $BEt_3$  at 150° evolves  $C_2H_6$  and gives (44% yield (8))  $\beta,\beta,\beta$ -trichloroethyl diethylborate,  $CCl_3CH_2OB(C_2H_5)_2$ , b.p. 78–79° at 12 mm. (8).]

—  $\beta,\beta,\beta$ -Trichloroethyl acetate: oil, b.p. 167° sl. dec. at 736 mm. (2), 71° at 18.3 mm. (2), 88–91° (35),  $D_4^{25} = 1.4239$  (35),  $n_D^{25} = 1.4691$  (35). [From  $\bar{C}$  with  $AcCl$  in *s.t.* at 130° for several hrs. (2).]

—  $\beta,\beta,\beta$ -Trichloroethyl benzoate: oil (29). [Note, however, that no constants are reported in the literature.]

①  $\beta,\beta,\beta$ -Trichloroethyl *m*-nitrobenzoate: m.p. 75° (29) (26). [From  $\bar{C}$  + *m*-nitrobenzoyl chloride + aq. alk. (29).]

②  $\beta,\beta,\beta$ -Trichloroethyl *p*-nitrobenzoate: m.p. 71° (28) (25). [From  $\bar{C}$  + *p*-nitrobenzoyl chloride + aq. alk. (28).]

③  $\beta,\beta,\beta$ -Trichloroethyl 3,5-dinitrobenzoate: m.p. 142–143° (25).

④  $\beta,\beta,\beta$ -Trichloroethyl carbamate: m.p. 64–65° (28) (36) (37) (38), 64° (39). [From  $\bar{C}$  (1 mole) with carbamyl chloride (1 mole) in dry ether (28) (note that  $\bar{C}$  with excess of carbamyl chloride gives (28)  $\beta,\beta,\beta$ -trichloroethyl allophanate, m.p. 182–183°), or from  $\bar{C}$  by treatment with phosgene (3:5000) followed by  $NH_3$  (37). — Note that this prod. comprises the hypnotic pharmaceutical known as "Voluntal." It also forms molecular cpds. with various other pharmaceuticals; e.g., "Voluntal," m.p. 64–65° + pyrazolone (2,3-dimethyl-4-dimethylamino-1-phenyl-pyrazolone-5) [Beil. XXV-452, XXV<sub>1</sub>-(672)], m.p. 108°, give a 1:1 mol. cpd., m.p. 75–76°, known as "Compral"; for f.p./compn. data and diagrams see this (and similar systems) see (39).]

—  $\beta,\beta,\beta$ -Trichloroethyl *N*-phenylcarbamate: m.p. 87° (39). [For f.p./compn. data and diagrams of this prod. (also known as *N*-phenylvoluntal) with atipyrine, etc., see (39).]

⑤  $\beta,\beta,\beta$ -Trichloroethyl *N*-( $\alpha$ -naphthyl)carbamate: m.p. 120° (7), 119° (26). [From  $\bar{C}$  +  $\alpha$ -naphthyl isocyanate at 120–135° for 2 hrs. (7).]

3:5780  $\beta$ -CHLOROETHYL CHLOROFORMATE  $C_2H_5O_2Cl_2$  Beil. III - 11  
( $\beta$ -Chloroethyl chlorocarbonate)  $ClCH_2CH_2O.CO.Cl$  III—  
III-(10)

B.P. 152.5° at 752 mm. (1)  $D_4^{20} = 1.3825$  (1)  $n_D^{20} = 1.4465$  (1)

Colorless lachrymatory liq. which fumes in air. — Insol. nq., eas. sol. alc., ether.

[For prepn. from  $\beta$ -chloroethanol (ethylene chlorohydrin) (3:5552) + phosgene (3:5000) see (1).]

$\bar{C}$  on slight warming with quinoline dec. at 41-42° into ethylene dichloride (3:5130) +  $CO_2$  (2).

$\bar{C}$  is readily hydrolyzed by warm aq. or dil. alk. to  $\beta$ -chloroethanol (3:5552) +  $CO_2$  + HCl (1).

①  $\beta$ -Chloroethyl carhamate: from  $\bar{C}$  + 2 moles conc. aq.  $NH_4OH$ ; m.p. 76° (3) (4) (5). [The value of 115° given in Beil. III-11 is wrong (5).]

②  $\beta$ -Chloroethyl *N*-phenylcarhamate: from  $\bar{C}$  in  $C_6H_6$  added to  $C_6H_6$  soln. of aniline (2 moles); after filtering off the pptd. aniline hydrochloride, the  $C_6H_6$  is evapd. (6); white ndls., m.p. 51° (3). [This deriv. on short boilg. with dil. aq. or alc. alk. loses HCl and by ring closure yields 3-phenyloxazolidone-2 [Beil. XXVII-136], lfts. from alc., m.p. 124° (3), 122° (7).]

③  $\beta$ -Chloroethyl *N*-*p*-tolylcarhamate: white ndls. from  $C_6H_6$ , m.p. 45° (6). [On treatment with alk. this gives 3-(*p*-tolyl)oxazolidone-2, white ndls. from alc., m.p. 91° (6).]

④  $\beta$ -Chloroethyl phenylcarbazate: from  $\bar{C}$  on treatment with 1 mole phenylhydrazine in aq. pyridine; the red oil initially formed soon solidifies and is recrystd. from  $C_6H_6$ ; white ndls., m.p. 89° (8).

**3:5820 3-CHLOROPROPEN-2-OL-1**  
 ( $\gamma$ -Chloroallyl alcohol)

Bell. I - 139

I<sub>1</sub>—I<sub>2</sub>—

High-boiling stereoisomer B.P. 153.0° at 756 mm. (1)

$D_{15}^{25} = 1.1582 \text{ (1)} \quad n_D^{25} = 1.4600 \text{ (1)}$

$D_{15}^{25} = 1.1681 \text{ (1)} \quad n_D^{25} = 1.4611 \text{ (1)}$

$D_{15}^{20} = 1.1720 \text{ (1)} \quad n_D^{20} = 1.4601 \text{ (1)}$

Low-boiling stereoisomer B.P. 146.3° at 746 mm. (1)

$D_{15}^{25} = 1.1623 \text{ (1)} \quad n_D^{25} = 1.4573 \text{ (1)}$

$D_{15}^{25} = 1.1720 \text{ (1)} \quad n_D^{25} = 1.4617 \text{ (1)}$

$D_{15}^{20} = 1.1760 \text{ (1)} \quad n_D^{20} = 1.4638 \text{ (1)}$

Colorless liquids; both stereoisomers possess a delayed vesicant notn., and care should be taken in handling them.

[For prepn. of  $\bar{O}$  from 1,3-dichloropropene-1 ( $\gamma$ -chloroallyl chloride) (3:5256) by hydrolysis for 2 hrs. under reflux with aq. 10%  $\text{Na}_2\text{CO}_3$  (10% excess over 1 equiv.) see (1); note that the high-boiling stereoisomer of  $\gamma$ -chloroallyl chloride gives (76% yield) of the high-boiling  $\bar{O}$ , and that the lower-boiling stereoisomer of  $\gamma$ -chloroallyl chloride gives (81% yield) the lower-boiling stereoisomer of  $\bar{O}$  (1).—Note that from  $\gamma$ -chloroallyl acetate (which was presumably a mixture of the acetates of both stereoisomers of  $\bar{O}$ ) by hydrolysis with cold aq.  $\text{NaOH}$   $\bar{O}$  (presumably a mixt. of stereoisomers) has been reported (2).]

The two stereoisomers of  $\bar{O}$  behave differently with hot aq.  $\text{NaOH}$  (1): the higher-boiling stereoisomer fails to give any propargyl alcohol but some acetylene and sodium formate are formed; the lower-boiling stereoisomer on refluxing with aq. 12.5%  $\text{NaOH}$  (10% excess) for 3 hrs. gives (by dehydrochlorination) 69% yield of propargyl alcohol (propyne-1-ol-3) [Bell. I-151], b.p. 114–115° (for study of influence of  $\text{NaOH}$  concn. and time see (1)).

①  $\gamma$ -Chloroallyl *N*-phenylcarbamate: ndls. from pet. ether, m.p. 75° (2). [From  $\bar{O}$  + phenyl isocyanate (note, however, that the  $\bar{O}$  employed very probably was a mixt. of the two stereoisomers (2)).]

[For prepn. of  $\bar{C}$  from fumaric acid (1:0395) with  $\text{PCl}_5$  (1) (2) (3), with  $\text{SOCl}_2$  (8) (10) (cf. (9) (11)), with phthalyl dichloride (3:6900) (12) (9) (10), or with benzotrichloride (3:6540) at 170° (27) see indic. refs.; from maleic anhydride (1:0625) by htg. 2 hrs. at

130–135° with phthaloyl dichloride (3:6900) +  $\text{ZnCl}_2$  (82–95% yield (7)) or with  $\text{PCl}_5$  (13) (6) for formn. of  $\bar{C}$  from succinyl dichloride (3:6200) with  $\text{Cl}_2$  see (14), from calcium malate with  $\text{PCl}_5$  see (15).]

$\bar{C}$  on htg. with fumaric acid (1:0895) at 175° (9) (16) or with silver fumarate (13) is largely converted to maleic anhydride (1:0625), b.p. 197–199°, m.p. 52°.

$\bar{C}$  with  $\text{Cl}_2$  in  $\text{CCl}_4$  in sunlight adds halogen almost quant. (19) yielding (17) (18) (20) *meso*- $\alpha, \alpha'$ -dichlorosuccinyl dichloride (3:9087). —  $\bar{C}$  adds  $\text{Br}_2$  at 150° (2) or in  $\text{CCl}_4$  in sunlight (20) yielding alm. quant. (19) *meso*- $\alpha, \alpha'$ -dibromosuccinyl dichloride, h.p. 113° at 18 mm. (20) (this prod. hydrolyzes with aq. to *meso*- $\alpha, \alpha'$ -dibromosuccinic acid, m.p. 257–258° in s.t. (20)).

$\bar{C}$  with 1,4-diphenylbutadiene-1,3 yields (10) 3,6-diphenyltetrahydrophthaloyl dichloride, colorless ndls from lgr., m.p. 143–144° cor. (10), this prod. on long boilg. (7½ hrs.) with aq. alc. NaOH gives (10) on acidif. 3,6-diphenyltetrahydrophthalic acid, ndls. from AcOH, m.p. 230–231° cor. dec. (10).] — [For color reactns. of  $\bar{C}$  with various polyenes see (21).]

$\bar{C}$  on htg. at 100° with  $\text{AlCl}_3$  is partially conv. to maleyl dichloride accompanied by evolution of  $\text{HCl} + \text{CO}$  (22). —  $\bar{C}$  with  $\text{AlCl}_3 + \text{C}_6\text{H}_6$  gives (yield: 78–83% (23), 74% (24)) *trans*- $\alpha, \beta$ -dihenzoyl ethylene (1,4-diphenylbuten-2-dione-1,4), cryst. from  $\text{C}_6\text{H}_6$  by addn. of alc., pale yel. ndls., m.p. 109–110° (23).] [For corresp. reactn. of  $\bar{C} + \text{AlCl}_3$  with toluene (24) (25), chlorobenzene (24), mesitylene (24), anisole (24), *m*-xylene (25), and biphenyl (25) see indic. refs.]

$\bar{C}$  with excess MeOH yields (8) dimethyl fumarate (1:2415), m.p. 101.7°. (Note, however, that  $\bar{C}$  with 1 equiv. MeOH in  $\text{C}_6\text{H}_6$  stood 5 hrs. at room temp. (5) or in ether (26) yields fumaric methyl ester chloride, b.p. 83° nt 17 mm. (26), 76° at 22-mm. (5), m.p. 16° (5), this on shaking with aq. gives nlm. quant. (5) methyl hydrogen fumarate, cryst. from  $\text{C}_6\text{H}_6$ , m.p. 144.5° cor (5).

$\bar{C}$  with phenol (6) or with sodium phenolate in  $\text{C}_6\text{H}_6$  (28) yields diphenyl fumarate, ndls. from alc., m.p. 161–162° (6); note, however, that the hmf ester, phenyl hydrogen fumarate, has m.p. 130° (28).

$\bar{C}$  with aq. readily hydrolyzes yielding fumaric acid (1:0895), m.p. nht. 293–295° subl.; for the diamide, dianilide, and other derivs. corresp. to  $\bar{C}$  see fumaric acid (1:0895).

See also Note 1.

Colorless liquid with odor suggesting chloroform. —  $\bar{\text{C}}$  is widely used in industry as solvent, degreasing agent, dry cleaner, component of insecticides, etc. — Note that comml.  $\bar{\text{C}}$  is likely to contain other prods., notably tetrachloroethylene (3:5460) q.v.

$\bar{\text{C}}$  is very spar. sol. aq.; e.g., 1 g.  $\bar{\text{C}}$  requires for soln. at 25° 2900 g. aq. (19); for study of soly. of  $\bar{\text{C}}$  in aq. at 20° see (20); for study of soly. of aq. in  $\bar{\text{C}}$  at 0°, 25°, and 30° as detd. by Karl Fischer reagt. see (21).

Binary systems contg.  $\bar{\text{C}}$ . For f.p./compn. data on systems  $\bar{\text{C}}$  + 1,2-dichloroethane (ethylene dichloride) (3:5130), eutectic, f.p. -62°, contg. about 56 wt. %  $\bar{\text{C}}$  (22);  $\bar{\text{C}}$  + 1,1,1-trichloroethane (methylchloroform) (3:5035), eutectic, f.p. -69.0° contg. 72.3%  $\bar{\text{C}}$  (14);  $\bar{\text{C}}$  + 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750), eutectic, f.p. -73°, contg. 59.9 wt. %  $\bar{\text{C}}$  (22);  $\bar{\text{C}}$  + tetrachloroethylene (3:5460), eutectic, f.p. -54.8°, contg. 41.6%  $\bar{\text{C}}$  (14);  $\bar{\text{C}}$  +  $\text{CCl}_4$  (3:5100), eutectic, f.p. -68° (82),  $\bar{\text{C}}$  +  $\text{CBr}_4$  (82) see indic. refs.

$\bar{\text{C}}$  forms binary azeotropes with various org. cpds.; e.g.,  $\bar{\text{C}}$  with chloroacetic acid (3:1370) forms a const.-boilg. mixt., b.p. 153.65° at 760 mm., contg. 90.1 wt. %  $\bar{\text{C}}$  (23);  $\bar{\text{C}}$  with trichloroacetic acid (3:1150) forms a const.-boilg. mixt., b.p. 161.8° at 760 mm., contg. 96.5 wt. %  $\bar{\text{C}}$  (24). — For other examples see Beil. I<sub>2</sub>-(57).

$\bar{\text{C}}$  either as liquid or vapor is extremely toxic; for further details see (83) (25) (26) (27) (28) (29); for extensive study of anthelmintic action see (19).

[For study of soly. in  $\bar{\text{C}}$  of gaseous  $\text{HCl}$  (30) (11),  $\text{H}_2\text{S}$  (30), or  $\text{NH}_3$  (30) see indic. refs.; for study of thermal conductivity of  $\bar{\text{C}}$  see (31); for study of influence of vapors of  $\bar{\text{C}}$  on

the explosion limits of mixtures of air with hydrogen, carbon monoxide, methane, acetylene, etc., see (32) (33) (34) (35).]

Preparation of  $\bar{C}$ . [For prepn. of  $\bar{C}$  from chloral (3:5210) with  $PCl_5$  (7) (37) or with  $AlCl_3$  (38) see indic. refs.; note that in latter case (38) presence of  $AlCl_3$  also facilitates loss of  $HCl$  from  $\bar{C}$  with consequent formn. of tetrachloroethylene (3:5460); from trichloroethylene (3:5170) by addn. of  $Cl_2$  in aq. (39) or under influence of ultra-violet light (40) (41) (note that  $O_2$  retards addition of halogen (41)), or with  $S_2Cl_2$  in s.t. at 140–150° (42), see indic. refs.]

[For formn. of  $\bar{C}$  (together with various other by-products) from ethyl chloride (3:7015) (43) or from 1,2-dichloroethane (ethylene dichloride) (3:5130) (44) with  $Cl_2$  see indic. refs.; from chloroform (3:5050) in electric arc (45) or in dark electric discharge (46) see indic. refs.; from  $CCl_4$  in dark elec. discharge see (46); from 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) or from trichloroethylene (3:5170) with  $Cl_2$  at 80°, 95°, or 115° in ultra-violet light (41), over pumice at 700° (47), or with  $FeCl_3$  on htg. in s.t. (48) see indic. refs.; from trichloroethylene (3:5170) with large excess  $Cl_2O$  in  $CCl_4$  at –20° see (10); from  $\beta,\beta'$ -dichlorodiethyl sulfide ("mustard gas") with dry  $Cl_2$  at 100° see (49).]

[For stabilization of  $\bar{C}$  by addn. of not over 0.1% alkyl amines such as  $Et_3N$  (50) or with a wide variety of other org. N cpds. (81) see indic. refs.]

[For studies of detn. of  $\bar{C}$  by reactn. with  $Na$  + ethanalamine in dioxane (51) followed by volumetric (51) or gravimetric (71) detn. of resultant chloride ion see indic. refs. (note that use of Stepanov's method ( $Na$  +  $EtOH$ ) for detn. of  $Cl$  in  $\bar{C}$  gives low results unless after addn. of  $Na$  mixt. is refluxed at least 20 hrs. (12)); for detn. of  $\bar{C}$  by thermal decn. and subsequent detn. of chlorine see (52).]

Chemical behavior of  $\bar{C}$ . [ $\bar{C}$  with dry  $Cl_2$  at 70° in diffuse light does not react and even after 30 hrs. no  $HCl$  is formed (52); however,  $\bar{C}$  with dry  $Cl_2$  +  $AlCl_3$  at 70° (53), or  $\bar{C}$  +  $Cl_2$  over activated charcoal at 300–400° (54), yields hexachloroethane (3:4835).]

[ $\bar{C}$  with  $F_2$  at 90° over a 10-hr. period yields (8) a mixt. of prods. contg. fluoropentachloroethane, m.p. 99.8–110° (in s.t.) (b.p. 137–139°), hexachloroethane (3:4835), tetrachloroethylene (3:5460), *sym.*-difluorotetrachloroethane, b.p. 91–92°, together with other materials. — For behavior of  $\bar{C}$  with  $SbF_5$  see (55).]

$\bar{C}$  with  $K_2Cr_2O_7/H_2SO_4$  is only partially oxidized to  $CO_2$  (56). — [ $\bar{C}$  on photochem. oxidn. with  $O_2$  in ultra-violet light (57) (58) gives a mixt. consisting of 80% trichloroacetyl chloride (3:5420) + 20% phosgene (3:5000). —  $\bar{C}$  with fuming  $H_2SO_4$  (60%  $SO_3$ ) at 50–60° yields (59) dichloroacetyl chloride (3:5200).]

$\bar{C}$  under various circumstances loses  $HCl$  yielding tetrachloroethylene (3:5460) [e.g.,  $\bar{C}$  over bone char at 280° (60) or over  $NiCl_2$  at 330° (61), or with  $AlCl_3$  at 70° (53) or under reflux (95% yield (72)) (62), or with liq.  $NH_3$  at –18 to –34° under reduced press. (63) (64), or with prim. or sec. aliph. amines (84), or with  $MeOH$  over  $Al_2O_3$  at 290° (methyl chloride (3:7005) is also formed) (65), or with acetylene over cat. at 200–300° (vinyl chloride (3:7010) is also formed) (68), or with alc.  $KOH$  (44) (66), or in alc. with 2  $N$  aqueous  $NaOH$  in cold (98% yield (12)) gives tetrachloroethylene (3:5460). — For detn. of  $\bar{C}$  by titration of chloride ion thus split off see (67); for study of kinetics of reactn. of  $\bar{C}$  with  $EtOH/NaOH$  see (12).]

$\bar{C}$  under certain conditions yields trichloroethylene (3:5170) [e.g.,  $\bar{C}$  with  $H_2$  over  $Ni$  at 270° (61), or  $\bar{C}$  on electrolysis at  $Pb$  cathode (69), or  $\bar{C}$  with  $MeMgI$  (70) gives trichloroethylene (3:5170).]

[ $\bar{C}$  with  $CHCl_3$  (3:5050) +  $AlCl_3$  gives (72) (73) (74) (75) *unsym.*-heptachloropropane (3:0200); note that this reactn. first involves loss of  $HCl$  under influence of  $AlCl_3$  (see also above) and subsequent condensation of the resultant tetrachloroethylene (3:5460)

with  $\text{CHCl}_3$ . —  $\bar{\text{C}}$  (1 mole) + 1,2-dichloroethylene (presumably mixt. of *cis* (3:5042) and *trans* (3:5028) stereoisomers) +  $\text{AlCl}_3$  (1% of sum of wts. of reactants) stood 12 days at  $40^\circ$  gives (76) (in addition to a residue a fraction volatile with steam which consists of 1,1,2,2,3,4,4-heptachlorobutane (3:0056)), two stereoisomeric 1,1,2,3,4-pentachlorobutanes, viz., the solid isomer (3:0750) and the liquid isomer (3:9068); for genesis of these compds. see (76).]

[For survey of actn. of  $\bar{\text{C}}$  on various common metals see (77). —  $\bar{\text{C}}$  with Na or K or their alloys may (like many other polychloro compds.) explode under certain conditions; for an extensive study of this behavior including sensitivity to mechanical shock see (78).]

$\bar{\text{C}}$  with excess phenylhydrazine on stdg. at ord. temp. evolves  $\text{N}_2$ , ppts. phenylhydrazine hydrochloride, and yields benzene (67); the full mechanism of this behavior seems never to have been established, but these same three prods. are similarly obtd. from hexachloroethane (3:4835) and to a lesser degree from 1,1,2,2-tetrachloroethane (3:5750).

⑤ Color test with  $\text{NH}_4\text{OH}/\text{Cu}_2\text{Cl}_2$ .  $\bar{\text{C}}$  (1-2 drops) in small glass-stoppered bottle filled with conc. aq.  $\text{NH}_4\text{OH}$  treated with powdered  $\text{Cu}_2\text{Cl}_2$ , stopper quickly inserted (to force out air and excess liq.) and shaken, gives within 5 mins. a blue color which rapidly darkens; note that this test is not specific for  $\bar{\text{C}}$  and is also shown by other epds. contg. the  $-\text{CCl}_3$  group such as trichloroacetic acid (3:1150), ethyl trichloroacetate (3:5950)  $\text{CHCl}_3$  (3:5050),  $\text{CCl}_4$  (3:5100), although hexachloroethane (3:4835) develops color at surface only after several hours; for further details see (79).

### 3:5885 1,2,3-TRICHLORO-2-METHYLPROPANE $C_4H_7Cl_3$ Beil. S.N. 10

B.P. 162.0-163.1° cor. (1)

$D_4^{25} = 1.3020$  (1)

$n_D^{20} = 1.4765$  (1)

{For prepn. of  $\bar{C}$  from *ter*-butyl chloride (3:7045) +  $\text{Cl}_2$  see (1); for formn. of  $\bar{C}$  (5%) from 3-chloro-2-methylpropene-1 (methallyl chloride) (3:7145) by addn. of  $\text{Cl}_2$  with  $\text{Cl}_2/\text{aq.}$  at 30° (main prod. is 1,3-dichloropropanol-2 (3:5985) in 70% yield) (2), or better with  $\text{SO}_2\text{Cl}_2$  (83% yield (4)) see indic. refs.; from 1,3-dichloro-2-methylpropene (3:7960) with  $\text{Cl}_2$ , or with  $\text{SO}_2\text{Cl}_2 + \text{Bz}_2\text{O}_2$  (73% yield) see (4).}

$\bar{C}$  on pyrolysis at 450-550° gives (3) three isomeric dichloroisobutenes, viz., *cis* and *trans* 1,3-dichloro-2-methylpropene (3:5590) and 3-chloro-2-(chloromethyl)propene-1 (3:5633).

[ $\bar{C}$  on dehydrohalogenation with equimolar proportion of quinoline at b.p. 1½ hrs. gives (73-83% yield (4)) 1,3-dichloro-2-methylpropene-1 (3:5590).]

$\bar{C}$  on hydrolysis with excess 5% aq. NaOH gives (84% yield (3)) a mixt. of *cis* and *trans* stereoisomers of  $\gamma$ -chloro- $\beta$ -methyl-allyl alcohol (3:8340).

[See also "Butyrychloral hydrate" (3:1905).]

Oily liq.

[For prepn. of  $\bar{C}$  from acetaldehyde (1:6100) (3) (7) or paraldehyde (1:0170) (7) (8) with  $Cl_2$  see indic. refs.; from  $\alpha$ -chlorocrotonaldehyde (3:8117) by addn. of  $Cl_2$  (6) (10) (36) in  $CCl_4$  soln. (9); from crotonaldehyde (1:6150) by satn. with  $HCl$  gas followed by treatment with  $Cl_2$  see (11) cf. (37).]

[For prepn. of  $\bar{C}$  from its polymers (see below) by distn. at atmospheric press. (2), or from its hydrate (3:1905) by distn. with half its wt. of  $Ac_2O$  (2), or shaking with conc.  $H_2SO_4$  (1) cf. (2), see indic. refs.]

[ $\bar{C}$  on reduction with fused  $Al(OEt)_3$  in boilg. abs. alc. under  $H_2$  or  $N_2$  for 14 hrs. (12) or with fused  $Al(OEt)_3 + AlCl_3$  in boilg. abs. alc. under  $H_2$  or  $N_2$  for 14 hrs. (13), or with  $C_2H_5OMgBr$  in dry ether followed by aq. (19), or by treatment with diethylzinc (14), di-*n*-propylzinc (15), or di-isobutylzinc (15) (followed by aq.) gives (92% yield (12)) 2,2,3-trichlorobutanol-1 (3:1336), m.p. 62°. — Note that  $\bar{C}$  (as hydrate) (3:1905) is reduced by fermenting yeast (16) to dextrorotatory 2,2,3-trichlorobutanol-1, m.p. 62°.]

[ $\bar{C}$  with  $Zn + HCl$  or  $Zn + aq.$  (17) is dehalogenated to a mixt. of  $\alpha$ -chlorocrotonaldehyde (3:8117) + crotonaldehyde (1:0150);  $\bar{C}$  with  $Fe$  filings +  $AcOH$  at room temp. for 8 days (18) dehalogenates to a mixt. of *n*-butyraldehyde (1:0130) + *n*-butyl alc. (1:6180) + crotonyl alc. (Beil. I-442,  $I_1$ -(227),  $I_2$ -(480)).]

$\bar{C}$  on oxidn. with 2 pts. fung.  $HNO_3$  stood overnight at ord. temp. yields (3)  $\alpha, \alpha, \beta$ -trichloro-*n*-butyric acid (3:1280) (cf. corresp. behavior of butyrychloral hydrate (3:1905)). —  $\bar{C}$  on oxidn. with boilg. aq.  $K_4Fe(CN)_6$  also loses 2 atoms of chlorine giving (41% yield (29))  $\alpha$ -chlorocrotonic acid (3:2760).

$\bar{C}$  (1 mole) with  $H_2O$  (1 mole) readily combines with evolution of heat yielding (3) (9) crystn. butyrychloral hydrate (3:1905). — Similarly,  $\bar{C}$  combines with equiv. amt. of alcohols giving the corresp. alcoholates: e.g.,  $\bar{C}$  with  $EtOH$  yields (20) butyrychloral-ethylalcoholate [Beil. I-665,  $I_1$ -(346)];  $\bar{C}$  with butanol-2 yields (1) butyrychloral-sec-butylalcoholate, etc. — Note that butyrychloral-ethylalcoholate in excess  $EtOH$  on satn. with dry  $HCl$  gas gives (50% yield (21))  $\alpha, \alpha, \beta$ -trichloro-*n*-butyraldehyde diethylacetal, b.p. 232-233°, 135° at 30 mm. (21). — [For study of dissociation of addn. epds. of  $\bar{C}$  with various *prim.*, *sec.*, and *ter.* alcohols see (22).]

$\bar{C}$  or its hydrate (3:1905) q.v. in pres. of conc.  $H_2SO_4$  or pyridine at ord. temp. can be trimerized to a mixt. of two parabutyrychlorals (2); these are colorless, crystalline, sharp melting solids, sol. in org. solvents but insol. in aq.; the less sol.  $\alpha$ -parabutyrychloral, rhombic cryst. from boilg.  $AcOH$  or boilg.  $EtOH$ , has m.p. 180°; the more soluble  $\beta$ -parabutyrychloral (stereoisomer?), cryst. from boilg.  $AcOH$  or boilg.  $EtOH$ , has m.p. 157°; these polymers can be distilled at 15 mm., but attempts to distil them at ord. press. result in complete dissociation to  $\bar{C}$  (2).

[ $\bar{C}$  with anhydrous acetaldehyde (1:0100) (2 moles) with dry HCl gas at 0° for 15-20 hrs. condenses to give (67% yield (23)) 2,4-dimethyl-6-( $\alpha,\alpha,\beta$ -trichloro-*n*-propyl)trioxane-1,3,5, h.p. 118° at 13 mm. (23).]

[ $\bar{C}$  in  $\text{CHCl}_3$  with  $\text{H}_2\text{S}$  gives (24) *bis*-( $\alpha$ -hydroxy- $\beta,\beta,\gamma$ -trichloro-*n*-butyl)sulfide ("butyrchloralsulphydrate"), m.p. 85° (24).]

[ $\bar{C}$  with  $\text{PCl}_5$  (1.4 wt. pts.) at 110-120° apparently has its oxygen replaced by equivalent chlorine but also loses 1 HCl yielding (25) a cpd. of compn.  $\text{C}_4\text{H}_2\text{Cl}_4$ , presumably 1,1,2,3-tetrachlorobutene-2, although no other report of this cpd. can be found.]

[ $\bar{C}$  with aq. HCN gives only butyrchloral hydrate (3:1905) since this prod. is too spar. sol. aq. to enter further reaction, but upon addn. of alc. and subsequent digestion this system yields (26) (27)  $\alpha,\alpha,\beta$ -trichloro-*n*-butyraldehyde cyanohydrin [Beil. 111-322, III- (226)], pl. from aq., m.p. 101-102° (27) (28), also obtd. from butyrchloral hydrate with aq. KCN (2 moles) at 40° (28). — See also further comments under butyrchloral hydrate (3:1905).]

[ $\bar{C}$  with ethyl diazoacetate gives (71% yield (30)) ethyl  $\beta$ -keto- $\gamma,\gamma$ -trichloro-*n*-caproate [Beil. III-684], b.p. 149° at 20 mm. (30).]

$\bar{C}$  in  $\text{CHCl}_3$  with  $\text{NH}_3$  gas gives on evapn. of solvent (31) butyrchloralammonia, cryst., m.p. 62° [see also under butyrchloral hydrate (3:1905)].

$\bar{C}$  also readily adds amides yielding cpds. of type  $\text{CH}_3\text{CHClCH}_2\text{CH}(\text{OH})\text{NH}\cdot\text{CO}\cdot\text{R}$ ; e.g.,  $\bar{C}$  with acetamide (1 mole) gives on htg. (31) (32) (33) (34) butyrchloralacetamide, obtd. by these workers in two isomeric forms one of m.p. 170° (spar. sol. hot alc.) (32) (33) (34), the other m.p. 158° (readily sol. in hot 50% alc.) (31) (32) (33); note, however, that butyrchloral hydrate (3:1905) with acetamide (1 mole) htd. at 100° until solidification occurs gives only (21) a prod. m.p. 208-210°;  $\bar{C}$  with benzamide (1 mole) gives on htg. butyrchloralbenzamide, obtd. in two isomeric forms, one of m.p. 146° (32) (33) cf. (34), the other of m.p. 132° (31) (32) (33); note, however, that butyrchloral hydrate (3:1905) with benzamids yields only (21) a prod. m.p. 176°.

$\bar{C}$  (3.5 g.) with urea (1.2 g.) htd. at 100°, cooled, powdered and recrystd. from alc., gives (yield not stated (35)) butyrchloralurea, m.p. 156°.

## 3:5956 ETHYL TRICHLOROACETATE

Beil. II - 209

II<sub>1</sub>-(94)II<sub>2</sub>-(200)

B.P. 167.5-168.0° cor.	(1)	$D_4^{20} = 1.3826$ (8)	$n_D^{20} = 1.45668$ (8)
167.5°	(2)	1.3823 (10)	1.45046 (10)
166.7-167.1° at 754.8 mm.	(3)		
167°	(4)		
166°	(13)		
166° at 738.2 mm.	(8)		
164-166°	(5)		
164°	(6)		
163.0-163.5° at 882 mm.	(7)		
74° at 28 mm.	(9)		
58.6-59.0° at 13 mm.	(10)		
62° at 12 mm.	(11)		
60-61° at 13 mm.	(12)		

[For prepn. of  $\bar{\text{C}}$  from trichloroacetic acid (3:1150) with abs. EtOH + dry HCl (yield: 90% (13), 53% (16)) or with  $\text{H}_2\text{SO}_4$  (50-60% yield (13)) (14) (15), or with Twitchell's reagt. (62.6% yield (5)) see indic. refs.; from trichloroacetyl chloride (3:5420) with ethyl orthoformate (1:3241) see (17); from "tetrachloroethylidene trichloroacetate" [Beil. XIX-105] with EtOH see (12); for formn. of  $\bar{\text{C}}$  from chloral (3:5210) with  $\text{Al}(\text{OEt})_3$  in  $\text{C}_6\text{H}_6$  (11), or with acetaldehyde +  $\text{Al}(\text{OEt})_3$  or  $\text{Mg}(\text{OMe})_2$  in dry ether (18), see indic. refs.]

[ $\bar{\text{C}}$  on warming with KCN in abs. alc. dec. (9) into chloroform (3:5050) +  $\text{CO}_2$ ;  $\bar{\text{C}}$  with NaOEt gives on warming (19) triethyl orthoformate (1:3241) + Na ethyl carbonate + NaCl.]

[ $\bar{\text{C}}$  with excess  $\text{H}_2$  over Ni at 320° gives (14) ethyl dichloroacetate (3:5850) + ethyl chloroacetate (3:5700) + EtOAc (1:3015) + acetaldehyde (1:0100).]

$\bar{\text{C}}$  with  $\text{Cu}_2\text{Cl}_2$  in conc. aq.  $\text{NH}_4\text{OH}$  gives dark blue color within 2 min. (21); also shown by chloral hydrate (3:1270) and trichloroacetic acid (3:1150) (the latter, however, acting instantly); for further limitations see (21). [ $\bar{\text{C}}$  htd. at 100° with Cu powder for 6-8 hrs. (22) gives diethyl tetrachlorosuccinate, b.p. 150° at 13 mm. (22).]

$\bar{\text{C}}$  with conc. aq.  $\text{NH}_4\text{OH}$  gives in the cold (14) trichloroacetamide, spar. sol. aq., cryst. from hot aq. or dil. alc., m.p. 141°. —  $\bar{\text{C}}$  on shaking with aq. benzylamine gives in the cold (23) trichloroacet-N-benzylamide, cryst. from lgr., m.p. 93.6-94.4° cor. (23). [Note, however, that the corresp. dichloroacet-N-benzylamide (from ethyl dichloroacetate (3:5850) has almost the same m.p., viz., 94.8-95.6° cor. (23), while chloroacet-N-benzylamide (from ethyl chloroacetate (3:5700)) has m.p. 93.0-93.6° cor. (23).]

$\bar{\text{C}}$  hydrolyzes very readily (5) yielding ethyl alcohol (1:0130) and trichloroacetic acid (3:1150). [For kinetic studies of hydrolysis of  $\bar{\text{C}}$  under various conditions (including very high pressure (9)) see (10) (2) (24); for kinetic study of alcoholysis of  $\bar{\text{C}}$  with MeOH + HCl see (25).]

**3:5955 *d,l*-1,1,1-TRICHLOROBUTANOL-2**  
 (Ethyl-trichloromethyl-carbinol)

B P. 169-171° at 738 mm. {1}  
 82-84° at 22 mm. {2}  
 69-71° at 12 mm. {3}  
 68-70° at 13 mm. {1}  
 44-46° at 3 mm. {1}

$D_{25}^{25} = 1.3760$  {1}  $n_D^{25} = 1.4901$  {1}

Oil. — Eas. sol. MeOH, EtOH, ether, acetone,  $\text{C}_6\text{H}_6$ ,  $\text{CHCl}_3$ ,  $\text{CCl}_4$ ,  $\text{CS}_2$ . [Note that b.p. of 99° at 680 mm. {1} may be a typographical error {1}.]

[For prepn. of  $\bar{\text{C}}$  from chloral (3:5210) via conversion with diazomethane to 3,3,3-trichloro-1,2-epoxypropane (3:1336) and reactn. of latter with 1 N LiMe in dry ether at -75° (yield 85%) see {1}; from chloral (3:5210) with  $\text{EtMgBr}$  {4} {5} or  $\text{EtMgI}$  {2} in ether (yields: 44% {4}, 16% {2}, 15% {5}) see indic. refs. (note, however, that by virtue of reducing actn. of  $\text{EtMgX}$  large amounts of 2,2,2-trichloroethanol-1 (3:5775) are also formed {5} {2} {1}); from chloral (3:5210) with  $\text{PbEt}_4$  (20% yield {6}) (note, however, that this could not be confirmed {1}), from trichloroacetyl chloride (3:5420) with  $\text{EtMgBr}$  at 10° see {3}.]

$\bar{\text{C}}$  with conc.  $\text{HCl} + \text{ZnCl}_2$  (Lucas' reagent) stood for 1 hr. at room temp. gives {1} 1,1,1,2-tetrachlorobutane (3:5622).

$\bar{\text{C}}$  with 5% soln. of  $\text{Na}_2\text{CO}_3$  in 50% aq. alc. refluxed for 10 hrs. {1} or  $\bar{\text{C}}$  with aq.  $\text{KOH}$ ,  $\text{NaOH}$ ,  $\text{Na}_2\text{CO}_3$ ,  $\text{Ba}(\text{OH})_2$ ,  $\text{Mg}(\text{OH})_2$ ,  $\text{CaCO}_3$ , etc., {2} undergoes both hydrolysis and hydrolytic cleavage giving respectively  $\alpha$ -hydroxy-*n*-butyric acid [Beil. III-302, III<sub>1</sub>-(114), III<sub>2</sub>-(216)] (yields: 46% {1}, 21% {2}), m.p. 43°, and propionaldehyde (1:0110) (29% yield {2}).

— Ethyl-trichloromethyl-carbinyl acetate: b.p. 164-165° at 680 mm. {4}. [From  $\bar{\text{C}}$  with  $\text{Ac}_2\text{O}$  at 130-135° for 2 hrs. {4}. Note that in light of subsequent work {1} the identity of this prod. has been questioned.]

— Ethyl-trimethyl-carbinyl benzoate: b.p. 217-218° at 680 mm. {4}. [From  $\bar{\text{C}}$  with  $\text{BzCl} +$  cold dil. aq. alk. {4}. Note that in light of subsequent work {1} the identity of this prod. has been questioned.]

Ⓔ Ethyl-trimethyl-carbinyl *p*-nitrobenzoate: cryst. from pet. ether, m.p. 70-71.5° {1}. [Note that this m.p. is identical with that of the *p*-nitrobenzoate of 2,2,2-trichloroethanol-1 (3:5775); although each appears to be authentic, whether their mixture shows depression of m.p. is not reported.]

## 3:5957 1,1,3-TRICHLOROPROPANONE-2

 $(\alpha, \alpha, \gamma\text{-Trichloroacetone})$ 

Bell. I - 655

I<sub>1</sub>—I<sub>2</sub>—

B.P. 172° (1)

[For prepn. of  $\bar{C}$  from 1,1-dichloro-3-bromopropanone-2 (1) with alc.  $\text{HgCl}_2$  see (1); for formn. from acetone (1:5400) with  $\text{Cl}_2$  in pres. of  $\text{NiCl}_2$  at 70° (together with other prods.) see (2).]

$\bar{C}$  with aq. or alc.  $\text{NH}_4\text{OH}$  fails (1) to give chloroform;  $\bar{C}$  with  $\text{KOH}$  + aniline fails (1) to give phenylisocyanide. [Dif. from isomer 1,1,1-trichloropropanone-2 (3:5620).]

[ $\bar{C}$  with diazotized aniline in pres. of  $\text{NaOAc}$  couples (3) to yield a cpd. having composition  $\text{C}_6\text{H}_7\text{ON}_2\text{Cl}_3$  (and presumably structure  $\text{C}_6\text{H}_5\text{NH.N}=\text{C}(\text{Cl}).\text{CO}.\text{CHCl}_2$ ), cryst from pet. ether, m.p. 115-116° (3).]

$\bar{C}$  when pure is colorless oil, volatile with steam.

[For f.p./compn. data and diagram of system  $\bar{C}$  + *o*-dichlorobenzene (3:6055) (eutectic, m.p. -45.9°, contg. 51.3%  $\bar{C}$ ) see (12); on system  $\bar{C}$  + *p*-dichlorobenzene (3:0980) (eutectic, m.p. -20.9°, contg. 88.0%  $\bar{C}$ ) see (12); for f.p./compn. data on ternary system of all three dichlorobenzenes see (7); for f.p./compn. data on systems:  $\bar{C}$  + fluorobenzene,  $\bar{C}$  + chlorobenzene (3:7903),  $\bar{C}$  + bromobenzene, and  $\bar{C}$  + *o*-chlorotoluene (3:8245) see (9).]

[For data on densities of solns. of  $\bar{C}$  in  $\text{C}_6\text{H}_6$  (1:7400) and in *n*-hexane (1:8530) see (13).]

[ $\bar{C}$  is very spar. sol. aq. (for study of this over range 20-60° see (14)).]

[For prepn. of  $\bar{C}$  from *m*-chloroaniline [Beil. XII-602, XII<sub>1</sub>-(300)] via diazotization and use of  $\text{Cu}_2\text{Cl}_2$  reactn. (yields: 80% (15), 70% (16)) (7) (17) or by pptn. of the diazonium chloroplatinate and hgt. of latter with  $\text{Na}_2\text{CO}_3$  (4) see indic. refs.; from 2,4-dichloroaniline [Beil. XII-621, XII<sub>1</sub>-(309)] via diazotization in alc. (18) (17) (3) (4) or isoamyl alc. (19) followed by replacement of orig. amino group by H by actn. of the alc. (60% yield (15)) or with hypophosphorous acid (50% yield (10)) (use of alk.  $\text{SnCl}_2$  or oxidn. of the corresp. 2,4-dichlorophenylhydrazine with  $\text{CuSO}_4$  gave only very low yields (15)) see indic. refs.; from *m*-phenylenediamine [Beil. XIII-33, XIII<sub>1</sub>-(10)] via totazotization in  $\text{AcOH}$  with

nitrosylsulfuric acid followed by use of  $\text{Cu}_2\text{Cl}_2$  reactn. (70.4% yield (20)) (21) see indic. refs.]

[For prepn. of  $\bar{\text{C}}$  from *m*-chloronitrobenzene [Beil. V-243, V<sub>1</sub>-(129)] with  $\text{SOCl}_2$  in s.t. at 190–200° for 12 hrs. (71% yield (22)), from *m*-nitrobenzenesulfonic acid [Beil. XI-68, XI<sub>1</sub>-(21)] with  $\text{SOCl}_2$  in s.t. at 180–200° (23), from *m*-bromonitrobenzene [Beil. V-248, V<sub>1</sub>-(131)] with  $\text{PCl}_5$  in s.t. at 180° (24), from 2,6-dichlorobenzoic acid (3:4200) by htg. in acetamide at 225–235° for 6 hrs. (93% yield (25)), or from 2,6-dichlorobenzaldehyde (3:1690) with 50% KOH under  $\text{N}_2$  at 100° for 5 hrs. (84% yield (6)) see indic. refs.]

[For formn. of  $\bar{\text{C}}$  from 2,6-dichloroacetophenone (5), 2,4-dichlorobenzophenone (3:0825) (26), 2,6-dichlorobenzophenone (3:2285) (26), or 3,5-dichlorobenzophenone (3:1505) (26) by fusion with KOH/NaOH see indic. refs.; for formn. of  $\bar{\text{C}}$  from 1,3-dichlorocyclohexadiene-1,3 [Beil. V-114] with  $\text{PCl}_5$  or with  $\text{Br}_2$  in  $\text{CHCl}_3$  see (27).]

[For formn. of  $\bar{\text{C}}$  from  $\text{C}_6\text{H}_6$  (1:7400) or chlorobenzene (3:7903) with  $\text{Cl}_2$  + cat. at 400–700° (50–60% yield (12)) (28) or with  $\text{Cl}_2$  in pres. of  $\text{AlCl}_3$  (29) cf. (30) see indic. refs.]

[ $\bar{\text{C}}$  with  $\text{Cl}_2$  +  $\text{Al}/\text{Hg}$  (31) or with  $\text{Cl}_2$  +  $\text{AlCl}_3$  (30) cf. (29) gives mainly 1,2,4-trichlorobenzene (3:6420). —  $\bar{\text{C}}$  suspended in 1% aq. NaOH adds 3  $\text{Cl}_2$  in sunlight giving (32) *m*-dichlorobenzene hexachloride, cryst. from alc., m.p. 81.8° (32). — For study of photochemical chlorination of  $\bar{\text{C}}$  see (33).]

[ $\bar{\text{C}}$  with Mg (1 mole) +  $\text{I}_2$  (0.25 equiv.) gave (34) after 3 days 62.5% *m*-chlorophenyl  $\text{MgCl}$ .]

[ $\bar{\text{C}}$  with  $\text{CHCl}_3$  +  $\text{AlCl}_3$  at 65° for 14 hrs. as directed gives (18% yield (35)) *tris*-(2,4-dichlorophenyl)methane, white cryst. from hot acetone, m.p. 227–228.5° (35). —  $\bar{\text{C}}$  with  $\text{CCl}_4$  +  $\text{AlCl}_3$  as directed gives (60% yield (35)) 2,4,2',4'-tetrachlorobenzophenone dichloride, white pl. from hot acetone, m.p. 139.0–140.5° (35), 140° (36); hydrolysis of this prod. with  $\text{AcOH}/\text{H}_2\text{SO}_4$  yields (37) 2,4,2',4'-tetrachlorobenzophenone, m.p. 78° (37), accompanied by some 2,4-dichlorobenzoic acid (3:4560), m.p. 161° (37).]

[ $\bar{\text{C}}$  with acetyl chloride (3:7065) +  $\text{AlCl}_3$  gives (15% yield (38)) 2,4-dichloroacetophenone, b.p. 140–150° at 15 mm. (33), m.p. 33–34° (33). —  $\bar{\text{C}}$  with chloroacetyl chloride (3:6235) +  $\text{AlCl}_3$  in  $\text{CS}_2$  yields (39) 2,4-dichlorophenacyl chloride (2,4- $\omega$ -trichloroacetophenone), pr. from lgr., m.p. 57° (39). —  $\bar{\text{C}}$  with  $\beta$ -chloro-*n*-butyric acid (3:0035) +  $\text{AlCl}_3$  or conc.  $\text{H}_2\text{SO}_4$  yields (40) by condens. and subsequent ring closure 4,6-dichloro-3-methylindanone-1, m.p. 67–70° (40). —  $\bar{\text{C}}$  with  $\alpha$ -bromobenzoyl chloride +  $\text{AlCl}_3$  in  $\text{CS}_2$  gives (43% yield (41)) 2-bromo-2',4'-dichlorobenzophenone, b.p. 227–228.5°, m.p. 33–34°.]

[ $\bar{\text{C}}$  with phthalic anhydride +  $\text{AlCl}_3$  at 100–110° for 7 hrs. gives (17% yield on the anhydride (42)) (43)  $\alpha$ -(2,4-dichlorobenzoyl)benzoic acid, white cubes from  $\text{C}_6\text{H}_6$  or  $\text{CHCl}_3$ , m.p. 106–107° (42), 100–101° (43), accompanied (44) (especially if acetylene tetrachloride is used as solvent) by 3,3-bis-(2',4'-dichlorophenyl)phthalide, m.p. 176° (44); the above  $\alpha$ -(2,4-dichlorobenzoyl)benzoic acid with fuming  $\text{H}_2\text{SO}_4$  at 155–160° ring-closes (90% yield (42)) to 1,3-dichloroanthraquinone [Beil. VII-787, VII<sub>1</sub>-(411)], yel. ndls. from  $\text{AcOH}$ , m.p. 209–210° (42).]

[ $\bar{\text{C}}$  on hydrolysis with steam + cat. at 550–850° yields (45) *m*-chlorophenol (3:0255) and/or resorcinol (1:1530). — For studies of reactn. of  $\bar{\text{C}}$  with  $\text{NaOMe}/\text{MeOH}$  see (46) (47) (48).]

[ $\bar{\text{C}}$  with conc. aq.  $\text{NH}_4\text{OH}$  in pres. of  $\text{CuO}$  under press. at 150–200° (49) cf. (50) (51) yields *m*-phenylenediamine. —  $\bar{\text{C}}$  with  $\text{K}$  diphenylamine gives on htg. (16) (52)  $N,N,N',N'$ -tetraphenyl-*m*-phenylenediamine [Beil. XIH-42], m.p. 137.5–138° (16) (52) (note that this same prod. is similarly obtd. from  $\alpha$ -dichlorobenzene (3:0055) and in part also from *p*-dichlorobenzene (3:0980).]

[ $\bar{\text{C}}$  on mononitration, e.g., by soln. in 4.5 moles  $\text{HNO}_3$  ( $D = 1.5$ ) in cold followed by 10 min. htg. at 70° (53) or with 5 pts. fuming  $\text{HNO}_3$  ( $D = 1.52$ ) at 0° (90% yield (54)) cf.

(3) (27) (17) gives 1,3-dichloro-4-nitrobenzene [Beil. V-245,  $V_1$ -(131)], cryst. from alc., m.p. 34° (55), 33-34° (27), 33° (53) (3), accompanied by a little (2.6% at -30°, 4% at 0° (17)) 1,3-dichloro-2-nitrobenzene [Beil. V-246,  $V_1$ -(131)], m.p. 70.5° (55), 70° (56) (reactn. prod. with piperidine is 3-chloro-2-nitro-1-piperidinobenzene, m.p. 63° (57)).] — [The only other possible mononitro-*m*-dichlorobenzene, viz., 1,3-dichloro-5-nitrobenzene [Beil. V-246,  $V_1$ -(131)], m.p. 65° (55), has been prep'd. indirectly.]

$\bar{C}$  on dinitration, e.g., with 3.4 wt. pts.  $HNO_3$  ( $D = 1.54$ ) + 6.8 wt. pts. conc.  $H_2SO_4$  at 99° for 1 hr. (56) (cf. (22) (55) (27) (59) (60) (61)) gives (85% yield (56)) 1,3-dichloro-4,6-dinitrobenzene [Beil. V-265,  $V_1$ -(135)], cryst. from alc., m.p. 103° (22) (60), 102-103° (55), 102° (27), 101° (56), accompanied by 15% yield (56) of 1,3-dichloro-2,4-dinitrobenzene [Beil. V-265], m.p. 68° (56). — For f.p./compn. data and diagram for these two cpds. (eutectic, m.p. 48.1°, contg. 33% of the former) see (56). — Note that 1,3-dichloro-4,6-dinitrobenzene with piperidine in alc. boiled for 10 min. replaces 1 chlorine yielding (62) 1-chloro-4,6-dinitro-3-piperidinobenzene, yel. cryst. from alc., m.p. 119° (62); with piperidine in pyridine (requires cooling) it replaces both chlorine atoms yielding (62) 4,6-dinitro-1,3-dipiperidinobenzene, yel. lfts. from  $AcOH$ , m.p. 130-131° (62). — [Both of the other two possible dinitro-*m*-dichlorobenzenes are known, viz., 1,3-dichloro-2,5-dinitrobenzene [Beil.  $V_1$ -(135)], m.p. 114°, and 1,3-dichloro-4,5-dinitrobenzene [Beil. V-264], m.p. 98°, but have been prep'd. indirectly.]

[The direct trinitration of  $\bar{C}$  has not been reported; of the four possible trinitro-*m*-dichlorobenzenes only one, viz., 1,3-dichloro-2,4,6-trinitrobenzene [Beil. V-275], m.p. 128°, is known.]

$\bar{C}$  on monosulfonation with fuming  $H_2SO_4$  at 230° (3) or with fuming  $H_2SO_4$  (7%  $SO_3$ ) at 100° (7) or with fuming  $H_2SO_4$  (12%  $SO_3$ ) (54) gives (82% yield (54)) 1,3-dichlorobenzenesulfonic acid-4 [Beil. XI-55,  $XI_1$ -(15)], m.p. 86° (54) (corresp. sulfonyl chloride, m.p. 54.6° (7), corresp. sulfonamide, m.p. 182° (7) (see also below)), both  $\bar{C}$  and its *ortho* isomer (3:6055) sulfonate with about equal ease, both much more readily than *p*-dichlorobenzene (3:0980) (use in sepsns. from latter).]

$\bar{C}$  on disulfonation with fuming  $H_2SO_4$  (45%  $SO_3$ ) at 140-150° for 5 hrs. (63) gives 1,3-dichlorobenzenedisulfonic acid-4,0 (corresp. *bis*-(sulfonyl chloride), m.p. 122-123° (63) (64), corresp. *bis*-(sulfonamide), m.p. 276° (63); unlike the corresp. 1,3-dichloro-4,6-dinitrobenzene the halogen in this disulfonic acid is unreactive (63).]

[For study of kinetics of sulfonation of  $\bar{C}$  see (66).]

⑥ 1,3-Dichlorobenzenesulfonamide-4 (2,4-dichlorobenzenesulfonamide-1): cryst. from dil. alc., m.p. 179-180° u.c. (65). [From  $\bar{C}$  on treatment as directed (65) with  $Cl_2SO_2$  followed by conv. of the intermediate 1,3-dichlorobenzenesulfonyl chloride-4, m.p. 52-53° u.c. (65), to the sulfonamide by means of  $(NH_4)_2CO_3$ .] — [Note that although the m.p. of this sulfonamide is practically identical with that from *p*-dichlorobenzene (3:0980) each depresses the m.p. of a mixt. with the other; the m.p.'s of the precursor sulfonyl chlorides, viz., 52-53° for  $\bar{C}$ , 35° for the *p*-isomer, may also serve to distinguish them (65).]

$\bar{C}$  with aq. forms a const.-boilg. mixt., b.p. 98.3°, contg. 35.2%  $\bar{C}$  (8). — Soly. of  $\bar{C}$  in aq. at 20° is 9.4 g.  $\bar{C}$  in 100 g. aq.; soly. of aq. in  $\bar{C}$  at 20° is 10.8 g. aq. in 100 g.  $\bar{C}$  (8).

### PREPARATION OF $\bar{C}$

[For prepn. of  $\bar{C}$  from 1-chloro-2-methylpropene-2 (methallyl chloride = isobutenyl chloride) (3:7145) by addn. of HOCl with HOCl (yields: 33% (4), 32% (3)) (7), with  $Cl_2$ /aq. (70% yield (8)), or with organic hypochlorites (7) see indie. refs.; note that if the initial methallyl chloride conts  $\beta,\beta$ -dimethylvinyl chloride (isocrotyl chloride) (3:7120) the crude HOCl addn. prod. will contain 1,1-dichloro-2-methylpropanol-2 (3:5772), but this can be separated from  $\bar{C}$  by fractional distillation]

[For prepn. of  $\bar{C}$  from  $\alpha,\alpha'$ -dichloroacetone (3:0563) with MeMgBr (yields: 80-85% (6), 40% (5)) (1) see indie. refs.; from chloroacetone (3:5425) with diazomethane via  $\beta$ -methyl epichlorohydrin (3-chloro-2-methyl-1,2-epoxypropane) (3:7657) and subsequent ring opening with conc. HCl see (2).]

### CHEMICAL BEHAVIOR OF $\bar{C}$

#### WITH INORGANIC REACTANTS

Dehydration. [ $\bar{C}$  is difficult to dehydrate but on twice htg. with equal wt.  $P_2O_5$  at 110-195° for 2 hrs. gives (46% yield (6)) 1,3-dichloro-2-methylpropene-1 (3:5590). —  $\bar{C}$  with strong  $H_2SO_4$  loses  $H_2O$  giving (9) 80% 3-chloro-2-(chloromethyl)propene-1 (3:5633) + 20% 1,3-dichloro-2-methylpropene-1 (3:5590).]

Dehydrohalogenation.  $\bar{C}$  with aq.  $Ca(OH)_2$  loses 1 HCl giving (93% yield (10) (11)) 3-chloro-2-methyl-1,2-epoxypropane ( $\beta$ -methylepichlorohydrin) (3:7657) which distils as its azeotrope, b.p. 89.8°, contg. 25.6% aq. (10). — Note that, if alk. is added in excess, reactn. is complete in a few seconds at room temp. and the process can even be used as a method for detn. of  $\bar{C}$  in aq. soln. [For use of  $\bar{C}$  in comml. prepn. of  $\beta$ -methylepichlorohydrin (3:7657),  $\beta$ -methylglycerol monochlorohydrin,  $\beta$ -methylglycidol, and  $\beta$ -methylglycerol see (10).]

Behavior with sodium sulfite. [ $\bar{C}$  (1 mole) with aq.  $Na_2SO_3$  (2 moles) at 70-90° for 2 hrs. yields (3) the salt of 2-methylpropanol-2-disulfonic acid-1,3; this prod. with  $PCl_4$  not only is converted to the bis (acid chloride) but simultaneously loses  $H_2O$  yielding (3) 2-methylpropen-1,3-bis-(sulfonyl chloride), long n.dls. from  $CCl_4$ ,  $C_6H_6$ , or pet. ether, m.p.

[For prepn. of  $\bar{C}$  from o-dichlorobenzene (3:6055) by partial hydrol. with aq. MeOH or EtOH alk., alk. earths, or alk. carbonates in pres. of Cu or Cu salts at elevated temps. under press. see (38)-(46) incl.]

[ $\bar{C}$  in excess dil. aq. KOH with  $H_2$  in pres. of Ni absorbs 1 mole  $H_2$  (47) but more slowly than m-chlorophenol (3:0255) or p-chlorophenol (3:0475). —  $\bar{C}$  is not reduced with HI in AcOH at 25° (48).]

[ $\bar{C}$  on oxidn. with 35% persacetic acid at 25° gives slowly (17 days) in small yield (49) o-chloromuconic acid (2-chlorobutadiene-1,3-dicarboxylic acid-1,4), m.p. 190° (49), ÷ 5-chlorohexadiene-2,4-al-6-oic acid-1, m.p. 145° (49).]

[ $\bar{C}$  with  $Cl_2$  (2 moles) in AcOH gives (80% yield (50)) 2,4-dichlorophenol (3:0560);  $\bar{C}$  with  $Cl_2$  (3 moles) undoubtedly gives 2,4,6-trichlorophenol (3:1673). — For study of chlorination of  $\bar{C}$  with HOCl see (51).]

$\bar{C}$  with  $Br_2$  (1 mole) in  $CCl_4$  gives (87% yield (52)) 4-bromo-2-chlorophenol, ndls. from lgr., m.p. 48–49° (52), 49–50° (53), 50–51° (54). —  $\bar{C}$  with  $Br_2$  (2 moles) in aq. KBr soln. gives (55) 2-chloro-4,6-dibromophenol [Beil. VI-203], ndls. from alc., m.p. 76° cor. (53), 75–76° (56). —  $\bar{C}$  with large excess  $Br_2$  in pres. of Fe powder gives (57) 2-chloro-3,4,5,6-tetrabromophenol, ndls. from alc. or AcOH, m.p. 224° (57).

[ $\bar{C}$  in aq. alk. with  $I_2/KI$  soln. as directed (55) gives 2-chloro-4,6-di-iodophenol, ndls. from alc., m.p. 96° (55). — For study of iodination of  $\bar{C}$  see (58).]

[ $\bar{C}$  on nitrosation as directed (59) (60) gives (96% yield (60)) 2-chloro-4-nitrosophenol (2-chlorobenzoquinone-1,4-oxime-4) [Beil. VII-631, VII<sub>r</sub>-(346)], pale yel. ndls. from  $C_6H_6$ , m.p. 145° (60), 142° (59); for discussion of tautomerism of this cpd. see also (61) (62) (63).]

[ $\bar{C}$  on mononitration, e.g., with cold mixt. of equal pts.  $HNO_3$  ( $D = 1.36$ ) ÷ aq. (13), with  $HNO_3$  in MeOH (64), or with  $HNO_3$  ( $D = 1.5$ ) in AcOH (65), gives a mixt. of 2-chloro-4-nitrophenol [Beil. VI-240], ndls. from aq., m.p. 110–111°, and (32% (65)) 2-chloro-6-nitrophenol [Beil. VI-239], ndls. from aq., m.p. 70–71°; of these only the latter is volatile with steam (use in detn. of  $\bar{C}$  in mixts. with 4-chlorophenol (3:0475) (27)). — Both of the other mononitro-o-chlorophenols are known but have been obtd. only by indirect means; e.g., 2-chloro-3-nitrophenol, m.p. 120.5° (66), 120° (67), and 2-chloro-5-nitrophenol, m.p. 119.5° (66).]

$\bar{C}$  on dinitration, e.g., by soln. in  $HNO_3$  ( $D = 1.36$ ) and subsequent warming yields (68) 2-chloro-4,6-dinitrophenol [Beil. VI-259, VI<sub>r</sub>-(125)], cryst. from alc., m.p. 113° (68); this prod. (unlike picric acid) is volatile with steam from  $H_2SO_4$  soln. (use in anal. of mixts. of  $\bar{C}$  with phenol (17)).

[ $\bar{C}$  in alk. soln. couples with diazotized aniline giving (70% yield (69) (70) (71)) 3-chloro-4-hydroxyazobenzene (2-chlorobenzoquinone phenylhydrazone-4) [Beil. XVI-120], yel. pr. from aq. alc., m.p. 88.5° (69), 88° (70), 86° (71). — For study of corresp. coupling of  $\bar{C}$  with diazotized p-nitrosaniline see (72).]

[For mercuration of  $\bar{C}$  and use of products as seed disinfectants, etc., see (73); for condens. prods. of  $\bar{C}$  with  $C_6H_5Hg.OH$  see (74).]

[ $\bar{C}$  over pumice in a silica tube at dull red heat (75) or K salt of  $\bar{C}$  + K phenolate at 250° for 8 hrs. (81) yields diphenylene dioxide [Beil. XIX-44, XIX<sub>r</sub>-(618)], ndls. from MeOH, m.p. 119°, readily identified by dinitration with fuming  $HNO_3$  in AcOH (75) to dinitrodiphenylene dioxide, ndls. from pyridine, m.p. 257° (75).]

Condensation reactions involving nuclear hydrogens. [ $\bar{C}$  with formalin (1:0145) in pres. of conc. HCl treated with HCl gas as directed (76) gives 3-chloro-4-hydroxybenzyl chloride, m.p. 92–93° (76). —  $\bar{C}$  with formalin +  $H_2SO_4$  (60%) at 60–65° for 16 hrs. gives (76) 3,3'-dichloro-4,4'-dihydroxydiphenylmethane, m.p. 103–104° (76). —  $\bar{C}$  with formalin (1:0145) + aq. 10% NaOH as directed (77) yields acc. to conditions 3-chloro-4-hydroxybenzyl alc., pl. from  $C_6H_6$ , m.p. 123.5–124°, and/or 3-chloro-4-hydroxy-5-(hydroxymethyl)-

benzyl alc., ndls. from  $\text{CHCl}_3$ , m.p. 117.5–119°. — For condens. of  $\tilde{\text{C}}$  with formalin in prepn. of synthetic tanning agents see (78).]

[ $\tilde{\text{C}}$  with  $\text{CHCl}_3$  or  $\text{CHBr}_3$  (79) in pres. of aq.  $\text{NaOH}$  undergoes Reimer-Tiemann reaction yielding both 3-chloro-2-hydroxybenzaldehyde (3:1010) and 3-chloro-4-hydroxybenzaldehyde (3:4065). —  $\tilde{\text{C}}$  with  $\text{CCl}_4$  in alc. alk. in s.t. at 125–136° yields (80) 3-chloro-4-hydroxybenzoic acid (3:4675). —  $\tilde{\text{C}}$  with  $\alpha, \alpha$ -dichlorodiphenylmethane (3:6960) +  $\text{AlCl}_3$  in cold  $\text{CS}_2$  gives (31) 3-chloro-4-hydroxyphenyl-diphenyl-carbinol, from 60%  $\text{AcOH}$  as deep orange pl. of quinonoid desmotrope, m.p. 118°, but from alc. colorless crystals of benzenoid desmotrope (contg.  $\frac{1}{2}$  mole solvent), m.p. 70–72° (31); note that in hot  $\text{C}_6\text{H}_6$ , however, this reaction takes a different course yielding (31)  $\alpha, \alpha$ -bis-(*o*-chlorophenoxy)diphenylmethane, cryst. from hot alc., m.p. 191–192° (31). —  $\tilde{\text{C}}$  with chloral hydrate (3:1270) in pres. of alk. salts condenses (82) to 3-chloro-4-hydroxyphenyl-trichloromethyl-carbinol which on hydrolysis with  $\text{NaOH}$  yields 3-chloro-4-hydroxybenzaldehyde (3:4065).]

[ $\tilde{\text{C}}$  with  $\text{SOCl}_2$  +  $\text{AlCl}_3$  in  $\text{CS}_2$  gives (85% yield (83)) *bus*-(3-chloro-4-hydroxyphenyl) sulfoxide [Beil. VI-422], ndls. from dil. alc. contg.  $\text{HCl}$ , m.p. 195°. —  $\tilde{\text{C}}$  with mixt. of conc.  $\text{H}_2\text{SO}_4$  + fuming  $\text{H}_2\text{SO}_4$  (25%  $\text{SO}_3$ ) at 100° for 6 hrs. disulfonates to 2-chloro-4,6-disulphophenol which undergoes bimolecular condensation to the corresp. internal ester (for details see (84)).]

[ $\tilde{\text{C}}$  with phthalic anhydride (1:0725) with  $\text{AlCl}_3$  in acetylene tetrachloride (3:5750) (85) (86) (87), or with  $\text{AlCl}_3$  +  $\text{NaCl}$  at 150° (88), gives (yields: 96% (85) (86), 87% (88)) 2-(3'-chloro-4'-hydroxybenzoyl)benzoic acid, cryst. from  $\text{MeOH}$ , m.p. 224–225° (85), cryst. from  $\text{AcOH}$ , m.p. 219.5–220° (86), 219° (88); this prod. on ring closure with 15 pts. conc.  $\text{H}_2\text{SO}_4$  at 150° for 1 hr. (88), or with 10 pts. conc.  $\text{H}_2\text{SO}_4$  + 1 pt.  $\text{ZnCl}_2$  at 130° for  $5\frac{1}{2}$  hrs. (85), or with 16 pts. 100%  $\text{H}_2\text{SO}_4$  + 1 pt.  $\text{H}_3\text{BO}_3$  at 195° for  $1\frac{1}{2}$  hrs. (86), gives (yields. 80% (85), 76% (88), 53.5% (86)) 3-chloro-2-hydroxyanthraquinone, yel. ndls. from  $\text{AcOH}$ , nitrobenzene +  $\text{AcOH}$ , or xylene, m.p. 267–268° (85), 266.5–267° (86), 266° (88). — Note that by slight variations other products are also formed; e.g.,  $\tilde{\text{C}}$  + phthalic anhydride + fuming  $\text{H}_2\text{SO}_4$  +  $\text{H}_3\text{BO}_3$  at 170–200° for 10 hrs. gives (89) both chloro-hydroxy-anthraquinone and dihydroxyanthraquinone cf. (90) and at 255° gives (91) 1,2,4-trihydroxyanthraquinone (purpurin). — Note that  $\tilde{\text{C}}$  (2 moles) with phthalic anhydride (1 mole) at 125° for 6 hrs. gives (75% yield (92)) dichlorophenolphthalein, m.p. 98°.]

Reactions of nuclear halogen of  $\tilde{\text{C}}$ . [ $\tilde{\text{C}}$  on hydrolysis with aq. alk., alk. carbonates, or alkaline earths in pres. of cat. such as  $\text{Cu}$  or  $\text{Cu}$  salts at elevated temps. and under press. yields (93) (94) (95) (96) (97) (98) pyrocatechol (1:1520) cf. (43). —  $\tilde{\text{C}}$  on fusion with  $\text{KOH}$  yields (13) pyrocatechol but some resorcinol (1:1530) is also formed (88) (99). —  $\tilde{\text{C}}$  with aq.  $\text{Na}_2\text{S}$  +  $\text{NaOH}$  at 210–215° for 24 hrs. yields (100) 2-mercaptophenol [Beil. VI-793], b.p. 216–217° corr., m.p. +5°.]

Reactions of the phenolic group of  $\tilde{\text{C}}$  (see also under @, below).  $\tilde{\text{C}}$  behaves as a weak acid; e.g.,  $\tilde{\text{C}}$  dis. in conc. aq.  $\text{Na}_2\text{CO}_3$  soln. on shaking at room temp. (dif. and sepn. from phenol (18)) and is reprecip. by treatment with  $\text{CO}_2$  (18). — Dissoc. const. of  $\tilde{\text{C}}$  in aq. =  $32 \times 10^{-10}$  (101); for studies of dissoc. const. in 50%  $\text{MeOH}$  at 20° (7) (101) (102), in 25%  $\text{EtOH}$  at 25° (103), in 30%  $\text{EtOH}$  at 25° (4) (102) see indic. refs.

$\tilde{\text{C}}$  has bactericidal (104) (105) (106) (107) (108) (109) and fungicidal (110) properties.

[ $\tilde{\text{C}}$  with alkali metals gives corresp. alk. *o*-chlorophenolates; for use of these as antioxidants in motor fuels see (111). — Dry  $\text{Na}$  *o*-chlorophenolate with  $\text{CO}_2$  at 140–150° under press. yields (25) 3-chloro-2-hydroxybenzoic acid (3-chlorosalicylic acid) (3:4745).]

[ $\tilde{\text{C}}$  in  $\text{MeOH}/\text{KOH}$  with  $\text{MeI}$  in s.t. at 130° (112), or  $\tilde{\text{C}}$  with aq.  $\text{KOH}$  +  $\text{Me}_2\text{SO}_4$  at ord. temp. (113), yields *o*-chlorophenyl methyl ether (*o*-chloroanisole) (3:6255). —  $\tilde{\text{C}}$  in abs. alc. +  $\text{NaOEt}$  with  $\text{EtI}$  yields (115) *o*-chlorophenyl ethyl ether (*o*-chlorophenetole) (3:8735). —  $\tilde{\text{C}}$  with alkyl bromide in acetone + aq. +  $\text{NaOH}$  gives (90% yield (146))

allyl *o*-chlorophenyl ether; b.p. 103–110° at 15 mm.,  $D_{25}^{25} = 1.132$ ,  $n_D^{25} = 1.5388$ ; this prod. on reflux. 10 min. gives by Claisen rearr. (89% yield (146)) 2-chloro-6-allylphenol, b.p. 61–63° at 1 mm.,  $n_D^{25} = 1.5447$ .]

[ $\bar{C}$  with  $POCl_3$  refluxed for 8–11 hrs.,  $POCl_3$  distd. off, and crude product saponified yields (117) *bis*-(*o*-chlorophenyl)phosphoric acid, m.p. 105–106° cor. — For condens. of  $\bar{C}$  with triphenylphosphine oxide and use of prod. as seed disinfectant see (118); for use of  $\bar{C}$  in prepn. of triaryl phosphates (119) or of mixed triaryl thiophosphates (120) and use as plasticizers see indic. refs. —  $\bar{C}$  with  $PCl_5$  gives on htg. (22) *o*-dichlorobenzene (3:6055).]

[ $\bar{C}$  with malic acid (1:0450) + conc.  $H_2SO_4$  fails (121) to give the expected von Pechmann synthesis of 8-chlorocoumarin; however,  $\bar{C}$  with  $\alpha$ -substituted acetoacetic esters +  $P_2O_5$  condenses to corresp. chromones; e.g.,  $\bar{C}$  with ethyl  $\alpha$ -methylacetoacetate (1:1712) +  $P_2O_5$  gives (27% yield (122)) 8-chloro-2,3-dimethylchromone [Beil. XVII<sub>1</sub>-(177)], pale yel. ndls. from dil. alc., m.p. 103°; for further examples see (123). —  $\bar{C}$  (as sodium salt) + diethyl fumarate (1:3761) refluxed in xylene yields (124) diethyl  $\alpha$ -(*o*-chlorophenoxy)-fumarate which on subsequent hydrolysis to the acid, ring closure with conc.  $H_2SO_4$ , and decarboxylation gives 8-chlorochromone, colorless ndls., m.p. 114–115° (124).]

$\bar{C}$  with  $AlCl_3$  evolves  $HCl$  and yields (125)  $Cl.C_6H_4.O.AlCl_2$ , insol.  $CS_2$ , but sol. in alc. and hydrolyzed by aq., m.p. 207–210° (125). —  $\bar{C}$  in 50% alc. with satd. soln. of  $KOH$  in 50% alc. yields (126) a mol. cpd.,  $\bar{C}.KOH$ , pale yel. ndls., m.p. 81–82° (126).

⑥  $FeCl_3$  color reaction:  $\bar{C}$  in aq. soln. with very dil.  $FeCl_3$  gives violet coloration;  $\bar{C}$  in alc. with very dilute aq.  $FeCl_3$  gives greenish-blue.

— *o*-Chlorophenyl acetate: oil, b.p. 103° cor. at 15 mm.,  $D_4^{20} = 1.2166$  (18). [From  $\bar{C}$  with  $Ac_2O$  (4 pts.) +  $NaOAc$  (1 pt.) boiled for 10 min. (18).]

— *o*-Chlorophenyl benzoate [Beil. IX-117]: oil, b.p. 314–316° (?) (127), 212–213° at 745 mm. (127), 155–157° at 3 mm. (127). [From  $\bar{C}$  + benzoyl chloride + aq.  $NaOH$  (127) (for study of rate see (129)).] [Note also that  $\bar{C}$  +  $BzCl$  +  $AlCl_3$  in acetylene tetrachloride yields (128) the Fries rearr. prods. to be expected from *o*-chlorophenyl benzoate, viz., 3-chloro-4-hydroxybenzophenone, cryst. from alc. or  $C_6H_6$ , m.p. 180–181° (128), and 3-chloro-2-hydroxybenzophenone, pale yel. cryst. from alc., m.p. 92.5–93° (128).]

⑦ *o*-Chlorophenyl *m*-nitrobenzoate: pr. from 1gr., m.p. 98° (18). [From  $\bar{C}$  with *m*-nitrobenzoyl chloride on shaking with 10% aq.  $NaOH$  at 35–50° (18).]

— *o*-Chlorophenyl *p*-nitrobenzoate: ndls. from 85% alc., m.p. 114.5–114.8°. [From  $\bar{C}$  + *p*-nitrobenzoyl chloride in pyridine (unpublished work).]

— *o*-Chlorophenyl 3,5-dinitrobenzoate: ndls. from 85% alc., m.p. 143.1–143.4°. [From  $\bar{C}$  + 3,5-dinitrobenzoyl chloride in pyridine (unpublished work).]

— *o*-Chlorophenyl benzenesulfonate: unrecorded.

— *n*-Chlorophenyl *p*-toluenesulfonate: m.p. 74° (4).

— *o*-Chlorophenyl benzyl ether: oil, b.p. 133–140° at 3 mm. (130). [From  $\bar{C}$  (as Na salt) + benzyl chloride but in very poor yield (7.5% (130)); note that the products elsewhere (131) (132) seem to be questionable.]

— *o*-Chlorophenyl *p*-nitrobenzyl ether: m.p. 100° (133). [From  $\bar{C}$  (as Na salt) with *p*-nitrobenzyl bromide refluxed in aq. alc. (133).]

⑧ *o*-Chlorophenyl 2,4-dinitrophenyl ether: greenish-yel. ndls. from alc., m.p. 99° (134). [From  $\bar{C}$  in equiv. amt. aq.  $NaOH$  refluxed with alc. 2,4-dinitrochlorobenzene (134). — Note that the m.p. of 75–76° reported earlier (135) for this compd. is identical with that given later (134) for the corresp. deriv. of *m*-chlorophenol (3:0255).]

⑨ *o*-Chlorophenoxyacetic acid (3:4375): m.p. 145–146° (136) (137), 143–145° (138); Neut. Eq. 186.5. [From  $\bar{C}$  in aq.  $NaOH$  (2 equivs.) with chloroacetic acid (1 equiv.) refluxed for 1 hr., then acidified (138) cf. (136) (137).]

- ③ *o*-Chlorophenyl *N*-(phenyl)carbamate: cryst. from  $C_6H_6$ , m.p. 120–121° (139). [From  $\bar{C}$  + phenyl isocyanate in dry ether (139).]
- ④ *o*-Chlorophenyl *N*-(*p*-iodophenyl)carbamate: m.p. 156–157° (147). [From  $\bar{C}$  + *p*-iodobenzazide in hot lgr. (147).]
- ⑤ *o*-Chlorophenyl *N*-(*p*-bromophenyl)carbamate: pr. from EtOAc, m.p. 141–143° cor. (140). [From  $\bar{C}$  + *p*-bromobenzazide in lgr. (140).]
- ⑥ *o*-Chlorophenyl *N*-(*m*-nitrophenyl)carbamate: m.p. 114° u.c., 116° cor. (148). [From  $\bar{C}$  + *m*-nitrobenzazide (148) or *m*-nitrophenyl isocyanate (148) in lgr. (148).]
- ⑦ *o*-Chlorophenyl *N*-(*p*-nitrophenyl)carbamate: ndls. from lgr., m.p. 143° cor. (141). [From  $\bar{C}$  + *p*-nitrobenzazide in lgr. (141).] — [Note that corresp. deriv. of *m*-chlorophenol (3:0255) has m.p. 144° cor. (141).]
- ⑧ *o*-Chlorophenyl *N*-(3,5-dinitrophenyl)carbamate: pl. from  $C_6H_6$ , m.p. 182–183° (142). [From  $\bar{C}$  + 3,5-dinitrobenzazide htd. in dry toluene (142).]
- ⑨ *o*-Chlorophenyl *N*-(3,5-dinitro-4-methylphenyl)carbamate: yel. pl. from lgr. or EtOAc, m.p. 175–176°, u.c., 180–181° cor. (143). [From  $\bar{C}$  + 3,5-dinitro-4-methylbenzazide in lgr. (143).]
- ⑩ *o*-Chlorophenyl *N*-( $\alpha$ -naphthyl)carbamate: cryst. from lgr., m.p. 120° (144). [From  $\bar{C}$  +  $\alpha$ -naphthyl isocyanate in lgr. (144).]
- ⑪ *o*-Chlorophenyl *N*-( $\beta$ -naphthyl)carbamate: pl. from lgr., m.p. 133–134° u.c., 136–137° cor. (145). [From  $\bar{C}$  +  $\beta$ -naphthyl isocyanate (or azide) in lgr. (145).]
- *o*-Chlorophenyl *N,N*-diphenylcarbamate: unreported.

3:5985 1,3-DICHLOROPROPANOL-2  
 ( $\beta,\beta'$ -Dichloroisopropyl alcohol;  
 glycerol  $\alpha,\alpha'$ -dichlorohydrin;  
 "alpha-dichlorohydrin")

B.P.

175.8-176.3° at 765 mm. (1)	$D_4^{25} = 1.359$ (2) (6)	$n_D^{25} = 1.4797$ (2)
176° at 760 mm. (2) (6)		
175.1° at 760 mm. (3)		$n_D^{20} = 1.4837$ (45)
175.5-176° at 733 mm. (4)		
174.3° at 760 mm. (5)	$D_4^{17} = 1.3506$ (9)	$n_D^{15} = 1.48025$ (9)
92-92.5° at 40 mm. (2) (6)		
86° at 32 mm. (7)		
75° at 12 mm. (8)		
70-73° at 14 mm. (10)		
69° at 12 mm. (45)		

Note: Because of the great magnitude of the literature of  $\bar{C}$  only the most important citations can be included here; for much additional data prior to 1930, the appropriate volume of Beilstein should also be consulted.

$\bar{C}$  dis. at 19° in 9 pts. aq.; at 72° in 6 pts. aq., misc. with ether. [For recovery of  $\bar{C}$  from aq. solns. by extraction with immiscible solvents (12) (13) (14) or by steam distillation (12) (15) see indic. refs.]

[For prepn. of  $\bar{C}$  from glycerol (1:6540) by actn. of HCl gas at 100-110° (yield: 87% (11), 82% (6), 55-57% (10)) (12) see indic. refs.; for prepn. of  $\bar{C}$  from 3-chloro-1,2-epoxypropane (epichlorohydrin) (3:5358) with fuming HCl (yield 80% (11)) (16) (17) (1) (18), with  $\text{MgCl}_2$  in dil. alc. at 125° (19), or with  $\text{S}_2\text{Cl}_2$  (67% yield (40)) see indic. refs.; for formn. of  $\bar{C}$  (together with other prods.) from glycerol (1:6540) with  $\text{SOCl}_2$  + pyridine see (20); from corresp. acetate (3:6318) by alcoholysis with MeOH + HCl see (21) (45); from  $\alpha,\alpha'$ -dichloroacetone (3:0563) reductn. with yeast see (22).]

$\bar{C}$  with aq. alk. rapidly loses HCl giving 3-chloro-1,2-epoxypropane (epichlorohydrin) (3:5358) (yield: 90% (6), 80-90% (23), 76-81% (24-B), 67-72% (24-A), 85% (25), 79% (26)).

$\bar{C}$  on oxidn. with  $\text{Na}_2\text{Cr}_2\text{O}_7$  +  $\text{H}_2\text{SO}_4$  gives (68-75% yield (27))  $\alpha,\alpha'$ -dichloroacetone (3:0563). (Overoxidn. of this prod. or  $\bar{C}$  on oxidn. with conc.  $\text{HNO}_3$  (28) gives chloroacetic acid (3:1370).]

[ $\bar{C}$  on reductn. with Na/Hg in moist ether gives various products including allyl alc. (1:0145), isopropyl alc. (1:6135), propylene together with epichlorohydrin (for refs. see Beil. I-364);  $\bar{C}$  htd. with III + P in s.t. at 180° gives (29) isopropyl iodide.]

[For behavior of  $\bar{C}$  with NaSH yielding 1,3-dithioglycerol (Hg deriv. m.p. 185°, Pb deriv. m.p. 175–180° dec.) see (41).]

$\bar{C}$  on hgt. with  $P_2O_5$  (31) or  $POCl_3$  (11) (30) yields 1,3-dichloropropene-1 (3:5280).

$\bar{C}$  on hgt. with excess EtOH + NaOH yields (by a series of definite intermediate stages (25)) (0) 1,3-diethoxypropanol-2 (glycerol  $\alpha,\gamma$ -diethyl ether) b.p. 108–111° at 60 mm.,  $D_4^{25} = 0.953$ ,  $n_D^{25} = 1.420$  (10) (0); similarly  $\bar{C}$  on hgt. with excess phenol + aq. NaOH as specified (19) gives 80% yield 1,3-diphenoxypropanol-2 (glycerol  $\alpha,\gamma$ -diphenyl ether), cryst. from alc., m.p. 80–81° (10).

—  $\beta,\beta'$ -Dichloroisopropyl acetate: b.p. 205° (see 3:6318).

—  $\beta,\beta'$ -Dichloroisopropyl benzoate: b.p. 296° sl. dec. (12); 171–173° at 10 mm. (43), 157–160° at 12 mm. (44). [From  $\bar{C}$  + benzoyl chloride on hgt. (42) or with pyridine (44).]

①  $\beta,\beta'$ -Dichloroisopropyl *p*-nitrobenzoate: m.p. 50–60° (32), 58–59° (33). [From  $\bar{C}$  + *p*-nitrobenzoyl chloride with pyridine (94% yield) (33) or with quinoline in  $CHCl_3$  (100% yield) (32).]

②  $\beta,\beta'$ -Dichloroisopropyl 3,5-dinitrobenzoate: m.p. 129° (32). [From  $\bar{C}$  + 3,5-dinitrobenzoyl chloride + quinoline in  $CHCl_3$  in 100% yield (32).]

③  $\beta,\beta'$ -Dichloroisopropyl benzenesulfonate: long colorless ndls. from  $C_6H_6$ , m.p. 50° (34). [From  $\bar{C}$  + benzenesulfonyl chloride + conc. aq. NaOH (34); for study of pyrolysis see (35).]

④  $\beta,\beta'$ -Dichloroisopropyl *p*-toluenesulfonate: m.p. 52–53° (36). [From  $\bar{C}$  + *p*-toluenesulfonyl chloride with conc. aq. NaOH (36).] [For use in prepn. of vat dyes of dibenzanthrone series see (37).]

⑤  $\beta,\beta'$ -Dichloroisopropyl *N*-(phenyl)carbamate: m.p. 73–74° (20) (38), 73° (39). [From  $\bar{C}$  with phenyl isocyanate (20) (39); also indirectly from  $\bar{C}$  by conv. to corresp. chloroformate and reacting with aq. anilino (38).] [This prod. htd. a few min. with conc. aq. KOH loses HCl and ring-closes alm. quant. to 5-chloromethyl-3-phenyloxazolidone-2, pr. from hot alc., m.p. 101–105° (39).]

⑥  $\beta,\beta'$ -Dichloroisopropyl *N*-( $\alpha$ -naphthyl)carbamate: m.p. 115° (38). [Prepd. indirectly from  $\bar{C}$  by conv. to corresp. chloroformate and reacting with aq. anilino (38).] [This prod. with conc. aq. alk. loses HCl and ring-closes to 5-chloromethyl-3-( $\alpha$ -naphthyl)-oxazolidone-2, m.p. 118° (38).]

⑦  $\beta,\beta'$ -Dichloroisopropyl *N*-( $\beta$ -naphthyl)carbamate: m.p. 101° (38). [Prepd. indirectly from  $\bar{C}$  by conv. to corresp. chloroformate and reacting with aq. anilino (38).] [This prod. with conc. aq. alk. loses HCl and ring-closes to 5-chloromethyl-3-( $\beta$ -naphthyl)-oxazolidone-2, m.p. 107° (38).]

## CHAPTER XIV

### DIVISION B. LIQUIDS WITH BOILING POINTS REPORTED AT ORDINARY PRESSURE

#### Section 1. $D_4^{20}$ greater than 1.1500

(3:6000-3:6499)

3:6000	<i>n</i> -PROPYL DICHLOROACETATE	$C_5H_9O_2Cl_2$	Beil. II - 204
	<i>n</i> -C <sub>3</sub> H <sub>7</sub> O.CO.CHCl <sub>2</sub>		II <sub>1</sub> — II <sub>2</sub> -(196)
B.P. 176.7-177°	at 771 mm. (1)	$D_4^{25} = 1.2006$ (4)	$n_D^{25} = 1.4369$ (4)
176.0-176.6°	(2)	$D_4^{20} = 1.2240$ (5)	$n_D^{20} = 1.4398$ (5)
176°	(3)		

[For prepn. (70% yield (3)) from anhydrous chloral (3:5210) in *n*-propyl alc. by treatment with 1.2 moles powdered KCN see (3); for prepn. (59% yield (4)) from cyclopropane + dichloroacetic ac. (3:6208) + BF<sub>3</sub> see (4).]

(2) Cheng, Z. physik. Chem. B-24, 307 (1934).  
(4) Dorris, Sowa, J. Am. Chem. Soc. 60, 358  
2, 229 (1935)

3:6010	$\gamma$ -CHLORO- <i>n</i> -PROPYL CHLOROFORMATE	$C_4H_7O_2Cl_2$	Beil. S.N. 199
	( $\gamma$ -Chloro- <i>n</i> -propyl chlorocarbonate)	$CH_2CH_2CH_2O.CO.Cl$	
		$\begin{array}{c}   \\ Cl \end{array}$	
B.P. 177°	(1)	$D_{20}^{25} = 1.2946$ (1)	$n_D^{20} = 1.4456$ (1)
175-176°	at 736 mm. (2)		

Colorless liq.; insol. in aq. toward which it is relatively stable.

[For prepn. of  $\bar{C}$  from 3-chloropropanol-1 (trimethylene chlorohydrin) (3:8285) with phosgene (3:5000) in 80% yield see (1) (2).]

$\bar{C}$  in quinoline begins to decompose into 1,3-dichloropropane (trimethylene (di)chloride) (3:5450) + CO<sub>2</sub> even at 35° (3) (for discussion see (4)).

$\bar{C}$  with primary arom. amines reacts as an acyl chloride yielding the corresp.  $\gamma$ -chloro-*n*-propyl *N*-arylcarbamates [e.g.,  $\bar{C}$  with *p*-aminobenzenearsonic acid (arsanilic acid) gives (92% yield (5))  $\gamma$ -chloro-*n*-propyl *N*-(*p*-arsonophenyl)carbamate, m.p. 245-246° (5) cf. (6); for analogous reactions of  $\bar{C}$  with *o*-aminobenzenearsonic acid (5) (6), *o*-toluidine-5-arsonic acid (5), *p*-phenetidine (1), *p*-aminobenzoic acid (1), *o*-chloroaniline (1), or *p*-chloroaniline (1) see indic. refs.]; for simpler cases see below.

①  $\gamma$ -Chloro-*n*-propyl carbamate: cryst. from hot aq., m.p. 62° (2). [From  $\bar{C}$  slowly added to 10% aq. NH<sub>4</sub>OH (2 moles) (violent reactn. and cooling is required), yield 71% (2).]

- ④  $\gamma$ -Chloro-*n*-propyl allophanate ( $\text{ClCH}_2\text{CH}_2\text{CH}_2\text{OCO.NH.CO.NH}_2$ ): cryst. from hot alc., m.p.  $166^\circ$  (2). [From  $\bar{\text{C}}$  with urea (2 moles) fused for 3 hrs. (75% yield (2)).]
- $\gamma$ -Chloro-*n*-propyl *N*-phenylcarbamate: pr. from alc., m.p.  $38^\circ$  (2),  $35\text{--}36^\circ$  (1). [From  $\bar{\text{C}}$  with aniline (2 moles) both diluted with dry ether (3 vols.) slowly mixed in flask surrounded by ice water, ether evaporated and prod. distilled, b.p.  $160\text{--}170^\circ$  at 5 mm. (2); this prod. in alc. on addn. of 1 *N* aq. NaOH ring-closes with loss of HCl giving (84% yield (2)) (1) 3-phenyl-tetrahydro-2-keto-1,3-oxazine, m.p.  $96^\circ$  (2),  $94.0\text{--}94.5^\circ$  (1).]
- ⑤  $\gamma$ -Chloro-*n*-propyl *N*-(*o*-tolyl)carbamate: ndls. from alc., m.p.  $49^\circ$  (2),  $46.0\text{--}46.5^\circ$  (1). [From  $\bar{\text{C}}$  with *o*-toluidine in dry ether as for preceding case (69% yield (2)); this prod. in alc. on addn. of 1 *N* aq. NaOH ring-closes with loss of HCl giving (60% yield (2)) (1) 3-(*o*-tolyl)-tetrahydro-2-keto-1,3-oxazine, m.p.  $89^\circ$  (1),  $87.0\text{--}87.5^\circ$  (2).]
- $\gamma$ -Chloro-*n*-propyl *N*-(*p*-tolyl)carbamate: oil, b.p.  $188^\circ$  at 4.5 mm.,  $D_4^{20} = 1.186$ ,  $n_D^{18} = 1.494$  (1). [This prod. with alc. KOH (1 mole) refluxed 2 hrs. ring-closes with loss of HCl giving (1) 3-(*p*-tolyl)-tetrahydro-2-keto-1,3-dioxazine, m.p.  $127.5\text{--}128^\circ$  (1).]
- ⑥  $\gamma$ -Chloro-*n*-propyl *N*-( $\alpha$ -naphthyl)carbamate: ndls. from ether and lgr., m.p.  $75.5\text{--}76.5^\circ$  (1). [From  $\bar{\text{C}}$  with  $\alpha$ -naphthylamine (2 moles) in aq. suspension (90% yield (1)); this prod. with alc. KOH (1 mole) refluxed 2 hrs. ring-closes with loss of HCl giving 3-( $\alpha$ -naphthyl)-tetrahydro-2-keto-1,3-dioxazine, m.p.  $149.5\text{--}150.5^\circ$  (1).]
- ⑦  $\gamma$ -Chloro-*n*-propyl *N'*-anilino-carbamate ( $\gamma$ -chloro-*n*-propyl *N*-phenylcarbazate): cryst. from  $\text{C}_6\text{H}_6$ , m.p.  $72^\circ$  (7). [From  $\bar{\text{C}}$  with phenylhydrazine (1 mole) in aqueous pyridine (62% yield (7)).]

### 3:6025 $\beta,\beta'$ -DICHLORODIETHYL ETHER

(bis-( $\beta$ -chloroethyl) ether;  
"chlorox")

B.P.  $177\text{--}178^\circ$  cor. (1) M.P.  $-24.5^\circ$  (2)  $D_4^{20} = 1.2095$  (3)  $n_D^{20} = 1.457$  (1)  
 $176^\circ$  at 744 mm. (2)  
 $80\text{--}82^\circ$  at 20-22 mm. (3)  $D_4^{20} = 1.213$  (1)  
 $70^\circ$  at 15 mm. (2)  
 $66^\circ$  at 12 mm. (2)

Colorless oil with pleasant ethereal odor. — (For data on surface tension and parachor see (4); for vapor-press. data see (5).)

[For prepn. from ethylene chlorohydrin (3:5552) see (1); for use in prepn. of di-( $\beta$ -chloroethyl) sulfate see (12).] [Note that  $\bar{\text{C}}$  forms with ethylene chlorohydrin (3:5552) a const.-boil. mixt., b.p.  $128.2^\circ$ , contg. 8.2 mole %  $\bar{\text{C}}$  (15).]

The halogen atoms of  $\bar{\text{C}}$  are very unreactive to most reagents;  $\bar{\text{C}}$  is extremely resistant to hydrolysis, gives no Fiedel-Crafts reaction with  $\text{C}_6\text{H}_6 + \text{AlCl}_3$ , no reaction with KCN, and is unaffected by  $\text{NaOH} + \text{As}_2\text{O}_3$  (2).

$\bar{\text{C}}$  on hfg. with solid KOH yields (6) (7) (9) (3) divinyl ether (1:7800) (accompanied by some  $\beta$ -chloroethyl vinyl ether (3:7464) q.v.), but  $\bar{\text{C}}$  on hfg. with dimethylaniline or quinoline fails to react at all, even to form quaternary salt- (6).

$\bar{C}$  on htg. with excess sodium alcoholates for 3-15 hrs. gives 30-45% yields of the corresponding liquid bis ethers (8);  $\bar{C}$  in alc. refluxed overnight with an excess of Na phenolates yields corresponding bis ethers (9); e.g.,  $\bar{C}$  with Na  $\alpha$ -naphtholate gives 52% yield bis [ $\beta$ -( $\alpha$ -naphthoxy)ethyl] ether, m.p. 87° (9);  $\bar{C}$  with Na  $\beta$ -naphtholate gives 59% yield bis [ $\beta$ -( $\beta$ -naphthoxy)ethyl] ether, m.p. 122° (9).

$\bar{C}$  on htg. with aniline (3 moles) for 2 hrs. at 200° gives (95% yield (9)) 4-phenylmorpholine, white flakes from 50% alc., m.p. 57-58° (1). [The crude prod. may also cont. bis-( $\beta$ -anilinoethyl) ether, pl. from alc., m.p. 115.5° (9).] [For similar prepn. (77% yield (9)) of *N*-(*p*-tolyl)morpholine, m.p. 51° (8); *N*-( $\alpha$ -naphthyl)morpholine (98% yield (9)), m.p. 83° (8); *N*-( $\beta$ -naphthyl)morpholine (72% yield (9)), m.p. 90° (8), see (8) (9).] [For corresp. reaction of  $\bar{C}$  with phenylhydrazine, *p*-phenylenediamine, and benzidine see (10); with ethylenediamine see (11).]

—  $\beta, \beta'$ -bis-( $\alpha$ -Naphthoxy)diethyl ether: m.p. 87° (16). [From  $\bar{C}$  +  $\alpha$ -naphthol (1:1500) + aq. NaOH in a.t. at 120° for 8 hrs. (16).]

—  $\beta, \beta'$ -bis-( $\beta$ -Naphthoxy)diethyl ether: m.p. 122° (16). [From  $\bar{C}$  +  $\beta$ -naphthol (1:1540) + aq. NaOH in a.t. at 120° for 8 hrs. (16).]

⑨ bis-( $\beta$ -Phthalimidoethyl) ether [Beil. XXI-470]: from  $\bar{C}$  on refluxing 3 hrs. with phthalimide +  $K_2CO_3$  (13) or from  $\bar{C}$  + K phthalimide (2 moles) + trace of diethylamine on htg. 4 hrs. at 135-140° (55% yield) (9), cryst. from alc. (14), ndls. from 50% AcOH (13), m.p. 159° (9), 157° (13), 156.5° (14). [The half reaction prod.,  $\beta$ -chloro- $\beta'$ -phthalimidodiethyl ether, ndls. from lt. pet., m.p. 72° (13), 90° (9), may be sepd. from the above bis-ether by its much greater solubility in pet. eth. (13).]

3:6050 1,1,3,3-TETRACHLOROPROPANONE-2  $\text{C}_3\text{H}_2\text{OCl}_4$  Beil. I - 656  
 (sym.-Tetrachloroacetone)  $\text{Cl}_2\text{CH}-\text{C}(=\text{O})-\text{CHCl}_2$  I<sub>1</sub>-(345)  
 I<sub>2</sub>—

B.P. 180-182° cor. at 718 mm. (1)  
 179-181° (3)

[See also 1,1,1,3-tetrachloropropanone-2 (unsym.-tetrachloroacetone) (3:6035).]

Colorless liq. with penetrating odor; produces blisters on skin. — Eas. sol. cold aq., alc., ether,  $\text{C}_6\text{H}_6$ .

$\bar{\text{C}}$  with aq. readily yields a crystn. tetrahydrate, m.p. 48-49° (1) (6), 48° (2), 47-48° (3) (4) (for crystallographic data see (2), for polymorphism see (5)); this tetrahydrate loses its aq. on distn., on stdg. over  $\text{H}_2\text{SO}_4$ , or by actn. of dry  $\text{HCl}$  gas.

[For prepn. of  $\bar{\text{C}}$  from phloroglucinol (1:1620) via conversion in  $\text{AcOH}$  with  $\text{Cl}_2$  to 1,1,3,3,5,5-hexachloro-2,4,6-triketocyclohexane ("hexachlorophloroglucinol") (Beil. VII-854, VII-469)], and treatment of latter with water (yield is almost quant.) (dichloroacetic acid (3:6203) is also formed) see (6); from 2,4,6-triaminophenol (Beil. XIII-569, XIII-(211)) (2), from chloroanilic acid (3:4970) (1) (7), from 3,3,5-trichlorocyclopentanetrione-1,2,4 (Beil. VII-852) (4), or from 2,2,5-trichlorocyclopentanedione-3,4-ol-1-carboxylic acid-1 (Beil. X-985) (4) by oxidn. with  $\text{KClO}_3 + \text{HCl}$  (other by-products are also formed and yield is low, e.g., 7% (7)) see indic. refs.; for formn. of  $\bar{\text{C}}$  from isopropyl alc. (1:6135) with  $\text{Cl}_2$  (8), from chloroacetone (3:5425) with  $\text{Cl}_2$  at 50-70° in light (9), or from 1,1-dibromo-3,3-dichloropropanone-2 (Beil. I-658) with alc.  $\text{HgCl}_2$  in s.t. at 100° for several hours (3) see indic. refs.]

[ $\bar{\text{C}}$  (as tetrahydrate) nn reduction with  $\text{Zn} + \text{H}_2\text{SO}_4$  yields (1) acetone (1:5400);  $\bar{\text{C}}$  on reduction with  $\text{Al}(\text{OEt})_3$ ,  $\text{Mg}(\text{OEt})_2$ , or  $\text{EtOMgCl}$  yields (10) 1,1,3,3-tetrachloropropanol-2 (3:9037).]

$\bar{\text{C}}$  with satd. aq.  $\text{NaHSO}_3$  readily yields a  $\text{NaHSO}_3$  cpd. (3).

$\bar{\text{C}}$  with aq. alk. does not (3) yield chloroform;  $\bar{\text{C}}$  with alk. + aniline does not (3) give phenylisocyanide (carbylamine test). [Dif. from the isomeric unsym.-tetrachloroacetone (3:6035).]

$\bar{\text{C}}$  in abs. ether with dry  $\text{NH}_3$  gas adds 1  $\text{NH}_3$  giving (92% yield (2)) 1,1,3,3-tetrachloro-2-aminopropanol-2 (Beil. I-656), ndls. from  $\text{C}_6\text{H}_6$ , m.p. 110-111° dec. with prev. sublimation; this prod. is eas. sol. in cold aq. but on warming the soln. dissociates into its components. — [The action of  $\bar{\text{C}}$  with aq.  $\text{NH}_4\text{OH}$  or with aniline has not been clarified cf. (3).]

[ $\bar{\text{C}}$  with excess conc. aq.  $\text{HCN}$  warmed at 50-60° soon dissolves and after 12 hrs. warming (2) ppts.  $\beta,\beta,\beta',\beta'$ -tetrachloro- $\alpha$ -hydroxyisobutyronitrile (Beil. III-318), cryst. from  $\text{C}_6\text{H}_6$ , m.p. 112-114° (2); this prod. with  $\text{AcOH}/\text{H}_2\text{SO}_4$  as directed (2) yields the corresp.  $\beta,\beta,\beta',\beta'$ -tetrachloro- $\alpha$ -hydroxyisobutyramide, cryst. from  $\text{C}_6\text{H}_6$ , m.p. 156° (2).]

$\bar{\text{C}}$  with  $\text{PCl}_5$  on htg. gives (2) mainly 1,1,2,2,3,3-hexachloropropane (3:6075) accompanied by some 1,1,2,3,3-pentachloropropene-1 (3:6075).

[ $\bar{\text{C}}$  with diazotized aniline (4 moles) in pres. of  $\text{NaOAc}$  yields (11) dichloro-bis-(benzeneazo)methane, yel.-or. cryst. from hot alc., m.p. 81-82° (11);  $\bar{\text{C}}$  with diazotized *p*-toluidine (4 moles) in pres. of  $\text{NaOAc}$  yields (11) dichloro-bis-(*p*-tolueneazo)methane, orange cryst. from  $\text{C}_6\text{H}_6$ , m.p. 159-160° (11).] [These prods. are also similarly obt'd. (11) from unsym.-dichloroacetone (3:6035).]

④ 4-(Benzeneazo)-1-phenylpyrazole (Beil. XXV-535): golden-yel. lfts. from dil. alc. or lgr., ndls. from  $\text{AcOH}$ , m.p. 126-127° cor. (2), 126° (6). [From  $\bar{\text{C}}$  in abs. alc. (2) or  $\text{AcOH}$  (6) with excess phenylhydrazine, refluxed for 5 min.]

$\bar{C}$  when pure is colorless oil, volatile with steam. — Ord. comml.  $\bar{C}$  conts. also the isomeric *p*-dichlorobenzene (3:0980), even as much as 25% (16); and a comml. prod. sold as insecticide conts. 40%  $\bar{C}$  + 30% *p*-dichlorobenzene (3:0980) + 30% trichlorobenzene (17).

[For f.p./compn. data and diagram of system  $\bar{C}$  + *p*-dichlorobenzene (3:0980) (eutectic, m.p. -23.4°, contg. 86.7%  $\bar{C}$ ) see (10) (11); for f.p./compn. data and diagram of system  $\bar{C}$  + *m*-dichlorobenzene (3:5960) (eutectic, m.p. -45.9°, contg. 48.7%  $\bar{C}$ ) see (11); for f.p./compn. data on ternary system of all three dichlorobenzenes see (10).]

[For data on densities of solns. of  $\bar{C}$  in  $C_6H_6$  (1:6400) and in *n*-hexane (1:8530) see (18); for data on  $D_{20}^{20}$  and  $n_D^{20}$  on system  $\bar{C}$  + diethylbenzene (and use of the mixt. in testing fractionating columns) see (19).]

[ $\bar{C}$  is very spar. sol. aq. (for study of this soly. over range 20-60° see (20).]

[For study and use of  $\bar{C}$  as cleaner for metals see (21); for use as solvent for fats and oils (16) and for detn. of oils in acids (by use of density of resultant extract (22) see indic. refs.; for use for removal of tar or pitch from surfaces coated with cellulose esters see (23); for use as solv. in purification of anthraquinone see (24); for study of toxicity of  $\bar{C}$  see (25).]

[For prepn. of  $\bar{C}$  from *o*-chloroaniline [Beil. XII-597, XII<sub>1</sub>-(297)] via diazotization and use of  $Cu_2Cl_2$  reactn. (yields: 70% (26), 25% (27)) (1) (8) (28) see indic. refs.; from *o*-phenylenediamine [Beil. XIII-6, XIII<sub>1</sub>-(5)] via tetrazotization in AcOH with nitrosyl-sulfuric acid followed by use of  $Cu_2Cl_2$  reactn. (70.1% yield) see (29); from 1,2-dichlorobenzenesulfonic acid-4 (see below) by distn. from a strong  $H_2SO_4$  with superheated steam at 200-240° see (30).]

[For formn. of  $\bar{C}$  from 2-chlorophenol (3.5980) by htg. with  $PCl_5$  (20% yield) see (7); from *o*-bromonitrobenzene [Beil. V-247, V<sub>1</sub>-(131)] with  $PCl_5$  in s.t. at 180° (31) or with  $NH_4Cl$  in s.t. at 320° (32) see indic. refs., from *o*-dinitrobenzene [Beil. V-257, V<sub>1</sub>-(135)] with conc.  $HCl$  in s.t. at 250-270° see (33)]

[For formn. of  $\bar{C}$  (together with *m*- and *p*-isomers in some cases) from  $C_6H_6$  with  $Cl_2$  in pres. of  $I_2$  (7),  $AlCl_3$  (34) (35), or  $SnCl_4$  (36) see indic. refs., from chlorobenzene (3:7903) with  $Cl_2$  + cat. at 600° (11) cf. (37) or with  $Cl_2$  in pres. of  $Al/Hg$  (38),  $AlCl_3$  (gives 30%  $\bar{C}$  (11)) (34),  $FeCl_3$  (gives 39%  $\bar{C}$  (11)), or with  $Al_2S_2Cl_8$  (i.e.,  $2AlCl_3 + S_2Cl_2$ ) +  $SO_2Cl_2$  (38) see indic. refs.]

[ $\bar{C}$  with  $Cl_2$  in pres. of  $Al/Hg$  (38) or  $FeCl_3$  (39) (40) (41) gives mainly 1,2,4-trichlorobenzene (3:6420), but 1,2,3-trichlorobenzene (3:0990) is also formed (41). —  $\bar{C}$  with  $Cl_2$  in s.t. at room temp. in sunlight as directed (42) adds  $3Cl_2$  yielding *o*-dichlorobenzene-hexachloride, m.p. 149° (42).] — [For study of photochem. chlorination of  $\bar{C}$  see (43).]

[ $\bar{C}$  with  $Mg$  in dry ether does not react (44)] — [ $\bar{C}$  with  $CO$  + cat. at elev. temps. gives (45) benzoic acid, presumably through intermediate formn. of *o*-phthalic acid and subsequent loss of  $CO_2$ .]

[ $\bar{C}$  with isopropyl alc. (1.6135) +  $BF_3$  +  $P_2O_5$  under reflux gives (53% yield (87)) 3,4-dichloro-*isopropylbenzene* (3,4-dichloro-*isopropylbenzene*) (87)]

[ $\bar{C}$  with  $CH_2Cl$  (3.7005) +  $AlCl_3$  yields (30) hexamethylbenzene (1:7265) + *iso*-trichloromesitylene (3.8725). —  $\bar{C}$  (3+ moles) with  $CHCl_3$  (1 mole) +  $AlCl_3$  without solv. at 55° for 8 hrs. gives (15% yield on the  $CHCl_3$  (46)) *trans*-(3,4-dichlorophenyl)methane, white pl., m.p. 160.5-162° (46) —  $\bar{C}$  with  $CCl_4$  +  $AlCl_3$  presumably yields 3,4,3',4'-tetrachlorobenzophenone dichloride (not isolated) since the reaction prod. with 95% alc. (46) or  $AcOH/H_2SO_4$  (47) gives 3,4,3',4'-tetrachlorobenzophenone, cryst. from hot alc. or hot acetone, m.p. 141-142° (46), 142° (47) (accompanied in latter case ( $H_2SO_4$ ) by some 3,4-dichlorobenzoic acid (3.4925), m.p. 203° (47).]

[ $\bar{C}$  with acetyl  $Cl$  (3:7005) +  $AlCl_3$  gives (yields: 70% (49), 40% (48)) 3,4-dichloroacetophenone, b.p. 135° at 12 mm. (48), m.p. 76° (48), 74° (49) (corresp. oxime, m.p. 107° (50)). —  $\bar{C}$  with chloroacetyl chloride (3.5235) +  $AlCl_3$  gives (50) (85) 3,4-dichlorophenacyl chloride (3,4-*ω*-trichloroacetophenone), m.p. 43° (50), 44° (85). —  $\bar{C}$  with  $\beta$ -chloro-*n*-butyric acid (3:0035) +  $AlCl_3$  or conc.  $H_2SO_4$  yields (51) by condens. and subsequent ring closure a mixt. of *x,y*-dichloro-3-methylindanone-1 epids.]

[ $\bar{C}$  with phthalic anhydride (1:0725) +  $AlCl_3$  gives (yields: 80% (5), 73% (52) (53), 35% (54)) (55) *o*-(3,4-dichlorobenzoyl)benzoic acid, m.p. 194.5° cor. (54), 192.5° (5), 191.2° cor. (52), 190° (55), this prod. on ring closure with conc.  $H_2SO_4$  gives a mixt. of two dichloroanthraquinones consisting of 87% (54) (5) 2,3-dichloroanthraquinone [Beil. VII<sub>1</sub>-(413)], m.p. 271° cor. (54), 268° (5), and 13% (54) (5) 1,2-dichloroanthraquinone [Beil. VII<sub>1</sub>-(411)], m.p. 196.5° cor. (54), 194.5° (5). Note that  $\bar{C}$  reacts with phthalic anhydride much more readily than *p*-dichlorobenzene (3:0980), after making reactn. mixt. alk. any *p*-dichlorobenzene (as from use of crude  $\bar{C}$ ) may be distilled out with steam (use in sepn. of *p*-dichlorobenzene from  $\bar{C}$  (86)); note also the claim (86) that under certain conditions  $\bar{C}$  with phthalic anhydride +  $AlCl_3$  is claimed to replace 1 chlorine atom by hydrogen so that an *o*-(*x*-chlorobenzoyl)benzoic acid results which on ring closure with 100%  $H_2SO_4$  gives 80% yield 2-chloroanthraquinone (3:4922). —  $\bar{C}$  with 4,5-dichlorophthalic anhydride (3:4830) +  $AlCl_3$  gives (80% yield (56)) 2-(3,4-dichlorobenzoyl)4,5-dichlorobenzoic acid, cryst. from  $C_6H_6$ , m.p. 183° (56); this prod. with conc.  $H_2SO_4$  ring-closes giving mainly 2,3,6,7-tetrachloroanthraquinone, m.p. 318° (56), accompanied by a little 1,2,6,7-tetrachloroanthraquinone, m.p. 242° (56).]

[ $\bar{C}$  on partial hydrol. with aq.  $MeOH$  alk., alk. carbonates, or best alk. earths in pres. of  $Cu$  or  $Cu$  salts at elevated temps. under press. gives in excellent yields (57) (58) (59) (60)

(61) (62) (63) (64) (65) *o*-chlorophenol (3:5980) (some phenol (1:1420) is also formed (62)); if the hydrolysis of  $\bar{C}$  is carried further, especially by use of aq. alk. in pres. of Ba or Sr salts and a reducing agt. (66), pyrocatechol (1:1520) is obtd. cf. (59) (61) (64).] — [For study of kinetics of reactn. of  $\bar{C}$  with NaOMe/MeOH at 175° see (67) (68) (69).]

[ $\bar{C}$  with anhyd.  $NH_3$  in alc. in pres. of  $CuCl_2 + Cu$  at 200° under press. yields (70) *o*-chloroaniline;  $\bar{C}$  with conc. aq.  $NH_4OH$  in pres. of  $CuO$  under press. at 150–200° (71) (72) or with Na in liq.  $NH_3$  (73) gives *o*-phenylenediamine.] — [ $\bar{C}$  with K diphenylamine gives by rearr. on btg. (74) (75)  $N,N,N',N'$ -tetraphenyl-*m*-phenylenediamine [Beil. XIII-42], m.p. 137.5–138° (74) (75).]

[ $\bar{C}$  on mononitration, e.g., at 0° with a mixt. of  $HNO_3$  ( $D = 1.52$ ) + conc.  $H_2SO_4$  (75) cf. (15) (4), gives (yields: 95% (15), 67% (75)) (7) (8) (76) mainly 1,2-dichloro-4-nitrobenzene [Beil. V-246, V<sub>1</sub>-(131)], cryst. from alc., m.p. 43° (7) (8), 42.5° (4) (reactn. prod. with piperidine is 2-chloro-4-nitropiperidinobenzene, m.p. 47–48° (78)), accompanied by a little (5.2% at –30°, 7.2% at 0° (8)) 1,2-dichloro-4,5-dinitrobenzene (see below).] — [The only other possible mononitro-isomer, viz., 1,2-dichloro-3-nitrobenzene [Beil. V-245, V<sub>1</sub>-(130)], m.p. 61°, has been obtd. only by indirect means (77) (76) although prob. present (4) in the oil from the main mononitration product.]

[ $\bar{C}$  on dinitration, e.g., with 4 wt. pts.  $HNO_3$  ( $D = 1.52$ ) + 6 wt. pts. conc.  $H_2SO_4$  at 100° for 1 hr. (79) (28) cf. (80) (or the above 1,2-dichloro-4-nitrobenzene with  $HNO_3$  ( $D = 1.6$ ) + fuming  $H_2SO_4$  (20%  $SO_3$ ) 2 hrs. at 100° (78)), gives 1,2-dichloro-4,5-dinitrobenzene [Beil. V-265], cryst. from dil. AcOH, m.p. 109–110° (78), 110° (28) (79) (reactn. prod. with piperidine is 1,2-dichloro-4-nitro-5-piperidinobenzene, m.p. 62–64° (78)), accompanied (28) by a little 1,2-dichloro-3,5-dinitrobenzene [Beil. V<sub>1</sub>-(133)], m.p. 56° (28).] — [All the other possible isomeric *o*-dichlorodinitro cpds. are known but have been obtd. only by indirect means: 1,2-dichloro-3,4-dinitrobenzene [Beil. V-264], m.p. 53–55°, 1,2-dichloro-3,6-dinitrobenzene, m.p. 60°, and 1,2-dichloro-4,6-dinitrobenzene, m.p. 56°.]

[None of the four possible 1,2-dichloro-trinitrobenzenes appears to have been reported.]

[ $\bar{C}$  on monosulfonation, e.g., with fuming  $H_2SO_4$  in s.t. at 210° for 8 hrs. (7), or at room temp. (30), or at 100° (10), or with  $H_2SO_4 \cdot H_2O$  + fuming  $H_2SO_4$  (60%  $SO_3$ ) in pres. of Hg at 100° for 1 hr. (81), gives mainly 1,2-dichlorobenzenesulfonic acid-4 [Beil. XI-55, XI<sub>1</sub>-(16)] (Na salt less sol. aq. (81)) accompanied by a lesser amt. of 1,2-dichlorobenzenesulfonic acid-3 (Na salt more sol. aq. (81)) (some *bis*-(dichlorophenyl) sulfone, m.p. 173° (30), may also be formed during sulfonation).] — [ $\bar{C}$  sulfonates much more readily than *p*-dichlorobenzene (3:0980); for use in sepn. see (7) (30); for removal of chlorobenzene from mixt. with dichlorobenzenes via sulfonation of former with 95%  $H_2SO_4$  see (11).]

① 1,2-Dichlorobenzenesulfonamide-4 (3,4-dichlorobenzenesulfonamide-1): cryst. from dil. alc., m.p. 134–135° u.c. (83). [From  $\bar{C}$  by treatment as directed (83) with  $ClSO_3H$  followed by conv. of the intermediate 1,2-dichlorobenzenesulfonyl chloride-4, m.p. 18–19° (83), with  $(NH_4)_2CO_3$  to the desired sulfonamide.] — [For formn. of 3,4-dichlorobenzenesulfonyl chloride with  $ClSO_3H$  and use in sepn. of  $\bar{C}$  from *p*-dichlorobenzene see (82); for prepn. of the sulfonamide and use as plasticizer see (84).]

3:6090 ETHYL *d,l*- $\alpha,\beta$ -DICHLOROPROPIONATE  $C_5H_8O_2Cl_2$  Beil. II - 252

B.P. 183-184° (1)

182-185° (3)

70-77° at 15 mm. (2)

$D_4^{20} = 1.2461$  (3)

$n_D^{20} = 1.44815$  (3)

[For prepn. of  $\bar{C}$  from  $\alpha,\beta$ -dichloropropionic acid (3:0855) with abs. EtOH + dry HCl at 0° (74-78% yield (2)) (1) see indic. refs.; from  $\alpha,\beta$ -dichloropropionyl chloride (3:0034) with EtOH see (4) (3) (5).]

$\bar{C}$  is difficult to keep and readily loses HCl (3). —  $\bar{C}$  on htg. with dimethylaniline, quinoline, or quinaldine at 100° for 10 min. under  $N_2$  loses HCl yielding (4) ethyl  $\alpha$ -chloroacrylate (3:0242).

$\bar{C}$  with  $Ba(OH)_2$  both saponifies and loses HCl yielding (5) (6)  $\alpha$ -chloroacrylic acid (3:1445), m.p. 65°.

$\bar{C}$  reacts easily with alc. KCN, and after boilg. the resulting soln. with KOH yields (7) fumaric acid (1:0895) and *d,l*-malic acid.

$\bar{C}$  on boilg. with 20% HCl hydrolyzes (4) yielding EtOH (1:0130) and  $\alpha,\beta$ -dichloropropionic acid (3:0855) q.v.

3:6090 (1) Werigo, Melikov, *Ber.* 10, 1500 (1877). (2) Yarnall, Wallis, *J. Org. Chem.* 4, 287 (1939). (3) Brühl, *Ann.* 203, 25 (1880). (4) Marvel, Dec, Cooke, Cowan, *J. Am. Chem. less liq. with weak odor suggestive both of acetic acid and butyric acid; misc. with ether; volatile with steam, blisters skin.

prepn. of  $\bar{C}$  from propionic acid (1:1025) with  $Cl_2$  (7) (8) or with  $SO_2Cl_2$  + dibenzoyl e in  $CCl_4$  (9) see indic. refs.; from  $\alpha$ -chloropropionyl chloride (3:5320) by hydrolysis (11) (12) with water see indic. refs.; from  $\alpha$ -chloropropionitrile by hydrolysis with HCl see (5); from 2-chloropropanol-1 (3:7917) (4) or from 3-chlorobutanone-2 ( $\alpha$ -thyl methyl ketone) (3:7598) (13) (14) by oxidn. with  $HNO_3$  or other oxidn. agts. ic. refs.]

n treatment with  $Cl_2$  as specified (15) yields  $\alpha,\beta$ -dichloropropionic acid (3:0855);  $SOCl_2$  yields (16)  $\alpha$ -chloropropionyl chloride (3:5320), b.p.  $111^\circ$ ;  $\bar{C}$  on reduction n + HCl yields (10) propionic acid (1:1025) [for study of catalytic hydrogenation r its salts see (17)];  $\bar{C}$  with  $SO_3$  at  $170^\circ$  yields (18)  $\alpha$ -chloro- $\alpha$ -sulfopropionic acid actn. of  $\bar{C}$  with sulfites see (2)],  $\bar{C}$  with conc. aq.  $NH_4OH$  gives (43-46% yield (19)) nine ( $\alpha$ -aminopropionic acid) [for behavior of  $\bar{C}$  with liq.  $NH_3$  see (20) (21)].]

n alk. hydrolysis gives (10) (22) lactic acid (1:0400) [for study of rate of hydrolysis 23) or its sodium salt (24) see indic. refs.].

on htg. with pyridine at  $100^\circ$  loses  $CO_2$  and yields (25) ethylpyridinium chloride.]

n conversion to salt, treatment with KCN, and subsequent acidification yields (26) ymalonic acid, m.p.  $132^\circ$  (has been used for ident. of  $\bar{C}$  (26)).

[ $\bar{C}$  with  $Cl_2$  in pres. of Fe gives (16) dichloromaleyl (di)chloride (3:6197) q.v. —  $\bar{C}$  with  $Br_2$  in dark does not react, but in direct sunlight for 5 hrs. adds 82% of theoretical amt. yielding (2)  $\alpha$ -chloro- $\alpha,\beta$ -dibromosuccinyl (di)chloride, b.p. 116–118° at 10 mm. (2), which on hydrolysis with aq. gives (2)  $\alpha$ -chloro- $\alpha,\beta$ -dibromosuccinic acid, hydrated pr. from HCl, m.p. 65–75°, which after drying over conc.  $H_2SO_4$  gives anhydrous form, m.p. 139–140° (2).]

[ $\bar{C}$  with 3 N EtOH/KOH (large excess) in freezing mixt. loses HCl and hydrolyzes (or vice versa) and after acidification as directed gives K H acetylenedicarboxylate which with aq. at 100° for 1 hr. loses  $CO_2$  giving (39% yield from  $\bar{C}$  (12)) propiolic acid [Beil. II-477,  $\Pi_1$ -(208),  $\Pi_2$ -(449).]

[ $\bar{C}$  with MeOH under reflux yields (13) dimethyl chlorofumarate (3:6582);  $\bar{C}$  with EtOH yields (1) (9) (15) diethyl chlorofumarate (3:6564); note that  $\bar{C}$  reacts with MeOH or with aniline much more rapidly than the isomeric chloromaleyl (di)chloride (3:6158) (for details and graphs see (2)).]

$\bar{C}$  (1 mole) with chlorofumaric acid (3:4853) (1 mole) at 125° for 1 hr. gives (11) chloromaleic anhydride (3:0280), m.p. 33°.

[ $\bar{C}$  with  $AlCl_3$  combines yielding a viscous oil, solidifying in freezing mixt. to yel. cryst., m.p. about 50°; this prod. with water regenerates  $\bar{C}$  but if first htd. at 100° for several hrs. and then treated with aq. gives (S5–S7% yield (2)) (3) chloromaleyl (di)chloride (3:6158).]

$\bar{C}$  with excess conc. aq.  $NH_4OH$  reacts vigorously yielding (1) (11) chlorofumaric acid diamide, ndls. from alc., m.p. 187° (11).

[ $\bar{C}$  in aq. AcOH (1:4) with hydrazine hydrate as directed gives hydrazine salt of  $N,N$ -bis ( $\alpha$ -chloro- $\beta$ -carboxyacryloyl)hydrazine (2), m.p. 215° (9); note that  $\bar{C}$  with  $NH_2.NH_2.H_2O$  in ether, pet. eth., or AcOH gives only (9) resinous or amorphous yel. prods.]

$\bar{C}$  (1 mole) with  $p$ -chloroaniline (4 moles) in dry ether reacts vigorously giving mainly (11) chlorofumaro-di- $p$ -chloroanilide, pale yel. ndls. from alc., m.p. 223° (11), accompanied by a little  $N$ -( $p$ -chlorophenyl)chloromaleimide, pl. from alc. mother liquor, m.p. 175° (11).

$\bar{C}$  on hydrolysis with aq. yields chlorofumaric acid (3:4853), m.p. 193°.

185.2°	at 730 mm. (1)		$D_4^{18.1} = 1.6049$ (3)	$n_D^{18.1} = 1.51362$ (3)	
104.0-105°	at 50 mm. (2)				
82.2-82.5°	at 26 mm. (3)		$D_4^{17.5} = 1.6044$ (3)	$n_D^{17.5} = 1.51375$ (3)	
71.5°	at 10 mm. (1)				

[See also chlorofumaryl (di)chloride (3:6105).]

$\bar{C}$  is generally formulated in the unsymmetrical structure shown above (for discussion see (1) (2)); note, however, that the position of the chlorine atom attached to the carbon bearing the double bond is frankly assumed and may be on the other such carbon.

Note also that  $\bar{C}$  appears to exist also in a labile form, m.p. 4.8° (1), which readily changes to the higher-melting (stable) variety;  $\bar{C}$  on supercooling and inoculation with the labile form cryst. in the latter.

$\bar{C}$  from pet. ether cryst. as needles;  $\bar{C}$  has disagreeable odor (1) and is far more lachrymatory than the isomeric chlorofumaryl (di)chloride (3:6105) (2).

[For prepn. of  $\bar{C}$  from chlorofumaryl (di)chloride (3:6105) by combination with  $AlCl_3$ , htg. at 100° for several hrs., and subsequently decomposing with ice water (yield as high as 85-87% but varies according to nature of  $AlCl_3$  used) see (1) (2).]

[ $\bar{C}$  on hydrogenation in dry ether in pres. of Pt black yields (4) *n*-butyric acid (1:1035) and other prods.]

[ $\bar{C}$  with  $AlCl_3$  gives a cpd., red-brown ndls., m.p. abt. 100° (1); on htg. at 180-225° this prod. decomposes yielding (1)  $\alpha,\beta$ -dichloroacryloyl chloride (see under 3:2265), b.p. 147.3° at 733 mm., phosgene (3:5000),  $CO$ ,  $HCl$ , and other prods.]

$\bar{C}$  on protracted boilg. is converted (1) to chlorofumaryl (di)chloride (3:6105).

[ $\bar{C}$  reacts with  $MeOH$  and with aniline much more slowly than the isomeric chlorofumaryl (di)chloride (3:6105) (for details and graphs see (1) cf. (2)).]

3:6162  $\alpha,\alpha$ -DICHLOROPROPIONIC ACID $\text{C}_3\text{H}_4\text{O}_2\text{Cl}_2$ 

Beil. II - 250

II<sub>1</sub>—II<sub>2</sub>-(228)

B.P. [185-190°] (1) (4) (6)

186-189° (7)

00-92° at 14 mm. (2)

 $D_4^{22.8} = 1.389$  (2)

Colorless liq. — Very eas. sol. aq. or alc.; from aq. solns. can be salted out with NaCl. — Volatile with steam without hydrolysis — Insol. conc. HCl.

[For prepn. of  $\bar{\text{C}}$  from corresp. acid chloride, viz.,  $\alpha,\alpha$ -dichloropropionyl chloride (3:5372), by hydrolysis see (3); from  $\alpha,\alpha$ -dichloropropionitrile monomer [Beil. II-251] (1) (4) (19),  $\alpha,\alpha$ -dichloropropionitrile dimer [Beil. II-252] (5), or  $\alpha,\alpha$ -dichloropropionitrile trimer [Beil. XXVI-38] (6) (7) by hydrolysis with  $\text{H}_2\text{SO}_4$  see indic. refs.; from  $\alpha,\alpha$ -dichloropropionanilide (see below) by hydrolysis with conc. HCl in s.t. at 140° see (2); for formn. of  $\bar{\text{C}}$  from propionic acid with  $\text{Cl}_2$  under certain conditions see (26).]

$\bar{\text{C}}$  is reduced by Zn + dil.  $\text{H}_2\text{SO}_4$  giving (1) propionic acid (1:1025).

$\bar{\text{C}}$  on keeping gradually splits off some HCl (2). —  $\bar{\text{C}}$  with alc. KOH on boilg. either loses HCl giving (8)  $\alpha$ -chloroacrylic acid (3:1445) or by some obscure mechanism gives (9) cf. (10) (11)  $\beta$ -ethoxyacrylic acid [Beil. III-369], m.p. 110°.

$\bar{\text{C}}$  as a monobasic acid forms corresp. salts; e.g.,  $\text{NH}_4\bar{\text{A}}$  (1),  $\text{K}\bar{\text{A}} \cdot 6\text{H}_2\text{O}$  (1);  $\text{Ca}\bar{\text{A}}_2 \cdot 3\text{H}_2\text{O}$  (1);  $\text{Ba}\bar{\text{A}}_2 \cdot \text{H}_2\text{O}$  (1);  $\text{Zn}\bar{\text{A}}_2 \cdot \text{H}_2\text{O}$  (1) (12),  $\text{Ag}\bar{\text{A}}$ , spar. sol. aq. (1), note that this dry  $\text{Ag}\bar{\text{A}}$  at 60° decomposes violently giving (12) AgCl and a mixed anhydride of  $\bar{\text{C}}$  with pyruvic acid, viz.,  $\text{CH}_3\text{C}(\text{Cl}_2)\text{CO O.CO.CO.CH}_3$ ; however,  $\text{Ag}\bar{\text{A}}$  on warming with aq. gives (12) AgCl + pyruvic acid (1:1040) and/or (1)  $\alpha$ -chloroacrylic acid (3:1445).

$\bar{\text{C}}$  with aq.  $\text{Ag}_2\text{O}$  or  $\text{Ag}_2\text{CO}_3$  on protracted hgt. gives (13) (12) pyruvic acid (1:1040), but use of excess  $\text{Ag}_2\text{O}$  (14) (1) cf. (15) leads to  $\text{AcOH}$  (1:1010) +  $\text{CO}_2$  +  $\text{H}_2\text{O}$ . —  $\bar{\text{C}}$  with aq.  $\text{Ba}(\text{OH})_2$  on boilg. or  $\bar{\text{C}}$  with aq. in s.t. at 120-150° gives (14) (16) pyruvic acid (1:1040).

[ $\bar{\text{C}}$  with finely divided Ag in  $\text{C}_6\text{H}_6$  on refluxing 40-70 hrs. gives (17) (18) (19)  $\alpha,\alpha'$ -dimethylmaleic anhydride [Beil. XVII-445], m.p. 95°, and  $\alpha,\alpha'$ -dichloro- $\alpha,\alpha'$ -dimethylsuccinic acid [Beil. II-668], m.p. 185°.]

[ $\bar{\text{C}}$  (3 moles) with  $\text{PCl}_3$  (1 mole) gives (3) (20)  $\alpha,\alpha$ -dichloropropionic acid anhydride [Beil. II-251], b.p. 196-200° (20), 190-192° (3). —  $\bar{\text{C}}$  (3 moles) with  $\text{PCl}_3$  (2 moles) (3) or with  $\text{SOCl}_2$  refluxed for 10 hrs. (21) gives  $\alpha,\alpha$ -dichloropropionyl chloride (3:5372).]

$\bar{\text{C}}$  with alcohols in pres. of dry HCl gives (1) the corresp. esters (see also below).

— Methyl  $\alpha,\alpha$ -dichloropropionate: b.p. 144-146° (7), 143-144 u.c. (1). [From  $\bar{\text{C}}$  with  $\text{MeOH}$  + dry HCl (1) (7); for study of kinetics of hydrolysis see (22).]

— Ethyl  $\alpha,\alpha$ -dichloropropionate: b.p. 160° (23), 156-157° (1) (6), 83-85° at 53 mm. (2). [From  $\bar{\text{C}}$  with  $\text{EtOH}$  + dry HCl (1) or from  $\alpha,\alpha$ -dichloropropionyl chloride (3:5372) with  $\text{EtOH}$  (23); note that this ester with aq. in s.t. at 130° gives (16) (14) undergoes hydrolysis yielding pyruvic acid (1:1010) and ethyl pyruvate (1:3308) or with aq.  $\text{Ag}_2\text{O}$  gives (15) Ag acetate.]

①  $\alpha,\alpha$ -Dichloropropionamide: lfts. from dil. alc., m.p. 117-118° (2) (24), 117° (12), 116-117° (3), 116° (23) (5) (20), 115-116° (4) (6) (7). [From ethyl  $\alpha,\alpha$ -dichloropropionate (above) (3) (23), from methyl  $\alpha,\alpha$ -dichloropropionate (above) (7), or from  $\alpha,\alpha$ -dichloropropionyl chloride (3:5372) (3) with conc. aq.  $\text{NH}_4\text{OH}$ .]

②  $\alpha,\alpha$ -Dichloropropion-*N*-ethylamide: m.p. 51-52° (2). [From  $\bar{\text{C}}$  with  $\text{EtNH}_2$ .]

—  $\alpha,\alpha$ -Dichloropropionanilide: m.p. 101° (2). [Reported only by indirect means (2).]

—  $\alpha,\alpha$ -Dichloropropion-*p*-toluidide: m.p. 81-86° (25). [Reported only by indirect means (25).]

(A)  $D_4^{20} = 1.6723$  (2) $n_{\text{D}}^{20} = 1.51572$  (2)

[See also dichloromaleic acid (3:3634) and dichloromaleic anhydride (3:3635).]

Colorless mobile lachrymatory liq. with penetrating camphoraceous odor but *not* fuming in moist air. — Insol. aq. but volatile with steam without hydrolysis. — Soluble in org. solvents.

Although  $\bar{\text{C}}$  has not been separated into the completely pure desmotropic forms (A) and (B), their presence is clearly evidenced (2). The relative proportion of the two forms varies with the age of the sample and other conditions, but the above data on density and refraction indicate the extremes so far realized (for much further detail see (2)).

[For prepn. of ord.  $\bar{\text{C}}$  (mixture of (A) and (B)) from succinyl (di)chloride (3:6200) with  $\text{Cl}_2$  at 145° in pres. of Fe (81% yield) see (2) (note that some dichloromaleic anhydride (3:3635) is also formed, that in absence of Fe the reactn. is very slow, and that use of  $\text{I}_2$  in place of Fe lowers yield of  $\bar{\text{C}}$  to 54% (2)); from chlorofumaryl (di)chloride (8:6105) with  $\text{Cl}_2$  in pres. of Fe see (1); from dichloromaleic anhydride (3:3635) with  $\text{PCl}_5$  see (1); from dihydromfumaryl (di)chloride [Beil. II<sub>1</sub>-(303)] with  $\text{AlCl}_3$  at 100° see (3).]

Ord.  $\bar{\text{C}}$  with 60% of its wt. of  $\text{AlCl}_3$  spontaneously evolves  $\text{HCl}$ ; after further hgt. at 100° and pouring into aq. the ethereal extract yields (2) a prod. which reacts as substantially pure unsym. form (B).

Ord.  $\bar{\text{C}}$  is not affected by ord. treatment with boilg. aq. or boilg. aq. KOH (2), although it is attacked by alc. KOH (1). —  $\bar{\text{C}}$  on very protracted (168 hrs.) boilg. with aq. slowly dissolves giving (2) an acidic soln. which on extraction with ether followed by drying and evapn. of this solvent gives (80% yield) dichloromaleic anhydride (3:3635).

[For study of rate of reactn. of  $\bar{\text{C}}$  with MeOH or with aniline see (2).]

[For condens. of  $\bar{\text{C}}$  with 1-aminoanthraquinone in prepn. of dyestuffs see (2) (4).]

Ord.  $\bar{\text{C}}$  (2 g.) in  $\text{C}_6\text{H}_6$  (150 mL.) treated with 4 moles aniline (3.4 g.) in  $\text{C}_6\text{H}_6$  (30 mL.) immediately ppts. aniline hydrochloride; after stdg. for  $\frac{1}{2}$  hr., then removing this ppt., the filtrate leaves on evapn. a mixture (m.p. 165-185°; yield 67-83% (2)) of two different dianilides, which can be separated by recrystn. from hot alc.: the dianilide from the sym. dichloride (A) is *white*, has m.p. 193°, and with alc. KOH is much more slowly hydrolyzed than its isomer and during such hydrolysis shows no transient color; the dianilide from the unsym. dichloride (B) is *yellow*, has m.p. 170°, and with hot 8% alc. KOH readily hydrolyzes with development of a transient cherry-red coloration. — Note that, although the *white* dianilide is somewhat more readily sol. in hot alc. than the *yellow* isomer, it also separates first on slow cooling; note also that on hydrolysis of the anilides with alc. KOH the presence of aniline is readily detected but (presumably because of further attack by the alkali) no dichloromaleic acid can be recovered in either case.

78.6°	at 11 mm. (9)						

Note that  $\bar{C}$  may react in either *sym.* (above) or *unsym.* form acc. to circumstances. [For discussion of structure see (1) (5) (7) (9) (10); in the liquid only the *sym* form ( $\bar{C}$ ) exists (9).] —  $\bar{C}$  is sol. in  $\text{C}_6\text{H}_6$ , but insol. in pet. ether (7)

[For prepn. of  $\bar{C}$  from succinic acid (1.0530) with  $\text{PCl}_5$  (yield: 85% (8) (12)) (13) (14) (4) (5) see indic. refs. (note that neither  $\text{PCl}_3 + \text{ZnCl}_2$  (8) nor  $\text{SOCl}_2$  (16) give  $\bar{C}$ ); for prepn. of  $\bar{C}$  from succinic anhydride (1.0710) with  $\text{PCl}_5$  (4) (6), with  $\text{PCl}_3 + \text{Cl}_2$  (17), or with  $\text{SOCl}_2 + \text{ZnCl}_2$  at 200-240° (18) (35) see indic. refs.; for formn. of  $\bar{C}$  from the trimer of  $\beta$ -aldehydopropionic acid with  $\text{PCl}_5$  see (19) ]

[ $\bar{C}$  with  $\text{Cl}_2 + \text{Fe}$  at 145° gives (81% yield (20)) dichloromaleyl dichloride (3.6197) cf. (21),  $\bar{C}$  with  $\text{Br}_2$  yields (22) (23) mixt. of *d,l*- and *meso*- $\alpha,\alpha'$ -dibromosuccinyl dichlorides;  $\bar{C}$  with  $\text{Br}_2 + \text{Fe}$  yields (24) dibromomaleic anhydride [Beil. XVII-435, XVII<sub>1</sub>-(233)], m.p. 118°.]

[ $\bar{C}$  on reduction with  $\text{Na/Hg} + \text{AcOH}$  in ether (25) or with  $\text{H}_2 + \text{Pd}$  (25) (15) gives (54% yield (26))  $\gamma$ -butyrolactone (1.5070), b.p. 206°.]

[ $\bar{C}$  with  $\text{AlCl}_3 + \text{C}_6\text{H}_6$  yields (27)  $\gamma,\gamma$ -diphenyl- $\gamma$ -butyrolactone [Beil. XVII-367], m.p. 90° (arising from reactn. of  $\bar{C}$  in the *unsym* form), 1,2-dibenzoylthane [Beil. VII-773, VII<sub>1</sub>-(401)], m.p. 144° (arising from reactn. of the *sym.* form), and  $\beta$ -benzoylpropionic acid [Beil. X-696, X<sub>1</sub>-(330)], m.p. 116°.]

[ $\bar{C}$  on distn. or htg. with succinic acid (1.0530) (30) (31), or on htg. (31) with anhydrous oxalic acid (1.0535) or on protracted boiling with  $\text{Na}$  in xylene (32), or on htg. with diethyl succinate (1.3756) +  $\text{ZnCl}_2$  (33), yields succinic anhydride (1.0710), m.p. 120°.]

$\bar{C}$  with conc. aq.  $\text{NH}_4\text{OH}$  (7) or with  $\text{NH}_3$  gas in  $\text{C}_6\text{H}_6$  reacts mainly in the *unsym.* form (7) yielding the hygroscopic *unsym.* succindiamide [Beil. XVII-410] with at most 5% of *sym*-succindiamide, m.p. 260°;  $\bar{C}$  with aniline in  $\text{C}_6\text{H}_6$  (7) (34), however, gives 90% yield (7) *sym*-succindiamide, m.p. 230°.

[For behavior of  $\bar{C}$  with diethyl sodio-malonate see (35) (36).]

$\bar{C}$  on hydrolysis yields succinic acid (1.0530) q.v., m.p. 185°.

+2.1° (2)

$D_{15}^{15} = 1.60$  (3)

97.5-98.5° at 40 mm. (2)

$D_{15}^{15} = 1.576$  (1)

[See also hexachloropropanone-2 (3:6312).]

Colorless oil with odor suggesting chloral (3:5210); slightly sol. cold aq. (aq. at 0° dis. 0.1 vol.  $\bar{\text{C}}$  (1)) but on warming to 50-60° the soln. becomes turbid. —  $\bar{\text{C}}$  with aq. at 0° forms (1) (4) a crystn. tetrahydrate, m.p. 15-17° (4), 15° dec. (1). —  $\bar{\text{C}}$  is volatile with steam.

[For prepn. of  $\bar{\text{C}}$  from acetone (1:5400) with  $\text{Cl}_2$  in sunlight see (1); from chloroacetone (3:5425) with  $\text{Cl}_2$  at 50-70° in light see (5) cf. (3); from citric acid (1:0455) in aq. soln. at 100° with  $\text{Cl}_2$  see (1); from chloranilic acid (3:4970) in aq. with  $\text{Cl}_2$  in pres. of  $\text{I}_2$  see (6); from isopropyl alcohol (1:6135) at 65° with  $\text{Cl}_2$  see (7); for formn. of  $\bar{\text{C}}$  from citric acid, gallic acid, quinic acid, salicylic acid, iadigo, etc., by distn. with  $\text{HCl}$  +  $\text{KClO}_3$  see (4); note that in prepn. of  $\bar{\text{C}}$  some hexachloroacetone (3:6312) is frequently also obt'd.]

$\bar{\text{C}}$  with  $\text{PCl}_5$  in s.t. at 180° for 6-8 hrs. yields (8) I,1,1,2,2,3,3-heptachloropropane (3:0200) b.p. 247-248°, m.p. 30°.

$\bar{\text{C}}$  with dil. aq. KOH undergoes hydrolytic cleavage yielding (1) (3) chloroform (3:5050) and the K salt of dichloroacetic acid (3:6203).

$\bar{\text{C}}$  with anilino in dil. AcOH yields (1) (3) chloroform (3:5050) and dichloroacetanilide [Beil. XII-244, XII-1-(193)], cryst. from aq.,  $\text{C}_6\text{H}_5$ , or ether/alc., m.p. 117°. —  $\bar{\text{C}}$  with alc.  $\text{NH}_4\text{OH}$  yields (1) chloroform (3:5050) and dichloroacetamido [Beil. II-205, II-1-(92), II-1-(106)], cryst., m.p. 98°.

3:6205 (1) Cloëz, *Ann. chim.* (6) 9, 187-194 (1836). (2) Edwards, Evans, Watson, *J. Chem. Soc.* 1937, 1914-1915. (3) Fritsch, *Ber.* 29, 598 (1893); *Ann.* 279, 317-318 (1894). (4) Stadel, *Ann.* 11, 293-301 (1859). (5) I.G., French 816,950, Aug. 21, 1937; *Cent.* 1938, I 2216. (6) Levy, Jedlicka, *Ann.* 249, 87-90 (1888). (7) Bue (to Standard Oil. Co. of N.J.), U.S. 1,301,757, Sept. 27, 1921; *Cent.* 1922, IV 942. (8) Fritsch, *Ann.* 297, 314 (1897).

alm. ident. with corresp. deriv. from the isomeric ethyl  $\gamma$ -chloroacetoacetate (3:6375)); for corresp. Mg, Cu, or Ni enolates see (20).

[ $\bar{C}$  with phenols in pres. of conc.  $H_2SO_4$  or  $P_2O_5$  undergoes condensation and ring closure with loss of  $H_2O$  giving the corresp. substituted coumarins: e.g.,  $\bar{C}$  with *m*-cresol (1:1730) in conc.  $H_2SO_4$  at  $0^\circ$  gives (6) 3-chloro-4,7-dimethylcoumarin, ndls. from alc., m.p.  $135^\circ$  (6);  $\bar{C}$  with *p*-cresol (1:1410) similarly (6) (or in small yield (21) with  $P_2O_5$ ) gives 3-chloro-4,6-dimethylcoumarin, ndls. from AcOH, m.p.  $160^\circ$  (6),  $158^\circ$  (21): for corresp. reactn. of  $\bar{C}$  with  $\alpha$ -naphthol (1:1500) (22) (6), with  $\beta$ -naphthol (1:1540) (23), with 6-chloro-*m*-cresol (4-chloro-3-methylphenol) (3:1535) (24) see indic. refs. — This type of condensation also occurs with polyhydric phenols: e.g.,  $\bar{C}$  with resorcinol (1:1530) + conc.  $H_2SO_4$  at  $0^\circ$  (25) or with  $P_2O_5$  in alc. (26) gives 3-chloro-7-hydroxy-4-methylcoumarin, cryst. from alc. with  $\frac{1}{2} H_2O$  (lost at  $105-110^\circ$ ) and then melting  $236^\circ$  (25) (26); for corresp. behavior of  $\bar{C}$  with orcinol (1:1525) (22) (25), with pyrogallol (1:1555) (22) (25), see indic. refs.; many other cases are known. — Note, however, with particular care that  $\bar{C}$  with sodium salts of these phenols reacts in a different manner yielding substituted coumarone derivs. (cf. case of sodium phenolate in fifth paragraph).]

$\bar{C}$  with aq. solns. of diazonium salts behaves quite differently from the isomeric ethyl  $\gamma$ -chloroacetoacetate (3:6375): e.g.,  $\bar{C}$  in alc. with aq. benzenediazonium sulfate in pres. of NaOAc (2 moles) yields (27) (28) (4) ethyl  $\alpha$ -chloro- $\alpha$ -(phenylhydrazono)acetate [Beil. XV-270], yel. lfts. or pl. from alc., m.p.  $80-81^\circ$  (28) (4),  $70-71^\circ$  (27) (for use of this reactn. on mixts. of  $\bar{C}$  with the isomer see (4)).

$\bar{C}$  with excess hydrazine hydrate is reduced with evolution of  $N_2$  (1);  $\bar{C}$  with phenylhydrazine (2 moles) condenses and ring-closes yielding (29) (30) 4-(benzeneazo)-3-methyl-1-phenylpyrazolone-5 [Beil. XXIV-328, XXIV-1(319)], or-red. ndls. from alc., AcOH, or  $CHCl_3$ , m.p.  $156-157^\circ$  (note, however, that in pres. of ether the reactn. with phenylhydrazine takes a different course yielding (31) ethyl  $\beta$ -(benzeneazo)-crotonate [Beil. XVI-27], red ndls. from alc., m.p.  $50-51^\circ$ ).

[ $\bar{C}$  with thioacetamide on warming yields (32) 5-carbethoxy-2,4-dimethylthiazole [Beil. XXVII-318], cryst. from ether, m.p.  $50-51^\circ$  (32). —  $\bar{C}$  with  $NH_4SCN$  (33) or better  $Ba(SCN)_2$  (34) in alc. gives (55% yield (34)) 5-carbethoxy-2-hydroxy-4-methylthiazole [Beil. XXVII-338], lfts. from alc., m.p.  $128^\circ$  (33),  $127-129^\circ$  (34); note that this prod. may be regarded as merely the isomeric ethyl  $\alpha$ -(thiocyano)acetoacetate (35). —  $\bar{C}$  with  $NH_4$  dithiocarbamate (from  $NH_4OH + CS_2$ ) in alc. eliminates  $NH_4Cl$  giving an intermediate, m.p.  $115-121^\circ$ , according to mode of htg. (38) but which on fusion ring-closes with loss of aq. to 5-carbethoxy-2-mercapto-4-methylthiazole [Beil. XXVII-339], ndls. from alc., m.p.  $150^\circ$  (38),  $141^\circ$  (39).]

[ $\bar{C}$  with urea in alc. contg. a little aq. HCl gives on stdg. 5 months (36) 5-carbethoxy-2-hydroxy-4-methylimidazole [Beil. XXV-216], ndls. from aq. or tbls. from alc., m.p.  $218^\circ$  (36). —  $\bar{C}$  (1 mole) with thiourea (1 mole) at  $90^\circ$  reacts vigorously eliminating  $H_2O$  and giving (alm. quant. yield (37)) as the hydrochloride 2-amino-5-carbethoxy-4-methylthiazole [Beil. XXVII-338]; addn. of alk. sets free the base, ndls. from ether/alc., m.p.  $175^\circ$  (37) (13).]

See Note 1.					

Note 1. The b.p. of  $\tilde{\text{C}}$  at normal press. is not very significant, some decomn to dichloroacetyl chloride (3:5290), phosgene (3:5000), and tarry products always occurring (8).

Note 2.  $\tilde{\text{C}}$  apparently can exist in at least two crystn. modifications (24); no clear-cut study of the matter, however, has been reported.

Note 3. For values of  $D_{20}^{20}$  and  $n_D^{20}$  for aq. solns. of  $\tilde{\text{C}}$  see (27).

[See also chloroacetic acid (3:1370) and trichloroacetic acid (3:1150).]

$\tilde{\text{C}}$  when pure is a colorless liq. which does not fume in moist air and which dissolves in

alm. ident. with corresp. deriv. from the isomeric ethyl  $\gamma$ -chloroacetoacetate (3:6375)); for corresp. Mg, Cu, or Ni enolates see (20).

[ $\bar{C}$  with phenols in pres. of conc.  $H_2SO_4$  or  $P_2O_5$  undergoes condensation and ring closure with loss of  $H_2O$  giving the corresp. substituted coumarins: e.g.,  $\bar{C}$  with *m*-cresol (1:1730) in conc.  $H_2SO_4$  at  $0^\circ$  gives (6) 3-chloro-4,7-dimethylcoumarin, ndls. from alc., m.p.  $135^\circ$  (6);  $\bar{C}$  with *p*-cresol (1:1410) similarly (6) (or in small yield (21) with  $P_2O_5$ ) gives 3-chloro-4,6-dimethylcoumarin, ndls. from AcOH, m.p.  $160^\circ$  (6),  $158^\circ$  (21); for corresp. reactn. of  $\bar{C}$  with  $\alpha$ -naphthol (1:1500) (22) (6), with  $\beta$ -naphthol (1:1540) (23), with 6-chloro-*m*-cresol (4-chloro-3-methylphenol) (3:1535) (24) see indie. refs. — This type of condensation also occurs with polyhydric phenols: e.g.,  $\bar{C}$  with resorcinol (1:1530) + conc.  $H_2SO_4$  at  $0^\circ$  (25) or with  $P_2O_5$  in alc. (26) gives 3-chloro-7-hydroxy-4-methylcoumarin, cryst. from alc. with  $\frac{1}{2} H_2O$  (lost at  $105$ – $110^\circ$ ) and then melting  $236^\circ$  (25) (26); for corresp. behavior of  $\bar{C}$  with orcinol (1:1525) (22) (25), with pyrogallol (1:1555) (22) (25), see indie. refs.; many other cases are known. — Note, however, with particular care that  $\bar{C}$  with sodium salts of these phenols reacts in a different manner yielding substituted coumarone derivs. (cf. case of sodium phenolate in fifth paragraph).]

$\bar{C}$  with aq. solns. of diazonium salts behaves quite differently from the isomeric ethyl  $\gamma$ -chloroacetoacetate (3:6375): e.g.,  $\bar{C}$  in alc. with aq. benzenediazonium sulfate in pres. of NaOAc (2 moles) yields (27) (28) (4) ethyl  $\alpha$ -chloro- $\alpha$ -(phenylhydrazono)acetate [Beil. XV-270], yel. lfts. or pl. from alc., m.p.  $50$ – $51^\circ$  (28) (4),  $70$ – $71^\circ$  (27) (for use of this reactn. on mixts. of  $\bar{C}$  with the isomer see (4)).

$\bar{C}$  with excess hydrazine hydrate is reduced with evolution of  $N_2$  (1);  $\bar{C}$  with phenylhydrazine (2 moles) condenses and ring-closes yielding (29) (30) 4-(benzeneazo)-3-methyl-1-phenylpyrazolone-5 [Beil. XXIV-328, XXIV-1-(319)], or.-red. ndls. from alc., AcOH, or  $CHCl_3$ , m.p.  $156$ – $157^\circ$  (note, however, that in pres. of ether the reactn. with phenylhydrazine takes a different course yielding (31) ethyl  $\beta$ -(benzeneazo)-crotonate [Beil. XVI-27], red ndls. from alc., m.p.  $50$ – $51^\circ$ ).

[ $\bar{C}$  with thioacetamide on warming yields (32) 5-carbethoxy-2,4-dimethylthiazole [Beil. XXVII-318], cryst. from ether, m.p.  $50$ – $51^\circ$  (32). —  $\bar{C}$  with  $NH_4SCN$  (33) or better  $Bu(SCN)_2$  (34) in alc. gives (55% yield (34)) 5-carbethoxy-2-hydroxy-4-methylthiazole [Beil. XXVII-338], lfts. from alc., m.p.  $128^\circ$  (33),  $127$ – $129^\circ$  (34); note that this prod. may be regarded as merely the isomeric ethyl  $\alpha$ -(thiocyano)acetoacetate (35). —  $\bar{C}$  with  $NH_4$  dithiocarbamate (from  $NH_4OH$  +  $CS_2$ ) in alc. eliminates  $NH_4Cl$  giving an intermediate, m.p.  $115$ – $121^\circ$ , according to mode of htg. (38) but which on fusion ring-closes with loss of aq. to 5-carbethoxy-2-mercapto-4-methylthiazole [Beil. XXVII-339], ndls. from alc., m.p.  $150^\circ$  (38),  $141^\circ$  (39).]

[ $\bar{C}$  with urea in alc. contg. a little aq. HCl gives on stdg. 5 months (36) 5-carbethoxy-2-hydroxy-4-methylimidazole [Beil. XXV-216], ndls. from aq. or tbls. from alc., m.p.  $218^\circ$  (36). —  $\bar{C}$  (1 mole) with thiourea (1 mole) at  $90^\circ$  reacts vigorously eliminating  $H_2O$  and giving (alm. quant. yield (37)) as the hydrochloride 2-amino-5-carbethoxy-4-methylthiazole [Beil. XXVII-338]; addn. of alk. sets free the base, ndls. from ether/alc., m.p.  $175^\circ$  (37) (13).]

See Note 1.					

Note 1. The b.p. of  $\bar{C}$  at normal press. is not very significant, some decompn. to dichloroacetyl chloride (3:5290), phosgene (3:5900), and tarry products always occurring (8).

Note 2.  $\bar{C}$  apparently can exist in at least two crystn. modifications (24); no clear-cut study of the matter, however, has been reported.

Note 3. For values of  $D_{20}^{20}$  and  $n_D^{20}$  for aq. solns. of  $\bar{C}$  see (27).

[See also chloroacetic acid (3:1370) and trichloroacetic acid (3:1150).]

$\bar{C}$  when pure is a colorless liq. which does not fume in moist air and which dissolves in

aq. without opalescence. — Ordinary comml. samples of  $\bar{C}$  may contain also chloroacetic acid (3:1370) and trichloroacetic acid (3:1150) as well as decompn. products from these or from  $\bar{C}$  itself, cf. (30) (31).

### MISCELLANEOUS PHYSICAL PROPERTIES OF $\bar{C}$

Adsorption of  $\bar{C}$ . [For studies of adsorption of  $\bar{C}$  by activated carbon, charcoal, etc., see (32) (33) (34) (35) (36) (39); by silica gel see (33); by cellulose (viscose) see (37); by hide powder see (38).]

Distribution of  $\bar{C}$  between solvents. [For studies and data on distribution of  $\bar{C}$  between aq. + ether at 25° (40) (41); aq. +  $C_6H_6$  at 15° (42) (43) (44) (45); aq. + nitrobenzene (43); aq. + toluene (43); aq. + *o*-nitrotoluene (43) (47); aq. +  $CHCl_3$  (3:5050) (43); aq. +  $CCl_4$  (3:5100) (43) (46); aq. +  $EtBr$  (43) (46); aq. (contg.  $MgSO_4$ ) + *di*-*n*-butyl ether (1:7950) (48); aq. + olive oil (49); acetone + glycerol (50) see indic. refs.]

Binary systems contg.  $\bar{C}$ . [For f.p./compn. data on systems  $\bar{C}$  + trichloroacetic acid (3:1150) (25);  $\bar{C}$  +  $AcOH$  (1:1010) (25);  $\bar{C}$  + crotonic acid (1:0425) (25);  $\bar{C}$  + benzoic acid (1:0715) (25);  $\bar{C}$  + *o*-toluic acid (1:0690) (25);  $\bar{C}$  + *m*-toluic acid (1:0705) (25);  $\bar{C}$  + *p*-toluic acid (1:0795) (25);  $\bar{C}$  + phenylacetic acid (1:0665) (25);  $\bar{C}$  + cinnamic acid (1:0735) (25);  $\bar{C}$  + 2,6-dimethylpyrone (24);  $\bar{C}$  + azobenzene (19);  $\bar{C}$  + urea (51);  $\bar{C}$  + ethyl carbamate (urethane) (51) see indic. refs.]

### PHYSIOLOGICAL BEHAVIOR OF $\bar{C}$

[For study of toxicity of  $\bar{C}$  see (52); for action of  $\bar{C}$  on human skin see (53) (54).]

### PREPARATION OF $\bar{C}$

#### FROM VARIOUS CHLORO COMPOUNDS

From chloral hydrate. [For prepn. of  $\bar{C}$  from chloral hydrate (3:1270) with aq.  $NaCN$  +  $CaCO_3$  (yields: 88–92% (55), 90% (15)) or with aq.  $NaCN$  (60–65% yield (16)) or with  $K_3Fe(CN)_6$  (63) see indic. refs.; cf. also (56) (57); note here also the closely related matter of conversion of anhydrous chloral (3:5210) with alcohols +  $KCN$  (58) to the corresponding alkyl dichloroacetates, e.g., with  $MeOH$  to methyl dichloroacetate (3:5655) or with  $EtOH$  to ethyl dichloroacetate (3:5850), etc.; also conversion of chloral hydrate (3:1270) in ether with  $KCN$  + conc. aq.  $NH_4OH$  to (65–78% yield (59)) cf. (58)  $\alpha,\alpha$ -dichloroacetamide (see also below).]

From trichloroacetic acid. [For prepn. of  $\bar{C}$  from trichloroacetic acid (3:1150) by partial reduction with  $Zn$  + aq. (13), with  $Cu$  powder in aq. (80% yield (14)) or  $C_6H_6$  + aniline (75–85% yield (8)) cf. (60), or by electrolytic reduction (80% yield (61)) see indic. refs.]

From chloroacetic acid. [For prepn. of  $\bar{C}$  from chloroacetic acid (3:1370) with  $Cl_2$  (1), or  $Cl_2$  in pres. of  $I_2$  (62), see indic. refs.]

From dichloroacetaldehyde. [For prepn. of  $\bar{C}$  from dichloroacetaldehyde (3:5180) by oxidn. with  $HNO_3$  see (2).]

From other misc. chloro compounds. [For formn. of  $\bar{C}$  from ethyl dichloroacetate (3:5850) with  $HCl$  gas (100% yield (11)); from dichloroacetyl chloride (3:5290) by hydrolysis or by disproportionation with  $AcOH$  (acetyl chloride (3:7065) also being formed (64)); from  $\beta,\beta,\beta$ -trichloro- $\alpha$ -hydroxypropionic acid (trichlorolactic acid) [Beil. III-286, III<sub>1</sub>-(111), III<sub>2</sub>-(210)] or its ethyl ester with excess aq.  $Ba(OH)_2$  (65); from  $\beta,\beta$ -dichloro- $\alpha$ -acetoxyacrylonitrile [Beil. III<sub>1</sub>-(135), III<sub>2</sub>-(254)] with boilg. aq. (66) or from  $\alpha,\beta,\beta$ -trichloro- $\alpha$ -acetoxypropionitrile [Beil. III-288, III<sub>1</sub>-(112)] with 33%  $H_2SO_4$  (66); from 2,2,4,4,6,6-hexachlorocyclohexantrione-1,3,5 (hexachlorophloroglucinol) [Beil. VII-854,

VII<sub>1</sub>-(469)] with aq. (*sym*-tetrachloroacetone (3:6050) is also formed) (67); from *unsym*-dichloroacetone (3:5430) by oxidn. with  $\text{HNO}_3$  + air (68); from 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) with air in ultra-violet light in pres. of water (21) cf. (69); from pentachloroethane (3:5880) by partial hydrolysis with 88-97%  $\text{H}_2\text{SO}_4$  at 168° (90% yield (70)) see indic. refs.]

From miscellaneous non-chlorinated compounds. [For formn. of  $\bar{\text{C}}$  from AcOH with  $\text{Cl}_2$  (71) in presence of  $\text{I}_2$  (62) see indic. refs.; from acetylene with  $\text{HOCl}$  at 75-80° see (72); from ethyl acetoacetate (1:1710) with aq. bleaching powder (yield 60%) see (73); from phloroglucinol (1:1620) with aq.  $\text{Cl}_2$  see (74) (75); from pyrrole with  $\text{NaOCl}$  see (76).]

## CHEMICAL BEHAVIOR OF $\bar{\text{C}}$

### BEHAVIOR AS AN ACID

Acid strength of  $\bar{\text{C}}$ .  $\bar{\text{C}}$  in aq. soln. is a strong acid [ionization const. at 25° is  $K = 5.14 \times 10^{-2}$  (77) cf. (78) (18), at 18°  $K = 5.15 \times 10^{-2}$  (45); for studies of activity coefficient of  $\bar{\text{C}}$  in aq. and in salt solns. see (18) (48). — For tests on corrosion of metals by  $\bar{\text{C}}$  see (16)].

[Studies of acid strength of  $\bar{\text{C}}$  in other solvents include the following: in aq. MeOH (70) (81), in aq. EtOH (79) (80), in abs. EtOH (82), in *n*-BuOH (5) (83), in  $\text{C}_6\text{H}_6$  (84), in chlorobenzene (85), in formamide (86), in acetonitrile (87).]

$\bar{\text{C}}$  on titration gives Neut. Eq. = 129.

Salts of  $\bar{\text{C}}$ . This topic cannot be exhaustively treated here but following examples are cited.

Salts with inorganic bases. [ $\text{NH}_4\bar{\text{A}}$  (88); hydroxylamine salt,  $\text{HONH}_2\bar{\text{A}}$ , cryst. from  $\text{C}_6\text{H}_6/\text{EtOH}$ , m.p. 116.0-116.5° (89);  $\text{Na}\bar{\text{A}}$  (on electrolysis gives (90)  $\text{H}_2$ ,  $\text{CO}_2$ ,  $\text{CO}$ , and also (91) dichloromethyl dichloroacetate,  $\text{K}\bar{\text{A}}$ , lfts. from alc. (11), on dry distn. gives (92)  $\bar{\text{C}}$  +  $\text{KCl}$  +  $\text{CO}_2$  + carbon,  $\text{Ca}\bar{\text{A}}_2$ , ndls. from abs. alc. (93);  $\text{Ca}\bar{\text{A}}_2 \cdot 3\text{H}_2\text{O}$  (93);  $\text{Cu}\bar{\text{A}}_2$  (88);  $\text{Cu}\bar{\text{A}}_2 \cdot 4\text{H}_2\text{O}$  (88);  $\text{Cd}\bar{\text{A}}_2 \cdot \text{H}_2\text{O}$  (94);  $\text{Mn}\bar{\text{A}}_2 \cdot 1\frac{1}{2}\text{H}_2\text{O}$  (94);  $\text{Co}\bar{\text{A}}_2 \cdot 3\text{H}_2\text{O}$  (94); note that all the foregoing salts are sol. nq.]

[Inorg. salts of  $\bar{\text{C}}$  which are sparingly sol. aq. include the following:  $\text{Ag}\bar{\text{A}}$  (93);  $\text{Th}(\text{OH})_2\bar{\text{A}}_2$  (96);  $(\text{UO})\bar{\text{A}}_2 \cdot 2\text{H}_2\text{O}$  (97).]

Salts with organic bases (amines). [Aniline dichloroacetate, m.p. 122-123° (8) (98) cf. (30) (159) (note that this prod. or its components at 140° for 24 hrs. gives (98) dichloroacetanilide, m.p. 118°). — *o*-Toluidine dichloroacetate, m.p. 132.5° (98), 140° (99) (note that this prod. or its components at 140° for 18 hrs. gives (98) dichloroaceto-*o*-toluidide, m.p. 133°, but depressing m.p. of the salt to as low as 112°). — *p*-Toluidine dichloroacetate, m.p. 138° (98) (note that this prod. or its components on htg. gives (98) dichloroaceto-*p*-toluidide, m.p. 154°). — Piperazine bis-(dichloroacetate), m.p. 181° cor. (100). — Semi-carbamide dichloroacetate, m.p. 108° (101). — For salts of  $\bar{\text{C}}$  with other org. amines see (30) (99).]

Esterification of  $\bar{\text{C}}$ . [For this see the text of methyl dichloroacetate (3:5655), ethyl dichloroacetate (3:5850), *n*-propyl dichloroacetate (3:6000), isopropyl dichloroacetate (3:5890); for study of direct esterification of  $\bar{\text{C}}$  with various butyl and amyl alcs. without cat. see (102).]

Conversion of  $\bar{\text{C}}$  to corresp. acid chloride.  $\bar{\text{C}}$  with  $\text{PCl}_3$  (103), with  $\text{HCl}$  gas +  $\text{P}_2\text{O}_5$  (104), with  $\text{SOCl}_2$  (poor yield apparently due to much formn. of dichloroacetic acid anhydride (3:6430) (105) (106) (107) (108)), with  $\text{BzCl}$  (3:6240) (73% yield (111)), or with benzotrichloride (3:6540) (109) (110) gives dichloroacetyl chloride (3:5290), b.p. 108°.

Addition reactions of  $\bar{\text{C}}$  with org. cpds.  $\bar{\text{C}}$  in pres. of suitable cat. adds to olefins yielding corresp. esters [e.g.,  $\bar{\text{C}}$  with propylene +  $\text{BF}_3$  as directed gives (39.5% yield (112)) isopropyl dichloroacetate (3:5890);  $\bar{\text{C}}$  with 2-methylbutene-2 (trimethylethylene) (1:8220) at 18°

shows slight tendency toward formn. of corresp. ester in  $C_6H_6$ ,  $CHCl_3$  or  $CS_2$  but none in alc. or ether (113)].

[ $\bar{C}$  with ethylene oxide (1:6105) in dry ether at  $0^\circ$  gives (15% yield (114)) cf. (115)  $\beta$ -hydroxythyl dichloroacetate (3:9107).]

#### BEHAVIOR OF $\bar{C}$ AS DICHLORO COMPOUND

**Reduction.** [ $\bar{C}$  in alc. KOH soln. with  $H_2$  + Pd/ $CaCO_3$  splits off all its halogen as HCl (116). —  $\bar{C}$  with Zn + water on hgt. is slowly reduced to chloroacetic acid (3:1370) but reaction is much less energetic than that of trichloroacetic acid (3:1150) under same conditions (13).]

**Hydrolysis of halogen atoms of  $\bar{C}$  or its salts.** [ $\bar{C}$  with aq. in s.t. at  $100^\circ$  is slowly or in pres. of NaOH or  $Ba(OH)_2$  rapidly decomposed (93) cf. (117). — For study of kinetics of hydrolysis of  $\bar{C}$  see (118) (119). — Note, however, that  $Ag\bar{A}$  on hgt. with aq. (93), or  $\bar{C}$  (or its salts) on hydrolysis at elevated temp. and press. (120), or salts of  $\bar{C}$  htd. with aq. solns. of NaOAc or NaOBz (121), gives glyoxylic acid,  $OHC-COOH$  [Beil. III-594, III<sub>1</sub>-207, III<sub>2</sub>-(385)], m.p.  $98^\circ$ , very sol. aq. — For a method of detn. of  $\bar{C}$  in pres. of chloroacetic acid (3:1370) and trichloroacetic acid (3:1150) based on this hydrolysis see (122).]

**Behavior of  $\bar{C}$  with alkoxides.** [ $\bar{C}$  (as  $K\bar{A}$ ) with excess MeOH/NaOMe refluxed under  $H_2$ , and the solution then further esterified with MeOH/HCl, gives (62% yield (123)) cf. (124) methyl dimethoxyacetate, b.p.  $60-61^\circ$  at 12 mm.,  $D_4^{18} = 1.0962$ ,  $n_D^{18} = 1.4015$  (124); this ester upon alk. hydrolysis gives (85.7% yield (124)) dimethoxyacetic acid (glyoxylic acid dimethylacetal) as a sirup.]

[ $\bar{C}$  with excess EtOH/NaOEt under reflux followed by acidification and esterification as above gives (50% yield (125)) (126) ethyl diethoxyacetate [Beil. III-601, III<sub>1</sub>-(210), III<sub>2</sub>-(389)], b.p.  $199^\circ$  (127),  $94-98^\circ$  at 19 mm. (125),  $83-85^\circ$  at 13 mm. (125).]

[ $\bar{C}$  in excess EtOH/NaOEt with Na phenolate refluxed 14 hrs., then acidified and esterified as above, gives (61% yield (128)) ethyl diphenoxyacetate [Beil. VI-170], oil, b.p.  $240^\circ$  at 53 mm. (129),  $166-168^\circ$  at 0.8 mm. (128). — However,  $\bar{C}$  with phenol in aq. NaOH on hgt. and acidification gives (130) (131) diphenoxyacetic acid, ndls. from pet. ether or aq. AcOH, m.p.  $91^\circ$  (129) (130).]

**Condensation with hydrocarbons.** [ $\bar{C}$  with aromatic hydrocarbons on hgt. condenses with elimination of 2 HCl giving diarylacetic acids [e.g.,  $\bar{C}$  with naphthalene at  $180^\circ$  for 60-100 hrs. gives (132) di-( $\alpha$ -naphthyl)acetic acid [Beil. IX-720, IX<sub>1</sub>-(313)], cryst. from  $CCl_4$ , m.p.  $224^\circ$  (133),  $223^\circ$  u c. (134); for analogous behavior of  $\bar{C}$  with other hydrocarbons see (132)].

**Behavior of  $\bar{C}$  with  $RMgX$  compounds.** [ $\bar{C}$  with  $C_6H_5MgBr$  (large excess) in ether soln. followed by usual hydrolysis gives (34% yield (135))  $\alpha,\alpha,\beta$ -triphenylethylene glycol, ndls. from  $C_6H_6$ , m.p.  $163^\circ$  (135).]

**Behavior of  $\bar{C}$  with hydroxylamine.** [ $\bar{C}$  (1 mole) with  $NH_2OH \cdot HCl$  (1 mole) + aq. KOH (4 moles) at  $60^\circ$  for 4 hrs. gives (136) isonitrosoacetic acid (glyoxylic acid oxime) [Beil. III-599, III<sub>1</sub>-(208), III<sub>2</sub>-(389)], cryst. from dry ether, m.p.  $138^\circ$  (136) (note that this prod. forms with water a monohydrate, m.p. about  $70^\circ$  (137)).]

**Behavior of  $\bar{C}$  with aromatic amines.** (See also salt formation above.)

**With aniline.** The products of reaction of  $\bar{C}$  on hgt. with aniline are disputed [on one hand  $\bar{C}$  (1 mole) with aniline (4 moles) at  $100^\circ$ , then evapd. with NaOAc, is claimed (138) (139) to give 4,4'-diaminodiphenylacetic acid [Beil. XIV-540, XIV<sub>1</sub>-(625)], m.p. about  $195^\circ$  (140); on the other hand, the prod. is regarded by some (141) (142) as a mixt. of two stereoisomeric forms of 2,2'(?)-diaminostilbene- $\alpha,\alpha'$ -dicarboxylic acids [Beil. XIV-573]].

**With o-toluidine.** [ $\bar{C}$  (1 mole) with o-toluidine (4 moles) at  $100^\circ$  gives (140) (143) 4,4'-diamino-3,3'-dimethyldiphenylacetic acid [Beil. XIV-543, XIV<sub>1</sub>-(627)], ndls. from alc.,

m.p. 239-240° (143) dec. (140), accompanied by some 7-methylisatin-3-(*o*-tolylimide) [Beil. XXI-512], yel. lfts. from alc., m.p. about 225° dec. (138).]

With *p*-toluidine.  $\bar{C}$  (1 mole) with *p*-toluidine (4 moles) at 100° in aq. or alc. soln. gives (144) (145) 5-methylisatin-3-(*p*-tolylimide) [Beil. XXI-510, XXI-401], golden-yel. ndls. or lfts. from alc., m.p. 259° (144) (145).]

Behavior of  $\bar{C}$  with urea.  $\bar{C}$  with urea (2 moles) in pres. of NaOEt condenses to give (146) 5-ureidohydantoin (allantoin) [Beil. XXV-474, XXV-1-(692)], m.p. by ord. htg. in cap. tube is 228-230° (147), by rap. htg. in bath already at 228° is 233-234° (147).

Behavior of  $\bar{C}$  with arylhydrazines.  $\bar{C}$  with arylhydrazines in alc. KOH yields a mixt. of the two stereoisomeric arylhydrazones of glyoxylic acid [e.g.,  $\bar{C}$  with phenylhydrazine in dil. alc. KOH refluxed 2 hrs. gives (148) a mixt. of the  $\alpha$ -glyoxylic acid phenylhydrazone, m.p. abt. 135° with decompn. at 142-143°, and the  $\beta$ -glyoxylic acid phenylhydrazone, m.p. 128-129° dec. (rap. htg.) (148); for analogous behavior of  $\bar{C}$  with other arylhydrazines see (148)].

② Color test with  $NH_4OH/Cu_2Cl_2$  reagent.  $\bar{C}$  on shaking in filled stoppered bottle with conc. aq.  $NH_4OH$  contg.  $Cu_2Cl_2$  gives dark blue color within 3 min. (149); note, however, that the same behavior is shown by trichloroacetic acid (3:1150).

— Methyl dichloroacetate: oil, b.p. 143° (see 3:5655).

— Ethyl dichloroacetate: oil, b.p. 155° (see 3:5850).

— Benzyl dichloroacetate: oil, b.p. 179° at 60 mm. (150). [From  $\bar{C}$  with benzyl alcohol (1:6480) with  $HCl$  gas (150).]

— Phenyl dichloroacetate [Beil. VI-153, VI-1-(87)]: m.p. 48° (151), b.p. 247.5° cor. (151) [From dichloroacetyl chloride (3:5290) +  $AlCl_3$  in  $CS_2$  (prod. m.p. 33° was probably impure (152)).]

— *p*-Tolyl dichloroacetate: m.p. 58° (151). [Prepd. indirectly from  $\alpha,\beta$ -dichlorovinyl ethyl ether (3:5440) with *p*-cresol (1:1410) (151).]

— *p*-Nitrobenzyl dichloroacetate: oil, unsuitable as ② (160) (161).

— Phenacyl dichloroacetate: oil (153).

— *p*-Chlorophenacyl dichloroacetate: m.p. 93.0-93.8° (153).

— *p*-Bromophenacyl dichloroacetate: m.p. 98.2-99.3° (153).

— *p*-Iodophenacyl dichloroacetate: unreported.

— *p*-Phenylphenacyl dichloroacetate: unreported.

③ *S*-Benzylthiuronium dichloroacetate: m.p. 178-179° (154). [Note that for corresp. salts from chloroacetic acid (3:1370) and from trichloroacetic acid (3:1150) the values are respectively 159-160° and 148-149° (154).]

— *S*-(*p*-Chlorobenzyl)thiuronium dichloroacetate: unreported.

— *S*-(*p*-Bromobenzyl)thiuronium dichloroacetate: unreported.

—  $\alpha,\alpha$ -Dichloroacetamide: cryst. from  $C_6H_6$ , m.p. 99.4° (155), 98.5-99° (58), 98.5° (156), 97.5-99.5° (59). [From ethyl dichloroacetate (3:5850) with aq.  $NH_4OH$  (155) or in other indirect ways, e.g., from chloral ammonia with KCN + aq.  $NH_4OH$  (93% yield (58)), or from chloral hydrate (3:1270) with KCN + aq.  $NH_4OH$  (65-78% yield (59)).] — [Note that dichloroacetamide forms with bromo-chloro-acetamide or with chloro-iodo-acetamide an unbroken series of mixed crystals.]

④  $\alpha,\alpha$ -Dichloroacetanilide: colorless ndls. from alc. or by sublimation, m.p. 118° (98), 117.7° (156). [From  $\bar{C}$  with aniline at 140° for 24 hrs. (98) or from dichloroacetyl chloride (3:5290) with aniline in  $C_6H_6$  (157) or acetone (157).] — [Note that this prod. forms with  $\alpha$ -bromo- $\alpha$ -chloroacetanilide, m.p. 116.8° (157), a series of mixed cryst. and with  $\alpha$ -chloro- $\alpha$ -iodoacetanilide, m.p. 142.3°, a eutectic, m.p. 105.2° (157).] — [Note also that aniline dichloroacetate (see also above) has m.p. 122-123° (98).]

⑤  $\alpha,\alpha$ -Dichloroacet-*o*-toluidide: cryst. from 50% alc. or by sublimation, m.p. 133° (98). [From  $\bar{C}$  + *o*-toluidine at 140° for 18 hrs. (98); note that the salt *o*-toluidine dichloroacetate has same m.p. 132.5° as the  $\alpha,\alpha$ -dichloroacet-*o*-toluidide but that the m.p. of a mixture of the two compds. is depressed to below 112° (98).]

—  $\alpha,\alpha$ -Dichloroacet-*p*-toluidide: pl. from alc. or by sublimation, m.p. 154° (98). [From  $\bar{C}$  + *p*-toluidine at 148° for 18 hrs. (98); note that the corresp. salt, *p*-toluidine dichloroacetate, has m.p. 138° (98).]

—  $\alpha,\alpha$ -Dichloroacet-*N*-benzylamide: m.p. 96.2° (156), 94.8–95.6° cor. (158), 94.2–95.0° u.c. (158). [From ethyl dichloroacetate (3:5850) (158) cf. (162) or dichloroacetyl chloride (3:5290) (156) with benzylamine; note, however, that the corresp. derivs. from chloroacetic acid (3:1370) and from trichloroacetic acid (3:1150) have almost the same m.p.'s, viz., 93.0–93.6° cor. and 93.6–94.4° cor., respectively (158).]

of  $\bar{C}$  for range  $T = 85.4$ -  
105.5° see also (21).

MISCELLANEOUS PHYSICAL PROPERTIES OF  $\bar{C}$ BINARY SYSTEMS CONTAINING  $\bar{C}$ 

$\bar{C}$  + inorganic compounds.  $\bar{C}$  +  $AlCl_3$ : m.p. 93° (22), 95° (26); for prepn. from  $\bar{C}$  +  $AlCl_3$  in  $CS_2$  see (26); for thermal anal. (eutectic with  $\bar{C}$  has m.p. -7.5° and conts. 87.3 wt. %  $\bar{C}$ ) see (22); for conductivity of  $AlCl_3$  in  $\bar{C}$  see (27); for study of mol. wt. in  $C_6H_6$  see (28).

$\bar{C}$  +  $AlBr_3$ : m.p. 90° (22); for thermal anal. (eutectic with  $\bar{C}$  has m.p. -5° and conts. 77.8 wt. %  $\bar{C}$  while eutectic with  $AlBr_3$  has m.p. abt. 7-8° and conts. 21 wt. %  $\bar{C}$ ) see (22); see also (30)

$\bar{C}$  +  $FeCl_3$ : scarlet red hygroscopic ndls. (31); for conductivity see (28).

$\bar{C}$  +  $SbCl_3$ : for thermal anal. (eutectic with  $\bar{C}$  has m.p. -23° and conts. 55 wt. %  $\bar{C}$ ) see (32).

$\bar{C}$  +  $SbCl_5$ : for prepn. see (34); for conductivity in liq.  $SO_2$  see (33).

$\bar{C}$  +  $SbBr_3$ : for thermal anal. (eutectic with  $\bar{C}$  has m.p. -6° and conts. 68 wt. %  $\bar{C}$ ) see (32).

$\bar{C}$  + organic compounds.  $\bar{C}$  +  $C_6H_6$ : for thermal anal. (eutectic has m.p.  $-26.8^\circ$  and conts. 63.6 wt. %  $\bar{C}$ ) see (35). —  $\bar{C}$  + *p*-xylene: for thermal anal. (eutectic has m.p.  $-18.5^\circ$  and conts. 67.2 wt. %  $\bar{C}$ ) see (35). —  $\bar{C}$  + *mesitylene*: for thermal anal. (eutectic has m.p.  $-70^\circ$  and conts. abt. 20 wt. %  $\bar{C}$ ) see (35). —  $\bar{C}$  + *biphenyl*: for thermal anal. (eutectic has m.p.  $-8^\circ$  and conts. 81.8 wt. %  $\bar{C}$ ) see (35). —  $\bar{C}$  + *diphenylmethane*: for thermal anal. (eutectic has m.p.  $-15^\circ$  and conts. 66.7 wt. %  $\bar{C}$ ) see (35).

$\bar{C}$  + *chlorobenzene*: for thermal anal. (eutectic has m.p.  $-54.2^\circ$  and conts. 19.3 wt. %  $\bar{C}$ ) see (35). —  $\bar{C}$  + *nitrobenzene*: for thermal anal. (eutectic has m.p.  $-20.5^\circ$  and conts. 50 wt. %  $\bar{C}$ ) see (35).

## PREPARATION OF $\bar{C}$

Note that comml.  $\bar{C}$  is often contaminated with various chlorobenzoyl chlorides (e.g., *o*-chlorobenzoyl chloride (3:6640), *m*-chlorobenzoyl chloride (3:6590), *p*-chlorobenzoyl chloride (3:6550), etc.), with traces of benzaldehyde (1:0195), or with benzoic acid (1:0715) + HCl from hydrolysis. For removal of BzOH + HCl from  $\bar{C}$  by shaking its  $C_6H_6$  soln. with cold aq. 5%  $NaHCO_3$  see (12); by treatment with metallic oxides or carbonates see (36).

From benzoic acid. [For prepn. of  $\bar{C}$  from benzoic acid (1:0715) with  $PCl_5$  (70% yield (37)) (10) (38), with  $PCl_3$  (39) (40) in pres. of  $ZnCl_2$  (77% yield (37)) or in pres. of a little aq. at  $100^\circ$  under press (41), with  $SOCl_2$  (90% yield (37)) (42), with  $SCl_2$  in  $CS_2$  (43), with  $SiCl_4$  directly (23% yield (44)) or in  $C_6H_6$  (77% yield (44)), with  $POCl_3$  + alkali chloride at elev. temp. (45), or with dry HCl +  $P_2O_5$  at  $200^\circ$  (46) see indic. refs.]

[For prepn. of  $\bar{C}$  from benzoic acid (1:0715) with NaCl + Na or K pyrosulfate at  $200^\circ$  (47), or with Na chlorosulfonate (48) cf. (49), see indic. refs.]

[For prepn. of  $\bar{C}$  from benzoic acid (1:0715) with other organic acyl chlorides such as carbonyl chloride (phosgene) (3:5000) at  $140$ – $200^\circ$  (50) or in pres. of tertiary bases (such as pyridine) or their salts (51), with oxalyl (di)chloride (3:5060) (98% yield (15)), with *p*-toluenesulfonyl chloride in pyridine (52), or with  $\alpha,\beta$ -dichloroethyl ethyl ether (3:5640) (53). see indic. refs.]

From salts of benzoic acid. Note that with salts of benzoic acid more or less formn. of benzoic anhydride (1:0595) may occur.

[For prepn. of  $\bar{C}$  from NaOBz with  $POCl_3$  (2) (54), with  $SCl_2$  at room temp. (55) cf. (43), with  $SO_2$  +  $Cl_2$  (56), with Na chlorosulfonate (48) cf. (49), or with benzenesulfonyl chloride (57) see indic. refs.]

[For prepn. of  $\bar{C}$  from AgOBz with carbonyl chloride (3:5000) in s.t. at  $100^\circ$  see (58).]

From dibenzoyl peroxide. [For prepn. of  $\bar{C}$  from dibenzoyl peroxide (1:4930) with oxalyl (di)chloride (3:5060) refluxed in dark for 24 hrs. (70% yield (59)), with  $PCl_5$  in pet. ether (60), with  $AlCl_3$  in  $CHCl_3$  at  $0^\circ$  (61) or in  $C_6H_6$  at  $100^\circ$  (62), or with  $FeCl_3$  in  $C_6H_6$  at  $100^\circ$  (62) see indic. refs.]

From other benzoic acid derivatives. [For formn. of  $\bar{C}$  from benzamide with dry HCl or AcCl at  $140^\circ$  see (63); from methyl benzoate (1:3586) with  $PCl_5$  at  $160$ – $180^\circ$  (64) or from ethyl benzoate (1:3721) with  $PCl_5$  in s.t. at  $140^\circ$  (65) see indic. refs.; from  $\alpha,\beta$ -dichloroethyl benzoate or from  $\alpha$ -chloroethyl benzoate on htg. in pres. of traces of  $ZnCl_2$  see (66); from benzoic anhydride (1:0595) with  $PCl_5$  +  $Cl_2$  (67) or with carbonyl chloride (3:5000) (68) see indic. refs.]

From benzaldehyde. [For formn. of  $\bar{C}$  from benzaldehyde (1:0195) with  $SO_2Cl_2$  (5 moles) on distn. (69), with  $S_2Cl_2$  in s.t. at  $150^\circ$  (107), with  $POCl_3$  in  $C_6H_6$  (70), with NOCl (71), with EtOCl (3:7022) (72), with *ter*-AmOCl (3:9237) (8.5% soln. in  $CCl_4$ ) at room temp. for 15 hrs. (73), or with  $Cl_2$  (91) (105) (106) see indic. refs.]

From henzotrichloride. [For prepn. of  $\bar{C}$  from benzotrichloride (3:6540) by partial hydrolysis with limited amt. of aq. in pres. of  $H_2SO_4$  or  $FeCl_3$  (74), with aq. vapor over tin phosphate at  $240^\circ$  (75), with ord. comml.  $ZnCl_2$  at  $120^\circ$  (76) in pres. of limited aq. (77) (note that pure  $ZnCl_2$  fails to react but addn. of 1 mole aq. or initial use of tech.  $ZnCl_2$  gives  $\bar{C}$  (76)), with pure  $ZnO$  at  $100^\circ$  (76), with  $BzOH$  in boilg. nitrobenzene (78) or in pres. of  $ZnCl_2$  (80), with  $NH_4OBz$  at  $200-210^\circ$  as directed (79), or with  $EtOH$  in pres. of  $FeCl_3$  or  $Fe$  (81) see indic. refs.]

Note that benzotrichloride (3:6540) on heating with carboxylic acids or anhydrides, especially in pres. of  $ZnCl_2$ , is often employed to prepare a mixture of  $\bar{C}$  with the acid chloride corresponding to the acid or anhydride so employed, particularly in cases where the two acyl chlorides are readily separable. [E.g., note that henzotrichloride (3:6540) with phthalic anhydride (1:0725) (81) (82) or phthalic acid (1:0820) (83) +  $ZnCl_2$  at  $110-120^\circ$  gives (96% yield (82))  $\bar{C}$  + (93% yield (82)) *sym.*-phthalyl (di)chloride (3:6900); benzotrichloride with  $AcOH$  (1:1010) in pres. of an acid cat. gives (84) (85) (86) (87)  $\bar{C}$  + acetyl chloride (3:7065); for other examples see under chloroacetyl chloride (3:5235), dichloroacetyl chloride (3:5290), trichloroacetyl chloride (3:5420), fumaryl (di)chloride (3:5875), and terephthalyl (di)chloride (3:2205). Similarly, henzotrichloride (3:6540) with salts of sulfonic acids yields  $\bar{C}$  + the corresp. arylsulfonyl chlorides; e.g., benzotrichloride with sodium  $\beta$ -naphthalenesulfonate gives (88) 90% yield  $\bar{C}$  + 80% yield  $\beta$ -naphthalenesulfonyl chloride.]

From henzal (di)chloride. [For formn. of  $\bar{C}$  from henzal (di)chloride (3:6327) with  $O_2$  in u.v. light (89), with air in pres. of  $Ni$  at  $160^\circ$  (90), or with  $BzOH$  (1:0715) +  $Cl_2$  at  $125-175^\circ$  (91) see indic. refs.]

From miscellaneous sources. [For formn. of  $\bar{C}$  from benzyl alc. (1:6480) with  $Cl_2$  (92) or with  $SOCl_2$  at  $180^\circ$  (103), from benzyl acetate (1:3751) with  $Cl_2$  at  $150-170^\circ$  (104), from thiohenzoyl chloride +  $O_2$  at  $100-120^\circ$  (93), from henzonitrile with  $NOCl$  at  $180^\circ$  (94), from tolan (diphenylacetylene) with  $NOCl$  at  $150-200^\circ$  (95), from dihenzoyltartaric anhydride +  $PCl_5$  (3 moles) in s.t. at  $130^\circ$  for 3 hrs. (note that chlorofumaryl dichloride is also formed) (96), from *N,N*-dibenzoylaniline (dibenzanilide) with dry  $HCl$  at  $250-270^\circ$  (note that henzanilide is also formed) (97), from  $\alpha$ -chloro- $\alpha$ -nitro-phenylacetamide on dry htg. (98), from phthalic anhydride (1:0725) +  $HCl$  gas +  $CrCl_3$  or  $ZnCl_2$  at  $290-300^\circ$  under press. (99), or from  $C_6H_6$  (1:7400) with carbonyl chloride (phosgene) (3:5000) +  $AlCl_3$  (100) (101), or with oxalyl (di)chloride (3:5060) +  $AlCl_3$  (102) see indic. refs.]

### CHEMICAL BEHAVIOR OF $\bar{C}$

Pyrolysis. [ $\bar{C}$  in  $N_2$  through porcelain tube at  $550-600^\circ$  (108) or over  $Ni$  at  $420^\circ$  (109) cf. (110) gives  $CO$ , chlorobenzene (3:7903), and other products;  $\bar{C}$  over finely divided  $Cu$  at  $420-450^\circ$  gives (110) benzoic anhydride (1:0595) +  $HCl$ ;  $\bar{C}$  over  $BaCl_2$  at  $420-450^\circ$  gives (110) benzoic anhydride (1:0595) and other products. For study of effect of radium radiation at  $2-12^\circ$  over 7-8 month period see (13).]

Reduction. [ $\bar{C}$  with  $H_2$  in boilg. xylene in pres. of  $PtO_2$  + trace of thiourea (111),  $Pd/BaSO_4$  (112), or powd.  $Ni$  (112), or  $\bar{C}$  over  $Pd$  at  $200-230^\circ$  (113) cf. (114) gives (yields: 96% (111), 87-89% (113)) benzaldehyde (1:0195); for study of purification of xylene as solvent for cat. reduction of  $\bar{C}$  see (115); for study of influence of various other solvents see (116) (112).]

[ $\bar{C}$  with  $H_2$  in pres. of  $NiCl_2$  at  $270-280^\circ$  gives (110) benzene, toluene, biphenyl +  $HCl$ ;  $\bar{C}$  with copper hydride is claimed (117) to yield benzaldehyde but this could not be confirmed (118).  $\bar{C}$  with chromous acetate in 50%  $KOH$  gives (very small yield (119)), benzyl alc. (1:6480), while  $\bar{C}$  with  $LiH$  in high-boilg. pet. ether at  $130^\circ$  gives (presumably by subsequent condensation of the intermediate benzaldehyde) 65% yield (120) benzyl benzoate (1:4422).]

[ $\bar{C}$  with Na/Hg + stream of dry HCl gives (121) benzyl alc. (1:6480);  $\bar{C}$  with Na/Hg in dry ether gives (122) (123) (124) benzyl alc. (1:6480), benzoic acid (1:0715), benzil (1:9015),  $\alpha, \alpha'$ -dibenzoxystilbene ("isobenzil") [Beil. IX-138], and  $\alpha, \alpha'$ -dibenzoxydibenzyl [Beil. IX-136];  $\bar{C}$  with Na in moist ether gives (125) benzyl alc. (1:6480), benzoic acid (1:0715), and benzyl benzoate (1:4422).]

Oxidation. [ $\bar{C}$  on oxidn. in pres. of hydrocarbon peroxides and various oxidn. cat. is claimed (126) to give dibenzoyl peroxide (1:4930); see also below under behavior of  $\bar{C}$  with  $\text{Na}_2\text{O}_2$ .]

Chlorination. [ $\bar{C}$  on monochlorination with  $\text{Cl}_2$  nt  $35^\circ$  in pres. of  $\text{FeCl}_3$  gives (10) cf. (127) mainly a mixt. of chlorobenzoyl chlorides (83.5% *m*- (3:6590) + 14.5% *o*- (3:6640) + 2.0% *p*- (3:6550)) accompanied by a small amt. of dichlorobenzoyl chlorides; for extensive study of effect of using higher proportion of  $\text{Cl}_2$  under otherwise same conditions see (128). Note, however, that  $\bar{C}$  with 3 moles  $\text{Cl}_2$  in s. t. gives (129) (130) a mixt. of addn. products, such as 1,2,3,4,5,6-hexachlorohexahydrobenzoyl chloride, substitution products, and materials formed by both addition and substitution (130).]

Sulfonation. [ $\bar{C}$  cannot be sulfonated without accompanying hydrolysis of the acyl chloride function (131) (132) (133) (134) (137), the end prod. of these sulfonation processes is, therefore, not *m*-sulfobenzoyl chloride (apparently still unknown cf. (135)) but rather *m*-sulfobenzoic acid [Beil. XI-384, XI<sub>1</sub>-(98)]. However,  $\bar{C}$  added to conc.  $\text{H}_2\text{SO}_4$  at  $0-40^\circ$  gives (136) a cryst. addn. prod.  $\bar{C} \cdot \text{H}_2\text{SO}_4$  which on stdg. loses HCl forming benzoyl hydrogen sulfate [Beil. IX<sub>1</sub>-(94)] but shows no transformation into *m*-sulfobenzoic acid even after 6 months over dry alkali even though HCl is lost completely (136). At  $100^\circ$  conversion of benzoyl hydrogen sulfate occurred very slowly and the prod. consisted of *o*-sulfobenzoic acid (not *meta*) (136).]

## BEHAVIOR OF $\bar{C}$ WITH OTHER INORGANIC REAGENTS

$\bar{C}$  with HF. [ $\bar{C}$  with HF as directed (138) (139) or with dry  $\text{KHF}_2$  in Cu retort (140) (141) (142), with  $\text{ZnF}_2$  nt  $195^\circ$  (11) (143), with  $\text{AgF}$  in s. t. at  $190^\circ$  for 6 hrs. (144), or with 3 moles  $\text{SbF}_3$  (145) gives (yields: 67-80% (140), 76% (145), 69% (11)) benzoyl fluoride, b.p.  $161.5^\circ$  at 745 mm. (142),  $159^\circ$  (139),  $156^\circ$  (146),  $155-156^\circ$  at 760 mm. (11),  $155^\circ$  (138),  $154-155^\circ$  (143),  $151^\circ$  u. c. at 736 mm. (141),  $145^\circ$  (144). Note, however, that  $\bar{C}$  with KF in anhydrous formic acid gives (147) formyl fluoride, b.p.  $26^\circ$  at 750 mm. (147), while  $\bar{C}$  with KF in AcOH gives (147) acetyl fluoride, b.p.  $20-22^\circ$  (147).]

$\bar{C}$  with HBr. [ $\bar{C}$  with dry HBr gas at  $100^\circ$  gives (148) benzoyl bromide [Beil. IX-195, IX<sub>1</sub>-(95)], b.p.  $218-219^\circ$  cor. at 760 mm. (149),  $215.0^\circ$  at 741 mm. (150),  $90-91^\circ$  at 12 mm. (16), m.p.  $+8.1^\circ$  (150),  $D_4^{20} = 1.5461$  (150),  $n_D^{20} = 1.5900$  (150).]

$\bar{C}$  with HI. [ $\bar{C}$  with excess HI at ord. temp. (148) (16), or  $\bar{C}$  with Mg +  $\text{I}_2$  in dry ether (151), gives benzoyl iodide [Beil. IX-195, IX<sub>1</sub>-(95)], b.p.  $109-109.5^\circ$  at 10 mm. (148) cf. (16). Note that  $\bar{C}$  with KI does not (152) give benzoyl iodide.]

$\bar{C}$  with metals. [ $\bar{C}$  with Na in dry ether stood 10 days at room temp. gives (86% yield (153)) (154) ethyl benzoate (1:3721) but  $\bar{C}$  with Na/Hg in dry ether causes the reaction to take a more complicated course (see above under reduction of  $\bar{C}$ ).  $\bar{C}$  with Na vapor gives (155) cf. (154) benzil (1:9015).  $\bar{C}$  with K in xylene refluxed 2 days gives (153) benzoic anhydride (1.0595).]

[For behavior of  $\bar{C}$  with Zn in dry ether or in di-isoamyl ether at  $20-32^\circ$  see (156). For behavior of  $\bar{C}$  with finely divided Cu or Ni at elevated temps. see above under pyrolysis of  $\bar{C}$ .]

## $\bar{C}$ WITH VARIOUS METAL OXIDES OR SALTS

$\bar{C}$  with  $\text{Na}_2\text{O}_2$ . [ $\bar{C}$  with  $\text{Na}_2\text{O}_2$  in water at  $5^\circ$  (157) cf. (159) or  $\bar{C}$  with 30%  $\text{H}_2\text{O}_2$  + aq. NaOH (158) cf. (159) gives (yields: 91% (157), 60-70% (158)) benzoyl hydrogen peroxide

(perbenzoic acid) [Beil. IX-178, IX-1(93)], m.p. 42°. For other methods for prepn. of perbenzoic acid such as from dibenzoyl peroxide with  $\text{NaOCH}_3$  in  $\text{MeOH}/\text{CHCl}_3$  (160) or with  $\text{NaOC}_2\text{H}_5$  in  $\text{EtOH}/\text{toluene}$  (161), or from benzaldehyde in acetone with air (162), see indic. refs. For study of Na perbenzoate (157) and its use in purification (163) of perbenzoic acid see indic. refs.]

[ $\text{C}$  with  $\text{Na}_2\text{O}_2$  in aq. at 0° (164) (165) or in aq. acetone (166), or  $\text{C}$  with aq.  $\text{H}_2\text{O}_2$  +  $\text{NaOH}$  (167) or aq.  $\text{H}_2\text{O}_2$  + iron-free  $\text{Ca}(\text{OH})_2$  (168), or  $\text{C}$  with aq.  $\text{BaO}_2 \cdot 8\text{H}_2\text{O}$  (169) (170) (171), or  $\text{C}$  with perbenzoic acid (see preceding paragraph) + aq.  $\text{NaHCO}_3$  (172) gives dibenzoyl peroxide [Beil. IX-170, IX-1(93)], m.p. 105°. For review of prepn. and properties of this prod. see also (173).]

$\text{C}$  with misc. salts.  $\text{C}$  on warming with various inorganic salts yields benzoic anhydride. [E.g.,  $\text{C}$  with  $\text{NaNO}_2$  (174) cf. (175) (176), with  $\text{KNO}_3$  (177), with  $\text{Pb}(\text{NO}_3)_2$  (178), with nitrates of other heavy metals (179), with  $\text{Na}_3\text{PO}_4 \cdot 12\text{H}_2\text{O}$  in aq. soln. at 60° (180), with  $\text{K}_2\text{S}_2\text{O}_8$  in pyridine (181), with  $\text{Na}_2\text{SO}_3$  in pyridine (183) in pres. of  $\text{C}_6\text{H}_6$  (181) cf. (182), or with  $\text{BaO}$  at 140–150° (184) gives benzoic anhydride (1:0595), m.p. 42°. For other methods of conversion of  $\text{C}$  to benzoic anhydride see above under pyrolysis of  $\text{C}$  and below under behavior of  $\text{C}$  with organic acids and their salts.]

$\text{C}$  with  $\text{NaN}_3$ . [ $\text{C}$  with  $\text{NaN}_3$  in aq. acetone at 0° (185), or in dry ether (186), gives (54.6% yield (185)) benzoyl azide (benzazido) [Beil. IX-332], m.p. 32° (185). Note that although this prod. readily explodes on htg. (187) (188) yet in inert solvents such as  $\text{C}_6\text{H}_6$  (194) it smoothly decomposes into  $\text{N}_2$  and phenyl isocyanate (for study of mechanism see (189)); under certain circumstances the latter may be hydrolytically split to aniline cf. (190). For studies on decomposition of benzoyl azide by ultrasonic waves see (185) (193).]

### HYDROLYSIS OF $\text{C}$

$\text{C}$  with cold aq. is slowly and with warm aq. rapidly hydrolyzed (195) to benzoic acid (1:9716) and  $\text{HCl}$ . [For study of rate of hydrolysis of  $\text{C}$  in ether with aq. at 20–22° (195) or at 0° (148), in 50% aq. acetone at 0° in pres. of  $\text{H}_2\text{SO}_4$  (196) cf. (198), in various other organic solvents immiscible with aq. (197) or with  $\text{BaBr}_2 \cdot 2\text{H}_2\text{O}$  at 158° (199) see indic. refs.]

$\text{C}$  with aq. alkali on warming readily yields (195) alkali benzoate + alkali chloride. Note that  $\text{C}$  in 50% aq. pyridine hydrolyzes much faster than in aq.  $\text{NaOH}$  or aq.  $\text{Na}_2\text{CO}_3$  (39) (use in determination of atomic weight of carbon by hydrolysis of  $\text{C}$  and pptn. of  $\text{AgCl}$  (39)). Note that rate of hydrolysis of  $\text{C}$  is 2000 times as fast (200) as that of benzyl chloride (3:8535).

[Note that  $\text{C}$  in  $\text{Ac}_2\text{O}$  soln. behaves as an acid (201) and can be titrated (202) with  $\text{NaOAc}$  in  $\text{Ac}_2\text{O}$ .]

### BEHAVIOR OF $\text{C}$ WITH VARIOUS INORGANIC SULFUR COMPOUNDS

With  $\text{H}_2\text{S}$ . [The behavior of  $\text{C}$  with  $\text{H}_2\text{S}$  is disputed; on one hand  $\text{C}$  in dry pyridine treated with  $\text{H}_2\text{S}$  at 5° and subsequently acidified is claimed (203) to give thiolbenzoic acid,  $\text{C}_6\text{H}_5\text{CO}_2\text{SH}$  [Beil. IX-419, IX-1(169)] (see next paragraph); on the other hand  $\text{C}$  refluxed in dry pyridine in stream of  $\text{H}_2\text{S}$  is claimed (204) to yield thiolbenzoic acid ( $\text{C}_6\text{H}_5\text{CS})_2\text{O}$ , colorless cryst. from hot alc.]

With $\text{KSH}$ . [ $\text{C}$ with cold alc. $\text{KSH}$ (207) (209) (8) salt of thiolbenzoic acid (207) (208), b.p. 98.0–98.6° at II–12 that this product is readily by air or mild oxidizing agent air followed by $\text{H}_2\text{O}_2$ as di	KOH with $\text{H}_2\text{S}$ (IX-419, 0.05 mm. (8) dibenzoyl dis (35% aq. 5–10° (211)
---	--

in acetone followed by  $I_2/KI$  oxidn. (213), or with  $HSMgBr$  followed by air oxidn. (208) gives (65-70% yield (210)) dibenzoyl disulfide [Beil. IX-424], cryst. from 1,2-dichloroethane (3:5130) (210) (211) (212), m.p. 128-129° (210) (211) (212); this prod. has considerable pharmaceutical interest as an antipruritic; for hydrolysis to benzoic acid as method of detn. see (210) (214).]

#### BEHAVIOR OF $\bar{C}$ WITH VARIOUS INORGANIC NITROGEN COMPOUNDS

With  $NH_3$ . [ $\bar{C}$  with conc. aq.  $NH_4OH$  (215), with dry  $NH_3$  (105), with liq.  $NH_3$  (216), with solid  $(NH_4)_2CO_3$  (217), or with  $KNH_2$  in dry ether (218) gives benzamide [Beil. IX-195, IX<sub>1</sub>-(96)], m.p. 130°; note that either the  $(NH_4)_2CO_3$  (219) or  $KNH_2$  (218) methods may give also small amounts of *N*-benzoylbenzamide (dibenzamide) [Beil. IX-213, IX<sub>1</sub>-(104)], m.p. 148°, and/or *N,N*-dibenzoylbenzamide (tribenzamide) [Beil. IX-214, IX<sub>1</sub>-(104)], m.p. 207-208°. However,  $\bar{C}$  with  $NH_3$  gas over  $Al_2O_3$  at 490-500° gives (220) benzonitrile [Beil. IX-275, IX<sub>1</sub>-(121)], b.p. 191°, m.p. -13°.]

With  $NH_2OH$ . [ $\bar{C}$  in  $C_6H_6$  with free  $NH_2OH$  (221), or  $\bar{C}$  in  $C_6H_6$  with  $NH_2OH.HCl$  + pyridine (221), or  $\bar{C}$  in ether with  $NH_2OH.HCl$  +  $Na_2CO_3$  (221), gives benzohydroxamic acid (*N*-benzoylhydroxylamine) [Beil. IX-301, IX<sub>1</sub>-(128)], cryst. from  $EtOAc$ , m.p. 128°. Note that  $\bar{C}$  with aq.  $NH_2OH$  solns. (222) also gives side reactions which diminish yield and increase difficulty of purification of prod.; also that  $\bar{C}$  with  $NH_2OH.HCl$  in toluene gives (222) benzohydroxamic acid benzoate (dibenzohydroxamic acid) [Beil. IX-303, IX<sub>1</sub>-(128)] and other products. For alternative method of prepn. of benzohydroxamic acid from ethyl benzoate (1:3721) with  $NH_2OH.HCl$  +  $MeOH/KOH$  see (223); for review of utility of hydroxamic acids in org. qual. anal. see (224); for study of formn. of benzohydroxamic acid and its  $FeCl_3$  color reaction as method of detn. of hydroxylamine see (230).]

With  $NH_2NH_2$ . [ $\bar{C}$  (1 mole) with  $N_2H_4.H_2O$  (2 moles) in ether gives (225) benzhydrazide (*N*-benzoylhydrazine) [Beil. IX-319, IX<sub>1</sub>-(129)], m.p. 112°, but this prod. is usually better obtd. from reaction of  $N_2H_4.H_2O$  with  $MeOBz$  (1:3586) (226) or  $EtOBz$  (1:3721) (227) (228).  $\bar{C}$  (1 mole) with  $N_2H_4.H_2SO_4$  (0.5 mole) + aq.  $NaOH$  (2.3 moles) as directed gives (66-75% yield (228)) *N,N'*-dibenzoylhydrazine [Beil. IX-324, IX<sub>1</sub>-(131)], ndls. from  $AcOH$  (228) or  $EtOH$  (229), m.p. 237-238° (229).]

#### BEHAVIOR OF $\bar{C}$ WITH ORGANIC REACTANTS

##### BEHAVIOR OF $\bar{C}$ WITH HYDROCARBONS

With cycloalkanes. [ $\bar{C}$  with cyclohexane (1:8405) +  $AlCl_3$  gives (19% yield (231)) phenyl 2-methylcyclopentyl ketone, b.p. 160-162° at 36 mm.,  $D_4^{18} = 1.0255$ ,  $n_D^{18} = 1.5380$ , accompanied by much benzaldehyde (1:0195) presumably formed from  $\bar{C}$  by the hydrogen corresp. to coupling of 2 moles of cyclohexane.]

With alkenes. [ $\bar{C}$  with ethylene +  $AlCl_3$  in special apparatus as directed gives (87-92% yield (232)) phenyl  $\beta$ -chloroethyl ketone ( $\beta$ -chloropropiophenone) (3:1115); cf. also (233).]

With cycloalkenes. [ $\bar{C}$  with cyclohexene (1:8070) +  $AlCl_3$  in  $CS_2$  gives by addition phenyl 2-chlorocyclohexyl ketone (234), which on dehydrochlorination in the pres. of  $AlCl_3$  (234) or with alc.  $KOH$  (235) gives (40% yield (235)) phenyl cyclohexenyl ketone (tetrahydrobenzophenone), b.p. 147° at 8 mm.,  $D_4^{22} = 1.070$ ,  $n_D^{22} = 1.5595$  (235).]

With alkynes. [For behavior of  $\bar{C}$  with heptyne-1 (1:8085) in pres. of  $AlCl_3$ ,  $ZnCl_2$ ,  $SnCl_4$ ,  $BF_3$ , etc., see (236).]

With aromatic hydrocarbons. [ $\bar{C}$  with  $C_6H_6$  in pres. of  $AlCl_3$  gives (yields: 74% (237), 71-74% (238)) (210) (241) (242) (243) (244) (245) benzophenone (1:5150), but best (239) prepn. of latter is from  $C_6H_6$  +  $CCl_4$  (3:5100) +  $AlCl_3$ . — For studies of substitution for

$\text{AlCl}_3$  of  $\text{FeCl}_3$  {237} {238} {246} {247} {248},  $\text{FeCl}_3 + \text{AlCl}_3$  {249},  $\text{GaCl}_3$  {250},  $\text{TiCl}_3$  {251},  $\text{WCl}_6$  {252},  $\text{UCl}_4$  {252},  $\text{ZrCl}_4$  {253}, Cr powder {254},  $\text{ZnCl}_2$  {238},  $\text{SbCl}_3$  {255} {256}, or  $\text{SbBr}_3$  {257} see indic. refs. —  $\bar{\text{C}}$  with  $\text{C}_6\text{H}_6$  in liq.  $\text{HCl}$  at 200° and 250 pounds press. {258} or in pres. of  $\text{P}_2\text{O}_5$  in s.t. at 180–200° {259} {260} gives small yield of benzophenone (1:5150). —  $\bar{\text{C}}$  with  $\text{C}_6\text{D}_6 + \text{AlCl}_3$  in  $\text{CS}_2$  gives {261} phenyl pentadeuterophenyl ketone, b.p. 160° at 15 mm. (corresp. oxime, m.p. 140°, does not depress m.p. of ordinary benzophenone oxime.)]

[ $\bar{\text{C}}$  with toluene in pres. of  $\text{AlCl}_3$  gives {262} {263} {264} mainly phenyl *p*-tolyl ketone (1:5160) together with some phenyl *o*-tolyl ketone [Beil. VII-439, VII<sub>1</sub>-(234)]. For studies of substitution for  $\text{AlCl}_3$  of  $\text{FeCl}_3$  {263},  $\text{FeCl}_3 + \text{AlCl}_3$  {265}, or  $\text{SbCl}_3$  {255} {256} see indic. refs.]

[For reaction of  $\bar{\text{C}}$  in pres. of  $\text{AlCl}_3$  with *o*-xylene (1:7430) {262}, *m*-xylene (1:7420) {262} {266} {267}, *p*-xylene (1:7415) {262}, ethylbenzene {268} {266} {269}, see indic. refs.]

[ $\bar{\text{C}}$  with biphenyl (1:7175) in pres. of  $\text{AlCl}_3$  gives (yields: 75% {270}, 60% {271}) {272} {273} {274} {275} {276} {242} phenyl *p*-xenyl ketone (*p*-phenylbenzophenone) [Beil. VII-521, VII<sub>1</sub>-(290)], scales from alc., m.p. 106° cor. {270}, 106° {272} {273}, 102–103° {275}, 102° {271} {274}, 101–102° {242}, 101° {276}; b.p. 413° at 758 mm. {271}, 419–420° at 744 mm. {274}, 258° at 10 mm. {276} (corresp. oxime exists in two stereoisomeric forms {277}, m.p. 200° and 173°, usual mixt. having m.p. 193–194° {278}, 186–187° {271}; corresp. 2,4-dinitrophenylhydrazones, m.p. 217–217.5° {271}); for use of  $\text{P}_2\text{O}_5$  (instead of  $\text{AlCl}_3$ ) in prepn. of *p*-phenylbenzophenone (above) see {279}. Note that the isomeric *o*-phenylbenzophenone, m.p. 86–87°, has been prepared indirectly {280}.]

[ $\bar{\text{C}}$  with naphthalene (1:7200) in pres. of  $\text{AlCl}_3$  in  $\text{CS}_2$  {281} {282} {283} {284} {285} {286} or without solvent at 150° {286}, or in liq.  $\text{SO}_2$  {287}, or  $\bar{\text{C}}$  with naphthalene in pres. of  $\text{ZnCl}_2$  at 125° {280} cf. {288} {289} or of  $\text{P}_2\text{O}_5$  {289} {279} {259} {260}, gives (yields: 85% {282}, 52% {287}) mainly phenyl  $\alpha$ -naphthyl ketone (1-benzoylnaphthalene) [Beil. VII-510, VII<sub>1</sub>-(283)], pr. from alc., m.p. 75.5–76° {276}, 75.5° {282}, 75–70° {281}, 75° {283}, b.p. 336° at 764 mm. {284}, 222° at 8 mm. {276}; note that this prod. is usually accompanied by some phenyl  $\beta$ -naphthyl ketone (2-benzoylnaphthalene) [Beil. VII-511, VII<sub>1</sub>-(283)], ndls. from alc., m.p. 82° {276} {289}, 81–83° {281}, b.p. 398° at 754 mm. {284}, 225° at 8 mm. {276}.]

[For reaction of  $\bar{\text{C}}$  with anthracene (1:7285) +  $\text{AlCl}_3$  in  $\text{CS}_2$  {277} {290} {291} {292} {293}, or in nitrobenzene at –10° {294}, or without  $\text{AlCl}_3$  in boiling nitrobenzene {295} giving (yields: 85% {277}, 78% {290}) 9-benzoylanthracene ( $\alpha$ -anthraphenone) [Beil. VII-538], cryst. from  $\text{EtOAc}$ , m.p. 145.5–146° {277}, see indic. refs.; note, however, that for prepn. of this prod. use of benzoic anhydride (1:0595) (rather than  $\bar{\text{C}}$ ) is preferred {296}. — For reaction of  $\bar{\text{C}}$  with phenanthrene (1:7240) +  $\text{AlCl}_3$  in  $\text{CS}_2$  {297} {298} or in nitrobenzene {298} see indic. refs.]

With heterocyclic parent nuclei. The behavior of  $\bar{\text{C}}$  with furan (1:8015) in the pres. of Friedel-Crafts cat. has apparently not been reported [however, the prod. to be expected, viz., phenyl  $\alpha$ -furyl ketone [Beil. XVII-348, XVII<sub>1</sub>-(186)], b.p. 285° at 759 mm. {299}, 186° at 46 mm. {299}, 164° at 19 mm. {299},  $D_{20}^{20} = 1.1732$  {300},  $D_{10}^{10} = 1.1839$  {299},  $n_D^{20} = 1.6055$  {299}, 1.5798 {300}, has been obt'd. (49% yield {301}) from benzoic anhydride (1:0595) with furan (1:8015) +  $\text{SnCl}_4$  in  $\text{C}_6\text{H}_6$ , and from furoyl chloride (3:8515) with  $\text{C}_6\text{H}_6$  in pres. of  $\text{AlCl}_3$  {299}.]

[ $\bar{\text{C}}$  with thiophene in pres. of  $\text{AlCl}_3$  {302},  $\text{SnCl}_4$  {303} {304},  $\text{P}_2\text{O}_5$  {305}, or  $\alpha$ -thienylmercuric chloride {306} cf. {307} {308} gives (yields: 89–90% {302}, 82.5% {304}) phenyl  $\alpha$ -thienyl ketone [Beil. XV11-348, XVII<sub>1</sub>-(187)], m.p. 56° {305} {307}, 55.5–56° {306}, 55–56° {302}, 55° {303} {304}.]

BEHAVIOR OF  $\bar{C}$  WITH ORGANIC HYDROXYL COMPOUNDS

$\bar{C}$  with organic OH or SH compounds (or their metallic salts) gives in general the corresponding benzoates. With phenols, however, there is also the additional possibility (according to the conditions employed) of either direct nuclear benzylation or Fries rearrangement of the benzoate esters to give phenolic ketones.

Esterification of alcohols or phenols with  $\bar{C}$  in presence of aqueous alkali comprises a general procedure first discovered by Lossen (309) and later developed and extended by Schotten, Baumann, and others. The reaction is not restricted to the use of benzoyl chloride but covers acid halides in general, e.g., acetyl chloride, *p*-nitrobenzoyl chloride, 3,5-dinitrobenzoyl chloride, benzenesulfonyl chloride, etc.

For detailed quantitative study of the influence of conditions on the Schotten-Baumann reaction see (310); for study of its application to *p*-nitrobenzoyl chloride (311) or of 3,5-dinitrobenzoyl chloride (312) in the derivatization of alcohols in dilute aqueous solution see indic. refs.; for study of substitution of the acyl halide by the corresponding anhydride see (313).

Note that in general the yield of ester is improved by use of low temperature ( $0^\circ$ - $25^\circ$ ) (310), by use of relatively concentrated solutions of both the hydroxyl compound and the alkali (310), and sometimes by additions of NaOAc or other salts. (311).

With monohydric alcohols.  $\bar{C}$  with monohydric alcs. gives the corresponding alkyl benzoates.

[E.g.,  $\bar{C}$  with MeOH (1:6120) gives methyl benzoate (1:3586), b.p.  $199.6^\circ$ , m.p.  $-12.5^\circ$  (for study of rate of reaction at  $0^\circ$  and  $25^\circ$  see (18)). —  $\bar{C}$  with EtOH (1:6130) gives ethyl benzoate (1:3721), b.p.  $213.2^\circ$ , m.p.  $-34.2^\circ$  (for study of rate of esterification at  $0^\circ$  (17) or at  $25^\circ$  in various solvents (314) see indic. refs. —  $\bar{C}$  with *n*-PrOH (1:6150) gives *n*-propyl benzoate (3:3917), b.p.  $231^\circ$ . —  $\bar{C}$  with isopropyl alc. (1:6135) gives isopropyl benzoate (1:3766), b.p.  $218.5^\circ$  (for study of rate of esterification at  $25^\circ$  (6) or at  $30^\circ$  (11) (315) see indic. refs.)]

$\bar{C}$  with *n*-BuOH (1:6180) gives *n*-butyl benzoate (1:4104), b.p.  $250.3^\circ$ , m.p.  $-22.4^\circ$ . —  $\bar{C}$  with isobutyl alc. (1:6165) gives isobutyl benzoate (1:4006), b.p.  $242.2^\circ$  cor. —  $\bar{C}$  with *sec*-BuOH (1:6155) gives (yields 75% (316), 66% (317), 20% (318)) *sec*-butyl benzoate [Beil. IX-112, IX<sub>1</sub>-(63)], b.p.  $234.5$ - $235.5^\circ$  cor. at 757 mm. (317),  $148$ - $151^\circ$  at 50 mm. (317),  $115$ - $117^\circ$  at  $20^\circ$  (319),  $112$ - $116^\circ$  at 14 mm (318),  $D_4^{25} = 0.9945$  (317),  $n_D^{25} = 1.4933$  (319). —  $\bar{C}$  with *ter*-BuOH (1:6140) in pres. of pyridine gives (yields 86% (320), 80% (321) (322)) *ter*-butyl benzoate [Beil. IX<sub>1</sub>-(64)], b.p.  $112^\circ$  at 18 mm. (321),  $91$ - $92^\circ$  at 8 mm. (323),  $91.3^\circ$  at 7.5 mm. (320),  $96^\circ$  at 2 mm. (322);  $D_4^{25} = 0.9928$  (322);  $n_D^{25} = 1.4896$  (322) (321),  $n_D^{20} = 1.4910$  (320).]

$\bar{C}$  with *n*-AmOH (1:6205) gives *n*-amyl benzoate [Beil. IX<sub>1</sub>-(64)], b.p.  $138$ - $139^\circ$  at 15 mm (316),  $137$ - $138^\circ$  at 15 mm. (324). —  $\bar{C}$  with isoamyl alc. (1:6200) gives isoamyl benzoate (1:4166), b.p.  $262.3^\circ$  cor. at 760 mm. —  $\bar{C}$  with neopentyl alc. (1:5812) gives (325) neopentyl benzoate, b.p.  $235$ - $237^\circ$  at 740 mm.,  $110$ - $111^\circ$  at 10 mm.,  $D_4^{25} = 0.9817$ ,  $n_D^{25} = 1.4875$  (325).]

$\bar{C}$  reacts with other alcohols and thiols similarly, but details cannot be tabulated here.

With phenols.  $\bar{C}$  can react with phenols in either or both of two modes; on one hand it can benzyolate the phenolic OH yielding the corresponding phenol benzoates (a list of the melting points of 88 phenols of Order 1 is given on page 635 of Vol. I of this series (326); for study of effect of structure on rate of benzyolation of various monohydric phenols see (329)); on the other hand  $\bar{C}$  may under certain conditions effect the direct nuclear benzyolation of phenols. Since the phenolic ketones thus formed may also be more or less readily obtained by catalyzed rearrangement of the phenol benzoates, the chemistry of the phenol

benzoates and their rearrangement products is so voluminous that it cannot here be given detailed discussion. [For extensive reviews of the Fries rearrangement (327) (328) of phenol esters (including the benzoates) see indie. refs.]

With enols (or their metallic derivatives). With methyl acetoacetate.  $\bar{C}$  with the Na enolate of methyl acetoacetate (1:1705) gives (330) methyl  $\alpha$ -benzoylacetate, b.p. 136–137° at 2 mm. (corresp. Cu enolate, blue-green ndls. from dioxane, m.p. 226–228°; corresp. semicarbazone, prepd. by indirect means, m.p. 166° (331)).]

With ethyl acetoacetate.  $\bar{C}$  with the Na enolate of ethyl acetoacetate (1:1710) gives (yields: 74.8% (332), 67% (333), 63–75% (334) cf. (335) (337) ethyl  $\alpha$ -benzoylacetate [Beil. X-817, X<sub>1</sub>-(396)], b.p. 202° at 50 mm. (335), 177–181° at 20 mm. (334), 175–176° sl. dec. at 12 mm. (337), 169° sl. dec. at 11 mm. (338), 165–167° at 10 mm. (333) (corresp. Cu enolate, m.p. 224° (336), 221–222° (339)). Note that this prod. upon cleavage of the acetyl group, e.g., with aq.  $NH_4OH + NH_4Cl$ , gives (77–78% yield (334)) (332) ethyl benzoylacetate (1:1778), for alternative prepn. of which see (340). — Note, however, that two forms of the isomeric ethyl *O*-benzoylacetate are known (341); a liq. form, b.p. 153–155° at 3 mm., prepd. from ethyl acetoacetate (1:1710) with  $\bar{C} +$  pyridine, and a solid form, m.p. 42°, prepd. from the Cu enolate of ethyl acetoacetate (1:1710) with  $\bar{C}$  in ether (for much further detail see (341)).]

With acetylacetone.  $\bar{C}$  with the Na enolate (342) or K enolate (343) of acetylacetone (1:1700) in ether gives (50% yield (343)) *O*-benzoylacetylacetone ( $\alpha$ -benzoyl- $\alpha$ -acetylacetone) [Beil. VII-865, VII<sub>1</sub>-(474)], m.p. 35° (342), 34–35° (343), b.p. 167° at 22 mm. (342), accompanied by some of the higher-melting form, m.p. 103° (342), 102–103° (343), of its benzoate [Beil. IX-150]; note that the lower-melting form, m.p. 66–67° (344), is obt'd. from  $\alpha$ -benzoyl- $\alpha$ -acetylacetone (above) with  $\bar{C}$  in pyridine (344).]

With benzoylacetone.  $\bar{C}$  with Na enolate of benzoylacetone (1:1450) under various conditions gives (345) (346) (347) cf. (348)  $\alpha,\alpha$ -dibenzoylacetone [Beil. VII-872, VII<sub>1</sub>-(480)] (q.v. for constants of various enol and keto forms) and/or the corresp. benzoate [Beil. IX-157], m.p. 87–88° (349).]

With dibenzoylmethane.  $\bar{C}$  with Na enolate of dibenzoylmethane (1:1480) gives (45% yield (350)) (351) (352) (353) tribenzoylmethane [Beil. VII-877, VII<sub>1</sub>-(485)] (q.v. for constants of various forms) and/or the corresp. benzoate [Beil. IX-158], m.p. 121–122° (351).]

#### BEHAVIOR OF $\bar{C}$ WITH ETHERS

With aliphatic ethers. Acyl chlorides with aliphatic ethers do not react even at elevated temperatures (354) although acid bromides (e.g., acetyl bromide (355)) or acyl iodides (e.g., benzoyl iodide (356)) are able to effect cleavage into alkyl halides and alkyl esters. However, when acyl chlorides are heated with aliphatic ethers in the presence of certain metallic salts, cleavage of the ethers is more or less readily effected. Although the topic cannot here be pursued exhaustively, several examples are cited in the following text.

$\bar{C}$  with diethyl ether (1:6110) on hgt. in pres. of  $ZnCl_2$  (354) (357) (358) (359) (360),  $SnCl_4$  (358),  $ZrCl_4$  (358),  $TiCl_4$  (358) (362),  $SbCl_5$  (358),  $FeCl_3$  (358) (301),  $AlCl_3$  (358) (362), or  $SbCl_3$  (358) gives ethyl benzoate (1:3721); note, however, that use of  $BF_3$ ,  $CuCl_2$ , and  $SnCl_2$  gives only traces while  $SiCl_4$ ,  $PCl_5$ ,  $PCl_3$ ,  $BCl_3$ ,  $AsCl_3$ , or  $MgCl_2$  achieves no cleavage (358) of the ether. Note that by extension of the  $ZnCl_2$  method to use of 3,5-dinitrobenzoyl chloride a procedure for the identifi. of ethers as the corresp. alkyl 3,5-dinitrobenzoates has been described (363) cf. (364).]

With phenol ethers. With phenol ethers where no phenolic OH remains to interfere,  $\bar{C}$  reacts in the pres. of suitable cat. in the Friedel-Crafts sense. Although the topic cannot here be pursued exhaustively, several examples are cited in the following text.

[ $\bar{C}$  with methyl phenyl ether (anisole) (1:7445) +  $AlCl_3$  in  $CS_2$  solution (81% yield (365)) (366) (367) cf. (368) (360) or without other solvent (369) gives mainly *p*-anisyl phenyl ketone (*p*-methoxybenzophenone) (1:5170), m.p. 62° (366) (367) (370), 61–62° (365) (369), 61° (371), h.p. 354–355° at 729 mm. (371); this prod. is accompanied by some *o*-anisyl phenyl ketone (*o*-methoxybenzophenone) (1:5142), m.p. 39°, which is separable from the main prod. only by repeated recrystallization from lgr. (b.p. 40–60°) and alc. (369).]

[ $\bar{C}$  with ethyl phenyl ether (phenetole) (1:7485) +  $AlCl_3$  in  $CS_2$  soln. (yields: 83% (372), 73% (374) (369) (366) (373) or without other solvent (369) gives mainly *p*-phenetyl phenyl ketone (*p*-ethoxybenzophenone) [Beil. VIII-159, VIII<sub>1</sub>-(569)], m.p. 47–48° (374), 47° (369) (372), 46.5° (373), 38–39° (366), b.p. 245–250° at 25 mm. (374), 227° at 21 mm. (373), 215–225° at 15 mm. (373) (corresp. oxime, m.p. 135–136° (374)), accompanied by some *o*-phenetyl phenyl ketone (*o*-ethoxybenzophenone) which (although not further characterized) is liq. and readily separable.]

[ $\bar{C}$  with diphenyl ether (1:7125) +  $AlCl_3$  in  $CS_2$  (375) (376) (374), or  $\bar{C}$  with diphenyl ether (1:7125) +  $HgCl_2$  at 150–160° (377) (27% yield), or  $\bar{C}$  with phenyl 4-chloromercuriphenyl ether at 150° (377), gives (yields: 97% (375), 95% (374), 70% (377)) *p*-phenoxybenzophenone [Beil. VIII-159], m.p. 71° cor. (375), 70–71° (374), 66° (377) (corresp. oxime, m.p. 124° (374)); for further benzoylation of this prod. to *bis*-(*p*-benzoylphenyl) ether, m.p. 163–164°, see (376).]

[ $\bar{C}$  with methyl  $\alpha$ -naphthyl ether (1:7630) +  $AlCl_3$  in  $CS_2$  (378) or in nitrobenzene (379) gives (84% yield (379)) 4-benzoyl-1-methoxynaphthalene, m.p. 82–83° (378), 81–82° (379); for high-press. hydrogenation of this prod. giving (84–86% yield) 4-benzyl-1-methoxynaphthalene, m.p. 83–84°, see (379). —  $\bar{C}$  with methyl  $\beta$ -naphthyl ether (1:7180) +  $AlCl_3$  in  $CS_2$  gives (85% yield (380)) 1-benzoyl-2-methoxynaphthalene, m.p. 125° cor.; note that use of 1,1,2,2-tetrachloroethane as solvent is much less satisfactory (381). —  $\bar{C}$  with ethyl  $\alpha$ -naphthyl ether (1:7635) +  $AlCl_3$  in  $CS_2$  gives (386) (382) 4-benzoyl-1-ethoxynaphthalene [Beil. VIII-207, VIII<sub>1</sub>-(586)], m.p. 74–75° (386), accompanied (383) by some 4-benzoylnaphthol-1 and other products. — The presumably analogous reaction of  $\bar{C}$  with ethyl  $\beta$ -naphthyl ether (1:7135) +  $AlCl_3$  appears not to have been studied, and the expected 1-benzoyl-2-ethoxynaphthalene is unreported.]

#### BEHAVIOR OF $\bar{C}$ WITH ACIDS (OR THEIR SALTS)

With sodium formate. [ $\bar{C}$  with  $NaOOCH$  on htg. (384) gives  $BzOH$  (1:0715),  $CO$ , +  $HCl$ .]

With acetic acid. [ $\bar{C}$  with  $AcOH$  (1:1010) refluxed in pres. of charcoal (385), or in pres. of a tertiary base (386) even at ord. temp., or  $\bar{C}$  with  $NaOAc$  on warming (387) cf. (388) (389) gives the mixed anhydride,  $CH_3CO.O.CO.C_6H_5$  [Beil. IX-163], accompanied by various other products. Note, however, that  $\bar{C}$  with  $AcOH$  (1:1010) at 100° for 3 hrs. gives (70% yield (147)) acetyl chloride (3:7065) while  $\bar{C}$  with  $Ac_2O$  (1:1015) at 100° for 1 hr. gives (77% yield (147)) acetyl chloride (3:7065) accompanied by benzoic anhydride (1:0595). For prepn. of acetic-benzoic anhydride by other means, e.g., from benzoic acid (1:0715) with ketene (390), and for study of its use in Friedel-Crafts type reactions (391), see indic. refs.]

With benzoic acid. [ $\bar{C}$  with benzoic acid (1:0715) in s.t. at 160–200° for 12 hrs. (392), or at 220° under reduced press. (397), or with pyridine (389) (393), or  $\bar{C}$  with  $NaOBz$  shaken with aq. (394) or htd. at 130° (395), gives benzoic anhydride (1:0595), m.p. 42°, h.p. 360°; for other modes of formn. of this prod. from  $\bar{C}$  see above under behavior of  $\bar{C}$  with various inorganic salts; for prepn. (72–74% yield) of benzoic anhydride (1:0595) from benzoic acid (1:0715) by use of acetic anhydride (1:1015) see (396).]

With aromatic secondary amines.  $\bar{C}$  with aromatic secondary amines gives the corresponding *N*-benzoyl derivatives but note that these same products are frequently also obtained by reaction of  $\bar{C}$  with the appropriate tertiary amines.

[ $\bar{C}$  with *N*-methylaniline (437), or  $\bar{C}$  with *N,N*-dimethylaniline at 190° (438), gives *N*-benzoyl-*N*-methylaniline (*N*-methylbenzanilide) [Beil. XII-260], scales from lgr., m.p. 63° (438), 59° (437), b.p. 331-332° (439) —  $\bar{C}$  with *N*-ethylaniline (not actually reported) or  $\bar{C}$  with *N,N*-diethylaniline at 200° (438) gives *N*-benzoyl-*N*-ethylaniline (*N*-ethylbenzanilide) [Beil. XII-270], cryst. from ether + lgr., m.p. 54° (440), 52° (441), 60° (438).]

[ $\bar{C}$  with *N*-methyl- $\alpha$ -toluidine should yield *N*-benzoyl-*N*-methyl- $\alpha$ -toluidine (*N*-methylbenzo- $\alpha$ -toluidide) [Beil. XII-796], pr. from ether/lgr., m.p. 65-66°, and  $\bar{C}$  with *N*-ethyl- $\alpha$ -toluidine should yield *N*-benzoyl-*N*-ethyl- $\alpha$ -toluidine (*N*-ethylbenzo- $\alpha$ -toluidide) [Beil. XII-796], pr. from ether/lgr., m.p. 71-72°, but both these products have been reported only by indirect means (442) — The analogous products to be expected from  $\bar{C}$  with *N*-methyl (or *N*-ethyl)-*m*-toluidine, or  $\bar{C}$  with *N*-methyl (or *N*-ethyl)-*p*-toluidine, have not been characterized in the literature.]

[ $\bar{C}$  with *N*-methyl- $\alpha$ -naphthylamine should yield *N*-benzoyl-*N*-methyl- $\alpha$ -naphthylamine [Beil. XII-1234], cryst. from  $C_6H_6$ /lgr., m.p. 121°, but this prod. has actually been reported only from  $\bar{C}$  with *N,N*-dimethyl- $\alpha$ -naphthylamine at 170-190° (438). — Similarly,  $\bar{C}$  with *N*-methyl- $\beta$ -naphthylamine + aq alk yields (443) *N*-benzoyl-*N*-methyl- $\beta$ -naphthylamine [Beil. XII-1287, XII<sub>1</sub>- (539)], ndls from pet. eth., m.p. 84° (443); this prod. is also claimed (438) from *N,N*-dimethyl- $\beta$ -naphthylamine at 170-180° but the m.p. of 169° is not in accord with the later work under mild conditions and presumably represents an isomeric material. — The analogous benzoyl derivatives of *N*-ethyl- $\alpha$ -naphthylamine and of *N*-ethyl- $\beta$ -naphthylamine are unreported.]

[ $\bar{C}$  with diphenylamine on warming (444) in ether soln. (445) gives *N*-benzoyldiphenylamine (*N,N*-diphenylbenzamide) [Beil. XII-270, XII<sub>1</sub>- (201)], cryst. from alc., m.p. 180° (435), 179-180° (446), 177° (447).]

$\bar{C}$  with heterocyclic secondary amines.  $\bar{C}$  with piperidine [Beil. XX-6, XX<sub>1</sub>- (5)] directly (536) or better in aq. NaOH (537) (538) (539) gives (87-91% yield (537)) *N*-benzoyl-piperidine [Beil. XX-46, XX<sub>1</sub>- (15)], m.p. 49° (540), 48° (538), 44° (537); b.p. 320-321° (541), 240-244° at 130 mm. (537), 193° at 25 mm (541), 180-184° at 20 mm (537), 172-174° at 12 mm. (537); not volatile with steam (538). [Note that this prod. with  $PBr_3$  (542) (543) (544) (545) (546), with  $PBr_3 + Br_2$  (547), or with  $PCl_3 + Br_2$  (548) comprises an important method of preparation of pentamethylene dibromide (1,5-dibromopentane).]

$\bar{C}$  with morpholine [Beil. XXVII-5] in ether gives (549) *N*-benzoylmorpholine, ens. sol. aq., pr. from dry ether, m.p. 74-75° (549).

$\bar{C}$  with aromatic diamines. [ $\bar{C}$  with *o*-phenylenediamine [Beil. XIII-6, XIII<sub>1</sub>- (5)] in aq. NaOH (448), or  $\bar{C}$  with *o*-phenylenediamine hydrochloride in aq. soln. (449), gives *N,N'*-dibenzoyl-*o*-phenylenediamine [Beil. XIII-21, XIII<sub>1</sub>- (8)], ndls. from AcOH, m.p. 301° (450), about 300° dec. (451) — Note that this prod. on htg. above m.p. (450), or on htg. with conc. HCl in s.t. at 200° (449), gives 2-phenylbenzimidazole [Beil. XXIII-230, XXIII<sub>1</sub>- (61)], m.p. variously reported around 290°, which latter, although stable toward  $\bar{C}$  at 260° (452), yet with  $\bar{C}$  + aq. NaOH in cold (450) reverts to *N,N'*-dibenzoyl-*o*-phenylenediamine (above). — Note that *N*-benzoyl-*o*-phenylenediamine [Beil. XIII-20, XIII<sub>1</sub>- (8)], m.p. 140° (453), has been reported only by indirect means (453) (454); on htg. 2 hrs. at 140° followed by a few minutes at 280° (455) it gives 2-phenylbenzimidazole (see above). — Note finally that 1-benzoylbenzimidazole [Beil. XXIII-133, XXIII<sub>1</sub>- (35)], m.p. 93-94° (456), 91-92° (450), on htg. with  $\bar{C}$  (457), or benzimidazole itself with  $\bar{C}$  + aq. NaOH (450), both give *N,N'*-dibenzoyl-*o*-phenylenediamine (above).]

[ $\bar{C}$  with hydrochloride of *m*-phenylenediamine [Beil. XIII-33, XIII<sub>1</sub>- (10)] on htg. gives

(458) *N,N'*-dibenzoyl-*m*-phenylenediamine [Beil. XIII-46], ndls. from AcOH, m.p. 240° (458) (460); for behavior of this prod. with  $\text{PCl}_5$  see (459). — Note that *N*-benzoyl-*m*-pbeoylenediamine (benz-*m*-aminoanilide) [Beil. XIII-46], m.p. 125°, has been reported only by indirect means (461) (462) (464).]

[ $\bar{\text{C}}$  with *p*-phenylenediamine [Beil. XIII-61, XIII<sub>1</sub>-(18)] + aq. NaOH (448) cf. (463) gives *N,N'*-dibenzoyl-*p*-pbenyleodiamine [Beil. XIII-98], m.p. above 300° (448) cf. (460); for behavior of this prod. with  $\text{PCl}_5$  see (459). — Note that *N*-benzoyl-*p*-pbenyleodiamine (benz-*p*-aminoanilide) [Beil. XIII-98, XIII<sub>1</sub>-(31)], m.p. 128° (452) (464), has been reported only by indirect means (452) (464).]

$\bar{\text{C}}$  with aminopheols.  $\bar{\text{C}}$  with *o*-aminophenol [Beil. XIII-354, XIII<sub>1</sub>-(103)] gives according to circumstances one of the two possible monobenzoyl derivatives, viz., *o*-(benzoylamino)phenol [Beil. XIII-372, XIII<sub>1</sub>-(115)] (or its ring-closure product, 2-phenylbenzoxazole-1,3 [Beil. XXVII-72, XXVII<sub>1</sub>-(235)]), or the dibenzoyl derivative, viz., *o*-benzoylamino-phenyl benzoate [Beil. XIII-373], as more fully described below. Note, however, that the other monobenzoyl derivative of *o*-aminophenol, viz., *O*-benzoyl-*o*-aminophenol or *o*-aminophenyl benzoate, known only as its hydrochloride, m.p. 149° (465), has been prepared only by indirect means (465) viz., from *O,N*-(dibenzoyl)-*o*-aminophenol, and on heating, or even on recrystn., loses HCl giving (465) 2-phenylbenzoxazole-1,3.

[ $\bar{\text{C}}$  (1 mole) with *o*-aminophenol (2 moles) in dry ether (466) gives *o*-(benzoylamino)phenol (*N*-benzoyl-*o*-aminophenol), tbs. from MeOH (465), lts. from  $\text{C}_6\text{H}_6$ , m.p. 169-171° u.c. (405), 169° (467), 167° (468) (corresp. acetate, m.p. abt. 140° (469) cf. (470); corresp. benzoate, m.p. 182° (470) (also below); corresp. benzenesulfonate, m.p. 90.5-91.0 (471)). — Note that this prod. on htg. above m.p. loses  $\text{H}_2\text{O}$  with ring closure yielding (468) 2-phenylbenzoxazole-1,3, m.p. 103° (see below). — Note also that *o*-(benzoylamino)phenyl benzoate (above) with  $\bar{\text{C}}$  in nitrobenzene refluxed 12 hrs. gives (479) *o*-(dibenzoylamino)phenyl benzoate, m.p. 170.5-171.5° (479).]

[ $\bar{\text{C}}$  with *o*-aminophenol on warming, followed by distn. of reaction product (472), or  $\bar{\text{C}}$  with *o*-aminophenol hydrochloride (468) (473) gives 2-phenylbenzoxazole-1,3, ads. from dil. alc., lts. from dil. HCl or dil.  $\text{H}_2\text{SO}_4$ , m.p. 103° (468) (472) (473) (474), volatile with steam, b.p. 314-317° (472) (corresp.  $\bar{\text{B}}$ .PhOH, m.p. 104° (477), corresp. MeI quaternary salt, m.p. 196° dec. (478).]

[ $\bar{\text{C}}$  (2 pts.) with *o*-aminophenol in aq. NaOH (448) or in pyridine +  $\text{CHCl}_3$  (465), or  $\bar{\text{C}}$  with *o*-aminophenol hydrochloride in  $\text{C}_6\text{H}_6$  at 100° (468), or  $\bar{\text{C}}$  + aq. NaOH with *o*-formylaminophenol (480), *o*-(acetylamino)phenol (481), or *o*-(benzoylamino)phenol (467), gives *O,N*-dibenzoyl-*o*-aminophenol (*o*-benzoylamino-phenyl benzoate), ndls. from alc. (480) or EtOAc (465), m.p. 185° (467), 183-184.5° (480), 182-183° (482), 181-182° (476), 180° (481), 179° u.c. (465). — Note that this prod. on boilg. with aq.  $\text{BaCO}_3$  (468) or for 2 days with alc. HCl (483) hydrolyzes at the ester linkage giving *o*-(benzoylamino)phenol, m.p. 169° (above).]

[ $\bar{\text{C}}$  with *m*-aminophenol [Beil. XIII-401, XIII<sub>1</sub>-(128)] in pyridine + ether (484) cf. (485) gives *m*-(benzoylamino)phenol [Beil. XIII-416], ndls. from toluene, m.p. 174° (485) (486), 173° (484). — Note that the isomeric *O*-benzoyl-*m*-aminophenol (*m*-aminophenyl benzoate) is unreported. —  $\bar{\text{C}}$  with *m*-aminophenol in aq. NaOH gives (486) *O,N*-dibenzoyl-*m*-aminophenol (*m*-(benzoylamino)phenyl benzoate) [Beil. XIII-416], pr. from  $\text{C}_6\text{H}_6$  or scales from abs. alc., m.p. 153° (486); this product with boilg. alc. KOH splits at the ester linkage giving (486) *m*-(benzoylamino)phenol (above), m.p. 174°.]

[ $\bar{\text{C}}$  with *p*-aminophenol [Beil. XIII-427, XIII<sub>1</sub>-(143)] in aq. NaOH (487), in pyridine (488), in alc. (489), or in ether + aq. NaOH (490) gives *p*-(benzoylamino)phenol (*N*-benzoyl-*p*-aminophenol) [Beil. XIII-469, XIII<sub>1</sub>-(165)], cryst. from AcOH, m.p. 216-217° (487), 214-215° (489) (for review of earlier confusion see (487)). — Note that the isomeric *O*-

benzoyl-*p*-aminophenol (*p*-aminophenyl benzoate) [Beil. XIII-440], m.p. 153–154° (491) (492), 148° (465), has been reported only by indirect means. —  $\bar{C}$  with *p*-aminophenol on htg. (472), or in aq. NaOH (448) (487) (488) or in pyridine (488), or  $\bar{C}$  with *p*-aminophenol hydrochloride (489) gives *O,N*-dibenzoyl-*p*-aminophenol (*p*-(benzoylamino)phenyl benzoate) [Beil. XIII-470, XIII<sub>1</sub>-(165)], cryst. from MeOH, EtOH, AcOH, or xylene, m.p. 235° (487) (467), 233–234° (489), 231° (472).]

The acylation of aminophenols (especially of the ortho series) and the relationships of the various multiple and mixed neyl derivatives have been extensively studied by Raiford (493)–(511), incl., Nelson (512)–(517), incl., and Bell (518) (519); the cited papers are arranged in chronological sequence for each worker.

$\bar{C}$  with tertiary amines.  $\bar{C}$  with certain tertiary amines especially in dry ether solution (520) forms addition products; these are presumably quaternary ammonium salts but have been very inadequately studied cf. (524).

[ $\bar{C}$  with  $Me_3N$  in ether at 0° or in  $C_6H_6$  at 80° fails to react (525). —  $\bar{C}$  with  $Et_3N$  in dry ether gives an immediate ppt. which increases on stdg. but appears to be a mixture of the expected addn. prod.,  $\bar{C} \cdot Et_3N$ , with triethylamine hydrochloride (520). —  $\bar{C}$  with triethylamine in dry ether after stdg. 2 months yields (520) long needles, m.p. 117°, whose analysis is in accord with "nearly pure" addn. prod.,  $\bar{C} \cdot (C_2H_5)_3N$ .]

[ $\bar{C}$  with *N,N*-dimethylaniline in dry ether in sunlight gives gradually hygroscopic crystals probably comprising the expected addn. prod.,  $\bar{C} \cdot C_6H_5N$ , (520). —  $\bar{C}$  with *N,N*-diethylaniline in dry ether gives (520) n crystals. prod. containing 71% of the expected  $\bar{C} \cdot C_{10}H_{15}N$ .]

[ $\bar{C}$  with pyridine in dry ether gives (520) a ppt. apparently contg. only 31% of the expected addn. prod.,  $\bar{C} \cdot C_5H_5N$ . —  $\bar{C}$  with pyridine in  $C_6H_6$  gives (521) pyridine hydrochloride, m.p. 144°. — For study of  $\bar{C}$  with pyridine in pres. of Zn dust giving the free radical *N*-benzoylpyridinium see (522); for study of  $\bar{C}$  with pyridine + *N,N*-dimethylaniline + Cu powder at 100° for 5 hrs. giving 4-(*p*-dimethylaminophenyl)pyridine see (523).]

Note that  $\bar{C}$  with pyridine in pres. of various inorganic salts gives benzoic anhydride; for further details see text above under behavior of  $\bar{C}$  with miscellaneous inorganic salts.

$\bar{C}$  with arylhydrazines.  $\bar{C}$  (1 mole) with phenylhydrazine (2 moles) [Beil. XV-67, XV<sub>1</sub>-(23)] in dry ether gives (526) *N'*-benzoyl-*N*-phenylhydrazine (also known as *sym*.-benzoyl-phenylhydrazine or  $\beta$ -benzoylphenylhydrazine) [Beil. XV-255, XV<sub>1</sub>-(67)], pr. from alc., m.p. 168° (526) (527). [Note that the isomeric *N*-benzoyl-*N*-phenylhydrazine (also known as *asym*.-benzoyl-phenylhydrazine or  $\alpha$ -benzoyl-phenylhydrazine) [Beil. XV-250, XV<sub>1</sub>-(65)], m.p. 70°, has been obtained only by indirect means, e.g., from  $\bar{C}$  with sodio-phenylhydrazine (528) or from *N*-chlorobenzaniline with  $NaNH_2$  (529). However,  $\bar{C}$  with phenylhydrazine hydrochloride in boilg.  $C_6H_6$  (530) (531), or  $\bar{C}$  with dry *K* phenylhydrazine- $\beta$ -sulfonate on htg. (526), or  $\bar{C}$  with  $\alpha$ -benzoyl-phenylhydrazine in ether (532), or  $\bar{C}$  with  $\beta$ -benzoyl-phenylhydrazine on htg. (526), gives *N,N'*-dibenzoyl-*N*-phenylhydrazine (also called  $\alpha,\beta$ -dibenzoyl-phenylhydrazine) [Beil. XV-261, XV<sub>1</sub>-(68)], pr. from alc., m.p. 177–178° (526) (530); note that this prod. on hydrolysis with alc. NaOH gives (533)  $\beta$ -benzoyl-phenylhydrazine (above).]

$\bar{C}$  with *p*-nitrophenylhydrazine [Beil. XV-468, XV<sub>1</sub>-(130)] presumably gives *N'*-benzoyl-*N*-(*p*-nitrophenyl)-hydrazine [Beil. XV-479, XV<sub>1</sub>-(140)], ndls. from alc., m.p. 193° (534), although this prod. is actually reported (534) only from benzoic anhydride (1:0595) with *p*-nitro-phenylhydrazine.

$\bar{C}$  with 2,4-dinitrophenylhydrazine [Beil. XV-489, XV<sub>1</sub>-(146)] in alc. suspension on warming gives (535) *N'*-benzoyl-*N*-(2,4-dinitrophenyl)-hydrazine [Beil. XV-492], or-red lfts. from alc., m.p. 206–207° (535).

$\bar{C}$  with diazomethane. [ $\bar{C}$  added slowly to excess  $CH_2N_2$  in ether at 0° gives (550) (551) (552) (553)  $\omega$ -diazoacetophenone [Beil. VII-362, XXIV-142]; this product may be caused

to undergo the Wolff rearrangement giving (554) phenylacetoacetic acid derivs. (e.g., amide or anilide (554)), or may be caused to react with HCl to give phenacyl chloride (3:1212); for comprehensive survey and review of the behavior of acyl halides with diazomethane see (555).]

$\bar{C}$  with miscellaneous nitrogen compounds. [For studies on the behavior of  $\bar{C}$  with indigo see (556) (557) (558) (559) (560) (561) (562) (563).]

#### BEHAVIOR OF $\bar{C}$ WITH ORGANOMETALLIC COMPOUNDS

Behavior of  $\bar{C}$  with Grignard reagents.  $\bar{C}$  with excess  $RMgX$  compounds in ether reacts in general to give the corresponding tertiary alcohols. Although extensive discussion of this reaction is manifestly infeasible here, the following examples are cited.

[ $\bar{C}$  with excess  $MeMgI$  gives (564) dimethyl-phenyl-carbinol [Beil. VI-506, VI<sub>2</sub>-(477)]. —  $\bar{C}$  with  $EtMgI$  gives (93% yield (565)) diethyl-phenyl-carbinol [Beil. VI-548, VI<sub>1</sub>-(269), VI<sub>2</sub>-(506)]. —  $\bar{C}$  with  $n\text{-}PrMgBr$  gives (81% yield (565)) di-*n*-propyl-phenyl-carbinol [Beil. VI<sub>1</sub>-(273), VI<sub>2</sub>-(513)]. —  $\bar{C}$  with  $C_6H_5MgBr$  as directed gives (91.5% yield (565)) triphenylcarbinol [Beil. VI-713, VI<sub>1</sub>-(349), VI<sub>2</sub>-(686)] (1:5935) accompanied by (7% yield (565)) biphenyl (1:7175); for study of limiting reaction of  $\bar{C}$  with  $C_6H_5MgBr$  to formation of diphenyl ketone (benzophenone) (1:5150) see (566); note also that  $\bar{C}$  with  $C_6H_5MgBr$  in presence of  $CoCl_2$  takes a different course yielding (567) benzoic acid, ethyl benzoate, biphenyl, benzophenone, phenylbenzoin, tetraphenylethylene oxide, and stilbene dibenzoate.]

[For interference of  $\bar{C}$  with the Gilman color test for  $RMgX$  compounds see (568).]

[For study of relative reactivity of  $\bar{C}$  as compared with various other organic compounds in competition for  $C_6H_5MgBr$  see (569) ]

Behavior of  $\bar{C}$  with other miscellaneous organometallic compounds. This topic cannot be treated extensively, but the following examples, mainly from the recent literature, will serve as lead references.

[ $\bar{C}$  with  $C_6H_5Li$  gives (570) no benzophenone and only 42% yield triphenylcarbinol (1:5985). —  $\bar{C}$  with  $Na$  phenylacetylene (571) (572) or  $Ag$  phenylacetylene (572) gives (74% yield (571)) phenyl phenylethynyl ketone (benzoyl-phenylacetylene) [Beil. VII-498, VII<sub>1</sub>-(275)].]

[ $\bar{C}$  +  $EtCu$  (573) in ether gives (22% yield (573)) ethyl phenyl ketone (propiophenone) (1:5525). —  $\bar{C}$  with  $C_6H_5Cu$  (573) in ether gives (55% yield (573)) benzophenone (1:5150).]

[ $\bar{C}$  +  $Et_2Hg$  gives (small yield (574)) propiophenone (1:5525). —  $\bar{C}$  with  $(C_6H_5)_2Hg$  in  $C_6H_6$  gives (575) benzophenone (1:5150). —  $\bar{C}$  with excess di-*p*-tolyl mercury in  $CCl_4$  fails (576) to react.]

[ $\bar{C}$  with  $Me_2Be$  gives (577) dimethyl-phenyl-carbinol [Beil. VI-506, VI<sub>2</sub>-(477)]. —  $\bar{C}$  with  $Me_2Cd$  gives (85% yield (578)) methyl phenyl ketone (acetophenone) (1:5515). —  $\bar{C}$  with  $Et_2Cd$  gives (50% yield (578)) ethyl phenyl ketone (propiophenone) (1:5525). —  $\bar{C}$  with  $(C_6H_5)_2Cd$  gives (57% yield (578)) diphenyl ketone (benzophenone) (1:5150). —  $\bar{C}$  with  $Me_2Zn$  gives (579) methyl phenyl ketone (acetophenone) (1:5515). —  $\bar{C}$  with  $Et_2Zn$  (580) (581) or with  $EtZnI$  (582) gives ethyl phenyl ketone (propiophenone) (1:5525).]

① Benzamide: cryst. from hot aq., m.p. 130°. [For methods of prepn. see above text under behavior of  $\bar{C}$  with various inorganic nitrogen compounds.]

② Benzanilide: lfts. from alc., m.p. 160°. [From  $\bar{C}$  with aniline directly (583), in ether contg. dry  $K_2CO_3$  (584), in  $C_6H_6$  (585), in toluene (586), in pyridine (or other tertiary amines) (587), in dil. aq. HCl (588), in  $AcOH/aq.$   $NaOAc$  (589), or aq.  $NaOH$ . — For study of rate of reaction of  $\bar{C}$  with aniline in aq. at various temperatures 0-60° (590),

in  $C_6H_6$  at  $25^\circ$  (591) cf. (585), in hexane at  $25^\circ$  (592), or in  $CCl_4$  at  $25^\circ$  (592) see indic. refs. — Note that  $\bar{C}$  with aniline hydrochloride in boilg.  $C_6H_6$  gives almost quant yield (530) benzanilide.]

① Benz-*o*-toluidide: ndls. from AcOEt/acetone, m.p.  $145-146^\circ$  (594) (595),  $144.3-144.6^\circ$  cor. (586),  $142-143^\circ$  (593),  $142^\circ$  (587). [From  $\bar{C}$  with *o*-toluidine (593) (594) in pres. of dil. (4%) aq. NaOH (595), or in pyridine (or other tertiary bases) (75% yield (587)), or in boilg. toluene (586).]

② Benz-*m*-toluidide: cryst. from dil alc, m.p.  $126^\circ$  (587),  $124.3-124.7^\circ$  cor. (586),  $125^\circ$  (596). [From  $\bar{C}$  with *m*-toluidine (596) in pyridine (or other tertiary bases) (80% yield (587)) or in boilg. toluene (586).]

③ Benz-*p*-toluidide: ndls. from alc., m.p.  $158^\circ$  (597),  $157.7-158.2^\circ$  cor. (586),  $157^\circ$  (587). [From  $\bar{C}$  with *p*-toluidine (598) (599) in pyridine (or other tertiary bases) (85% yield (587)) or in boilg. toluene (586).]

④ Benz- $\alpha$ -naphthalide: ndls. from alc. or AcOH, m.p.  $161-162^\circ$  (600),  $159-160^\circ$  (601) cor. (603),  $159^\circ$  (587),  $156^\circ$  (602),  $155-156^\circ$  (603). [From  $\bar{C}$  with  $\alpha$ -naphthylamine (604) (602) in aq. NaOH (603), pyridine (or other tertiary bases) (80% yield (587)), or in AcOH/aq. NaOAc (589). — For mol. cpd. of benz- $\alpha$ -naphthalide with 1,3,5-trinitrobenzene, viz.,  $\bar{C} \cdot C_6H_3(NO_2)_3$ , yel. ndls. from alc. soln. of components, m.p.  $131-132^\circ$  (605); see indic. refs. — For behavior of  $\bar{C}$  with  $\alpha$ -naphthylamine in pres. of  $ZnCl_2$  at  $175-180^\circ$  yielding 1-benzoylamino-4-benzoylnaphthalene, m.p.  $178^\circ$ , 1-benzoylamino-2,4-dibenzoylnaphthalene, m.p.  $224-226^\circ$ , etc., see (606) (607).]

⑤ Benz- $\beta$ -naphthalide: ndls. from  $C_6H_6$  or AcOH, m.p.  $162-163^\circ$  (609),  $162^\circ$  (587),  $161^\circ$  (612),  $157^\circ$  (610),  $156.5-157^\circ$  cor. (608). [From  $\bar{C}$  with  $\beta$ -naphthylamine (611) (610) in ether +  $K_2CO_3$  (612), in pyridine (or other tertiary bases) (80% yield (587)), or in AcOH/aq. NaOAc (589).]

⑥ Benzhydrazide: m.p.  $112^\circ$ . [See above text under behavior of  $\bar{C}$  with various inorganic nitrogen compounds, specifically with  $NH_2 \cdot NH_2$ .]

⑦  $\beta$ -Benzoylphenylhydrazine (*N*-Anilino benzhydrazide). pr. from alc., m.p.  $168^\circ$ . [See above text under behavior of  $\bar{C}$  with organic nitrogen compounds, specifically with arylhydrazines.]

⑧  $\beta$ -Benzoyl-*p*-nitrophenylhydrazine (*N*-(*p*-nitroanilino) benzhydrazide): ndls. from alc., m.p.  $193^\circ$ . See above text under behavior of  $\bar{C}$  with organic nitrogen compounds, specifically with arylhydrazines.

⑨  $\beta$ -Benzoyl-2,4-dinitrophenylhydrazine (*N*-(2,4-dinitroanilino) benzhydrazide): or-red lfts. from alc, m.p.  $206-207^\circ$ . [See above text under behavior of  $\bar{C}$  with organic nitrogen compounds, specifically with arylhydrazines.]

① 3-Chloro-4-methoxybenzenesulfonamide: cryst. from dil. alc., m.p. 130-131° u.c. (13), 130° cor. (14). [From  $\bar{C}$  + chlorosulfonic acid followed by conversion of the resultant sulfonyl chloride, m.p. 77-80° (14), to sulfonamide with  $(NH_4)_2CO_3$ ; 85% yield (13).] [A by-product, 3,3'-dichloro-1,4'-dimethoxydiphenyl sulfone, m.p. 165-166° cor. (14) (but unlike the sulfonamide insol. in alk.), has also been observed (14).]

[For prepn. of  $\bar{C}$  from 6-chloro-2-aminotoluene (Beil. XII-836, XII-(389)) via diazotization and use of  $Cu_2Cl_2$  reactn. (70% yield (2)) (1) (3) see indic. refs.; from 2,6-dichlorotoluenesulfonic acid-4 (itself obtd. by chlorination of *p*-toluenesulfonyl chloride and subsequent hydrolysis) by hydrolysis in conc.  $H_2SO_4$  with superheated steam (yield 42-50% (5)) (4) (6) together with 2,3,6-trichlorotoluene (3:0625) as by-product (5) (6) see indic. refs.; for formn. of  $\bar{C}$  (together with other isomers) from toluene with  $Cl_2$  in pres. of  $MoCl_5$  (7) (8) (9), from *o*-chlorotoluene (3:8215) with  $Cl_2$  in pres. of Fe (9) or Al/Hg (10), or from 2,6-dichlorobenzaldehyde hydrazone by Wolff-Kishner reduction (32-36% yield (19)) see indic. refs.]

[ $\bar{C}$  with  $Cl_2$  in pres. of Al/Hg yields (11) 2,3,6-trichlorotoluene (3:0625);  $\bar{C}$  at its b.p. in u.v. light treated with  $Cl_2$  yields (5) 2,6-dichlorobenzyl chloride (3:0410) cryst. from lgr. or ether, m.p. 39-40° (5).]

[ $\bar{C}$  with  $Br_2$  at 170° in sunlight (2) yields (2) (12) 2,6-dichlorobenzyl bromide which on oxidn. with alk.  $KMnO_4$  yields (2) (12) 2,6-dichlorobenzoic acid (3:4200), m.p. 143-144°.]

$\bar{C}$  on mononitration in cold with 2 pts. fuming  $\text{HNO}_3$  (11) or with mixt. of 2 pts. conc.  $\text{HNO}_3$  ( $D = 1.4$ ) + 3 pts. conc.  $\text{H}_2\text{SO}_4$  at  $100^\circ$  (3) yields 2,6-dichloro-3-nitrotoluene [Beil. V-332], ndls. from alc. +  $\text{AcOH}$ , m.p.  $53^\circ$  (3),  $52-53^\circ$  (11),  $50^\circ$  (13); note that the other possible isomer, viz., 2,6-dichloro-4-nitrotoluene, m.p.  $65^\circ$  (14),  $63-64^\circ$  (15), has been obtd. only by other means. —  $\bar{C}$  on dinitration with mixt. of 7 pts. fuming  $\text{HNO}_3$  ( $D = 1.5$ ) and  $3\frac{1}{2}$  pts. conc.  $\text{H}_2\text{SO}_4$  at  $100^\circ$  yields (3) 2,6-dichloro-3,5-dinitrotoluene [Beil. V-345], ndls. from alc., m.p.  $121-122^\circ$  (3),  $121^\circ$  (4) (14); note that the isomeric 2,6-dichloro-3,4-dinitrotoluene, m.p.  $130-131^\circ$  (14),  $129-130^\circ$  (16), has been obtd. only by other means.

$\bar{C}$  is extremely resistant to oxidn. either with dil.  $\text{HNO}_3$  (9) (1) (3), aq. alk.  $\text{KMnO}_4$  (4) (12), acid  $\text{KMnO}_4$  (12),  $\text{KMnO}_4$  in acetone (4),  $\text{CrO}_3$  in  $\text{H}_2\text{SO}_4$  or  $\text{AcOH}$  (12), or  $\text{K}_2\text{Cr}_2\text{O}_7$  in  $\text{H}_2\text{SO}_4$  (12); by conversion of  $\bar{C}$  with  $\text{Br}_2$  to 2,6-dichlorobenzyl bromide (see above) and oxidn. of this with alk.  $\text{KMnO}_4$  (2) (12) 2,6-dichlorobenzoic acid (3:4200), m.p.  $143-144^\circ$ , is obtd. in 57% yield (12).

$\bar{C}$  on sulfonation with fuming  $\text{H}_2\text{SO}_4$  (3) yields 2,6-dichlorotoluenesulfonic acid-3 (corresp. sulfonyl chloride, m.p.  $60^\circ$  (3) (13), corresp. sulfonamide, m.p.  $204^\circ$  (3) (13),  $199-201^\circ$  u.c. (17));  $\bar{C}$  on treatment with chlorosulfonic acid in  $\text{CHCl}_3$  as directed (17) cf. (18) yields 2,6-dichlorotoluenesulfonyl chloride-3, m.p.  $54-56^\circ$  u.c. (17),  $60^\circ$  (3) (13) (18).

For f.p./compn. diagram of system:  $\bar{C}$  + 3,4-dichlorotoluene (3:6355) see (1); the eutectic conts. 48%  $\bar{C}$  and freezes about -38° (1).

[For prepn. of  $\bar{C}$  from 2-chloro-4-aminotoluene [Beil. XII-988, XII<sub>1</sub>-(435)] via diazotization and use of  $Cu_2Cl_2$  reaction (yield: 72% (5), 30% (6)) see indic. refs.; similarly from 4-chloro-2-aminotoluene [Beil. XII-835, XII<sub>1</sub>-(389)] see (2); from 2,4-diaminotoluene [Beil. XIII-124, XIII<sub>1</sub>-(40)] via tetrazotization and use of  $CuCl_2$  reaction (yield: 75% (7), 57% (16), 45% (4)) (3) see indic. refs.; from toluene +  $AlCl_3$  +  $SO_2Cl_2$  at 70° (68% yield) see (10).]

[For formn. of  $\bar{C}$  (58% together with 42% 3,4-dichlorotoluene (3:6355) from *p*-chlorotoluene (3:8237) with  $Cl_2$  in pres. of Fe see (1); for formn. of  $\bar{C}$  (together with other isomers) from toluene with  $Cl_2$  in pres. of  $FeCl_3$  or  $MoCl_5$  (8) or by electrolysis in conc.  $HCl/AcOH$  soln. (9) see indic. refs.; from *o*-chlorotoluene (3:8245) or *p*-chlorotoluene (3:8237) with  $Cl_2$  in pres. of  $FeCl_3$  or  $MoCl_5$  (8) or  $Al/Hg$  (11) see indic. refs.; from potassium salt of 2,4-dichlorotoluenesulfonic acid-5 (12), sodium salt of 2,4-dichlorotoluenesulfonic acid-6 (12), or the sodium salt or amide of 2,4-dichlorotoluenesulfonic acid-3 (12) by hydrolysis in  $H_3PO_4$  with steam at 240° see indic. refs.]

[ $\bar{C}$  with  $Cl_2$  in pres. of Fe (13) or of  $Al/Hg$  (14) yields 2,4,5-trichlorotoluene (3:2100) together with other isomers;  $\bar{C}$  with  $Br_2$  at 180-200° yields (15) 2,4-dichlorobenzal dibromide which upon hydrolysis with conc.  $H_2SO_4$  as directed gives 92% overall yield 2,4-dichlorobenzaldehyde (3:1800), m.p. 74.5° (15) (for similar reaction with  $Cl_2$  see (5)).]

[ $\bar{C}$  with  $AlCl_3$  + phthalic anhydride gives (60% yield (16)) (17) *o*-(2,4-dichloro-5-methyl)benzoyl-benzoic acid, cryst. from hot toluene, m.p. 140° (16); this prod. htd. 2 hrs. at 100° with 20 pts. conc.  $H_2SO_4$  + 0.2 pt.  $H_3BO_3$  ring-closes yielding 2,4-dichloro-1-methylantraquinone, yel. cryst. from  $CHCl_3$ , m.p. 155° (16).]

$\bar{C}$  on mononitration, e.g., with cold mixt. of 2 pts. conc.  $HNO_3$  ( $D = 1.42$ ) + 3 pts. conc.  $H_2SO_4$  (2), yields (2) (8) 2,4-dichloro-5-nitrotoluene [Beil. V-332, V<sub>1</sub>-(163)], long hard ndls. from alc., m.p. 54-55° (2), 55° (18), 53° (8), 49-50° (19);  $\bar{C}$  on dinitration, e.g., with 7 pts. fuming  $HNO_3$  ( $D = 1.5$ ) + 3½ pts. conc.  $H_2SO_4$  (2), yields (2) (8) (10) 2,4-dichloro-3,5-dinitrotoluene [Beil. V-345, V<sub>1</sub>-(169)], ndls. from  $MeOH$ , m.p. 104° (2) (18) (10)

$\bar{C}$  on oxidn. with dil.  $HNO_3$  in s.t. at 130-150° (2) (6) (12), with alk.  $KMnO_4$  (70% yield (25)), with  $Na_2Cr_2O_7$  +  $H_2SO_4$  (60% yield (20)), or on electrolytic oxidn. (6.5% yield (21)) gives 2,4-dichlorobenzoic acid (3:4560), m.p. 164°.

$\bar{C}$  on sulfonation with fuming  $H_2SO_4$  yields (2) (22) 2,4-dichlorotoluenesulfonic acid-5 (corresp. sulfonyl chloride, m.p. 72° (22), 71° (2) (24), corresp. sulfonamide, m.p. 176° (2) (22); 175-176° u.c. (23));  $\bar{C}$  on treatment with chlorosulfonic acid in  $CHCl_3$  as directed (23) cf. (24) yields 2,4-dichlorotoluenesulfonyl chloride, m.p. 71-72° u.c. (23), 71° (24).

Note 1. The b.p. of 214° given by (15) appears without justification.

104-105° nt 30 mm. (8)

Note 2.  $D_4^{56.8} = 1.2122$  (4);  $D_4^{79.2} = 1.1877$  (4);  
 $D_4^{135.5} = 1.1257$  (4).

See Note 1.

Note 3. The value of  $n_D^{20}$  for mixtures of  $\bar{C}$  with benzyl chloride (3:8535) ( $n_D^{20} = 1.5391$  (13)) is a linear function of their composition (13).

[See also benzyl chloride (3:8535) and benzotrichloride (3:6540).]

Ordinary comm.  $\bar{C}$ , usually obtd. by chlorination of toluene, frequently conts. benzyl chloride (3:8535) and benzotrichloride (3:6540), which are difficult (if not impossible) to remove by distillation methods. For purification of  $\bar{C}$  by repeated fractional freezing see (5); for patent on purification of  $\bar{C}$  from inorganic contaminants see (16). The best approach to pure  $\bar{C}$  is from benzaldehyde by action of PCl<sub>5</sub> (see below).

$\bar{C}$  is insol. aq.; sol. alc., ether, or below -20° in equal vol. of pet. ether (17).

[For a method for quant. detn. of  $\bar{C}$  in mixtures with benzyl chloride (3:8535) and benzotrichloride (3:6540) see (18); for a rapid combustion method for detn. of chlorine in  $\bar{C}$  see (19).]

### PREPARATION OF $\bar{C}$

From benzaldehyde. [For prepn. of  $\bar{C}$  from benzaldehyde (1:0195) with PCl<sub>5</sub> (yield: 80-85% (20)) (21) in CHCl<sub>3</sub> (9), with POCl<sub>3</sub> in C<sub>6</sub>H<sub>6</sub> (22), with SOCl<sub>2</sub> (23) (24), with COCl<sub>2</sub> (3:5000) in s.t. at 120-130° (25), with oxalyl (di)chloride (3:5060) in s.t. at 130-140° for 2 hrs. (26), or with succinyl (di)chloride (3:6200) in s.t. at 100° (27) see indic. refs.]

From toluene. [For prepn. of  $\bar{C}$  from toluene (1:7405) with SO<sub>2</sub>Cl<sub>2</sub> (2 moles) in presence of a trace of dibenzoyl peroxide refluxed for 6 hours (90% yield (8)), with SOCl<sub>2</sub> in s.t. at 230-250° (28), with PCl<sub>5</sub> in s.t. at 190-195° for 2 hours (29), or with NOCl at 350° (30) see indic. refs.]

[For studies of formn. of  $\bar{C}$  from toluene (1:7405) with Cl<sub>2</sub>, especially in light, see the scientific papers (13) (31) (32) (33) and patents (34) (35) (36).]

From other sources. [For formn. of  $\bar{C}$  from benzyl chloride (3:8535) with Cl<sub>2</sub> (37) (38), with NOCl at 150° (39), or with PbCl<sub>2</sub>·2NH<sub>4</sub>Cl (40) see indic. refs.; from various benzyl ethers by cleavage with PCl<sub>5</sub> see (41); from  $\alpha$ -chlorobenzyl chloroformate [Beil. VII-211] by loss of CO<sub>2</sub> on distn. see (42); or from benzaldazine with NOCl see (43).]

CHEMICAL BEHAVIOR OF  $\tilde{C}$ 

**Pyrolysis.** [ $\tilde{C}$  passed over red-hot Pt wire gives (44) HCl and both *cis* (3:1380) and *trans* (3:4210) toluene dichlorides ( $\alpha, \alpha'$ -dichloro- $\alpha, \alpha'$ -diphenylethylenes).]

**Reduction.** [ $\tilde{C}$  with  $H_2$  in pres. of Pd/CaCO<sub>3</sub> (45) or Ni (46) in alc. KOH loses all its halogen as HCl (use in quant. detn.) but the corresp. org. reduction prod. has not been characterized. —  $\tilde{C}$  with  $H_2$  in pres. of colloidal Pd in dil. alc. gives (47) toluene (1:7405), benzyl chloride (3:8535), and  $\alpha$ -stilbene dichloride (3:4854). —  $\tilde{C}$  in MeOH/KOH with hydrazine hydrate in pres. of Pd gives (10% yield (48))  $\alpha$ -stilbene dichloride (3:4854).]

**Hydrolysis.**  $\tilde{C}$  upon hydrolysis yields benzaldehyde (1:0195) and HCl; frequently the reaction is so executed that the benzaldehyde reacts further according to the nature of the environment; examples of both types of reaction are cited below.

[ $\tilde{C}$  with aq. in s.t. at 140–160° (1), with aq. in pres. of ferric salts (49) or metallic Fe (50) below 100°, with 50% aq. acetone at 72° (59), with conc. H<sub>2</sub>SO<sub>4</sub> (2 moles) at 50° subsequently poured into aq. (51), with H<sub>3</sub>BO<sub>3</sub> (1 mole) at 130–160° (52) (note that benzyl chloride (3:8535) is unaffected while benzotrichloride (3:6540) gives benzoic acid (1:0715)), with boilg. aq. K<sub>2</sub>CO<sub>3</sub> (53), with moist NiCO<sub>3</sub> at 120° or moist CoCO<sub>3</sub> at 60° for 3 hrs. (60), with aq. Na<sub>2</sub>SO<sub>3</sub> at 110° (54), with ZnO in C<sub>6</sub>H<sub>6</sub> followed by aq. (55), with anhydrous formic acid (56) (57), or with anhydrous oxalic acid at 130° (58) gives (yields: 85% (52), 82% (58), 79% (51), 76% (60), 75% (59), 70% (54), 30% (55)) benzaldehyde (1:0195).]

[For study of kinetics of hydrolysis of  $\tilde{C}$  at 30° and 60° in aq. acetone either directly or in pres. of H<sub>2</sub>SO<sub>4</sub> or KOH see (61), with aq. or KOH in 95% alc. see (62); for study of influence of substituents on hydrolysis of  $\tilde{C}$  see (61) (63) (64).]

[ $\tilde{C}$  with AcOH + ZnCl<sub>2</sub> gives (65) benzaldehyde (1:0195) + acetyl chloride (3:7065) + HCl. —  $\tilde{C}$  with anhydrous alkali acetate at 180–200° for 10–20 hrs. gives (66) cinnamic acid (1:0735). —  $\tilde{C}$  with AgOAc (32) (1) (67) or with PhO in AcOH (68) gives benzal diacetate [Beil. VII-210, VII<sub>1</sub>-(119)], m.p. 45–46°.]

**Alcoholysis.** [ $\tilde{C}$  with EtOH + ZnCl<sub>2</sub> gives (65) benzaldehyde (1:0195) + ethyl chloride (3:7015) + HCl; an analogous reaction occurs with  $\tilde{C}$  + ZnCl<sub>2</sub> + aromatic alcohols (69). —  $\tilde{C}$  with sodium alcoholates under ord. press. gives the corresp. benzaldehyde acetals; e.g.,  $\tilde{C}$  with MeOH/NaOMe at 100° for 15 hrs. gives (15% yield (70)) (67) benzaldehyde dimethylacetal [Beil. VII-209], b.p. 194–196°;  $\tilde{C}$  with EtOH/NaOEt at 100° for 24 hrs. gives (33% yield (70)) (67) benzaldehyde diethylacetal [Beil. VII-209, VII<sub>1</sub>-(119)], b.p. 222°. — However,  $\tilde{C}$  with sodium alcoholates under press. in s.t. gives (70) benzaldehyde (1:0195) together with the corresp. alkyl chlorides.]

**Substitution. Chlorination** [ $\tilde{C}$  with Cl<sub>2</sub> in pres. of I<sub>2</sub> gives (32) *p*-chlorobenzal (di)chloride (3:6700). — Note, however, that  $\tilde{C}$  with excess liquid Cl<sub>2</sub> in s.t. in sunlight gives (71) an addn. prod., viz., benzal (di)chloride hexachloride, m.p. 153° (71); also that  $\tilde{C}$  with NOCl at 150° substitutes in the side chain giving (39) benzotrichloride (3:6540). — Note further that  $\tilde{C}$  with SO<sub>2</sub>Cl<sub>2</sub> + dibenzoyl peroxide does not react even when refluxed for 20 hrs. (8); cf. prepn. of  $\tilde{C}$  from toluene by this method (above).]

**Bromination.** [ $\tilde{C}$  with Br<sub>2</sub> in pres. of metallic beryllium gives (72) *p*-bromobenzal (di)bromide, b.p. 170–171° at 10 mm. (72). —  $\tilde{C}$  with Br<sub>2</sub> at 120–140° gives (57) benzodichloride bromide, C<sub>6</sub>H<sub>4</sub>CCl<sub>2</sub>Br, b.p. 88–94° at 1 mm., and benzochloride dibromide, C<sub>6</sub>H<sub>4</sub>OCIBr<sub>2</sub>, b.p. 98–103° at 1 mm.]

**Sulfonation.** [ $\tilde{C}$  with SO<sub>3</sub> does not sulfonate but instead undergoes hydrolysis: e.g.,  $\tilde{C}$  with sulfuric acid monohydrate at 35° gives (73) a mixt. of benzaldehyde-sulfonic acids in the ratio 10% *o*- + 30% *m*- + 60% *p*-, although these products cannot be isolated as such.]

**Nitration.** [All three isomeric mononitro derivatives of  $\tilde{C}$  are known, viz., *o*-nitrobenzal (di)chloride [Beil. V-332, V<sub>1</sub>-(163)], m.p. 27.5° (63), 26–26.5° (61), 25.7° (11); *m*-nitrobenzal (di)chloride [Beil. V-332, V<sub>1</sub>-(163), V<sub>2</sub>-(254)], m.p. 64.5–65° (61), 64.5° (11); *p*-nitrobenzal

(di)chloride [Beil. V-332, V<sub>1</sub>-(163), V<sub>2</sub>-(255)], m.p. 43.0–43.5° (61), 43° (63), 42.8° (11); however, they are best prepared by reaction of the corresp. nitrobenzaldehydes with PCl<sub>5</sub> (74) (75). — For thermal anal. of mixtures of the three nitrobenzal (di)chlorides see (11). — For study of the mononitration of  $\bar{C}$  with anhydrous HNO<sub>3</sub> in Ac<sub>2</sub>O at 20° giving about 23% o- + 34% m- + 43% p- see (11) cf. (76). — Note that neither dinitro nor trinitro derivatives of  $\bar{C}$  have been reported.]

**Behavior with other inorganic reactants.  $\bar{C}$  with metals.** [ $\bar{C}$  with Na on htg gives (1) stilbene (1:7250). For behavior of  $\bar{C}$  with Na in liq. NH<sub>3</sub> giving dibenzyl, benzylamine, and other products see (80). —  $\bar{C}$  with equal wt. of Cu powder at 100° for 12 hrs. couples with loss of 2 Cl giving (77)  $\alpha$ -stilbene dichloride (3:4854). —  $\bar{C}$  on boiling with Cu in aq. Na<sub>2</sub>CO<sub>3</sub> for 24 hrs. gives (78) benzaldehyde-copper, 2C<sub>6</sub>H<sub>5</sub>.CHO.Cu, green cryst., decg. about 220° without melting. —  $\bar{C}$  with Cu in pyridine reacts vigorously (79), but the products have not been characterized.]

**$\bar{C}$  with inorganic salts.** [ $\bar{C}$  with AlCl<sub>3</sub> in pet. eth. or CS<sub>2</sub> evolves HCl and resinifies (37);  $\bar{C}$  with very small amt. AlCl<sub>3</sub> at -15° gives (small yield (81)) phenyl-*m*-dichloromethyl-phenylchloromethane, b.p. 285° at 750 mm.]

[ $\bar{C}$  with SbF<sub>3</sub> on htg gives (82) (83) benzal (di)fluoride [Beil. V-290, V<sub>1</sub>-(149), V<sub>2</sub>-(224)], b.p. 130.95° (83),  $D_4^{20} = 1.13572$  (84),  $n_D^{20} = 1.45775$  (84).]

[ $\bar{C}$  with alc. Na<sub>2</sub>S under N<sub>2</sub> gives (85) cf. (86) monomeric thiobenzaldehyde, but this cannot be isolated since it immediately undergoes polymerization to  $\beta$ -trithiobenzaldehyde and/or other reactions. —  $\bar{C}$  with alc. NaSH refluxed 3–4 hrs. gives (86) dibenzyl disulfide [Beil. VI-465, VI<sub>1</sub>-(229), VI<sub>2</sub>-(437)], m.p. 69–70° (86).]

[ $\bar{C}$  with conc. aq. NH<sub>4</sub>OH on stdg. 4 months at ord. temp. (87), or  $\bar{C}$  with alc. NH<sub>4</sub>OH in s.t. at 100° (88), or  $\bar{C}$  with alc. NH<sub>4</sub>OH + trace of Zn dust at room temp. (88), gives hydrobenzamide [Beil. VII-215, VII<sub>1</sub>-(120)], m.p. 119°, doubtless through intermediate hydrolysis to benzaldehyde since this can sometimes (88) be isolated.]

**Behavior with organic reactants.  $\bar{C}$  with hydrocarbons.** [ $\bar{C}$  with C<sub>6</sub>H<sub>6</sub> in pres. of AlCl<sub>3</sub> (37) (89), Cr (90), BeCl<sub>2</sub> at 130–140° for 20 hrs. (91), or Zn dust (92) undergoes Friedel-Crafts reaction giving (yields: 28.7% (91), 19.5% (90), 13.4% (37)) triphenylmethane (1:7220) frequently accompanied (37) (89) by other products such as diphenylmethane (1:7120) and triphenylchloromethane (3:3410). —  $\bar{C}$  with C<sub>6</sub>H<sub>6</sub> + Al + HgCl<sub>2</sub> at 50–55° gives (93) cf. (89) 9,10-diphenyl-9,10-dihydroanthracene [Beil. V-745, V<sub>2</sub>-(681)], m.p. 164° (89), 159° (93).]

[ $\bar{C}$  with toluene in pres. of BeCl<sub>2</sub> refluxed 3 hrs. gives (73% yield (91)) phenyl-di-*p*-tolylmethane (4,4'-dimethyl-triphenylmethane) [Beil. V-712, V<sub>1</sub>-(352), V<sub>2</sub>-(623)], accompanied by other products. —  $\bar{C}$  with toluene + Al + HgCl<sub>2</sub> at 60–70° for 2 hrs. gives (93) a hydrocarbon C<sub>26</sub>H<sub>24</sub>, m.p. 185°, possibly having the structure 9,10-di-*p*-tolyl-9,10-dihydroanthracene.]

[ $\bar{C}$  with *o*-xylene (1:7430) + AlCl<sub>3</sub> in acetylene tetrachloride (3:6750) as solvent gives (very small yield (94)) 2,3,6,7-tetramethyl-9,10-diphenylanthracene, m.p. 312°; note that this product has composition C<sub>30</sub>H<sub>26</sub> and is *not* a dihydroanthracene deriv.]

[For use of  $\bar{C}$  + conc. H<sub>2</sub>SO<sub>4</sub> as a color test for various aromatic hydrocarbons see (95) (96).]

**$\bar{C}$  with phenols.** [ $\bar{C}$  with phenol at 120° for 10 hrs. condenses with loss of HCl giving (87% yield (70)) 4,4'-dihydroxy-triphenylmethane (leucobenzaurin) [Beil. VI-1042, VI<sub>1</sub>-(1010)], ndls. from aq. alc. or from ClICH<sub>3</sub>, m.p. 160–161° (corresp. diacetate, m.p. 115° (97)); this prod. is also ohtd. from benzaldehyde (1:0195) by condensation with phenol (1:1420) in pres. of H<sub>2</sub>SO<sub>4</sub> (yields: 25% (98), 22% (99)) or H<sub>3</sub>PO<sub>4</sub> (100); note that the isomeric benzaldehyde diphenylacetal is unreported. For formn. of resin from  $\bar{C}$  with phenol see (101).]

( $\bar{C}$  with 2 moles  $\beta$ -naphthol (1:1540) on htg. condenses with loss of  $HCl + H_2O$  giving (97% yield (102)) (103) 9-phenyl-1,2,7,8-dibenzoxanthene [Beil. XVII-98], pr. or tbs. from  $AcOH$ , m.p. 190–191° (103), 190° (102); this prod. is also obtd. from benzaldehyde (1:0195) by condensation with  $\beta$ -naphthol in  $AcOH$  in s.t. at 200° for 2 days (104) or in pres. of  $H_2SO_4$  (104) at 100°; see also under benzaldehyde (1:0195) for use as test for latter.]

$\bar{C}$  with amines ( $\bar{C}$  with aniline (2 moles) in pres. of  $Zn$  dust (92) or  $BeCl_2$  at 120–125° for 2 hrs. (91) condenses giving (54% yield (91)) 4,4'-diamino-triphenylmethane [Beil. XIII-274, XIII-1-(89)], cryst. from  $C_6H_6$  with 1 mole solvent, m.p. 106° (106), 104–105° (92), cryst. from dry ether without solvent, m.p. 139–140° (106), 139° (107) (corresp. diacetyl deriv., m.p. 233–234° (108) (109)); this compound is also obtd. from benzaldehyde (1:0195) by condensation with 2 moles aniline in various ways, e.g., see (108) (106) (107).]

( $\bar{C}$  with  $N,N$ -dimethylaniline (2 moles) in pres. of  $ZnCl_2$  at 100° (110) condenses giving 4,4'-bis-(dimethylamino)-triphenylmethane (leuco-Malachite Green) [Beil. XIII-275, XIII-1-(89)], cryst. from  $C_6H_6$  or alc. in 3 forms, m.p. 102° (111) (112), m.p. 93–94° (111), 92–93° (112), and 77° (112) cf. (111); this prod. is also obtd. from benzaldehyde (1:0195) by condensation with 2 moles  $N,N$ -dimethylaniline in various ways, e.g., with  $ZnCl_2$  at 100° (113) (112), or with  $POCl_3$  (alm. 100% yield (114)) ]

[For study of reactivity of  $\bar{C}$  toward pyridine or piperidine see (115).]

$\bar{C}$  with other nitrogenous reactants ( $\bar{C}$  (excess) with thiourea at not above 150° gives (116) (117) a salt,  $C_6H_5N_2S_2HCl$ , m.p. 236° (117), regarded as 4,6-di-imino-2-phenyl-1,3,5-dithiazane (117). — For analogous behavior of  $\bar{C}$  with  $N$ -phenylthiourea and with  $N$ -( $p$ -tolyl)-thiourea see (117) ]

( $\bar{C}$  with  $Zn$  salt of  $o$ -aminophenyl mercaptan in  $AcOH/NaOAc$  refluxed 30 min. in current of  $H_2S$  gives (low yield (118)) 2-phenylbenzothiazole, m.p. 114° cor.)

$\bar{C}$  with organometallic reactants ( $\bar{C}$  with  $MeMgI$  gives (22% yield (119))  $\alpha$ -stilbene dichloride (3:4854) + ethane but no isopropylbenzene (cumene) or *sym*-dimethyldiphenylethane; however,  $\bar{C}$  with  $MeMgCl$  gives (120) no  $\alpha$ -stilbene dichloride but instead a mixture of four other compds., viz., isopropylbenzene (cumene) (1:7440), 1-chloro-1,2-diphenylpropane, and two forms of 2,4-diphenylbutane.)

( $\bar{C}$  with  $C_6H_5MgBr$  gives (119) cf. (121) triphenylmethane (1:7220) +  $\alpha$ -stilbene dichloride (3:4854) + biphenyl (1:7175) ]

( $\bar{C}$  with  $Me_2Zn$  gives (122) isopropylbenzene (cumene) (1:7440).]

( $\bar{C}$  does not react with  $Hg$  di- $p$ -tolyl even on refluxing in toluene for 300 hrs (123).]

⑤ Hydrolysis to benzaldehyde:  $\bar{C}$  on boilg. with 10%  $K_2CO_3$  soln. gives benzaldehyde (1:0195); after acidification with  $HCl$  the benzaldehyde may be detected with fuchsin aldehyde reagent. (Dif. from pure benzyl chloride (3:6335) or pure benzotrichloride (3:6540).)

⑥ Benzaldehyde phenylhydrazone: m.p. 156° u.c. (From  $\bar{C}$  with 3 moles phenylhydrazine refluxed in alc. for 2 hrs. (55% yield (124)); note that from the mother liquor small amounts of an isomeric ( $\gamma$ ) benzaldehyde phenylhydrazone, m.p. 154–155°, are obtd. (124).]

⑦ Benzaldehyde semicarbazone: m.p. 219–220° u.c. (124). [From  $\bar{C}$  (3.2 g.) with semicarbazide hydrochloride (4.4 g.) +  $Na_2CO_3$  (2.1 g.) refluxed a few hrs. in alc. and the ppt. recrystd. from hot sq. (124); note that the m.p. of this prod. varies somewhat with rate of htg. cf. (1:0195).]

[For prepn. of  $\bar{C}$  from 2-chloro-3-aminotoluene [Beil. XII-870, XII<sub>1</sub>-(404)] via diazotization and use of  $Cu_2Cl_2$  reaction (alm. quant. yield (2), 64% (8)) see indic. refs.; for formn. of  $\bar{C}$  (together with other dichlorotoluenes) from toluene or *o*-chlorotoluene (3:8245) with  $Cl_2$  in pres. of  $FeCl_3$  or  $MoCl_5$  see (3) (4), from *o*-chlorotoluene +  $Cl_2$  +  $Al/Hg$  see (4).]

[ $\bar{C}$  with  $Cl_2$  in pres. of  $Al/Hg$  gives (70% yield (5)) 2,3,4-trichlorotoluene (3:0425), m.p. 41°.] [ $\bar{C}$  with  $Br_2$  at 180–200° gives (8) 2,3-dichlorobenzal (di)bromide (not isolated) which on hydrolysis with conc.  $H_2SO_4$  gives (71% yield (8)) 2,3-dichlorobenzaldehyde (3:1480).]

$\bar{C}$  on mononitration with conc.  $HNO_3$  (6) or cold mixt. of 2 pts. conc.  $HNO_3$  + 3 pts. conc.  $H_2SO_4$  (2) yields 2,3-dichloro-4-nitrotoluene [Beil. V-332], ndls. from alc. +  $AcOH$ , m.p. 50.5–51.5° (2), 51° (6);  $\bar{C}$  on dinitration with mixt. of 7 pts. fuming  $HNO_3$  + 3.5 pts. conc.  $H_2SO_4$  yields (2) 2,3-dichloro-4,6-dinitrotoluene [Beil. V-345], cryst. from  $AcOH$  or alc., m.p. 71–72° (2).

$\bar{C}$  on oxidn. with alk.  $KMnO_4$  (6) or with dil.  $HNO_3$  for some hrs. in s.t. at 140° (2) (6) yields 2,3-dichlorobenzoic acid (3:4650), m.p. 166° (6), 163° (2).

$\bar{C}$  on sulfonation with 2 pts. 10% oleum at 50° gives (7) mixt. of 89% 2,3-dichlorotoluene-sulfonic acid-6 (corresp. sulfonyl chloride, m.p. 51–52° (7), corresp. sulfonamide, m.p. 228° (7)) and 11% 2,3-dichlorotoluenesulfonic acid-5 (corresp. sulfonyl chloride, m.p. 87° (7), corresp. sulfonamide, m.p. 185° (7)).

80° at 3 mm.	(19)				

[See also ethyl  $\alpha$ -chloroacetoacetate (3:6207).]

Colorless limpid liq. which soon turns yellow (4). — Almost insol. aq. but miscible with most org. solvents. — [Note that purity of material of earlier workers (5) has been seriously questioned (2).]

[For prepn. of  $\bar{C}$  from acetylketene (ketene dimer (6) (7)) by conversion with  $Cl_2$  to  $\gamma$ -chloroacetoacetyl chloride (3:9088) and reactn. of the latter with excess alc. EtOH at 0° see (3); from ethyl chloroacetate (3:5700) (2 moles) with Mg (1 mole) in dry ether contg.  $HgCl_2$  (56% yield (1)) cf. (19) or with Mg in dry ether contg.  $I_2$  (35% yield (4)) or with

Al/Hg in pres. of a trace of EtOH (8) see indic. refs.; from chloroacetaldehyde (3:7212) with ethyl diazoacetate see (5); from ethyl  $\gamma$ -chloro- $\beta$ -hydroxy- $n$ -butyrate [Beil. III-310, III-116] by careful oxidn. with  $K_2Cr_2O_7 + H_2SO_4$  (poor yield) see (9).]

$\bar{C}$  on hydrolysis with aq. HCl for 3 hrs undergoes ketonic splitting yielding (1) chloroacetone (3:5425) +  $CO_2$  + EtOH (note that this does not distinguish  $\bar{C}$  from ethyl  $\alpha$ -chloroacetoacetate which yields same products).

[ $\bar{C}$  with alc. NaOEt at  $100^\circ$  undergoes bimolecular condensation with loss of 2 HCl yielding (10) diethyl succinylsuccinate [Beil. X-894, XI-434], m.p.  $125-126^\circ$  (10); this same condensation is also effected by other alkaline agents, e.g., sodium phenolate, dil. aq. NaOH,  $NH_4OH$ ,  $NH_3$  in ether, KOAc alone or in pres. of alc. or  $C_6H_6$ , diethyl sodiomalonate or  $Me_2NH$  in  $C_6H_6$ , or K phthalimide (10).]

[ $\bar{C}$  with ethyl orthoformate (1:3241) in  $Ac_2O$  refluxed for  $\frac{1}{2}$  hr. ppts. on cooling (45% yield (11)) ethyl  $\gamma$ -chloro- $\alpha$ -ethoxymethylene-acetoacetate, colorless ndls. from alc. or  $C_6H_6$ , m.p.  $98^\circ$  (11).]

Note that  $\bar{C}$  is capable of displaying keto-enol tautomerism as is shown by the following reactions:

$\bar{C}$  with  $FeCl_3$  soln. gives red coloration (1) (4) (9) (19);  $\bar{C}$  conts. 10.9% enol, but 4% soln. of  $\bar{C}$  in ether conts. 53% enol. (19).

$\bar{C}$  forms a series of metallic salts of the enolic form; these are in general insol. in aq. but soluble in org. solvents: e.g.,  $Cu(C_6H_5O_3Cl)_2$  (from  $\bar{C}$  on shaking with aq.  $Cu(OAc)_2$ ), green ndls. from  $C_6H_6$ , m.p.  $163-169^\circ$  dec. (9) (4) cf. (19),  $167.5^\circ$  dec. (1),  $163^\circ$  (8);  $Mg(C_6H_5O_3Cl)_2$  (from  $\bar{C}$  shaken with aq.  $MgSO_4 + NH_4Cl$ ), m.p.  $170^\circ$  (1);  $Zn(C_6H_5O_3Cl)_2$  (from  $\bar{C}$  on shaking with  $NH_4OH/ZnSO_4$ ), m.p.  $121^\circ$  (1);  $Ni(C_6H_5O_3Cl)_2$  (from  $\bar{C}$  on shaking with  $Ni(OAc)_2 + NH_4OH$ ), m.p.  $131-132^\circ$  (1); other metals behave similarly (1).

$\bar{C}$  couples with diazonium salt solns. in pres. of NaOAc yielding the corresp.  $\alpha$ -(arylhydrazines) of ethyl  $\gamma$ -chloro- $\alpha,\beta$ -diketo- $n$ -butyrate (ethyl  $\gamma$ -chloro- $\alpha$ -(aryldiazo)acetoacetates (cf. dif. behavior of isomeric ethyl  $\alpha$ -chloroacetoacetate (3:6207)): e.g.,  $\bar{C}$  with benzenediazonium chloride soln. in pres. of NaOAc at  $0^\circ$  gives (12) (13) ethyl  $\gamma$ -chloro- $\beta$ -keto- $\alpha$ -phenylhydrazono- $n$ -butyrate, sparing sol. yel. ndls. from alc., m.p.  $92-93^\circ$  (12) (13),  $92^\circ$  (14) (note that this prod. on htg. with alc. KOAc loses HCl and ring-closes to 3-carbethoxy-4-hydroxy-1-phenylpyrazole, colorless pr. from alc., m.p.  $85^\circ$  (14) (15)); similarly  $\bar{C}$  with  $p$ -nitrobenzenediazonium chloride soln. in pres. of NaOAc at  $0^\circ$  gives (16) ethyl  $\gamma$ -chloro- $\alpha$ -( $p$ -nitrobenzeneazo)acetoacetate, yel. ndls. from alc., m.p.  $135^\circ$  (16) (note that this prod. with hot alc. KOAc loses HCl and ring-closes to 3-carbethoxy-4-hydroxy-1-( $p$ -nitro)phenylpyrazole, colorless ndls. from AcOH, m.p.  $220^\circ$  (16). — [For analogous reactions of  $\bar{C}$  with numerous other diazonium salts see the papers represented by (16) (14) (17).]

$\bar{C}$  with thiourea on warming in alc. for 4 hrs. loses HCl and ring-closes yielding (9) ethyl (2-aminothiazolyl-4)acetate, colorless cryst. from  $C_6H_6$ , m.p.  $94^\circ$  (18),  $74^\circ$  (9) (one of these is probably a misprint for the other).

[For prepn. of  $\bar{C}$  from  $\alpha,\alpha,\beta$ -trichloro-*n*-butyric acid (3:1280) in EtOH with 10% conc.  $H_2SO_4$  in s.t. at 100° for 3 days see (2); note that the acid esterifies with difficulty and attempts to use the dry HCl method give only very poor yields (2).]

$\bar{C}$  with Zn dust in moist ether loses HCl giving (almost 100% yield (3)) ethyl  $\alpha$ -chloro-crotonate (3:8523).

3:6380 (1) Judson, *Ber.* 3, 787 (1870). (2) Perkin, *J. Chem. Soc.* 65, 424 (1894). (3) Michael, Schulthess, *J. prakt. Chem.* (2) 43, 504-596 (1891).

## 3:6400 o-CHLOROBENZYL CHLORIDE

 $C_7H_6Cl_2$ 

Boil. V - 297

V<sub>1</sub>-(152)V<sub>2</sub>-(231)

B.P. 213-214°	(1)
105-107°	at 28 mm. (2)
109.0-109.2°	at 25.6 mm. (3)
110°	at 24 mm. (4)
94°	at 15 mm. (5)
96-98°	at 14 mm. (4)
94-95°	at 10 mm. (6)
84-85°	at 3 mm. (4)

(For prepn. of  $\bar{C}$  from o-chlorobenzyl alcohol [Beil. VI-444, VI<sub>1</sub>-(222)] with  $PCl_5$  (7) or with  $SOCl_2$  + pyridine (5) see indic. refs.; from o-chlorotoluene (3:8245) with  $PbCl_4$ - $2NH_4Cl$  (1) or with  $Cl_2$  (8) (9) in ultra-violet light (4) see indic. refs.; from benzyl chloride (3:8535) with  $Cl_2$  see (10).]

[For condens. of  $\bar{C}$  with p-chlorophenol and use of prod. as anti-moth prepn. see (11); for use in prepn. of condensation prod. with sulfonated phenol see (12).]

[ $\bar{C}$  with phenol in toluene yields (13) 2-(o-chlorobenzyl)phenol, b.p. 146-151° at 3 mm. (benzoate, b.p. 173-176° at 2.5 mm.), and o-chlorobenzyl phenyl ether, b.p. 140-145° at 2.5 mm.,  $\bar{C}$  with 2,4-dichlorophenol (3:0560) in toluene yields 2-(o-chlorobenzyl)-4,6-dichlorophenol, m.p. 59.5-60.6° (benzoate, m.p. 81-82°), and o-chlorobenzyl 2,4-dichlorophenyl ether, m.p. 61-62°.]

[ $\bar{C}$  with phenol +  $AlCl_3$  yields (13) 4-(o-chlorobenzyl)phenol, m.p. 68-69° (benzoate, m.p. 64.5-65.5°), and 2-(o-chlorobenzyl)phenol (see above);  $\bar{C}$  with 2,6-dichlorophenol (3:1395) +  $AlCl_3$  yields (13) 4-(o-chlorobenzyl)-2,6-dichlorophenol, m.p. 86.5-87.5° (benzoate, m.p. 86-87°).]

[ $\bar{C}$  with Mg in 10 moles dry ether gives (60-75% yield (4)) cf. (25) o-Cl.C<sub>6</sub>H<sub>4</sub>.CH<sub>2</sub>MgCl (particularly sensitive to air oxidn.); this with  $CO_2$  followed by acidification or with methyl chloroformate (3:5075) followed by hydrolysis yields (4) o-chlorophenylacetic acid, m.p. 94-95° (3:2040); the R.MgCl cpd. with phenyl isocyanate as directed (22) for p-isomer should yield o-chlorophenylacetanilide [Beil. XII-275], m.p. 140° cor. (23), 133.5° (24), although this method has not been specifically reported for  $\bar{C}$ ; the RMgCl cpd. with  $HgCl_2$  gives (25) o-chlorobenzyl  $HgCl$ , m.p. 111°, or with  $HgBr_2$  gives (25) o-chlorobenzyl  $HgBr$ , m.p. 128°.]

[For study of behavior of  $\bar{C}$  with NaOEt see (14) (7); for study of rate of reaction of  $\bar{C}$  with LiI, NaI, or KI (6) (5) or with  $Na_2SO_3$  (2) see indic. refs., for study of acid hydrolysis of  $\bar{C}$  in various solvents see (5); for reaction of  $\bar{C}$  with KCN yielding o-chlorobenzyl cyanide (which on hydrolysis gives o-chlorophenylacetic acid (3:2040)) see (15) (16); for behavior of  $\bar{C}$  with cellulose (17) or sodium cellulose (18) see indic. refs.]

$\bar{C}$  refluxed 4 hrs. with hexamethylenetetramine (1 mole) in 60% alc. soln. yields (19) o-chlorobenzaldehyde (3:6410) q.v.;  $\bar{C}$  htd. in xylene with p-nitrophenylhydrazine yields (20) o-chlorobenzal-p-nitrophenylhydrazone, m.p. 241° (20).

$\bar{C}$  on mononitration with 1.2 pts. fuming  $HNO_3$  at 30-40° gives (35% yield (21)) 2-chloro-5-nitrobenzyl chloride, pr. from alc., m.p. 66° (21).

## 3:6410 o-CHLORO BENZALDEHYDE

 $C_7H_5OCl$ 

Bell. VII - 233  
VII<sub>1</sub> - (132)

B.P.		M.P.	
213-214°	(1)	11° (4)	$D_4^{20} = 1.2512$ (6) $n_D^{20} = 1.50708$ (6)
	(2)	(14)	
209.7-211.7° at 760 mm.	(3)		
208° at 748 mm.	(4)		
205-206° cor. at 740 mm.	(5)		
96.0-96.0° at 16 mm.	(3)		

Oil, volatile with steam. —  $\bar{C}$  often contains o-benzyl chloride (3:6400) as impurity (7). —  $\bar{C}$  very easily oxidized in air (probably also of variant constants). —  $\bar{C}$  yields  $\text{NaHSO}_3$  epd. (15) (21).

[For prepn. of **6** from *o*-chlorotoluene (**3:8**)<sup>(245)</sup> with MnO<sub>2</sub> + H<sub>2</sub>SO<sub>4</sub> (**8**), or PbO<sub>2</sub> (24% yield) (**21**), or CrO<sub>2</sub>Cl<sub>2</sub> in CCl<sub>4</sub> (**9**) or CS<sub>2</sub> (**10**), or via halogenation to *o*-chlorobenzal (di)chloride (**3:6626**) (**5**) (**12**) or *o*-chlorobenzal (di)bromide (**11**) and subsequent hydrolysis with fuming H<sub>2</sub>SO<sub>4</sub> (**11**) (**12**) (**1**) or anhydrous oxalic ac. (**14**) see indicated refs.; for prepn. from *o*-nitrobenzaldehyde via *o*-aminobenzaldehyde see (**12**); from *o*-chlorobenzyl alc. by dehydrogenation with CuO + dinitrobenzene in quinoline (86% yield) see (**13**); from *o*-chlorobenzyl chloride (**3:0400**) . . . . . chlorido (**3:6040**) by cat. reduct.

$\text{C}$  with  $\text{CrO}_3$  (16) or  $\text{KMnO}_4$  (2) oxidizes to *o*-chlorobenzoic acid (3:4150), m.p. 141°. [For study of auto-oxidn. see (17).] —  $\text{C}$  on cat. hydrogenation gives (yield: 90% (18); 50% (16)) *o*-chlorobenzyl alc., m.p. 60° (16), 64–65° (18). —  $\text{C}$  with conc. alk. undergoes Cannizzaro reactn. (for study on dioxane soln. see (20)) although presumable products, *o*-chlorobenzyl alc. and *o*-chlorobenzoic alc., have not (by this reactn.) actually been isolated.

$\bar{C}$  with dil. alc. KCN for 4 hrs. at  $00^\circ$  gives (21% yield (22)) 2,2'-dichlorobenzoin, m.p.  $63-64^\circ$  (22). —  $\bar{C}$  with KCN + HCl yields *o*-chloromandelonitrile which on hydrolysis with HCl gives *o*-chloromandelic acid, m.p.  $84-85^\circ$  (23).

with  $\text{HCl}$  gives *o*-chloromandelic acid, m.p. 84–85° (23).  
 $\dot{\text{C}}$  on hgt. with  $\text{NaOAc} + \text{Ac}_2\text{O}$  for 8 hrs. at 180–200° undergoes Perkin reactn. giving (71% yield (12)) *o*-chlorocinnamic acid, m.p. 214° (12). [This with  $\text{Br}_2$  in  $\text{CHCl}_3$  gives (24) *o*-chlorocinnamic acid dibromide, m.p. 183° (24).] —  $\dot{\text{C}}$  + malonic acid + pyridine gives (38) alm. quant. yield of *o*-chlorocinnamic ac., m.p. 211–212° (31). [In absence of pyridine reactn. gives 63% yield *o*-chlorobenzalmalonic acid, m.p. 102° (37).]

C on mononitration as specified (25) gives 2-chloro-5-nitrobenzaldehyde, *cryst. from*

dil. AcOH, m.p. 78–79° (25), 80° (26). [Oxime, m.p. 147–148° (26); corresp. acid, 2-chloro-5-nitrobenzoic acid, m.p. 165° (25).]

$\bar{C}$  in alc. warmed at 58–60° for 2 hrs. with  $(NH_4)_2CO_3 + KCN$  as directed (37) gives 5-(*o*-chlorophenyl)hydantoin, m.p. 175.7–176.1° cor. (37).

$\bar{C}$  with hydrazine sulfate gives (91–95% yield (40)) *o*-chlorobenzaldazine, m.p. 143.5° cor., but  $\bar{C}$  with hydrazine hydrate gives (84% yield (40)) *o*-chlorobenzaldehyde hydrazone m.p. 33–34°, b.p. 165–170° at 14 mm.; note that latter on Wolff-Kishner reduction gives (35–82% yield (40)) *o*-chlorotoluene (3:8245).]

① *o*-Chlorobenzaldoxime (*anti* form): pr. from alc., m.p. 75–76° (1) (27). [From  $\bar{C} + NH_2OH.HCl + Na_2CO_3$  (1); the *sym.* isomer has m.p. 98–102° (28), 101–103° (7).]

② *o*-Chlorobenzaldehyde phenylhydrazone: m.p. 86° (29), 84° (39).

③ *o*-Chlorobenzaldehyde *p*-nitrophenylhydrazone: or. pl., m.p. 249° (30) (31); br.-red. ndls., 241° (32); red ndls. from alc., 237–238° (13).

④ *o*-Chlorobenzaldehyde 2,4-dinitrophenylhydrazone; or.-red. ndls. from xylene, m.p. 209° (33), 213.6° (34) 207° (41). [Use in detn. of  $\bar{C}$  (11).]

⑤ *o*-Chlorobenzaldehyde dimethone: ndls. from alc., m.p. 199° u.c., 205° cor. (35). [Corresp. anhydride, cryst. from alc., m.p. 224–226° cor. (35).]

⑥ *o*-Chlorobenzaldehyde semicarbazone: lfts. from MeOH, m.p. 229–230° (36), tpls. from pyridine, m.p. 225–226° (9), 226° (42).

For thermal annl. of mixts. of  $\bar{C}$  with 1,2,3-trichlorobenzene (3:0990) or with 1,3,5-trichlorobenzene (3:1400) see (10) (the eutectic of  $\bar{C}$  with the former conts. 71%  $\bar{C}$  and melts 2.7° (10)); for m.p./compu. data on ternary mixt. of  $\bar{C}$  with the other two isomers see (10).

[For use of  $\bar{C}$  in mfg. of elec. insulating material see (16).]

[For prepn. of  $\bar{C}$  from 2,4-dichloroaniline [Beil. XII-621; XII<sub>1</sub>-(309)] (1) (11), from 2,5-dichloroaniline [Beil. XII-625, XII<sub>1</sub>-(311)] (6), or 3,4-dichloroaniline [Beil. XII-626 XII<sub>1</sub>-(311)] (1) via diazotization and use of  $Cu_2Cl_2$  reaction see indic. refs.; from 4-chloro-1,3-diaminobenzene [Beil. XIII-53, XIII<sub>1</sub>-(15)] via tetrazotization and use of  $Cu_2Cl_2$  reaction (62% yield) see (17); from *p*-dichlorobenzene (3:0980) with  $S_2Cl_2$  in  $SO_2Cl_2$  +  $AlCl_3$  (58% yield  $\bar{C}$ ) see (3) (18).]

[For formn. of  $\bar{C}$  from 2,3,6-trichlorobenzaldehyde (3:2287) by KOH fusion (88% yield (4)) or from 2,3,6-trichloroacetophenone by KOH fusion (82% yield (14)) see indic. refs.; from 2,4-dichlorophenol (3:0560) by htg. 7 hrs. with  $PCl_5$  (25.5% yield) see (1); from 2-nitro-1,4-dichlorobenzene or from 4-chloro-3-nitrobenzenesulfonic acid by btg. with  $SOCl_2$  in s.t. 10 hrs. at 160-180° see (19) (20); from 2-chlorobenzene-1,4-disulfonyl chloride with  $PCl_5$  in s.t. 4 hrs. at 210° see (8); from 2,4-dichlorobenzene-sulfonyl chloride by htg. with  $SOCl_2$  in s.t. at 180° see (21).]

[For formn. of  $\bar{C}$  (together with other products) from  $C_6H_6$  with  $Cl_2$  in pres. of  $I_2$  (7) or of Fe (22) see indic. refs.; from *o*-dichlorobenzene (3:6055) and/or *p*-dichlorobenzene (3:0980) with  $Cl_2$  under various conditions see (22) (23) (24) (25) (9); from *m*-dichlorobenzene (3:5960) with  $Cl_2$  under various conditions see (9) (13) (23); from chlorobenzene (3:7903) or *p*-dichlorobenzene (3:0980) by boilg. with  $FeCl_3$  see (26); from  $\alpha$ -benzene-hexachloride (3:4410) on htg. above its m.p. (158°) (28) (21) or htd. with aq. in s.t. at 200° (27), or on boilg. with  $MeOH/KOH$  (10),  $EtOH/KOH$  (10) (28) (5) (22), alc. KCN (27), or pyridine (10), or on htg. with quinoline at 105-110° (10), see indic. refs.; from  $\beta$ -benzene-hexachloride (3:4990) q.v. on boilg. with alc. KOH see (10).]

[ $\bar{C}$  with  $Cl_2$  in pres. of Al/Hg yields exclusively (23) 1,2,4,5-tetrachlorobenzene (3:4115), m.p. 135-136° (23);  $\bar{C}$  with liq.  $Cl_2$  in s.t. at room temp. for 10 days gives (29) (30) a mixt. of addn. products.]

[ $\bar{C}$  with  $NuOMe$  in  $MeOH$  under various conditions (31) (32) (33) (11) (34) yields 2,5-dichlorophenol (3:1190), m.p. 57°; for behavior with  $EtOH/KOH$  see (38).]

$\bar{C}$  on mononitration, e.g., by soln. of  $\bar{C}$  (1 g.) in 5 ml. fuming  $HNO_3$  ( $D = 1.49$ ) (35), then pouring onto ice (35), gives 100% yield (35) (1) (5) (15) (39) 1,2,4-trichloro-5-nitrobenzene [Beil. V-246], pr. from alc., m.p. 53° (1), 57° (7) (15), 56° (35); this prod. with piperidine as directed (36) yields 1,2-dichloro-4-piperidino-5-nitrobenzene, red pr. from alc., m.p. 64-65° (36).

$\bar{C}$  on dinitration, e.g., by soln. of  $\bar{C}$  (1 g.) in 5 ml. fuming  $\text{HNO}_3$  ( $D = 1.49$ ) + 5 ml. conc.  $\text{H}_2\text{SO}_4$  and subsequent refluxing for 1 hr., then pouring into aq. (35), gives (100% yield (35)) (7) (37) 1,2,4-trichloro-3,5-dinitrobenzene [Beil. V-266], pr. from alc., m.p. 103.5° (7), 102.5–103.5° (35) (37); this prod. (1 g.) htd. 1 hr. at 100° with 5 g. aniline as directed (35) yields 1-chloro-2,4-dianilino-3,5-dinitrobenzene, m.p. 182° (35).

Note that the trinitration prod. to be expected from complete nitration of  $\bar{C}$  has not been reported.

$\bar{C}$  with chlorosulfonic acid as directed (35) yields 1,2,4-trichlorobenzenesulfonyl chloride, m.p. 31–34° (35) which with  $(\text{NH}_4)_2\text{CO}_3$  yields 1,2,4-trichlorobenzenesulfonamide, m.p. above 200° (35).]

—  $p$ -CHLOROBENZYL CHLORIDE

$\text{C}_7\text{H}_5\text{Cl}_2$

Beil. V - 297

V<sub>1</sub>-(152)

V<sub>2</sub>-(231)

B.P. 214°

M.P. 29–30°

See 3:0220. Division A: Solids.

3:6425 HEXACHLOROBUTADIENE-1,3

$\text{C}_4\text{Cl}_6$

Beil. S.N. 12

B.P.

M.P.

215°

(1)

–21° (1) (2)

$D_4^{20} = 1.6820$  (1)

$n_D^{20} = 1.5542$  (1)

211° at 710 mm. (2)

–19° (5)

[See also octachlorocyclopentene (3:0422).]

Colorless oily liq. with weak turpentine-like odor.

[For prepn. of  $\bar{C}$  from butadiene-1,3 (1) (3) or butane, buteno, or their chloro substitution products (3) (4) with  $Cl_2$ ; or from hexachlorobutene (itself obtd. from dimerization (5) (2) of trichloroethylene (3:5170)) by cat. addn. of  $Cl_2$  followed by cat. removal of 2 HCl or vice versa (1) (2); or from acetylene with  $Cl_2$  (6) (note that tetrachloroethylene (3:5460) is also formed).]

$\bar{C}$  on reduction with Zn + alc. gives (1) butadiene-1,3 (corresp. tetrahydride, m.p. 117°).

$\bar{C}$  behaves as if saturated: e.g.,  $\bar{C}$  does not add  $Cl_2$  (even in sunlight) (1);  $\bar{C}$  does not (1) react with maleic anhydride or benzoquinone-1,4;  $\bar{C}$  does not (1) polymerize (even at 100 atm.).

$\bar{C}$  is stable toward acids and alkalis and (unlike some other highly chlorinated unsaturates) does not give a carboxylic acid on treatment with conc.  $H_2SO_4$  (1).

Note that a product of m.p. 38° and b.p. 283° formerly regarded as  $\bar{C}$  is now thought to be octachlorocyclopentene (3:0390).

3:6425 (1) Fruhwirth, *Ber.* 74, 1700-1701 (1941). (2) Consortium für Elektrochem. ### 3:6430 DICHLOROACETIC ACID ANHYDRIDE

 $C_2H_2O_2Cl_4$ 

Beil. II - 204

 $\Pi_1-$   
 $\Pi_2-$ 

B.P.

214-216° dec. (1)

 $D_4^{25} = 1.574$  (1)

140° at 35 mm. (2)

100-102° at 15 mm. (3)

Note that the above name of  $\bar{C}$  is so rendered to emphasize that it is the anhydride of dichloroacetic acid (not a dichlorinated acetic anhydride).

[For prepn. of  $\bar{C}$  from dichloroacetyl chloride (3:5290) with Na $\bar{A}$  in  $POCl_3$  in dry ether (1), or with Na $\bar{A}$  +  $AlCl_3$  (4), or on boilg. with  $Na_2CO_3$  (2) see indic. refs.; for formn. of  $\bar{C}$  as by-product during reactn. of sodium dichloroacetate with acetyl chloride (3:7065) in dry ether see (3) (the other prod. is the mixed anhydride, acetic-dichloroacetic anhydride [Beil. II-204], b.p. 79-80° at 15 mm.,  $D_4^{20} = 1.5170$  (3).]

$\bar{C}$  on hydrolysis with aq. yields dichloroacetic acid (3:6208) q.v.; for the amide, anilide, p-toluidide, and other derivs. corresp. to  $\bar{C}$  see dichloroacetic acid (3:6208).

3:6430 (1) Anthoine, *Jahresber.* 1883, 1032. (2) Patterson, *Ber.* 38, 212-213 (1905). (3) Baroni, *Gazz. chim. ital.* 63, 30 (1933); *Cent.* 1933, I 3183; *C.A.* 27, 3447 (1933). (4) Strosacker, Schwieger (to Dow Chem. Co.), U.S. 1,713,104, May 14, 1929; *Cent.* 1929, II 1215; *C.A.* 23, 3234 (1929).

3:6445 *m*-CHLOROBENZYL CHLORIDE $C_7H_6Cl_2$ 

Beil. V —

 $V_1$ — $V_2$ -(231)

B.P.

215-216° at 753 mm. (1)

 $D_4^{15} = 1.2695$  (1)

213-214° at 740 mm. (2)

111.0-111.2° at 25.4 mm. (3)

111-113° at 25 mm. (4)

110-111° at 25 mm. (5)

104° at 17 mm. (6)

[For prepn. from *m*-chlorobenzyl alc. [Beil. VI-444] with  $PCl_5$  (1) or with  $SOCl_2$  (yield: 87% (5), 78% (4)) see indic. refs.; from *m*-chlorotoluene (3:8275) with  $Cl_2$  see (2) (3) (6) (7) (8) (9) see indic. refs.]

[ $\bar{C}$  with phenol in toluene yields (10) *o*-(*m*-chlorobenzyl)phenol, h.p. 192-194° at 14 mm. (benzoate, m.p. 67-67.4°), and *m*-chlorobenzyl phenyl ether, m.p. 36.0-36.4°;  $\bar{C}$  with 2,4-dichlorophenol (3:0560) in toluene yields (10) 2-(*m*-chlorobenzyl)-4,6-dichlorophenol, m.p. 59.4-60.0° (benzoate, m.p. 63.5-64.0°, benzenesulfonate, m.p. 114.5-115.0°, *p*-toluenesulfonate, m.p. 125.4-126.0°), and *m*-chlorobenzyl 2,4-dichlorophenyl ether, m.p. 42-42.5°.]

[ $\bar{C}$  with phenol +  $AlCl_3$  yields (10) *p*-(*m*-chlorobenzyl)phenol, h.p. 145-148° at 3 mm. (benzoate, m.p. 57.5-58.0°);  $\bar{C}$  with 2,6-dichlorophenol (3:1595) yields (10) 4-(*m*-chlorobenzyl)-2,6-dichlorophenol, m.p. 79-80° (benzoate, m.p. 130-130.4°; *p*-toluenesulfonate, m.p. 104.5-105.0°).]

[ $\bar{C}$  with Mg in dry ether yields (8)  $m-Cl.C_6H_4.CH_2Cl$ ; this on treatment with  $CO_2$  yields  $m-Cl.C_6H_4.CH_2.COOMgCl$  which on subsequent further treatment with various other  $RMgX$  cpds. undergoes abnormal reaction giving *m*-chlorophenylmalonic acid, m.p. 127-128° (8); the  $RMgCl$  cpd. with phenyl isocyanate as directed (13) for the *p*-isomer should yield *m*-chlorophenylacetanilide, m.p. 130° cor. (14), although this reaction has not been specifically reported for  $\bar{C}$ .]

[For studies of rate of reaction of  $\bar{C}$  with  $NaOEt$  see (1) (11) (5); with  $Na_2SO_3$  see (4); with  $AlCl_3 + C_6H_6$  see (12); for acid hydrolysis in acetone see (6); with  $KI$  in various solv. see (6); for reactn. of  $\bar{C}$  with diethyl malonate see (2).]

 Oil. — Volatile with steam. —  $\bar{\text{C}}$  yields  $\text{NaHSO}_3$  cpd.

 [For prepn. of  $\bar{\text{C}}$  from *m*-nitrobenzaldehyde via reductn. with  $\text{SnCl}_2$  to *m*-aminobenzaldehyde followed by diazotization and reactn. with  $\text{CuCl}$  (yield: 75-79% (4), 70-80% (3), 58-65% (7) (24) see indic. refs.; from *m*-chlorotoluene (3:8275) with  $\text{CrO}_2\text{Cl}_2$  (44.5% yield) see (8); from *m*-chlorobenzyl alc. by oxidn. with  $\text{HNO}_3/\text{H}_2\text{SO}_4$  see (9); for formn. (together with other products) during chlorination of benzaldehyde see (10); from *m*-chlorobenzylamine with formalin + hexamethyleotetramine see (25).]

 $\bar{\text{C}}$  is readily oxidized even by air (4);  $\bar{\text{C}}$  with  $\text{KMnO}_4$  yields *m*-chlorobenzoic acid (3:4392), m.p. 154°. [For study of auto-oxidn. see (11).] —  $\bar{\text{C}}$  with conc. NaOH undergoes Cannizzaro reactn. (for study in dioxane soln. see (23)) although the presumable products, *m*-chlorobenzyl alc., b.p. 234°, and *m*-chlorobenzoic acid, m.p. 154°, have not (by this reactn.) actually been isolated.

 $\bar{\text{C}}$  with dil. alc. KCN at 60° for 5 hrs. in absence of air gives 22% yield of 3,3'-dichlorobenzoin, cryst. from lgr., m.p. 75-76° (12).

 $\bar{\text{C}}$  on hgt. with  $\text{NaOAc} + \text{Ac}_2\text{O}$  for 8 hrs. at 180-200° undergoes Perkin reactn. giving (61.5% yield (13)) *m*-chlorocinnamic acid, m.p. 165° (13) (14). [This with  $\text{Br}_2$  in  $\text{CHCl}_3$  gives dibromide, m.p. 183° (15).] —  $\bar{\text{C}}$  htd. with malonic acid + pyridine (24) gives alm. quant. yield (24) of *m*-chlorocinnamic acid, m.p. 163° (24). [In absence of pyridine reaction gives 100% yield *m*-chlorobenzalmalonic acid, m.p. 184-186° (24).]

 $\bar{\text{C}}$  on mononitration as specified (3) yields 3-chloro-6-nitrobenzaldehyde [Beil. VII-262], ndls. from dil. alc., m.p. 77.5° (3). [Oxime, thls. from alc., m.p. 112° (3); phenylhydrazone, ndls. from alc., m.p. 180-181° (3).]

- ① *m*-Chlorobenzaldoxime (*anti* form): pr. from alc., m.p. 70-71° (2), 70° (16) (17). [From  $\bar{C}$  +  $NH_2OH \cdot HCl$  +  $Na_2CO_3$  (2); the *syn* isomer (from the *anti* via ethereal  $HCl$ , then  $Na_2CO_3$ ) has m.p. 115-116° rap. htg. (2), 118° (17).]
- ② *m*-Chlorobenzaldehyde phenylhydrazone: ndls. from abs. alc., m.p. 134-135° (3), 133-134° (18).
- ③ *m*-Chlorobenzaldehyde *p*-nitrophenylhydrazone: cryst. from dil.  $AcOH$ , m.p. 216° (19), 214° (16). [For m.p./compn. data on mixt. of this deriv. with benzaldehyde *p*-nitrophenylhydrazone, m.p. 190°, see (16).]
- ④ *m*-Chlorobenzaldehyde 2,4-dinitrophenylhydrazone: or.-yel. cryst., m.p. 256° (20), Bordeaux-red cryst. from xylene, m.p. 248° cor. (22), 245° (25). [Use in detn. of  $\bar{C}$  (22).]
- ⑤ *m*-Chlorobenzaldehyde semicarbazone: mts. from  $MeOH$  (21) or pyridine (8), m.p. 230° (21), 228° (8). [This deriv. does not distinguish  $\bar{C}$  from *o*- (3:6410) or *p*- (3:0765) isomers.]

Colorless liquid insol. aq., sol. many org. solvents. — Ord. samples of  $\bar{C}$  may also cont. benzal (di)chloride (3:6327) or even benzyl chloride (3:8535). —  $\bar{C}$  when pure is stable in dry air, but ord. material (contg. dislvd. HCl) hydrolyzes rapidly in moist air (3). — The very high value (93) of molal f.p. lowering of  $\bar{C}$  prob. accounts for difficulty of earlier workers in attaining high f.p. values (3). — For removal of dislvd. HCl from  $\bar{C}$  by treat. with  $PbCO_3$  see (9). — For purification of  $\bar{C}$  via crystallization see (10); for comml. purification see (12).

$\bar{C}$  forms const.-boilg. mixts. with various cpds., e.g.,  $\bar{C}$  with *p*-dibromobenzene (b.p. 220.25°) forms an azeotrope, b.p. 219.6° at 760 mm., contg. 28 wt. %  $\bar{C}$  (2);  $\bar{C}$  with nitrobenzene (b.p. 210.75°) forms an azeotrope, b.p. 210.72° at 760 mm., contg. 1.5 wt. %  $\bar{C}$  (2);  $\bar{C}$  with *o*-nitrotoluene (b.p. 221.85°) forms an azeotrope, b.p. 219.55° at 760 mm., contg. 75.5 wt. %  $\bar{C}$  (13);  $\bar{C}$  with methyl salicylate (1:1750) (b.p. 222.35°) forms an azeotrope, b.p. 220.75° at 760 mm., contg. 97 wt. %  $\bar{C}$  (13).

$\bar{C}$  is impt. intermediate in prepn. of benzoic acid (see below under hydrolysis), in prepn. of certain dyestuffs (see below), and in prepn. of acyl halides and anhydrides (see below); for use in prepn. of films of cellulose ethers see (14).

[For prepn. of  $\bar{C}$  from toluene with  $Cl_2$  especially in pres. of light and/or other catalysts see (15) (16) (17) (18); with  $Cl_2$  in pres. of  $PCl_3$  (3) cf. (19); with  $SOCl_2$  in s.t. at 220° for 18 hrs. (20) or at 230-250° (21) see indic. refs.; with  $NOCl$  at 350° see (22); for formn. of  $\bar{C}$  from benzal (di)chloride (3:6327) with  $Cl_2$  (23) or with  $NOCl$  at 150° (24) see indic. refs.; from benzyl chloride (3:8535) by htg. with  $PhCl_4 \cdot 2NH_4Cl$  see (25); from benzoyl chloride (3:6240) with  $PCl_5$  see (26); from benzotrifluoride + acetyl chloride +  $AlCl_3$  as directed see (8); from benzyl ethers with  $PCl_5$  see (27).]

[ $\bar{C}$  on reductn. in alc. soln. with  $H_2$  in pres. of colloidal Pd (28) or  $Pd/CaCO_3$  (29) reacts bimolecularly giving (75% yield (28)) toluene tetrachloride (diphenylacetylene tetrachloride) (3:4496), colorless cryst. from  $AcOH$ , m.p. 162-163° (28), also obt'd. from  $\bar{C}$  by other treatments (see below); this prod. with  $H_2$  +  $Pd/CaCO_3$  in alc. KOH is further reduced yielding (29) dibenzyl (1:7149) (use in quant. detn. of its halogen (29)). —  $\bar{C}$  with hydra-

zine hydrate in MeOH/KOH in pres. of Pd/CaCO<sub>3</sub> refluxed for 1½ hrs. gives (42% yield (30)) a mixt. of the two geom. isomeric tolane dichlorides consisting mainly of the  $\alpha$ -isomer (3:4210), colorless tbls. from alc., m.p. 148° (30), with a little of the  $\beta$ -isomer (3:1380), m.p. 61° (30); despite their unsaturation these prods. reduce further only with difficulty.

[ $\bar{C}$  satd. with Cl<sub>2</sub> and stood in sunlight for 8 months or  $\bar{C}$  with liq. Cl<sub>2</sub> in sunlight for a few days adds 3 Cl<sub>2</sub> yielding (31) 1,2,3,4,5,6-hexachloro-1 (trichloromethyl)cyclohexane, cryst. from CHCl<sub>3</sub> or by sublimation, m.p. 103° (31); this may be accompanied by a little pentachlorotrichloromethylcyclohexene, m.p. 132–134° (31). —  $\bar{C}$  with Cl<sub>2</sub> in pres. of I<sub>2</sub> yields (32) a mixt. of mono- and di-chlorobenzotrichlorides.]

[ $\bar{C}$  on pyrogenic decompn. over Pt at red heat yields (32a) cf. (34) tolane tetrachloride (3:4496) together with its isomorphous mixt. with  $\alpha$ -tolano dichloride (see above). —  $\bar{C}$  with Na in liq. NH<sub>3</sub> yields (33) 5% dibenzyl (1:7149) accompanied by much nitrogenous tar. —  $\bar{C}$  with Zn in ether soln. reacts vigorously yielding (35) a deep green sola. contg. tolane dichloride (see above). —  $\bar{C}$  with equal wt. reduced Cu at 100° for 10 hrs. yields (36) tolane tetrachloride, m.p. 162° (3:4496); note that distn. of crude reactn. prod. leads to further reactn. and formation (36) (37) of  $\alpha$ - and  $\beta$ -tolane dichlorides (see above). —  $\bar{C}$  with C<sub>6</sub>H<sub>6</sub> in pres. of powdered chromium metal at 100° for 5 hrs. gives (17% yield (38)) triphenylchloromethane (3:3410), m.p. 106° (38). —  $\bar{C}$  with small proportion of AlCl<sub>3</sub> (0.1 mole) at 50–60° evolves HCl and gives a mixt. (39) contg. 40%  $\alpha,\alpha$ -dichloro-*m*-trichloromethyl-diphenylmethane, m.p. 50–61°, + 10% *m*-( $\alpha,\alpha'$ -dichloro-*m'*-trichloromethylbenzyl)- $\alpha,\alpha$ -dichlorodiphenylmethane, oil, + 34% unchanged  $\bar{C}$ . —  $\bar{C}$  with AlCl<sub>3</sub> in C<sub>6</sub>H<sub>6</sub> (39) or  $\bar{C}$  with Al + HgCl<sub>2</sub> in C<sub>6</sub>H<sub>6</sub> (40) gives (62% yield (39)) 0,0',10,10'-tetraphenyl-0,10-dihydroanthracene, cryst. from acetone or lgr., m.p. 159° (40), 157–158° (39).]

[ $\bar{C}$  with MeMgCl in ether gives two types of reactn. according to concn. (41); e.g.,  $\bar{C}$  with dilute MeMgCl yields tolane tetrachloride (3:4496) + ethano + MgCl<sub>2</sub>, while  $\bar{C}$  with conc. MeMgCl gives in 22% yield a mixt. of the two geom. isomers of tolane dichloride (see above) consisting of 5 pts. of the *trans* form (3:4210), m.p. 138–139° (41), together with 1 pt. of the *cis* form (3:1380), m.p. 63° (41), separable by fractional crystn. from alc. — For reactn. of  $\bar{C}$  with EtMgBr see (42). —  $\bar{C}$  does not (43) react with excess mercury di-*p*-tolyl.]

[ $\bar{C}$  with HF gas in Cu flask at 0° for 72 hrs. (44), or  $\bar{C}$  with SbF<sub>3</sub> (45) (46), or  $\bar{C}$  with SbF<sub>3</sub>.2NaF at 130–140° (47), gives yields; 75–95% (44), 75% (45), benzotrifluoride, b.p. 102.3°, m.p. –29°. — Note that  $\bar{C}$  with ZnF<sub>2</sub> in Cu flask at 120° for 6 hrs. gives (65% yield (57)) benzoyl fluoride, b.p. 155–156° (57), also that  $\bar{C}$  + KF in HCOOH gives (16% yield (58)) formyl fluoride, b.p. –26° at 750 mm. (58).]

$\bar{C}$  on complete hydrolysis yields benzoic acid (1:0715): e.g.,  $\bar{C}$  on htg. with anhydrous HCOOH yields (48) BzOH + CO + HCl (use in detn. of side-chain halogen (49));  $\bar{C}$  with aq. in s.t. at 150° (15) or with aq. at 90–95° in pres. of Fe salts (50), or with aq. vapor at 550–850° over cat. (51), or with aq. + ZnCl<sub>2</sub> at 110–115° under press. (52), or with aq. CaCO<sub>3</sub> at 90° followed by acidif. with minl. acid (53) yields BzOH; note, however, although  $\bar{C}$  in ether soln. is only slowly hydrolyzed by aq. at room temp. (54) yet  $\bar{C}$  adequately shaken with aq. at room temp. is completely hydrolyzed (use in detn. of  $\bar{C}$  + benzal (di)-chloride + benzyl chloride by titration with std. alk. using thymolsulfonphthalein (55)) and  $\bar{C}$  if subjected to actn. of steam (as in steam distn. of mixt. with volatile cpds.) is partially hydrolyzed (8). — [For study of kinetics of hydrolysis of  $\bar{C}$  in aq. acetone at 30° in pres. of acids, bases, or salts see (1).]

[ $\bar{C}$  on partial hydrolysis yields benzoyl chloride (3:6240): e.g.,  $\bar{C}$  with limited amt. aq. in pres. of H<sub>2</sub>SO<sub>4</sub> or FeCl<sub>3</sub> (56), or  $\bar{C}$  with ord. comml. ZnCl<sub>2</sub> at 120° (57) (58), or  $\bar{C}$  with aq. vapor over tin phosphate at 240° (59), or  $\bar{C}$  with pure ZnO at 100° (57), or  $\bar{C}$  with benzoic

acid in boilg. nitrobenzene (60), yields  $BzCl$ ; note, however, that  $\bar{C}$  with pure  $ZnCl_2$  fails to react but addn. of 1 mole aq. or initial use of tech.  $ZnCl_2$  gives  $BzCl$  (57).]

[ $\bar{C}$  htd. with carboxylic acids or anhydrides especially in pres. of  $ZnCl_2$  is often used to prepare a mixture of benzoyl chloride with the acid chloride of the acid employed, particularly in cases where the two acyl chlorides are readily separable: e.g.,  $\bar{C}$  with phthalic anhydride (1:0725) (61) (62) or phthalic acid (1:0820) (62) +  $ZnCl_2$  at 110–120° or above gives 96% yield  $BzCl$  (3:6240) + 93% *sym.*-phthalyl (di)chloride (3:6900); for other examples see under chloroacetyl chloride (3:5235), dichloroacetyl chloride (3:5290), trichloroacetyl chloride (3:5420), fumaryl (di)chloride (3:5875), and terephthalyl (di)chloride (3:2205). — Similarly  $\bar{C}$  with salts of sulfonic acids yields  $BzCl$  + the corresp. sulfonyl chloride: e.g.,  $\bar{C}$  + sodium  $\beta$ -naphthalenesulfonate gives (63) 90% yield  $BzCl$  + 80% yield  $\beta$ -naphthalenesulfonyl chloride.]

[ $\bar{C}$  under certain conditions may be converted to benzoic anhydride (1:0595): e.g.,  $\bar{C}$  with  $BzOH$  + trace Fe salts htd. 6 hrs. at 110–115° under reflux (64), or  $\bar{C}$  with  $NaOBz$  (65), or  $\bar{C}$  with ord. conc.  $H_2SO_4$  (66), or  $\bar{C}$  in  $AcOH$  in pres. of phosgene (67), yields  $Bz_2O$ .]

$\bar{C}$  very readily undergoes alcoholysis: e.g.,  $\bar{C}$  with  $EtOH$  in pres. of  $ZnCl_2$  yields (69) ethyl benzoate (1:3721); note, however, that  $\bar{C}$  + abs.  $EtOH$  in s.t. at 130–140° (70) or  $\bar{C}$  + trace sublimed  $FeCl_3$  treated at 80–110° with 95% alc. (71) yields benzoyl chloride (3:6240) + ethyl chloride (3:7015); furthermore that  $\bar{C}$  + ethyl acetate (2 moles) in pres. of  $ZnCl_2$  yields (69) ethyl benzoate (1:3721) + acetyl chloride (3:7065) + ethyl chloride (3:7015).

$\bar{C}$  reacts with phenols to give various products according to circumstances:  $\bar{C}$  with aq. (72) (74) or better alc. (73) sodium phenolate (3 mmoles) gives at 100° small yields of phenyl benzoate (1:2257), m.p. 71°, and of *o*-hydroxybenzophenone (1:1414), m.p. 41°, together with other prods. notably benzaurin (see below). —  $\bar{C}$  with phenol in pres. of  $ZnO$  gives (75) phenyl benzoate (see above) + *p*-hydroxybenzophenone (1:1500), m.p. 134°. —  $\bar{C}$  with phenol (2 moles) htd. at 100° and reactn. prod. treated with steam yields (76) (77) 4,4'-dihydroxytriphenylcarbinol (=phenolbenzein=4'-hydroxyfuchson=benzaurin) [Beil. VI-1145, VIII<sub>1</sub>-(589)], as red crystn. powder (diacetate, m.p. 119° (76) (77); dibenzoate, m.p. 153–154° (76)), accompanied by *p*-hydroxybenzophenone (see above). — [For corresp. reactns. of  $\bar{C}$  with *o*-cresol (1:1400) yielding *o*-cresolbenzein (78) (79), with thymol (1:1430) yielding thymolbenzein (80), with resorcinol (1:1530) yielding resorcinolbenzein (76), or with pyrogallol (1:1555) yielding pyrogallolbenzein (81) see indic. refs. — For reactn. of  $\bar{C}$  with  $\alpha$ -naphthol (1:1500) (73) (94) (95) (or with 1-hydroxynaphthoic acid-2 (82) (83) (95)) yielding 4-(1-hydroxynaphthyl) phenyl ketone (or the corresp. 4-(1-hydroxy-2-carboxynaphthyl) phenyl ketones) respectively see indic. refs.; for reactn. of  $\bar{C}$  with  $\beta$ -naphthol (1:1540) see (84).]

$\bar{C}$  with ammonia or amines gives varied reactns. —  $\bar{C}$  with liq.  $NH_3$  (85) or with  $NH_4Cl$  in s.t. at 200° (86) gives (75% yield (85)) benzonitrile;  $\bar{C}$  with conc. aq.  $NH_4OH$  in s.t. at 130° yields (85) benzoic acid + benzamide + benzonitrile. —  $\bar{C}$  (1 mole) with aniline (2 moles) warmed together without solvent or with  $ZnCl_2$  in  $AcOH$  soln. gives (87) *N,N'*-diphenylbenzamidine hydrochloride [Beil. XII-273, XII<sub>1</sub>-(202)], the free base of which has m.p. 147°; note, however, that  $\bar{C}$  with aniline hydrochloride + nitrobenzene + Fe filings htd. at 180° for 3–4 hrs. yields (87) the dyestuff Doebner's Violet (the  $HCl$  reactn. prod. of 4,4'-diaminotriphenylcarbinol) [Beil. XIII-742, XIII<sub>1</sub>-(293)]. —  $\bar{C}$  (1 mole) with dimethylaniline (2 moles) htd. at 100° preferably in pres. of  $ZnCl_2$  yields (86) the dyestuff Malachite Green (the  $HCl$  reactn. prod. of 4,4'-dimethylaminotriphenylcarbinol) [Beil. XIII-743, XIII<sub>1</sub>-(293)] (see  $\textcircled{P}$  below); analogous dyestuffs from other tertiary amines cannot be discussed here.

[ $\bar{C}$  with excess phenylhydrazine in alc. does not react until Cu powder is added; the

solution then (89) rapidly turns or.-red. and on cooling soon ppts. a mixture of benzaldehyde-phenylhydrazon, m.p. 157° (see 1:0195) (doubtless accounted for by reductn. of  $\bar{C}$  to benzal (di)chloride (3:6327) at the expense of phenylhydrazine), together with phenylhydrazine hydrochloride. —  $\bar{C}$  + excess phenylhydrazine heated in alc. without Cu (89) turns dark red and ppts. a mixt. of "formazylbenzene" [Beil. XVI-17], red lfts. from alc., m.p. 173° (doubtless accounted for as above), and phenylhydrazine hydrochloride.]

[ $\bar{C}$  with amides or ammonium salts gives on htg. mixtures of corresp. nitriles and acid halides: e.g.,  $\bar{C}$  with benzamide at 140° yields (90) benzonitrile + benzoyl chloride;  $\bar{C}$  with *p*-toluamide at 140° yields (90) benzonitrile, *p*-tolunitrile, benzoyl chloride, and *p*-toluyl eldride (3:6000). — For patents exemplifying this type of reactn. see (91) (92).]

$\bar{C}$  on mononitration, e.g., with 0.44 pt. fuming  $\text{HNO}_3$  + 0.44 pt. conc.  $\text{H}_2\text{SO}_4$  at 25-30° for  $\frac{1}{2}$  hr. (4), gives 85% yield *m*-nitrobenzoic acid, m.p. 140° (4); very possibly hydrolysis here precedes nitration since  $\bar{C}$  on nitration with  $\text{N}_2\text{O}_5$  in cold  $\text{CCl}_4$  gives (32) (93) an oily mixt. of nitrobenzotrichlorides more stable to hydrolysis than original  $\bar{C}$ , but which on cleavage with alk. or conc.  $\text{H}_2\text{SO}_4$  yields a mixt. of nitrobenzoic acids containing 70% *m*-nitrobenzoic acid (for other studies of nitration of  $\bar{C}$  see (5) (10)). —  $\bar{C}$  on dinitration by sola. in 5.4 pts. conc.  $\text{H}_2\text{SO}_4$  and treatment with 6.8 pts. fuming  $\text{HNO}_3$  at 185° for 1 hr. gives (4) 33% yield of 3,5-dinitrobenzoic acid, m.p. 203-204° (4).

[ $\bar{C}$  cannot be sulfonated without hydrolysis of the  $-\text{CCl}_3$  group;  $\bar{C}$  with conc.  $\text{H}_2\text{SO}_4$  even at 30° yields (66) benzoic acid (or its anhydride). — However,  $\bar{C}$  with gaseous  $\text{SO}_2$  at room temp. (6) gives on subsequent vac. distn. an oil (perhaps *m*-sulfobenzotrichloride) which with aq. yields *m*-sulfobenzoic acid [Beil. XI-384, XI-(98)], dihydrate, m.p. 67-68°, losing aq. at 100° yielding anhydrous acid, m.p. 140-141° (6).]

⑤ Malachite Green formation.  $\bar{C}$  (1 drop) + dimethylaniline (1 drop) warmed with 0.1 g. fused  $\text{ZnCl}_2$  gives intense green color.

⑥ Benzoic acid:  $\bar{C}$  on refluxing with aq.  $\text{NaOH}$  soln., subsequently acidified, ppts. benzoic acid (1:0715), m.p. 121°.

$D_4^{15.5} = 1.2016$  (4)

Colorless mobile liquid with agreeable odor.

[For prepn. of  $\bar{C}$  from o-chlorophenyl-methyl-carbinol (4) (5) by oxidn. with  $CrO_3$  see (4) (5); from methyl o-chlorobenzoylacetate (60% yield (2)) or from ethyl o-chlorobenzoylacetate (80% yield (1)) (54% from  $\bar{C}$  (10)) on ketonic hydrol. with boilg. 20%  $H_2SO_4$  for 10-12 hrs. see indic. refs.; from o-chlorobenzonitrile [Beil. IX-336] with  $MeMgI$  in ether (56% yield) see (3).]

[ $\bar{C}$  with  $CuCN$  on hgt. in mixt. of quinoline + pyridine as directed (6) gives 20% yield o-cyanoacetophenone, m.p. 48°, b.p. 148° at 12 mm. (6); for behavior of  $\bar{C}$  on hgt. with  $CuCN$  in quinoline at 210° or with  $CuCN$  + phthalonitrile in quinoline yielding copper-contg. pigments of the phthalocyanine type see (7).]

[ $\bar{C}$  on hgt. with 50%  $KOH$  as directed (8) gives small yield o-chlorobenzoic acid.]

[ $\bar{C}$  on mononitration with 10 pts.  $HNO_3$  ( $D = 1.52$ ) at 0° gives (85% yield (1)) 2-chloro-4-nitroacetophenone, colorless pr. from alc., m.p. 62° (1) (for condens. of this prod. with arylamines to give substituted acridines see (9)).]

- ④ *o*-Chloroacetophenone oxime: ndls. from aq., m.p. 112-113° (4), 103° (1).  
 ⑤ *o*-Chloroacetophenone *p*-nitrophenylhydrazine: maroon cryst. from AcOH, m.p. 215° (2). (The phenylhydrazone of  $\bar{C}$  is unstable (2).)  
 ⑥ *o*-Chloroacetophenone 2,4-dinitrophenylhydrazine: dark yel. lfts. from AcOEt, m.p. 206° (3).  
 ⑦ *o*-Chloroacetophenone semicarbazone: cryst. from MeOH, m.p. 178-179° (3), from 40% AcOH, m.p. 159-160° (2).

Insol. aq.; misc. alc. or ether. —  $\bar{C}$  does not yield an addo. prod. with  $NaHSO_4$ .

[For propn. of  $\bar{C}$  from chlorobenzene (3:7903) with  $Ac_2O$  +  $AlCl_3$  in  $CS_2$  (yields: 83-79% (15), 78-74% (5), 68-66% (1)) (5) (9) or with acetyl chloride (3:7065) +  $AlCl_3$  in absence

of solvent (poor yield (2)) or in  $\text{CS}_2$  (yields: 80–90% (16), 81% (6), 41% (17)) see indie. refs.; from *p*-chlorobenzoylacetic acid on warming (18); from methyl *p*-chlorobenzoylacetic acid (4) on ketonic hydrolytic cleavage by boilg. 10–12 hrs. with 20%  $\text{H}_2\text{SO}_4$  see (4).]

[ $\bar{\text{C}}$  in  $\text{CS}_2$  treated with 1 mole  $\text{Cl}_2$  yields (19) *p*-chlorophenacyl chloride (3:2990), m.p. 101°;  $\bar{\text{C}}$  with 2 moles  $\text{Cl}_2$  at 50–60° without solv. (19) yields 4,  $\omega$ ,  $\omega$ -trichloroacetophenone [Beil. VII-283], m.p. 57°. —  $\bar{\text{C}}$  with 1 mole  $\text{Br}_2$  in  $\text{CS}_2$  or  $\text{AcOH}$  yields (17) (20) *p*-chlorophenacyl bromide [Beil. VII-285], cryst. from alc., m.p. 96.5° (20), 96° (17) (for studies of rate of bromination see (13), of influence of light and other factors see (21));  $\bar{\text{C}}$  with excess  $\text{Br}_2$  directly (22), in  $\text{AcOH}$  (17), or in  $\text{CCl}_4$  susp. of  $\text{CaCO}_3$  (22) yields 4-chloro- $\omega$ ,  $\omega$ -dibromoacetophenone [Beil. VII-286], m.p. 93.5–94.5° (22), 92.5° (17).] [Note proximity of this m.p. to that (96°) of *p*-chlorophenacyl bromide (above).]

[ $\bar{\text{C}}$  on mononitration with mixt. of conc.  $\text{HNO}_3$  + conc.  $\text{H}_2\text{SO}_4$  at  $-10^\circ$  as directed (6) or added slowly to 10 pts.  $\text{HNO}_3$  ( $D = 1.5$ ) at 0° (23) yields 4-chloro-3-nitroacetophenone, ndls. from alc., m.p. 104° (6), 99–101° (23) (accompanied in the former case (6) by a little 4-chloro-3-nitrobenzoic acid, m.p. 181°).]

$\bar{\text{C}}$  in alk. medium readily condenses with aldehydes: e.g.,  $\bar{\text{C}}$  in dil. alc. with a little alk. gives (yields: 96% (24), 93% (25), 83% (7)) henzal *p*-chloroacetophenone (*p*-chloro-chalcone), cryst. from ether of  $\text{CHCl}_3$ , m.p. 101° (24), 98.5° (7), 96.4° (12), 96° (25) (for study of rate of condensation see (12)); similarly  $\bar{\text{C}}$  with salicylaldehyde (1:0205) yields (23) salicylidene-*p*-chloroacetophenone, yel. ndls. from alc., m.p. 151° (23);  $\bar{\text{C}}$  with *p*-dimethylaminobenzaldehyde yields (26) *p*-dimethylaminobenzal-*p*-chloroacetophenone, yel. ndls. from alc., m.p. 140–140.5° (26); for corresp. condensation of  $\bar{\text{C}}$  with *p*-chlorobenzaldehyde (3:0765) see (16), with *o*-nitrobenzaldehyde see (27) (28).

[ $\bar{\text{C}}$  also readily condenses with esters: e.g.,  $\bar{\text{C}}$  in abs. alc. +  $\text{NaOEt}$  treated with ethyl formate (1:3000) gives (28) hydroxymethylene-*p*-chloroacetophenone, yel. ndls. from pet. eth., m.p. 48–49° (28);  $\bar{\text{C}}$  with ethyl phenylacetate (1:3872) in ether with  $\text{Na}$  gives (40% yield (29))  $\omega$ -(phenylacetyl)-*p*-chloroacetophenone.]

[ $\bar{\text{C}}$  with  $\text{PCl}_5$  at 100° for 4 hrs. gives (60% yield (30)) *p*,  $\alpha$ -dichlorostyrene, b.p. 115–116° at 20 mm., m.p.  $-6$  to  $-5^\circ$ ,  $D_{25}^{25} = 1.247$ ,  $n_D^{25} = 1.5735$  (30);  $\bar{\text{C}}$  with selenium oxychloride ( $\text{SeOCl}_2$ ) gives (50% yield (31)) *bis*-(*p*-chlorophenacyl)selenium dichloride, m.p. 126° (31);  $\bar{\text{C}}$  with  $\text{K}$  pyrosulfate + a little conc.  $\text{H}_2\text{SO}_4$  htd. at 80° for 4 hrs. (46% yield (32)) or  $\bar{\text{C}}$  with 1%  $\text{I}_2$  htd. 4 hrs. at 170° (32) gives 1,3,5-*tris*-(*p*-chlorophenyl)benzene, white ndls. from  $\text{AcOEt}$ , m.p. 238° (32); for behavior of  $\bar{\text{C}}$  with  $\text{NOCl}$  see (33) (14), with  $\text{NaOEt}$  + amyl nitrite in alc. see (34) (35).]

[ $\bar{\text{C}}$  htd. as directed with excess  $\text{NH}_4$  formate and the intermediate formyl deriv. hydrolyzed with  $\text{HCl}$  gives (yields: 82% (36), 65% (37)) *d,l*- $\alpha$ -(*p*-chlorophenyl)ethylamine, b.p. 105° at 10 mm.,  $D_{20}^{20} = 1.1178$ ,  $n_D^{25} = 1.5420$  (hydrochloride, m.p. 192–193°, *N*-henzoyl deriv., m.p. 144–145° (36)).]

[ $\bar{\text{C}}$  on htg. with 10% aq.  $\text{NaOH}$  +  $\text{Cu}$  at 190° for 5 hrs. under press. yields (38) *p*-hydroxyacetophenone (1:1527), m.p. 109°;  $\bar{\text{C}}$  with conc. aq.  $\text{NH}_4\text{OH}$  in pres. of  $\text{Cu}_2\text{O}$  htd. 5 hrs. at 220° under press. yields (39) *p*-aminoacetophenone [Beil. XIV-46, XIV-1-(366)];  $\bar{\text{C}}$  on htg. with 50%  $\text{KOH}$  as directed (40) gives small yield of *p*-chlorobenzoic acid (3:4940);  $\bar{\text{C}}$  with alc.  $\text{NaOEt}$  htd. in s.t. at 130°–140° gives (41) *p*-chlorophenyl-methyl-carbinol, *p*-chlorobenzoic acid, and other prods.]

$\bar{\text{C}}$  on oxidn. with  $\text{KMnO}_4$  (2) or in  $\text{MeOH}$  soln. with  $\text{NaOH}$  +  $\text{Cl}_2$  (93% yield (42)) or with  $\text{CrO}_3$  +  $\text{H}_2\text{SO}_4$  (95% yield (43)) or by cat. vapor-phase oxidn. (90% yield (44)) gives *p*-chlorobenzoic acid (3:4940), m.p. 242°. [Note that  $\bar{\text{C}}$  in abs. alc. refluxed with  $\text{SeO}_2$  gives (45) *p*-chlorophenylglyoxal, m.p. 122° (for study of rate see (46)).]

⑩ *p*-Chloroacetophenone oxime: ndls. from alc., m.p. 95° (17). [This prod. with conc.

$H_2SO_4$  htd. at  $100^\circ$  rearranges to acet-*p*-chloroanilide [Beil. XII-611, XII<sub>1</sub>-(306)], m.p.  $172-173^\circ$  (17).]

③ *p*-Chloroacetophenone phenylhydrazone: m.p.  $114^\circ$  (17),  $112-113^\circ$  (48) (decomposes on stdg. 2 days (17) (4).)

④ *p*-Chloroacetophenone *p*-nitrophenylhydrazone: maroon cryst. from AcOH, m.p.  $239^\circ$  (4).

⑤ *p*-Chloroacetophenone 2,4-dinitrophenylhydrazone: scarlet cryst., m.p.  $231^\circ$  cor. (47).

⑥ *p*-Chloroacetophenone semicarbazone: white cryst. from 40% AcOH, m.p.  $200-201^\circ$  (4).

## Lachrymatory oil.

[For prepn. from acetophenone (1:5515) by actn. of  $Cl_2$  (100% yield (4) (5)) in AcOH (80-94% yield (11)) see (4) (2) (11) or of suluryl chloride see (1); from phenylacetylene (1:7425) by actn. of  $HOCl$  (7),  $CH_3OCl$  (6), or  $C_2H_5OCl$  (5) see (7) (6) (5); from  $C_6H_6$  + dichloroacetyl chloride (3:5290) (2) or dichloroacetonitrile (4) +  $AlCl_3$  see (2) (4).]

$\bar{C}$  is almost unchanged by boiling with aq. (2). —  $\bar{C}$  on shaking with 20 pts. 2 N aq. NaOH dissolves in 1-2 min.; after boiling under reflux for a few min. and acidifying, extraction with ether gives in 95% yield (5) 85-90% yield (11) *d,l*-mandelic ac. (1:0465), cryst. from  $CHCl_3$  + pet. eth., m.p. 118.5° (8).

$\bar{C}$  on oxidn. with alk.  $KMnO_4$  yields (1) (2) (3) (5) (5) benzoic ac. (1:0715), m.p. 121°. [ $\bar{C}$  on treatment with NaOH + NaOCl in the cold yields benzoic ac. (1:0715) and chloroform in proportions depending upon conditions (9).] [Note that *d,l*-mandelic ac. (see above) may also be formed owing to actn. of alk. upon  $\bar{C}$  cf. (9).]

$\bar{C}$  on nitration yields *m*-nitro- $\omega,\omega$ -dichloroacetophenone, m.p. 57-58° (10).

$\bar{C}$  in alc. treated with excess alk.  $NH_2OH$  for 7-10 hrs. yields (6) phenylglyoxaldioxime [Beil. VII-672], cryst. from  $CHCl_3$ , m.p. 168° (5). [The product, m.p. 150-152°, so obtd. by (5) may have been a mixt. of the high-melting stereoisomer, m.p. 180°, with the low-melting stereoisomer, m.p. 168°.]

			$D_4^{16.3} = 1.1822$ (4)	$n_D^{16.3} = 1.45979$ (4)

[See also diethyl chloromaleate (3:6697).]

Colorless liq. with irritating actn. on skin and whose vapor strongly attacks the eyes. — Insol. cold aq., eas. sol. alc., ether; volatile with steam.

[For prepn. of  $\bar{\text{C}}$  from chlorofumaric acid (3:4853) in abs. EtOH with  $\text{HCl}$  gas (1) or conc.  $\text{H}_2\text{SO}_4$  (4) see indic. refs.; from chlorofumaryl (di)chloride (3:6105) with EtOH see (10) (1) (9) (3).]

[For formn. of  $\bar{\text{C}}$  from diethyl *d*-tartrate (1:4256) with  $\text{PCl}_5$  see (11) (note that ethyl hydrogen chlorofumarate, cryst. from pet. ether, m.p. 52–53°, has also been obt'd. (12) as one of the prods. of this reactn.); from diethyl *d,l*-(7)- $\alpha,\alpha$ -dichlorosuccinate by loss of  $\text{HCl}$  under actn. of dimethylaniline see (5).]

[ $\bar{\text{C}}$  (1 mole) with diethyl sodio-malonate (1 mole) is said (13) to yield tetraethyl cyclopropane-1,1,2,3-tetracarboxylate [Beil. IX-991] although no details are given; in the presence of excess  $\text{NaOEt}$  in cold alc. for 12 hrs., however, the same components give (15–20% yield (14)) (15) triethyl  $\gamma$ -carbethoxyaconitate [Beil. II-876], b.p. 205–207° at 16 mm. (14); for reactn. of  $\bar{\text{C}}$  (1 mole) with diethyl mono- and di-substituted malonates yielding triethyl corresp. subst. aconitates see (13) —  $\bar{\text{C}}$  (1 mole) with ethyl sodioacetate (1 mole) in abs. alc. refluxed for  $\frac{1}{2}$  hr. gives (72% yield (3)) (16) triethyl  $\gamma$ -acetyl-aconitate [Beil. III-860], yel. oil, b.p. 187–188° at 15 mm. (3), the same as similarly obt'd. (3) from diethyl chloromaleate (3:6697).]

[ $\bar{\text{C}}$  with *o*-chlorophenol (3:5950) or its Na deriv. in boilg. xylene for 2 hrs. gives (77% yield (17)) diethyl *o*-chlorophenoxyfumarate, b.p. 203–204° at 14 mm. (17). —  $\bar{\text{C}}$  with *p*-chlorophenol (3:0475) +  $\text{NaOEt}$  gives (17) diethyl *p*-chlorophenoxyfumarate, b.p. 199–200° at 12 mm. (17).]

The reactn. of  $\bar{C}$  with  $NH_3$  under various circumstances is disputed and confused and cannot profitably be discussed here; for refs. see Beil. II-745.

$\bar{C}$  (1 mole) with hydrazine hydrate (2 moles) directly (18) or in alc. or AcOH (9) yields ethyl pyrazolone-5 (or 3)-carboxylate-3 (or 5) [Beil. XXV-206, XXV-1-(567)], ndls. from boilg. aq., m.p. 184-185° (18); 178° (9); note that in the direct treatment with just 2 moles of hydrazine hydrate much heat is evolved and the product ppts. on cooling; if excess base is employed (in which the prod. is soluble) neutralization with acid is necessary.

[ $\bar{C}$  with phenylhydrazine reacts much more slowly; however, after several hrs. at 100° phenylhydrazine HCl ppts. leaving an oil from which a cryst. prod. spar. sol. in boilg. AcOH hut sepg. from it in colorless ndls., m.p. 272° dec., can be obt'd. (18); this prod. is not, however, the ethyl 1-phenylpyrazolone-5(or 3)-carboxylate-3(or 5) which might be expected, hut is regarded [Beil. XXVI-578] (18) as a 4,4'-bis derivative of it.

$\bar{C}$  on boilg. with 1:1 HCl and subsequent evapn. to dryness undergoes hydrolysis yielding (4) chlorofumaric acid (3:4853), m.p. 191.5° (4).

Colorless liquid.

[For prepn. of  $\bar{C}$  from o-methoxybenzoic acid (o-anisic acid) (1:0685) with  $PCl_5$  (1) (4) (9) (10) (11) (every trace of salicylic acid must first be removed (9)) or with  $SOCl_2$  (2) (3) (4) (5) (6) (7) (12) (prolonged heating tends to demethylate product (4)) see indic. refs.; note that for none of the preps. is the yield recorded.]

[ $\bar{C}$  on cat. reductn. at 250° with  $H_2$  at ord. press. in pres. of Pd gives (11), not the expected o-methoxybenzaldehyde, but instead o-methoxytoluene (methyl o-tolyl ether) (1:7480).]

$\bar{C}$  with anhydrous  $Na_2CO_3$  in pyridine shaken for  $\frac{1}{2}$  hr., poured onto ice, yields (13) o-methoxybenzoic acid anhydride, ndls. from pet. ether, m.p. 72.4° (13).

[ $\bar{C}$  with  $C_6H_6$  +  $AlCl_3$  gives (14) (9) (2) (12) o-hydroxybenzophenone (1:1414) (note demethylation of intermediate o-methoxybenzophenone (1:5142) and also the formn. in small amt. (12) of 2-hydroxy-5-(2'-hydroxybenzoyl)benzophenone, m.p. 131-132° (12)).]

[ $\bar{C}$  with  $Et_2Zn$  gives (87% yield (3)) ethyl 2-methoxyphenyl ketone [Beil. VIII-102], b.p. 137° cor. at 18 mm. (3).]

[For reaction of  $\bar{C}$  with ethyl sodio-acetoacetate (5), with ethyl sodio- $\alpha$ -methylacetoacetate (15), with ethyl sodio- $\alpha$ -allylacetoacetate (16), or with ethyl sodio- $\alpha,\gamma$ -dimethoxyacetoacetate (17) (together with hydrolytic cleavage of the resulting products to ketones and/or acids) see indic. refs.; for reactn. of  $\bar{C}$  with Na phenylacetylene and ring closure of intermediate to corresp. 2-methoxyflavone see (18).]

[ $\bar{C}$  (1 mole) with HCN (4 moles) in dry ether + pyridine gives (4) o-methoxybenzoyl cyanide, yel. ndls. from lgr., m.p. 56°, b.p. 161° at 12 mm. (4).]

[ $\bar{C}$  with urea refluxed in  $C_6H_6$  for 15 hrs. gives (19) N-(o-methoxybenzoyl)urea, ndls. from hot aq. or toluene, m.p. 192° (19).]

[ $\bar{C}$  with methyl salicylate gives (20) methyl O-(2-methoxybenzoyl)salicylate, m.p. 102-104° (20);  $\bar{C}$  with salicylamide in pyridine gives (21) N-(2-methoxybenzoyl)salicylamide, m.p. 189° (21).]

[ $\bar{C}$  with MeOH yields methyl o-methoxybenzoate (1:4091), b.p. 248°;  $\bar{C}$  with EtOH yields ethyl o-methoxybenzoate (1:4151), b.p. 261°; for study of rate of reactn. of  $\bar{C}$  with EtOH at 0° see (22) (8).]

$\bar{C}$  on hydrolysis yields o-methoxybenzoic acid (1:0685), m.p. 100-101°; for the amide, anilide, and other derivs. corresp. to  $\bar{C}$  see o-methoxybenzoic acid (1:0685).

Colorless oil, volatile with steam. — Note that presence of as much as 10% of 2-chloronaphthalene (3:1285) has no effect upon density of  $\bar{C}$  (9). — Note also that addn. of 1,4-dichloronaphthalene (3:1655), m.p. 68°, or of 1,6-dichloronaphthalene (3:0310), m.p. 48°, lowers m.p. of  $\bar{C}$  (9).

[For sepn. of mixts. of  $\bar{C}$  with the isomeric 2-chloronaphthalene by fractional freezing of their soln. in appropriate solvents see (6). — For purification of tech.  $\bar{C}$  by treatment with 1-2% alk. at 150° under reduced press. see (13). — For sepn. of  $\bar{C}$  from dichloronaphthalenes by means of its const.-boil. mixt. (b.p. 99°) with aq. see (18).]

[For prepn. of  $\bar{C}$  from  $\alpha$ -naphthylamine [Beil. XII-1212, XII<sub>1</sub>-(519)] via diazotization and use of  $Cu_2Cl_2$  reactn. (70-75% yield (9)) (8) (7) or even by warming diazo soln. with HCl (10-20% yield (14)) or from diazonium/ $ZnCl_2$  cpd. on addn. to phenol at 60° (46%  $\bar{C}$  + 29% hydroxybiphenyl + 20% diphenyl ether (52)) see indic. refs.; from  $\alpha$ -naphthalenesulfonyl chloride [Beil. XI-157, XI<sub>1</sub>-(37)] (2), or from 1-nitronaphthalene [Beil. V-553, V<sub>1</sub>-(264)] (15), or from  $\beta$ -naphthol (1:1500) (16) with  $PCl_5$  as directed see indic. refs.; for formn. of  $\bar{C}$  from 1-nitronaphthalene with  $Cl_2$  see (17).]

[For prepn. of  $\bar{C}$  from naphthalene with  $Cl_2$  in boilg. naphthalene (19) (48), in vapor phase (20) (22) (27), in various solvents (21) (22) (23) (24) (25) (26) see indic. refs.; from naphthalene with HCl gas + air in pres. of cat. see (28); from naphthalene with  $PbCl_4 \cdot 2NH_4Cl$  at 140-150° (29) or with  $SO_2Cl_2$  +  $AlCl_3$  (79% yield (30)) see indic. refs.; from

naphthalene dichloride [Beil. V-519] with boilg. alc. KOH (31) cf. (32) or by distn. (33) cf. (34) see indic. refs.]

[For thermal anal. of systems of  $\bar{C}$  with  $SbBr_3$  see (35); with  $PkOH$  see (36); with 2,4,6-trinitroresorcinol (styphnic acid) see (37).]

[ $\bar{C}$  with  $Cl_2$  io cold or  $\bar{C}$  with  $Cl_2$  io lt. pet. yields (38) 1-chloroonaphthalene tetrachloride, m.p. 131° (38), and 1,4-dichloroonaphthalene (3.1655), m.p. 68° (38);  $\bar{C}$  with  $Cl_2$  io  $CHCl_3$  yields (38) the above 1-chloroonaphthalene tetrachloride and 1,4-dichloroonaphthalene tetrachloride, m.p. 172° (38);  $\bar{C}$  with  $Cl_2$  io  $CS_2$  gives (38) a new dichloroonaphthalene tetrachloride, m.p. 158° (38).]

[ $\bar{C}$  on chloromethylation with paraformaldehyde +  $HCl$  gas +  $H_3PO_4$  io  $AcOH$  gives (81) 1-chloro-4-(chloromethyl)naphthalene, m.p. 78-79° (81).]

[ $\bar{C}$  is not reduced with excess 5%  $Na/Hg$  io alc. eveo after 5 hrs. (39) nor by  $HI + P$  at 182° for 10 hrs. (42); however,  $\bar{C}$  in boilg.  $AmOH$  treated with  $Na$  yields (40) 1,4-dihydro-naphthalene [Beil. V-518,  $V_1$ -(249)] (identified by addn. of  $Br_2$  gviog dihydromide, m.p. 74° (40)) and 1,2,3,4-tetrahydro-naphthalene (1:7550) q.v.; furthermore,  $\bar{C}$  with  $Mg$  io boilg.  $MeOH$  evolves gas and upoo acidification and pouring into aq. gives alm. quoot. yield (41) naphthalene (1:7200), m.p. 80°.]

[ $\bar{C}$  on cat. oxido. with air at 250-300° gives (43) 97% phthalic anhydride (1:0725) + 3% 3-chlorophthalic anhydride (3:3900).]

[ $\bar{C}$  with  $Li$  in s.t. 17½ hrs. at 263° followed by treatment with aq. gives (44) naphthalene (1:7200) + 1,1'-binaphthyl [Beil. V-725,  $V_1$ -(358)], m.p. 156°. —  $\bar{C}$  with  $Li$  in dry ether yields soln. of  $\alpha$ -naphthyl-lithium which with  $Me_2SO_4$  gives (77% yield (45)) 1-methylnaphthalene (1:7600), the reactn. of  $\bar{C}$  with  $Li$  occurring even more readily (46) than with  $Mg$ .]

[ $\bar{C}$  with  $Mg$  at 200-220° reacts very eoegetically and is complete within a few minutes; naphthalene sublimes abundantly, and yield of  $\alpha$ - $C_{10}H_7MgCl$  is only 10-13% (47).]

[ $\bar{C}$  with  $AlCl_3$  at 100° gives small amts. (50) naphthalene (1:7200) + 2-chloronaphthalene (3:1285).]

[ $\bar{C}$  with  $CuCN$  io pyridioe htd. 24 hrs. in bath at 245-250° (92% yield (10)) or  $\bar{C}$  with  $K_4Fe(CN)_6$  + pyridioe at 270° for 18 hrs. (49) gives  $\alpha$ -naphthonitrile [Beil. IX-649, IX-1-(275)], h.p. 299° cor., b.p. 173-174° at 27 mm., 166-169° at 18 mm. (10).]

[ $\bar{C}$  does not with  $Ag$  3,5-dinitrobenzoate yield corresp. ester (80).]

[ $\bar{C}$  with 15% aq.  $NaOH$  above 300° for 12 hrs gives (46% yield (51))  $\alpha$ -naphthol (1:1500);  $\bar{C}$  with 5 moles 3-25% aq.  $NaOH$  at 350-360° uoder pressure in pres. of  $Cu$  for 1 hr. gives (52) a mixt. of  $\alpha$ -naphthol (1:1500) +  $\beta$ -naphthol (1:1540). —  $\bar{C}$  with aq.  $Na_2CO_3$  +  $Cu$  at 300° under press. (53) or  $\bar{C}$  with aq.  $Na_2CO_3$ ,  $Na_2HPO_4$ , or  $Na_2B_4O_7$  at 325° and 280 atm. (54) yields  $\alpha$ -naphthol (1:1500). —  $\bar{C}$  with aq. vapor over cat. at 300-400° yields (55)  $\alpha$ -naphthol (1:1500).]

[ $\bar{C}$  with conc. aq.  $NH_4OH$  +  $CuO$  at 150-250° under press. (56) or  $\bar{C}$  with conc. aq.  $NH_4OH$  +  $Cu_2Cl_2$  +  $Ca(OH)_2$  at 225-230° under press. (57) cf. (58) yields  $\alpha$ -naphthylamine (for study rate of reacto. see (58) (61); under suitable conditions the main prod. may be di- $\alpha$ -naphthylamine (60).]

[ $\bar{C}$  with  $KNH_2$  in liq.  $NH_3$  at -33° gives (82) only 2-3%  $\alpha$ -naphthylamine, the main prod. (43-53%) being  $\beta$ -naphthylamine; for behavior of  $\bar{C}$  with  $LiNEt_2$  see (83).]

[ $\bar{C}$  oo mononitration, e.g., with a mixt. of conc.  $HNO_3$  ( $D = 1.4$ ) (1 mole) + conc.  $H_2SO_4$  (2 moles) at 0° (63) cf. (64) (65) (66) gives a mixt. of three monoo nitro derivs., viz., 1-chloro-4-nitronaphthalene [Beil. V-555,  $V_1$ -(264)], pale yel. ndls. from alc., m.p. 85° (66) (63), 87-87.5° (67); 1-chloro-5-nitronaphthalene [Beil. V-556], m.p. 111° (63) (68); and 1-chloro-8-nitronaphthalene [Beil. V-556], ndls. from  $AcOH$  or  $C_6H_6$ , m.p. 94° (63), 93-94° (69). (Note that the relative proportions of these three mononitration products

[ $\bar{C}$  on htg. with Cu powder in  $C_6H_6$  for 25 hrs. gives (5) a mixt. of the two stereoisomeric forms of 1,2-bis-(*o*-chlorophenyl)-1,2-dichloroethylene, [Beil. V-635]; by repeated cryst. from pet. ether this mixt. is separable into 3 pts. higher-melting stereoisomer, m.p.  $172^\circ$  (5), and 1 pt. lower-melting stereoisomer, m.p.  $129^\circ$  (5).]

$\bar{C}$  on hydrolysis, e.g., by htg. with aq. in s.t. nt  $150^\circ$  (1) or by boildg. with conc.  $HNO_3$  (2), yields *o*-chlorobenzoic acid (3:4150) q.v.

[For prepn. of  $\bar{C}$  from *p*-methoxybenzoic acid (*p*-anisic acid) (1:0805) with  $PCl_5$  (93% yield (3)) (4) (9) (10) (11) or with  $SOCl_2$  (6) (7) (12) (13) see indic. refs.; from sodium *p*-anisate with oxalyl chloride (3:5060) in  $C_6H_6$  (75-90% yield) see (14).]

[ $\bar{C}$  with 3%  $H_2O_2$  in acetone + pyridine nt  $0^\circ$  yields (15) di-*p*-anisyl peroxide, cryst. from AcOEt or pet. eth., m.p.  $128^\circ$  (15); for reactn. of  $\bar{C}$  with  $H_2S_2 + ZnCl_2$  giving (60% yield) di-*p*-anisyl disulfide see (30).]

[ $\bar{C}$  on cat. reductn. with  $H_2$  and cat. as directed gives (81% yield (16)) *p*-methoxybenzaldehyde (1:0240) (under some cond. (17) reductn. goes to *p*-methoxytoluene (methyl-*p*-tolyl ether) (1:7495)).]

[Although 2-methoxybenzoyl chloride (3:6870) with anhydrous  $Na_2CO_3$  + pyridine gives the corresp. anhydride, this reactn. is not specifically reported for  $\bar{C}$ ; however,  $\bar{C}$  + a tertiary amino (pyridine) in  $C_6H_6$  with excess  $K_2S_2O_8$  yields (18) *p*-methoxybenzoic acid anhydride, m.p.  $99-100^\circ$  (18).]

[ $\bar{C}$  with  $C_6H_6 + AlCl_3$  yields (1) *p*-methoxybenzophenone (1:5170);  $\bar{C}$  with toluene +  $AlCl_3$  gives (40% yield (11)) 4-methoxy-4'-methylbenzophenone, cryst. from alc., m.p.  $89^\circ$  (11);  $\bar{C}$  with perylene +  $AlCl_3$  in  $CS_2$  gives (19) 3,9-bis-(*p*-methoxybenzoyl)perylene, m.p.  $310.5^\circ$  (19).]

[ $\bar{C}$  condenses with many phenol ethers in pres. of  $AlCl_3$ ; e.g., for reactn. of  $\bar{C}$  with anisole

yielding 4,4'-dimethoxybenzophenone [Beil. VIII-317, VIII<sub>1</sub>-(641)], m.p. 143-144° (20), see (20) (21); for  $\bar{C}$  with phenetole yielding 4-methoxy-4'-ethoxybenzophenone, m.p. 112° (13), 111° (20), see indic. refs.; for  $\bar{C}$  with pyrocatechol dimethyl ether (veratrole) (1:7560) yielding 3,4,4'-trimethoxybenzophenone [Beil. VIII-422], m.p. 98-99°, see (22); for  $\bar{C}$  with resorcinol dimethyl ether (1:7570) yielding 2,4,4'-trimethoxybenzophenone [Beil. VIII<sub>1</sub>-(702)], m.p. 70-71° (23), see (23); for  $\bar{C}$  with phloroglucinol trimethyl ether (1:7148) yielding 2,4,6,4'-tetramethoxybenzophenone [Beil. VIII-496], m.p. 146°, see (22); for  $\bar{C}$  with many other phenol ethers see (20).]

[ $\bar{C}$  with MeZnI (24) or better with Me<sub>2</sub>Cd (25) gives (yields. 25% (24), 84% (25)) p-methoxyphenyl methyl ketone (p-methoxyacetophenone) (1:5140), m.p. 38°;  $\bar{C}$  with C<sub>6</sub>H<sub>5</sub>ZnBr gives (65% yield (26)) p-methoxybenzophenone, (1:5170), m.p. 61°, b.p. 202° at 14 mm. (26).]

[ $\bar{C}$  with ethyl sodioacetoacetate yields (4) ethyl  $\alpha$ -(p-methoxybenzoyl)acetoacetate [Beil. X-1004];  $\bar{C}$  with ethyl sodio- $\alpha,\gamma$ -dimethoxyacetoacetate yields (27) ethyl  $\alpha,\gamma$ -dimethoxy- $\alpha$ -(p-anisoyl)acetoacetate (which on ketonic hydrolytic cleavage yields (27)  $\omega$ ,4-dimethoxyacetophenone).]

[ $\bar{C}$  (1 mole) with HCN (4 moles) in dry ether + pyridine gives (12) p-methoxybenzoyl cyanide, m.p. 63°, b.p. 150° at 12 mm. (12);  $\bar{C}$  with KCN + quinoline yields (28) 1-(p-anisoyl)-2-cyano-1,2-dihydroquinoline, m.p. 120°, which upon acid hydrolysis gives (57% yield (28)) p-methoxybenzaldehyde (p-anisaldehyde) (1:0240).]

[ $\bar{C}$  with urea refluxed in C<sub>6</sub>H<sub>6</sub> for 15 hrs. yields (29) N-(p-methoxybenzoyl)urea, ndls. from alc., m.p. 215° (29).]

[For reactn. of  $\bar{C}$  with K<sub>2</sub>S in alc. + ether yielding K salt of p-methoxythiobenzoic acid see (30); for reactn. of  $\bar{C}$  with sodium phenylacetylene see (31); for reactn. of  $\bar{C}$  with diphenylketene see (32); for reactn. of  $\bar{C}$  with d-glucose and other carbohydrates see (33); for reactn. of  $\bar{C}$  with 3,4-dimethoxyphenylethylamine (34) or with  $\beta$ -(n-butylamino)ethanol (3) see indic. refs.]

$\bar{C}$  with MeOH yields methyl p-methoxybenzoate (methyl p-anisate) (1:2128), m.p. 49°;  $\bar{C}$  with EtOH yields ethyl p-anisate (1:4191), b.p. 269°, m.p. +7° (for study of rate of reactn. of  $\bar{C}$  with EtOH see (3) (35)).

$\bar{C}$  on hydrolysis yields p-methoxybenzoic acid (1:0805), m.p. 184°; for the amide, anilide, p-toluidide, and other derivs. corresp. to  $\bar{C}$  see p-methoxybenzoic acid (1:0805).

131-133°	at 9-10 mm. (7)				

[See also *unsym.-o*-phthalyl dichloride (3:2395).]

The m.p. of ord. samples of  $\bar{C}$  is usually abt. 12°, but distn. at ord. press. (7) yields a prod. with m.p. 16°. The chem. of  $\bar{C}$  is closely connected with that of the isomeric *unsym.-o*-phthalyl dichloride (3:2395) q.v.; for f.p./compn. curve for mixts. of the two isomers see (8).

[For prepn. of  $\bar{C}$  from phthalic anhydride (1:0725) with  $PCl_5$  (92% yield (7)) (1) (3) (9) (10), with  $PCl_3 + Cl_2$  (12), with benzotrichloride (3:6540) + a little  $ZnCl_2$  (13), with a little  $ZnCl_2$  at  $220^\circ$  by grad. addn. of  $SOCl_2$  (100% yield (14)) (15), or with  $CCl_4$  (etc.) + 2%  $ZnCl_2$  at  $250-280^\circ$  (16) see indic. refs.; from phthalic acid (1:0820) with benzotrichloride + a little  $ZnCl_2$  see (17).]

[For prepn. of  $\bar{C}$  from unsym.-o-phthalyl dichloride (3:2395) by htg. at  $150^\circ$  for 1 hr. see (5); from thiophthalic anhydride [Beil. XVII-486, XVII-1-(256)] with dry  $Cl_2$  at  $245^\circ$  see (18); for formn. as by-product of action of  $Cl_2$  on o-toluoyl chloride (3:8740) see (19).] [For purification of  $\bar{C}$  by treatment with  $MgO$  or  $CaO$  see (20).]

$\bar{C}$  on htg. with  $AlCl_3$  ( $\frac{1}{2}$  mole), then decg. cpd. with aq. and extracting with pet. ether, isomerizes (72% yield (7)) (1) (21) to unsym.-o-phthalyl dichloride (3,3-dichlorophthalide) (3:2395), m.p.  $89^\circ$ .

[ $\bar{C}$  with  $Cl_2$  at  $120-170^\circ$  in pres. of  $Fe$  yields (22) tetrachlorophthalic acid (3:4946).]

[ $\bar{C}$  on reduction with  $Zn + HCl$  (23) (24) or  $HI + P$  in  $CS_2$  (23) (25) yields phthalide (1:4920);  $\bar{C}$  on boilg. with  $AcOH + Na/Hg$  yields (26) phthalyl alcohol (o-xylylene glycol) [Beil. VI-910].]

$\bar{C}$  on heating with  $K$  in xylene (27), or with *ter*-bases +  $K_2S_2O_8$  (28), or with  $ZnCl_2 + SO_2$  at  $200^\circ$  (14) yields phthalic anhydride (1:0725). [Note that last reaction is the reverse of an impt. method (15) of prepa. of  $\bar{C}$ .]

[ $\bar{C}$  on shaking for 20 min. at  $60^\circ$  in glass flask with  $ZnF_2$ , then extracting with pet. eth. yields (29) o-phthalyl difluoride, m.p.  $42-43^\circ$ , h.p.  $224-236^\circ$  at 760 mm. (29);  $\bar{C}$  with  $HBr$  gas at  $150-160^\circ$  gives (50% yield (30)) sym.-o-phthalyl dihydromide, m.p.  $78-81^\circ$  rap. htg., h.p.  $191^\circ$  at 24 mm.,  $134^\circ$  at 2 mm. (30).]

[ $\bar{C}$  htd. with a little  $ZnCl_2$  and diethyl ether (31) or diethyl phthalate (32) gives (80% yield (31)) ethyl chloride (3:7015).] [Use in mfg. of alkyl chlorides (33).]

[For reactn. of  $\bar{C}$  with glycols see (34); for use of  $\bar{C}$  in acylation of cellulose see (35).]

[For behavior of  $\bar{C}$  with  $H_2O_2$  yielding phthalyl peroxide see (36); with  $PCl_5$  see (37); with  $NaN_3$  see (38) (39); with  $C_6H_5MgBr$  see (40).]

$\bar{C}$  on treatment with cold conc.  $NH_4OH$  followed by acidification yields (41) (42) o-cyanobenzoic acid [Beil. IX-814, IX-1-(365)], m.p.  $190^\circ$  dec., converted by htg. to phthalimide, m.p.  $228.5^\circ$  u.e. [For reactn. of  $\bar{C}$  with dimethylamine yielding  $N,N,N',N'$ -tetramethyl-o-phthalaldiamide, m.p.  $121-122^\circ$ , see (43); with diethylamine yielding (44) (45) corresp.  $N,N,N',N'$ -tetra-ethyl-o-phthalaldiamide, m.p.  $36^\circ$  (44),  $39^\circ$  (45) see indic. refs.]

$\bar{C}$  htd. with 1 mole acetamide until no more  $HCl$  is evolved gives in good yield (46) *N*-acetylphthalimide, cryst. from toluene, m.p.  $135-136^\circ$  (46); similarly benzamide gives *N*-benzoylphthalimide, m.p.  $168^\circ$  (46).

$\bar{C}$  reacts instantly with aniline yielding (29) sym.-phthalaldianilide, m.p.  $253-255^\circ$ . [Note that when  $\bar{C}$  is treated with aniline in ether or  $C_6H_6$  and stood for some time the prod. has m.p. about  $231^\circ$ ; when recrystd. from  $EtOH$ , however, the m.p. rises to  $253-255^\circ$ . This apparent anomaly is attributable to the pres. in most samples of  $\bar{C}$  of some phthalic anhydride whose slower reactn. with aniline contaminates the main prod. but is removed by recrystn. from alc. If, on reactn. of ord.  $\bar{C}$  with aniline, the resultant ppt. is filtered at once (before the anhydride has reacted), washed with  $C_6H_6$ , alc., and then aq., the prod. shows m.p.  $253-255^\circ$  without recrystn. (29).]

$\bar{C}$  on hydrolysis yields o-phthalic acid (1:0825) q.v.

Colorless oil showing bluish fluorescence and having only faint odor (3).

[For prepn. of  $\bar{C}$  from benzophenone (1:5150) with  $PCl_5$  (yield: 90% (3), 85% (7), 68% (9)) (1) (10) (11) (12) (15); with  $PCl_5$  in  $C_6H_6$  (92% yield (13)), or with oxalyl dichloride (3:5060) in s.t. at 130–140° (14) see indic. refs.; from  $C_6H_6 + AlCl_3 +$  excess  $CCl_4$  (yield: 90–95% (16), 80–90% (18)) (17) see indic. refs.; for formn. of  $\bar{C}$  from diphenylmethane (1:7120) with  $PCl_5$  in s.t. at 170° see (13), from *bis*-(triphenylmethyl) peroxide with  $PCl_5$  (19) or with  $Cl_2$  in  $CCl_4$  in pres. of  $I_2$  (19), from diphenyldiazomethane with  $SOCl_2$  or  $SO_2Cl_2$  in pet. ether (100% yield (20)), or from benzotrichloride (3:6540) htd. with uranium metal at 115–128° (4) see indic. refs.]

[For use of  $\bar{C}$  in prepn. of acid anhydrides by htg. at 110–120° with salts of aliph. or arom. acids see (21).]

$\bar{C}$  hydrolyzes slowly with cold but rapidly with hot aq. yielding (1) benzophenone (1:5150) and  $HCl$  (for study of rate of hydrolysis of ether soln. on shaking with aq. see (22));  $\bar{C}$  dis. in conc.  $H_2SO_4$  with yel. color (which grad. disappears) and on pouring onto ice yields (6) benzophenone (1:5150);  $\bar{C}$  in dry ether shaken 2 hrs. with silver oxide gives (78% yield (23)) benzophenone (1:5150);  $\bar{C}$  with alc.  $NH_3$  yields (33) benzophenone.

$\bar{C}$  with  $MeOH$  alone (6), with dry  $MeOH + Mg$  (24), with dry  $MeOH$  in dry pyridine at 0° (25), with  $NaOMe$  in  $MeOH$  (3) (26), or with  $NaN_3$  in dry  $MeOH$  (27) gives (yields: 86% (6) (24), 81% (3))  $\alpha,\alpha$ -dimethoxy-diphenylmethane (benzophenone dimethylacetal) [Beil. VII-415], cryst. from  $MeOH$ , m.p. 107–108° (25), 107.5° cor. (24), 106.5–107° (3) (for application to higher alcs. see (3) (26)).

$\bar{C}$  htd. with  $Ag$  (11) (5), or stood overnight with  $Ag$  or  $Zn$  in dry  $EtOAc$  (28) cf. (29), or reflux in  $CS_2$  with 3–4 moles  $Hg$  (28) (less  $Hg$  gives different result), or with 2 moles  $NaI$  in boilg. acetone (30) (1 mole  $NaI$  gives different result), or with excess cyclohexyl- $MgBr$  (31) (less reagent gives different result), or with  $Na$  in liq.  $NH_3$  (90% yield (32)) or htd. 8 hrs. with diphenylmethane (1:7120) (83% yield (12)) gives tetraphenylethylene [Beil. V-743, V<sub>1</sub>-(376)], m.p. 227° cor., 222° u.c. (31), 221° (11). — [ $\bar{C}$  does not react with

Mg in dry ether even in pres. of  $I_2$  (28).] — [ $\bar{C}$  refluxed in  $CS_2$  with less than 3 moles Hg (28), or  $\bar{C}$  with 1 mole NaI in acetone in cold (30), or  $\bar{C}$  with 1 mole cyclohexyl MgBr (31), gives tetraphenylethylene dichloride (Beil. V<sub>1</sub>-(371)), cryst. from ether, m.p. 186° cor. dec. (31).]

[ $\bar{C}$  with 2 moles Ag azide in ether gives (88% yield (34)) benzophenone diazide, m.p. 42°;  $\bar{C}$  treated as directed (15) with alc. NaSH gives 42-50% yield thiobenzophenone (Beil. VII-429, VII<sub>1</sub>-(232)), cryst. from pet. ether, m.p. 53-54° (15) (note that an excess of  $\bar{C}$  must always be present to prevent reduction of the thiobenzophenone to dibenzohydril disulfide (Beil. VI-681), ndls. from alc., m.p. 152°, and that the latter is obtd. in 70% yield (15) if  $\bar{C}$  is added to the alc. NaSH instead of the reverse); for reactn. of  $\bar{C}$  with diethyl sodio-malonate (2) (9) or with ethyl sodioacetoacetate (8) see indic. refs.; for reaction of  $\bar{C}$  with  $SbF_3$  yielding  $\alpha,\alpha$ -difluorodiphenylmethane, b.p. 260° dec., 125° at 10 mm., m.p. -1.8°,  $D_4^{20} = 1.1614$ ,  $n_D^{20} = 1.53786$ , see (35)]

$\bar{C}$  with 4 moles aniline in cold gives (36) benzophenone anil (Beil. XII-201, XII<sub>1</sub>-(174)) + aniline hydrochloride, the former is sol. in ether, the latter in aq.; sepn. of the layers and addition of alc. to the ether ppts. benzophenone anil, pale yel. lfts. from abs. alc., m.p. 109° u.c. (36) 113°.

## CHAPTER XVI

### DIVISION B. LIQUIDS WITH BOILING POINTS REPORTED AT ORDINARY PRESSURE

#### Section 2. $D_4^{20}$ less than 1.1500

(3:7000-3:7499)

3:7000	CHLOROACETYLENE (Chloroethyne)	$\text{HC}\equiv\text{C}-\text{Cl}$	$\text{C}_2\text{HCl}$	Beil. I - 244 I <sub>1</sub> -(106) I <sub>2</sub> -(221)
--------	-----------------------------------	-------------------------------------	------------------------	---

B.P.  $-29.6^\circ$  (1)  
 $-32$  to  $-30^\circ$  (2)

[See also dichloroacetylene (3:5010).]

$\bar{\text{C}}$  is a gas with extremely nauseating odor reminiscent both of yellow phosphorus and of carbylamines; its inhalation even in traces produces very unpleasant symptoms. It is also treacherously explosive and may detonate during manipulation (2). —  $\bar{\text{C}}$  ignites spontaneously in air (6) (3).

[For prepn. of  $\bar{\text{C}}$  from *cis*-1,2-dichloroethylene (3:5042) via treatment in dil. alc. with aq. alk.  $\text{Hg}(\text{CN})_2$  to yield  $\text{Hg}(\text{C}\equiv\text{CCl})_2$  (see below) which is then warmed (under  $\text{N}_2$ ) with alk.  $\text{NaCN}$  soln. see (1) (2) (3) (4)] cf. (7).

[For formn. of  $\bar{\text{C}}$  during reaction of 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) with solid  $\text{KOH}$  see (5); from 1,2-dichloroethylene with alc.  $\text{KOH}$  see (3) (4); from  $\beta,\beta$ -dichloroacrylic acid (3:1575) with  $\text{Ba}(\text{OH})_2$  see (6).]

$\bar{\text{C}}$  with  $\text{NH}_4\text{OH}/\text{CuCl}$  gives (3) (6) an explosive ppt. —  $\bar{\text{C}}$  with  $\text{NH}_4\text{OH}/\text{AgNO}_3$  gives (2) (3) a ppt. of silver salt, which is extremely explosive, detonating with great violence not only in dry state but also when moist and even under water, quantities as small as 0.1 g. causing considerable damage (2).

$\bar{\text{C}}$  with aq. alk.  $\text{Hg}(\text{CN})_2$  yields (3) (4) (1) (2) a mercury salt,  $\text{Hg}(\text{C}\equiv\text{CCl})_2$ , cryst. from  $\text{CHCl}_3$  (1) (2) (3) (4), m.p.  $185^\circ$  (1) (4),  $186^\circ$  (2); explodes at  $195^\circ$  with flame and deposition of soot (3) (4). [This prod. with alk.  $\text{KCN}$  evolves  $\bar{\text{C}}$  (use in prepn. of  $\bar{\text{C}}$  as above).]

$\bar{\text{C}}$  with  $\text{Br}_2/\text{aq.}$  yields (6) 1-chloro-1,1,2,2-tetrabromoethane [Beil. I-95], m.p.  $33-34^\circ$  (6). [For other reactns. see (2) (7); for study of oxidation of  $\bar{\text{C}}$  see (1).]

12.3°	at 760 mm. (11)		
12.18°	at 760 mm. (12)		
12-12.5°	(13) (14)		

Colorless mobile liq. with pungent ethereal odor and sweetish taste. —  $\bar{C}$  is inflammable (see also below) and burns with smoky green-edged flame producing fumes of HCl.

### SELECTED PHYSICAL PROPERTIES

Vapor pressure. [For vapor-press. data over various temp. ranges, e.g., from -30 to +40° (5), -30° to 100° (21), 12-187° (4) (22), see indic. refs.]

Solubility relations.  $\bar{C}$  is very spar. sol. aq., e.g., 100 g. aq. at 0° dis. 0.447 g.  $\bar{C}$  (23), 0.570 wt. % (24), although even this is somewhat more than its homologs (24).

$\bar{C}$  is miscible with EtOH although forced out of soln. by addn. of aq. (25); for use of mixt. of EtOH (50-80%) + aq. (50-20%) as selective solv. for  $\bar{C}$  in sepn. from butane see (26). —  $\bar{C}$  is also miscible with ether. — [For study of rate of volatilization of  $\bar{C}$  from solns. in ether or oils see (32).]

[For soly. of  $\bar{C}$  in  $\text{CCl}_4$  (3:5100) or in ethylene dichloride (3:5130) at -10° and 20° and at 100-760 mm. press. see (27); for soly. of  $\bar{C}$  in various high-boilg. ethers and esters of interest to refrigeration industry see (28) (29); for solubility, density, b.p., vapor/liq. equil., etc., of system  $\bar{C}$  + kerosene see (30); for sepn. of  $\bar{C}$  from butane by azeotropic distn. with  $\text{SO}_2$  see (31).]

[For soly. in  $\bar{C}$  of anhydrous  $\text{FeCl}_3$  (33) (34) or anhydrous  $\text{AlCl}_3$  (35) (36) see indic. refs.]

Adsorption of  $\bar{C}$ . [For studies on adsorption of vapors of  $\bar{C}$  by activated carbon at -15° (37), 0° (37) (38), 20° (37), 25° (39), or 50° (40) see indic. refs. and also (41); for sepn. of  $\bar{C}$  from ethylene + HCl gas by adsorption on carbon see (42). — For adsorption of vapors of  $\bar{C}$  by dehydrated chabazite see (43).]

Inflammability of  $\bar{C}$  or its mixtures.  $\bar{C}$  is readily inflammable; in mixts. with air explosive range conts. 4.00-14.18 vol. %  $\bar{C}$  with minimum ignition temp. 517°C. (44) cf. (47) (48); in mixts. with  $\text{O}_2$  explosive range conts. 4.05-67.2 vol. %  $\bar{C}$  (44) (45) with min. ignition temp. 463°C.; in mixts. with  $\text{N}_2\text{O}$  explosive range conts. 2.1-32.8 vol. %  $\bar{C}$  (45) cf. (46); for study of explosion range of  $\bar{C}$  +  $\text{C}_2\text{Cl}_2\text{F}_2$  ("Freon") + air or  $\bar{C}$  + butane + air see (49). — See also below under use of  $\bar{C}$  as anesthetic.

Other miscellaneous physical props. [For study of thermal conductivity of  $\bar{C}$  see (50).]

Binary systems contg.  $\bar{C}$ . [For f.p./compu. data and diagram of system  $\bar{C}$  + methylene (di)chloride (3:5020), eutectic, f.p. -149.7°, contg. 68.3 wt. %  $\bar{C}$ , see (18); for f.p./compu. data and diag. of system  $\bar{C}$  + EtBr (note no eutectic is formed) see (18); for system  $\bar{C}$  + solid  $\text{CO}_2$  see (5) ]

TOXICITY AND PHYSIOLOGICAL ACTION OF  $\bar{C}$ 

Full treatment of this topic is beyond the scope of this work; however, for lead references on its pharmacology (51), toxicity (52) (53) (54) (55), or anthelmintic props. (56) see indic. refs. — For use as narcotic and anesthetic see below.

USES OF  $\bar{C}$ 

Use for anesthesia and narcosis. [For general reviews on use of  $\bar{C}$  as anesthetic see (57) (58) (59) (60); for use of  $\bar{C}$  as dental anesthetic see (61) (62) (63); for short narcosis see (64) (65). — For data on mortality from use of  $\bar{C}$  as anesthetic see (66). — For studies of explosion hazards with  $\bar{C}$  or  $\bar{C}$  + ether (67) especially in presence of X-ray apparatus (68) see indic. refs. (see also above under inflammability of  $\bar{C}$ ).]

Use as a refrigerant.  $\bar{C}$  either alone or mixed with other cpds. is often used in refrigerating systems: e.g., for general survey of this aspect see (21); for examples of patents on use in refrigerating systems of  $\bar{C}$  (70), of  $\bar{C}$  (96%) + MeCl (4%) (3:7005) (71), of  $\bar{C}$  (25%) + methylene (di)chloride (3:5020) (75%) (72), of  $\bar{C}$  (40%) + EtBr (60%) (72), of  $\bar{C}$  + an alc. + a hydrocarbon lubricant (74) see indic. refs. — For study of use of  $\bar{C}$  with other suitable liq. in low-temp. cryostats see (18).

Use as solvent for extraction of oils. For use of  $\bar{C}$  as extremely volatile solvent for extraction of oils, fats, resins, perfumes, etc., see (75) (76) (77).

Miscellaneous uses of  $\bar{C}$ .  $\bar{C}$  is now an important raw material in the prepn. of tetraethyllead for use as an anti-knock agent in gasoline; for further details see below under chem. behavior of  $\bar{C}$  toward metals.

[For use of  $\bar{C}$  in purification of metallic mercury see (78).]

Because of its inertness toward ozone, its availability, and its low b.p.,  $\bar{C}$  is often used as solvent for ozonolysis.

DETERMINATION OF  $\bar{C}$ 

For detn. of  $\bar{C}$  by pyrolytic dissociation at 900° into ethylene and HCl, followed by detn. of chloride ion with stand. AgNO<sub>3</sub> (42) (80) cf. (81) or by combustion with O<sub>2</sub> in an explosion pipet to yield H<sub>2</sub>O, CO<sub>2</sub> + HCl (47), see indic. refs. — For detn. of  $\bar{C}$  by hydrolysis with excess std. N/2 alc. KOH in a.t. at 120° for 15 min. and back titration with N/2 HCl see (79).

For detn. of  $\bar{C}$  in CHCl<sub>3</sub> (3:5050) see (82); for detection of  $\bar{C}$  in perfumes see (83).

For further aspects of identification of  $\bar{C}$  see below under  $\bar{C}$ .

PREPARATION OF  $\bar{C}$ 

$\bar{C}$  can be prepared from various sources and by many methods (see simplification below); however, for quick laboratory methods the most convenient are those from EtOH by hgt. with AlCl<sub>3</sub> (1 mole) at 150° (97.6% yield (13)) and from diethyl sulfate with aq. CaCl<sub>2</sub> (63% yield (84)).

From ethyl alcohol (1:0130).

With hydrogen chloride or hydrochloric acid. [For prepn. of  $\bar{C}$  from EtOH by reactn. with HCl in absence of cat. under reflux (85) (86) or at 125° and 16 atm. (87), or 140° and 24 atm. (88), see indic. refs.; for use of EtOH + liq. HCl see (89).]

For prepn. of  $\bar{C}$  from EtOH with conc. HCl in pres. of ZnCl<sub>2</sub> (60% yield (7) (91)) see articles represented by (90) (7) (91) (92) (93) [for patents (often including also other metal salt cat. such as BiCl<sub>3</sub>, etc.) see (94)–(102), incl.].

[For prepn. of  $\bar{C}$  from EtOH + HCl in pres. of H<sub>3</sub>PO<sub>4</sub> (103) (104) (105) or H<sub>2</sub>SO<sub>4</sub> (106) or EtHSO<sub>4</sub> (107) see indic. refs.]

*By use of metal salts* For prepn. of  $\bar{C}$  from EtOH by use of  $AlCl_3$  at  $150^\circ$  (97.6% yield (13)) or of aq.  $FeCl_3$  at  $80^\circ$  (108), or by reflux with subl.  $FeCl_3$  for  $1\frac{1}{2}$  hrs. (86% yield (112)), see iodic. refs.

*By use of inorganic acid chlorides.* For prepn. of  $\bar{C}$  from EtOH by use of  $PCl_3$  (43% yield (109)),  $PCl_3 + ZnCl_2$  (62% yield (91)),  $PCl_5 + ZnCl_2$  (70% yield (91)),  $SOCl_2 + pyridine$  (75% yield (91)), or  $SO_2Cl_2 + pyridine$  (110) see indic. refs.

*By use of organic acid chlorides.* [For prepn. of  $\bar{C}$  from EtOH with benzotrichloride (3:6540) +  $FeCl_3$  see (111)]

From diethyl ether (1:6110).

*By cleavage with HCl + a catalyst.* [For prepn. of  $\bar{C}$  from diethyl ether with  $HCl + ZnCl_2$  (113) at  $80-280^\circ$  under press. (114) or at  $300-370^\circ$  under press. (115), or with  $HCl + AlCl_3/NaCl/FeCl_3$  at  $200-325^\circ$  (116), or with  $HCl +$  a nitrogen heterocycle (117) see iodic. refs.]

*By cleavage with acid chlorides + a catalyst.* [For prepn. of  $\bar{C}$  from diethyl ether with  $SOCl_2$  or  $S_2Cl_2$  in pres. of  $SnCl_4$  or  $TiCl_4$  (118), or with  $SOCl_2 + ZnCl_2$  (119); or with benzoyl chloride (3:6240) in pres. of  $Zn$  (120) cf. (121),  $ZnCl_2$  at  $150^\circ$  (78% yield (122)) cf. (123) (124),  $MeZnI$  (125) or  $AlCl_3$  (126), or with phthalyl (di)chloride (3:6900) in pres. of  $ZnCl_2$  at  $170^\circ$  (80% yield (122)); or with acetyl chloride (3:7065) in pres. of  $ZnCl_2$  (127) or  $AlCl_3$  (126) see indic. refs.]

[For formn. of  $\bar{C}$  from diethyl ether +  $CHCl_3$  (3.5050) + cat. at  $200^\circ$  and 25 atm. see (128)]

*From various ethyl esters of inorganic and organic acids.* [For prepn. of  $\bar{C}$  from diethyl sulfate with aq.  $CaCl_2$  as lab. method (63% yield (84)) or as manufacturing process (129); from diethyl sulfate with conc.  $HCl$  at  $140^\circ$  and 24 atm. (130), from ethyl chlorosulfonate with fuming  $HCl$  at  $100^\circ$  (91% yield (131)) (132) cf. (189), pyridine (133), or di-*n*-butylamine at  $100^\circ$  (53% yield (134)) see indic. refs.]

[For prepn. of  $\bar{C}$  from ethyl formate (1:3000) with  $AlCl_3$  (1 mole) at  $110^\circ$  (82% yield (135)); from ethyl chloroformate (3:7295) on litg. at  $250^\circ$  (for study of this reaction see (136) (137)), with dimethylaniline at  $150^\circ$  (138), with pyridine (139), with quinoline at  $100^\circ$  (139) or even  $59^\circ$  (140) (141), or with  $AlCl_3$  at room temp. (142), or with  $EtHSO_4$  (143) see indic. refs.]

[For prepn. of  $\bar{C}$  from ethyl acetate (1:3015) with subl.  $FeCl_3$  on  $1\frac{1}{2}$  hrs. reflux (73% yield (112)), or with  $SiCl_4$  (144), from ethyl benzoate (1:3721) with subl.  $FeCl_3$  on  $1\frac{1}{2}$  hrs. reflux (74% yield (112)); or from diethyl phthalate (1:4331) with phthalyl (di)chloride (3:6900) + trace  $ZnCl_2$  at  $130^\circ$  (145) see indic. refs.]

From vinyl chloride (3:7010). [For prepn. of  $\bar{C}$  from vinyl chloride by cat. hydrogenation at elev. temp. and press. see (146)]

From ethane. [For prepn. of  $\bar{C}$  from ethane with  $Cl_2$  above  $200^\circ$  in pres. of ethylene or  $PbEt_4$  as cat. (yields 67.8-71.4% (147)) (148) see indic. refs. — For examples of other patents on prepn. of  $\bar{C}$  from ethane with  $Cl_2$  in pres. of various cat. (149) (150) (151) (152) (153) see indic. refs.]

From ethylene. The preparation of  $\bar{C}$  from ethylene by catalytic addn. of hydrogen chloride has been extensively studied both in the scientific and in technical literature. At very low temperatures, the catalyzed reaction is quantitative, but as the temperature is increased the reverse reaction (dissociation of  $\bar{C}$  into ethylene and  $HCl$ ) is favored.

[For studies on the prepn. of  $\bar{C}$  from ethylene with  $HCl$  in pres. of  $AlCl_3$  or  $BiCl_3$  at  $-78^\circ$  (100% yield (3) (155)), or as high as  $-12^\circ$  (95% yield (151) (155)) or  $130^\circ$  (37% yield (42)), see indic. refs.; for studies on equilibrium at  $114^\circ$  and  $124^\circ$  (156), at  $170^\circ$ ,  $200^\circ$ , and  $230^\circ$  (157) or for calcul. of entropy of system (158) see indic. refs.; for study of various cat. see (159)]

[The patent literature on prepn. of  $\bar{C}$  from ethylene + HCl is extensive and overlapping, but illustrative examples may be cited. For patents involving use of  $AlCl_3$  (160) (161) under pressure (162) (163) (164) (165) in the pres. of a solvent (often  $\bar{C}$  itself) (162) (166) (167) (168) (190) see indic. refs. — For use of ethylene + mixt. of HCl (90%) +  $Cl_2$  (10%) +  $AlCl_3$  (169) (170) or for prepn. (171) or revivification (172) of  $AlCl_3$  cat. see indic. refs.]

[For patents on prepn. of  $\bar{C}$  from  $C_2H_4$  + HCl with various cat., e.g., with  $BiCl_3$  (173) (174) (175), with anhydrous  $EtHSO_4$  (176), with  $SnCl_4$  on activated carbon at  $150^\circ$  (177), with bauxite cat. (178), with iron oxide cat. at  $50^\circ$  and ord. or increased press. (179), with  $BaCl_2$  at  $250^\circ$  (180), with  $FeCl_3$  in  $\bar{C}$  or  $AlCl_3$  in nitrobenzene (181), with  $ZnCl_2$  on activated carbon, silica gel, etc., (182) (183), with various surface agts. (184) (185), with  $SO_2$  (186), with 00%  $H_2SO_4$  + NaCl (188), or in liq. ethyl chlorosulfonate +  $BiCl_3$  (189) see indic. refs.]

[For purification of  $\bar{C}$  obtd. from techn. gases by HCl method see (187).]

From miscellaneous sources. [For formn. of  $\bar{C}$  from  $EtBr$  with  $CHCl_3$  (3:5050) in pres. of  $AlCl_3$  at  $50^\circ$  (191), from  $EtMgBr$  during reaction with  $S_2Cl_2$  (102) or with 1,2-dichloroethylene (3:5030) (193), from  $EtI$  with  $Hg_2Cl_2$  in s.t. at  $140^\circ$  (12), from ethyl  $\alpha,\beta$ -dichlorovinyl ether (3:5540) with  $Cl_2$  at ord. temp. followed by warming, or stdg. in absence of aq. (194), or from dichloroacetaldehyde diethylacetal (3:6110) with  $ZnEt_2$  (195) see indic. refs.]

[For formn. of  $\bar{C}$  from succinic acid (1:0530) with aq.  $FeCl_3$  in sunlight (196) or from  $MeCl$  (3:7005) + aq. by disproportionation over cat. at  $200$ – $275^\circ$  (107) see indic. refs.]

## CHEMICAL BEHAVIOR OF $\bar{C}$

### Pyrolysis of $\bar{C}$

$\bar{C}$  passed through plain tube at  $410^\circ$  is largely unchanged, but  $\bar{C}$  passed at  $550^\circ$  through tube contg. pumice (108) cf. (42) or other cat. (100) dissociates completely into ethylene + HCl (see in detn. of  $\bar{C}$  (42)).

### BEHAVIOR OF $\bar{C}$ WITH INORGANIC REACTANTS

Chlorination. [ $\bar{C}$  with liq.  $Cl_2$  (1 mole) in u.v. light and cooling yields (200) mainly 1,1-dichloroethane (3:5035) accompanied by some 1,2-dichloroethane (3:5130) and higher chlorination prods.; the two dichloroethanes are also obtd. from  $\bar{C}$  with  $Cl_2$  + aq. (201). — For very imp. study of behavior of  $\bar{C}$  with  $Cl_2$  at  $202$ – $380^\circ$  see (202) (147).]

[ $\bar{C}$  with  $SbCl_5$  in s.t. at  $100^\circ$  (203) or  $\bar{C}$  with  $NCl_3$  (204) yields 1,2-dichloroethane (ethylene dichloride) (3:5130).]

Bromination. [For behavior of  $\bar{C}$  with  $Br_2$  see (207) (208).]

Fluorination. [ $\bar{C}$  at  $900^\circ$  with  $F_2$  in pres. of Cu yields (205)  $CF_4$ ,  $CF_3Cl$ ,  $CF_3CF_2Cl$ ,  $CHF_2CH_2Cl$ ,  $CF_2=CCl_2$ , and other prods.]

Hydrogenation. [For behavior of  $\bar{C}$  with atomic hydrogen see (206).]

Hydrolysis. [ $\bar{C}$  over suitable partially dehydrated  $Al(OH)_3$  at room temp. (209), or  $\bar{C}$  + aq. vapor over cat. at  $300$ – $500^\circ$  at ord. press. (210) (211) (212), or  $\bar{C}$  with aq. NaOH above  $150^\circ$  under press. (213), or  $\bar{C}$  with alc. NaOH (214), alc.  $Na_2CO_3$ , MgO, or CaO (215) is saponified yielding EtOH (1:0130). — The reaction of  $\bar{C}$  with EtOH/KOH is bimolecular (216); furthermore during hydrol. of  $\bar{C}$  with alk. some diethyl ether is always formed cf. (213) (214) and the reaction may be adapted to its prepn. (217).]

Amination. [ $\bar{C}$  with alc.  $NH_3$  in s.t. at  $100^\circ$  (218) or  $\bar{C}$  with liq.  $NH_3$  at  $220^\circ$  and 220 atm. press. (219) gives salts of ethylamine, diethylamine, triethylamine, and other prods. —

$\bar{C}$  with  $\text{NaNH}_2$  in liq.  $\text{NH}_3$  at  $0^\circ$  and 20 atm. gives ethylamine (30% yield (220)) and ethylene.]

Behavior of  $\bar{C}$  with inorganic acids. [ $\bar{C}$  passed through boilg.  $\text{H}_2\text{SO}_4$  gives  $\text{C}_2\text{H}_4 + \text{SO}_2 + \text{HCl}$ ;  $\bar{C}$  is absorbed by  $\text{SO}_3$  giving a liq. which probably comprises a mixture of ethyl chlorosulfonate,  $\beta$ -chloroethanesulfonic acid, and  $\beta$ -hydroxyethanesulfonyl chloride (221).]

Behavior of  $\bar{C}$  with inorganic salts. [For study of rate of reaction of  $\bar{C}$  with  $\text{KI}$  in acetone at  $50^\circ$  and  $60^\circ$  see (222). —  $\bar{C}$  with  $\text{AlBr}_3$  under suitable cond. yields (223) ethyl bromide.]

Behavior of  $\bar{C}$  with metals. With sodium. The most important reaction of  $\bar{C}$  with metals is that involved in the manufacture of tetraethyllead for use as an anti-knock agent in motor fuels. Tetraethyllead is prepared for  $\bar{C}$  either by direct reaction with  $\text{Na/Pb}$  alloys, or by reaction with  $\text{Mg}$  and subsequent conversion of the  $\text{EtMgCl}$  by means of  $\text{PbCl}_2$ . For a general survey (without references) on the manufacture of tetraethyllead see (224).

For patents involving the prepn. of  $\text{Et}_4\text{Pb}$  from  $\bar{C}$  by reactn with  $\text{Na/Ph}$  alloys under various circumstances see (225)–(244) incl.; for patents involving the use of  $\text{EtMgCl}$  see (245)–(248) incl.

[For behavior of  $\bar{C}$  with  $\text{Na}$  in lgr. followed by  $\text{CO}_2$  (249) or with amyl-sodium or octyl-sodium (250) see indic. refs. —  $\bar{C}$  with  $\text{K/Na}$  alloy in xylene gives (251) ethane (32%) and ethylene (5.5%). —  $\bar{C}$  with  $\text{Ti/Na}$  yields (252)  $\text{TiEt}_3$ .]

With magnesium. [ $\bar{C}$  with  $\text{Mg}$  in a.t. at  $260^\circ$  for 4 hrs gives (253) gas (consisting of 45% butane + 20% olefins + 22%  $\text{H}_2$ ) and a white solid which with aq. gives a gas contg. 86%  $\text{H}_2$  + 13% ethane]

$\bar{C}$  with  $\text{Mg}$  in dry ether in absence of air and in pres. of trace of  $\text{I}_2$  gives (99.7% yield in 4 hrs. (254))  $\text{EtMgCl}$ ; this reagt. is actually an equil. mixt. contg. 25%  $\text{EtMgCl}$  + 42.5%  $\text{MgEt}_2$  + 42.5%  $\text{MgCl}_2$  (255). — For study of competitive reaction with  $\text{Mg}$  in ether of an equimolar mixt. of  $\bar{C}$  +  $\text{EtI}$  yielding 27%  $\text{EtMgCl}$  + 73%  $\text{EtMgI}$  see (256). — [For reactn. of  $\text{EtMgCl}$  with  $\text{NH}_4\text{Cl}$  or triethylamine. $\cdot\text{HCl}$  (254), with  $\text{NH}_2\text{Cl}$  (257), or with  $\text{NCl}_3$  (258) see indic. refs.; for study of electrolysis of  $\text{EtMgCl}$  in ether see (259). — For reactn. of  $\text{EtMgCl}$  with  $\text{PbCl}_2$  yielding  $\text{PbEt}_4$  see (245)–(248) incl.; with  $\text{C}_6\text{H}_5\text{NCO}$  yielding propionanilide see below under  $\text{C}_6\text{H}_5\text{NCO}$ .]

#### BEHAVIOR OF $\bar{C}$ WITH ORGANIC REAGENTS

[ $\bar{C}$  with  $\text{C}_6\text{H}_6$  +  $\text{Al/Hg}$  gives (76% yield (260)) ethylbenzene (1:7410);  $\bar{C}$  + hexane +  $\text{AlCl}_3$  gives (261) octane.]

[ $\bar{C}$  with  $\text{CO}$  +  $\text{AlCl}_3$  at  $40$ – $50^\circ$  and 120 atm. followed by treatment with  $\text{H}_2\text{O}$  gives (43% yield (262)) (263) propionic acid (1:1025).]

[ $\bar{C}$  with ethylene oxide (1:6105) +  $\text{AlCl}_3$  gives (264) a mixt. contg. 4-chlorobutanol-1 (3:9170) + ethylene chlorohydrin (3:5552).]

[ $\bar{C}$  may be used for the ethylation of  $\text{OH}$  groups or  $\text{NH}_2$  groups: e.g., for reaction of  $\bar{C}$  with sodium phenolate yielding (265) ethyl phenyl ether (1:7485) or for use of  $\bar{C}$  in ethylation of cellulose (266) (267) see indic. refs.; for use of  $\bar{C}$  in ethylation of metanilic acid (268) (214) (215), *o*-toluidine (269), or *m*-aminophenol (268) see indic. refs.]

[For condens. of  $\bar{C}$  with hexamethylenetetramine see (270).]

[ $\bar{C}$  (2 moles) with ethylene (di)bromide (1 mole) + 3%  $\text{AlCl}_3$  in steel bomb at  $25^\circ$  for 14 days undergoes a redistribution reactn. yielding (271) a mixt. consisting of 5 cpds., viz.,  $\bar{C}$  (35 mole %) +  $\text{EtBr}$  (30 mole %) + ethylene chlorobromide (17 mole %) + ethylene (di)bromide (11 mole %) + ethylene dichloride (3.5130) (7 mole %).]

[ $\bar{C}$  (1 mole) with quinoline (1 mole) in a.t. in direct sunlight reacts only very slowly (incomplete in 1 year) but grad. separates ethylquinolium chloride, cryst. from abs.  $\text{EtOH}$  by addn. of dry ether, m.p.  $122^\circ$  (290).]

- ③ Propionanilide: m.p. 104.0–104.5° u.c. (272). (See also under propionic acid (1:1025).) [From  $\bar{C}$  by conversion to EtMgCl (see above) and reactn. in dry ether with phenyl isocyanate (272).]
- Propion-*p*-toluidide: m.p. 123°. [Presumably obtainable (272) from  $\bar{C}$  via conversion to EtMgCl (see above) and reaction in dry ether with *p*-tolyl isocyanate.]
- Propion- $\alpha$ -naphthalide: m.p. 126° u.c. (273). [Presumably obtainable (272) from  $\bar{C}$  via conversion to EtMgCl (see above) and reaction in dry ether with  $\alpha$ -naphthyl isocyanate; the analogous process for EtBr has been reported (273).]
- Ethyl mercuric chloride: m.p. 193.5° cor. (274), 192.5° (275), 192° (276). [Prepd. indirectly (276); but should be preparable from EtMgCl with HgCl<sub>2</sub> since corresp. EtHgBr has been reported (276) from EtMgBr + HgBr<sub>2</sub>. — Note that m.p. of EtHgCl is almost identical with that (193.5°) of EtHgBr cf. (276).]
- *S*-(Ethyl)isothiourea picrate: m.p. 188° (277). [Not reported from  $\bar{C}$ , but readily obtd. from EtBr or EtI (277) (278) (1 g.) with thiourea (1 g.) in alc. (10 ml.) on refluxing for 2 hrs., then adding PkOH (1 g.), htg. until clear soln. results, then cooling (277). — Note that the m.p. of this prod. is very close to those of *S*-(*sec*-butyl)isothiourea picrate, m.p. 190° (278), and *S*-benzylisothiourea picrate, m.p. 188° (277).]
- *N*-Ethylphthalimide: [Beil. XXI-461, XXI-(363)], ndls. from alc., m.p. 79° (279), 78° (280). [Prepd. indirectly (280), also from EtI with potassium phthalimide in s.t. at 150° (279).]
- *N*-Ethyl-3-nitrophthalimide: pl. from CS<sub>2</sub>, m.p. 105–106° (281) (282); for photographs of crystals see (282). [Not reported from  $\bar{C}$  itself, but obtd. from EtBr with K phthalimide on protracted reflux. (281).]
- *N*-Ethyltetrachlorophthalimide: pl. from CHCl<sub>3</sub> on pouring into 2 vols. EtOH, m.p. 192–193° (283). [Not reported from  $\bar{C}$  but obtd. from EtBr or EtI with K tetrachlorophthalimide in s.t. at 200° for 6 hrs. (283).]
- *N*-Ethylsaccharin: cryst. from dil. alc., m.p. 94° (284). [This prod. cannot be obtd. from  $\bar{C}$  itself (284) but is obtd. from either EtBr or EtI with sodium saccharin in aq. butylcarbitol (1:6517) contg. KI on refluxing for 30 min. (284).]
- *N*-Ethyl-*N*-(*p*-bromobenzenesulfonyl)-*p*-aniside: m.p. 113.5° u.c. (285). [Not reported from  $\bar{C}$  but obtained from EtBr with *N*-(*p*-bromobenzenesulfonyl)-*p*-aniside (285).]
- *p*-Ethoxybenzoic acid: m.p. 195° (286) cf. (287).
- Ethyl 2,4,6-triiodophenyl ether: m.p. 83.5° cor. (288).
- Ethyl  $\alpha$ -naphthyl ether: oil, b.p. 280.5° cor., f.p. below -10° (289). (Corresp. picrate, m.p. 118.5–119.5° cor.; Neut. Eq. 401 (289).)
- Ethyl  $\beta$ -naphthyl ether: m.p. 35.5–36.0° cor., b.p. 282° cor. (289). (Corresp. picrate, m.p. 101.0–101.5° cor., Neut. Eq. 401 (289).)

3:7022 ETHYL HYPOCHLORITE  $\text{CH}_3\text{CH}_2\text{OCl}$   $\text{C}_2\text{H}_5\text{OCl}$  Beil. I- 324  
I<sub>1</sub>-(164)  
I<sub>2</sub>-(325)

B.P. 36° at 758 mm. (1)

$D_4^{20} = 1.013$  (1)

36° at 752 mm. (2)

[See also *ter-butyl hypochlorite* (3:7165).]

Colorless oil (rapidly turning yellow in light) with odor like hypochlorous acid. —  $\bar{\text{C}}$  explodes on superhtg. its vapor or even in cold upon addn. of Cu powder or in bright sunlight —  $\bar{\text{C}}$  gradually decomposes on stdg. in diffuse light with formn. of ethyl acetate and other prods. (3) (4) (10). [For study of stability of  $\bar{\text{C}}$  in aq. or in  $\text{CCl}_4$  soln. see (4).] — Sol. ether,  $\text{C}_6\text{H}_6$ ,  $\text{CHCl}_3$ ; for distrib. of  $\bar{\text{C}}$  between aq. and  $\text{CCl}_4$  see (4).

[For prepn. of  $\bar{\text{C}}$  from EtOH (1:6130) with  $\text{Cl}_2$  in cold aq. alk. (2) (5) (1) (6) (7) (8) (9) or alk. earth (9) or with aq. HOCl in pres. of  $\text{CCl}_4$  (4) see indic. refs.; for formn. of  $\bar{\text{C}}$  from EtOH (1:6130) with  $\text{Cl}_2$  at  $-18^\circ$  (8) or with dry  $\text{Ca}(\text{OCl})_2$  (15) or aq. HOCl (15) (16) see indic. refs.]

$\bar{\text{C}}$  is able according to prevailing circumstances to act as an oxidizing agent, chlorinating agent, or for addn. to unsaturated linkages: furthermore since in aq.  $\bar{\text{C}}$  is extensively hydrolyzed (69% in sat. aq. soln. (4)) it may serve as source of HOCl; examples of these reactions are given below.

$\bar{\text{C}}$  with inorganic reactants.  $\bar{\text{C}}$  with KI + AcOH liberates  $\text{I}_2$  quant. according to the equation  $\text{C}_2\text{H}_5\text{OCl} + 2\text{HI} \rightarrow \text{C}_2\text{H}_5\text{OH} + \text{HCl} + \text{I}_2$  (use in quant. detn. of  $\bar{\text{C}}$  (2) (4) (7));  $\bar{\text{C}}$  with dil. alk.  $\text{Na}_3\text{AsO}_3$  gives (11) (12)  $\text{EtCl}$  (3:7015) +  $\text{Na}_3\text{AsO}_4$ ;  $\bar{\text{C}}$  in dil. alk. KSH/KCN mixt. gives (12)  $\text{KSCN} + \text{KCl} + \text{EtOH}$ .

[ $\bar{\text{C}}$  adds to dry  $\text{SO}_2$  yielding (5) ethyl chlorosulfonate [Beil. I-327, I<sub>2</sub>-(327)], b.p. 151-154° dec.,  $n_D^{20} = 1.4174$ ]

[ $\bar{\text{C}}$  (1 mole) with KCN (2 moles) in 7 pts. aq. at  $-5^\circ$  gives (30% yield (13)) ethyl cyaniminoformate [Beil. II-549, II<sub>1</sub>-(238), II<sub>2</sub>-(511)], oil, h.p. 133° dec., accompanied by a little diethyl di-imino-oxalate [Beil. II-547, II<sub>1</sub>-(238)], m.p. 38°, b.p. 172° strong dec.; in aq. alc., however, the same components give (13) diethyl iminocarbonate [Beil. III-37, III<sub>1</sub>-(18), III<sub>2</sub>-(31)], oil, b.p. 141° cor., accompanied by diethyl di-iminoxalate (see above).]

$\bar{\text{C}}$  with organic reactants. [ $\bar{\text{C}}$  with EtOH (1:6130) yields (8) acetaldehyde (1:0100), acetaldehyde diethylacetal (1:0156), and paraldehyde (1:0170). —  $\bar{\text{C}}$  with acetaldehyde (1:0100) at 0° followed by distn. of the mixture with anhyd. oxalic acid yields (3) chloroacetaldehyde (3:7212).]

[ $\bar{\text{C}}$  with acetone (1:5400) yields (3) chloroacetone (3:5425);  $\bar{\text{C}}$  with methyl phenyl ketone (acetophenone) (1:5515) yields (3)  $\alpha$ -chloroacetophenone (phenacyl chloride) (3:1212);  $\bar{\text{C}}$  with benzaldehyde (1:0195) yields (3) benzoyl chloride (3:6240).]

[ $\bar{\text{C}}$  with phenol in  $\text{CCl}_4$  yields (3) both *o*-chlorophenol (3:5980) and *p*-chlorophenol

(3:0475);  $\bar{C}$  with hydroquinone (1:1590) in ether gives (3) 2,3-dichlorohydroquinone (3:4220).]

$\bar{C}$  with phenyl MgBr in ether at 0° gives (60% yield (14)) (1) chlorobenzene (3:7903). [ $\bar{C}$  with phenylacetylene (1:7425) in  $CCl_4$  yields (3)  $\omega, \omega$ -dichloroacetophenone (3:6835).]

$\bar{C}$  with cyclohexene (1:8070) in  $CCl_4$  yields (3) 2-chlorocyclohexanol-1 (3:0175); for reactn. of  $\bar{C}$  with indene (1:7522) or with 1,4-dihydronaphthalene see (3).]

[ $\bar{C}$  with olefins adds to the unsatd. linkage to give chlorohydrin ethyl ethers (a process now generically designated as chloroalkoxylation): e.g.,  $\bar{C}$  with ethylene yields (15) (17)  $\beta$ -chloroethyl ethyl ether (ethylene chlorohydrin ethyl ether) (3:7463);  $\bar{C}$  with amylene gives (3) a corresp. prod.; the rate of addn. of  $\bar{C}$  to olefins increases from ethylene to amylene (18). — For extensive studies on the prepn. of chlorohydrin ethers from olefins by use of alic. + *N,N*-dichlorobenzenesulfonamide (which mixture appears to generate  $ROCl$  as the active addn. agent) see (18) (19) (20) (21).]

[ $\bar{C}$  has, however, but slight tendency to add to unsaturated acids: e.g.,  $\bar{C}$  in  $CCl_4$  has no actn. (22) on cinnamic acid (1:0735);  $\bar{C}$  in dry ether or  $CCl_4$  with crotonic acid (1:0425) or sorbic acid gives only traces (23) of the expected prods. —  $\bar{C}$  in  $CCl_4$  with hexen-3-oid acid-1 (hydrosorbic acid) [Beil. II-435, II-1(193), II-2(404)] gives addn. to extent of 92% in 3 days (23), but the prod. is not a chloro-ethoxy-hexanoic acid and consists entirely of a mixt. of two stereoisomeric  $\beta$ -chlorohexanoic lactones.]

Colorless limpid liquid with not unpleasant odor. — Alm. insol. aq. [for precise data see (9) (10) (11).] — [For use as refrigerant see (12).]

$\bar{C}$  with MeOH, b.p. 64.7°, forms const.-boilg. mixt., b.p. 33.4°, contg. 94 wt. %  $\bar{C}$  (4);  $\bar{C}$  with EtOH, b.p. 78.3°, forms const.-boilg. mixt., b.p. 35.6°, contg. 97.2 wt. %  $\bar{C}$  (4) [for other azeotropes see Beil. I<sub>2</sub>-(72).]

[For prepn. of  $\bar{C}$  from propanol-2 (1:6135) with conc. HCl + ZnCl<sub>2</sub> (yield: 70-76% (13)) (14) (15) (16) (17) (43); with PCl<sub>3</sub> + ZnCl<sub>2</sub> (74% yield (15)); with PCl<sub>5</sub> + ZnCl<sub>2</sub> (66% yield (15)); with SOCl<sub>2</sub> + pyridine (80% yield (15)); or with AlCl<sub>3</sub> (70% yield (18)) see indic. refs.; for prepn. from propylene by addn. of HCl under various conditions see (19) (20) (21) (22) (23) (24) (25) (26) (27) (28) (29) (30).]

[For formn. of  $\bar{C}$  (together with other products) by actn. of Cl<sub>2</sub> on propane see (31), for further actn. of Cl<sub>2</sub> on  $\bar{C}$  see (3).] — [For isomerization of 1-chloropropane to  $\bar{C}$  in presence of metallic catalysts see 1-chloropropane (3:7040).] — [For purification of  $\bar{C}$  with conc. H<sub>2</sub>SO<sub>4</sub> see (32).]

$\bar{C}$  on hydrolysis yields propanol-2 (1:6135). [For study of this reactn. see (2); for use in mfg. of propanol-2 see (33).]

[For reactn. of  $\bar{C}$  with KI in acetone see (1).]

$\bar{C}$  with Mg in dry ether gives (90% yield (17), 93.9% (44)) RMgCl (for reactions of this see below).

[For study of behavior of  $\bar{C}$  with C<sub>6</sub>H<sub>6</sub> or toluene in pure HCl under press. see (45); for behavior with C<sub>6</sub>H<sub>6</sub> + Al/Hg see (46).]

⑤ Isobutyranilide: m.p. 105° (34); 104-105° (35); u.c. (36); 103° cor. (37). [From  $\bar{C}$  (36) or from isopropyl bromide (37) via conversion to RMgX and reactn. with phenyl isocyanate.]

— Isobutyryl-*p*-toluidide: m.p. 103.5-109.5° (38); 106-106.5° (39). [Presumably similarly obtainable via RMgCl + *p*-tolyl isocyanate but not actually so recorded.]

— Isobutyryl- $\alpha$ -naphthalide: unrecorded.

— *S*-(Isopropyl)isothiourea picrate: m.p. 196° (40). [From isopropyl bromide on btg. 3 hrs. in alc. with thiourea, then adding PhOH (40), but not recorded from  $\bar{C}$ .]

— Isopropyl mercuric chloride (sec-PrHgCl): m.p. 97° (47). [Reported only by indirect means (47).]

— *N*-(Isopropyl)phthalimide (2-(*N*-phthalimido)propane): m.p. 86° (48), 85° (49). [Not reported from  $\bar{C}$  but obtd. from isopropyl bromide with K phthalimide in s.t. at 160-170° for 7 hrs. (49), also indirectly (48) (50).]

— *N*-(Isopropyl)-3-nitrophthalimide: unreported.

— *N*-(Isopropyl)tetrachlorophthalimide: unreported.

— *N*-(Isopropyl)-*o*-sulfobenzoic imide (*N*-isopropylsaccharin): m.p. 134° (51). [Not reported from  $\bar{C}$  but obtd. from either isopropyl bromide or isopropyl iodide with aq. sodium saccharin in aq. butylcarbitol (1:6517) on refluxing 30 mm. (51).]

— *N*-(Isopropyl)-*N*-(*p*-bromobenzenesulfonyl)-*p*-anisidine: m.p. 107° u.c. (52). [Not reported from  $\bar{C}$  but obtd. from isopropyl bromide with *N*-(*p*-bromobenzenesulfonyl)-*p*-anisidine in alc. KOH (52).]

— *p*-Isopropoxybenzoic acid: m.p. 160-163° (53). [From  $\bar{C}$  (?) or from isopropyl bromide with ethyl *p*-hydroxybenzoate (1:1534) in abs. alc. NaOEt on refluxing 1 hr. (53).]

— Isopropyl 2,4,6-triiodophenyl ether: m.p. 43° cor. (41). [From isopropyl bromide on refluxing with 2,4,6-triiodophenol, m.p. 157-158°, in alc. NaOEt (41).]

— Isopropyl  $\alpha$ -naphthyl ether: b.p. 282.5° cor. (42) [picrate: m.p. 104.5-105.5° cor. (42)].

— Isopropyl  $\beta$ -naphthyl ether: b.p.  $285^\circ$  cor., m.p.  $40.0^\circ$  cor. (42) [picrate: m.p.  $95.0-95.5^\circ$  cor. (42)].

Colorless oil, spnr. sol. aq.; volatile with steam.

$\bar{C}$  with EtOH (1:6130) forms a const.-boilg. mixt., b.p. 44° at 760 mm., contg. 95%  $\bar{C}$  (5); with formic acid (1:1005) forms a const.-boilg. mixt., h.p. 45.0° nt 760 mm., contg. 92.5%  $\bar{C}$  (15).

$\bar{C}$  is one of most toxic of all halohydrocarbons (for study see (16)).

[For prepn. of  $\bar{C}$  from allyl alcohol (1:6144) + conc. HCl in s.t. at 100° for 3 hrs. (17), with conc. HCl (1) (23) or 10 days nt room temp. (55–6 N HCl (50% yield (19)), with  $\text{ZnCl}_2$  or dislvd. in cold conc. HCl and treated with  $\text{Cu}_2\text{Cl}_2$  (small amt.) + conc.  $\text{H}_2\text{SO}_4$  (yield 85–90% (2), 80% (22)) see indic. refs.; from allyl alcohol (1:6145) with  $\text{SOCl}_2$  in  $\text{C}_6\text{H}_6$

(71% yield (21)), with  $\text{PCl}_3$  (1) (24), with  $\text{PCl}_3 + \text{ZnCl}_2$  in  $\text{C}_6\text{H}_6$  at  $0^\circ$  (63% yield (21)), with  $\text{PCl}_3 + \text{pyridine}$  (73% yield (9)), with  $\text{PCl}_3 + \text{ZnCl}_2$  in  $\text{C}_6\text{H}_6$  (57% yield (21)) see indic. refs.]

[For prepn. of  $\bar{\text{C}}$  from allyl formate (1:3035) with conc.  $\text{HCl} + \text{a little } \text{Cu}_2\text{Cl}_2 + \text{conc. } \text{H}_2\text{SO}_4$  (93–98% yield (22)), or with  $\text{ZnCl}_2 + \text{HCl}$  gas (80–90% yield (25)) (26) see indic. refs.; from allyl oxalate in alc.  $\text{CaCl}_2$  in s.t. at  $100^\circ$  see (27); from allyl iodide with alc.  $\text{HgCl}_2$  at ord. temp. see (27).]

[For comml. prepn. of  $\bar{\text{C}}$  from propylene with  $\text{Cl}_2$  at elevated temps., e.g.,  $500^\circ$  (yield 96%  $\bar{\text{C}}$  accompanied by 3% 2-chloropropene-1 (3:7020) + 1% mixed *cis* and *trans* isomers of 1-chloropropene-1 (3:7030) (11)) (28) (29), see indic. refs. (note also that the high-boiling material from distn. of comml.  $\bar{\text{C}}$  contains (110) approx. 60% 1,3-dichloropropene-1 (3:5250) + 30% 1,2-dichloropropane (3:5200)); for examples of patents covering this procedure see (30) (31) (32) (33) (34) (35), from propane (34) (36) or 1-chloropropane (3:7040) (36) with  $\text{Cl}_2$  + cat. at  $500\text{--}700^\circ$  see indic. refs.; from 1,2-dichloropropane (3:5200) by suitable pyrolysis (yield: 55–70%  $\bar{\text{C}}$  + 30–40% of mixt. of *cis* and *trans* isomers of 1-chloropropene-1 (3:7030) + 5% 2-chloropropene-1 (3:7020) (11)) cf. (12) (13) (39); for examples of relevant patents see (37) (38) (40).]

Reactions involving the double bond of  $\bar{\text{C}}$ . [ $\bar{\text{C}}$  with  $\text{Cl}_2$  adds and/or substitutes according to conditions (for study of relative proportions of these reactions see (29) (11));  $\bar{\text{C}}$  with  $\text{Cl}_2$  at ord. temp. (41) or  $\bar{\text{C}}$  with  $\text{SO}_2\text{Cl}_2$  in  $\text{CCl}_4$  in pres. of peroxides (42) gives (80–90% yield (42)) 1,2,3-trichloropropane (3:5840) (note that this comprises one step in one of the modern syntheses of glycerol from petroleum (43) (44));  $\bar{\text{C}}$  with  $\text{Cl}_2$  at high temp. yields (11) a mixt. of prods. of which the dichloropropene fraction comprises (11) 47% 1,3-dichloropropene-1 (high-boilg. isomer) (3:5250) + 42% 1,3-dichloropropene-1 (low-boilg. isomer) (3:5250) + 11% 1,1-dichloropropene-2 (3:5140) + trace of 1,2-dichloropropene-2 (3:5190).]

[ $\bar{\text{C}}$  with  $\text{Br}_2$  adds 1 mole of halogen yielding (45) mainly 1,2-dibromo-3-chloropropane ( $\gamma$ -chloropropylene dibromide) [Beil. I-111], b.p.  $195^\circ$  (45); for study of rate of addn. of  $\text{Br}_2$  under various conditions see (14) (9) (46) (105); for heat of reactn. see (47).]

[ $\bar{\text{C}}$  with conc. aq.  $\text{HCl}$  in s.t. at  $100^\circ$  for 18 hrs. (48), or  $\bar{\text{C}}$  with dry  $\text{HCl}$  in dark at  $0^\circ$  in absence of  $\text{FeCl}_3$  (33% yield (49)) or at room temp. in pres. of  $\text{FeCl}_3$  (85–89% yield (49)), gives 1,2-dichloropropane (propylene dichloride) (3:5200); note that addn. of  $\text{HCl}$  is not complicated by a peroxide effect but is very slow unless  $\text{FeCl}_3$  (or less advantageously  $\text{AlCl}_3$ ) is used as a cat. (49). —  $\bar{\text{C}}$  satd. with  $\text{HBr}$  gas at  $0^\circ$  or below (50), or with conc. aq.  $\text{HBr}$  at  $0^\circ$  (51), or with  $\text{HBr}$  gas in s.t. at  $100^\circ$  for 8 hrs. (45) cf. (52), or in presence of  $\text{Fe}$  (53) or other cat., e.g.,  $\text{BiCl}_3$  (54), as directed, gives (yields: 36–38% (53), 43% (52), 50% (51), 87% (50)) 1-bromo-3-chloropropane ( $\gamma$ -chloro- $n$ -propyl bromide) (trimethylene chlorobromide) [Beil. I-109, I<sub>1</sub>-(36), I<sub>2</sub>-(75)], b.p.  $142^\circ$ ; note that the above mode of addn. is favored by peroxides (49) (54) cf. (106). —  $\bar{\text{C}}$  with  $\text{HI}$  (10–20% excess at  $0^\circ$ ) gives exclusively (90–100% yield (55)) 1-chloro-2-iodopropane, b.p.  $66.2^\circ$  at 50 mm.,  $n_D^{20} = 1.5472$  (55); note that in this reactn. formn. of 2-iodopropane (isopropyl iodide) has also been reported (56)]

[ $\bar{\text{C}}$  (1 mole) with conc.  $\text{H}_2\text{SO}_4$  (2 moles) at  $0^\circ$  gives an oily addn. prod. (24) (presumably  $\beta$ -chloroisopropyl hydrogen sulfate) which upon dilution with aq. and subsequent distillation gives (50% yield (57) (61)) (24) (58) (59) (60) 1-chloropropanol-2 (3:7747); in pres. of  $\text{CuSO}_4$  the yield rises to 66–70% (62). —  $\bar{\text{C}}$  adds  $\text{HOCl}$  yielding (63) (64) (65) (76) 2,3-dichloropropanol-1 (glycerol  $\beta$ -dichlorohydrin) (3:6060). —  $\bar{\text{C}}$  with *ter*-butyl hypochlorite (3:7165) in  $\text{MeOH}$  contg. a little *p*-toluenesulfonic acid gives at  $40^\circ$  (44% yield (66)) 1,3-dichloro-2-methoxypropane ( $\beta,\beta'$ -dichloroisopropyl methyl ether), b.p.  $154\text{--}156^\circ$  at 730 mm.,  $D_4^{20} = 1.2235$ ,  $n_D^{20} = 1.4542$  (66)]

[ $\bar{C}$  with liq.  $SO_2$  + trace of ascaridole + a few drops of aq. or alc.  $HCl$ ,  $HBr$ , or  $H_2SO_4$  gives (70–100% yield (67)) cf. (68) allyl chloride polysulfone, no def. m.p., dec. 210–235°, sol.  $CHCl_3$  or acetone but insol. most other org. solvents; note, however, that this addn. of  $SO_2$  is completely inhibited by the pres. of as little as 5 mole % of allyl bromide or cinnamyl bromide (67). —  $\bar{C}$  (2 moles) with  $S_2Cl_2$  (1 mole) in s.t. at 100° for 6 hrs. deposits sulfur and yields (69) bis-( $\beta$ , $\gamma$ -dichloro-*n*-propyl) sulfide, pale yel. oil, b.p. 181–182° at 15 mm. (69); the same components maintained at room temp. for 10 days, however, deposit no sulfur and on distn. yield (69) bis-( $\beta$ , $\gamma$ -dichloro-*n*-propyl) disulfide, b.p. 190° at 11 mm. (69).]

[ $\bar{C}$  (2 moles) with cyclopentadiene (1 mole) (1:8030) in s.t. at 170–180° for 8 hrs. gives (74% yield on  $C_5H_6$  (70)) by Diels-Alder addn. 2,5-endomethylene-1,2,5,6-tetrahydrobenzyl chloride (1-(chloromethyl)-2,5-endomethylenecyclohexene-3), b.p. 54–57° at 11 mm. (70). — For polymerization of  $\bar{C}$  see (71) (101).]

[ $\bar{C}$  with excess diazomethane in ether stood for 3 days yields a yel. very hygroscopic ppt. presumably 3-(chloromethyl)- $\Delta^2$ -pyrazoline (72).]

[ $\bar{C}$  with  $C_6H_6$  + conc.  $H_2SO_4$  gives (73) by addn. to the ethylene linkage  $\beta$ -chloro-*n*-propylbenzene (2-chloro-1-phenylpropane) [Beil. V-391,  $V_1$ -(189),  $V_2$ -(304)], b.p. 85° at 13 mm.,  $D_4^{19} = 1.047$ ,  $n_D^{19} = 1.5245$  (73); note, however, that  $\bar{C}$  with  $C_6H_6$  in pres. of  $FeCl_3$  at –20° gives (33.5% yield (74)) (73) the isomeric ( $\beta$ -chloroisopropyl)benzene (1-chloro-2-phenylpropane) [Beil.  $V_1$ -(191)], b.p. 79° at 10 mm.,  $D_4^{17} = 1.0367$ ,  $n_D^{16} = 1.52129$  (74);  $\bar{C}$  with  $C_6H_6$  +  $AlCl_3$  ( $\frac{1}{2}$  mole) gives none of the  $\beta$ -chloroisopropylbenzene since it apparently reacts with more  $C_6H_6$  yielding (74)  $\alpha$ -methylbibenzyl (1,2-diphenylpropane [Beil. V-613,  $V_1$ -(288),  $V_2$ -(517)].] [For analogous condensation of  $\bar{C}$  with fluorobenzene, chlorobenzene (3:7903), and bromobenzene see (118).]

[For oxidn. of  $\bar{C}$  in liq. phase at 75–250° by  $O_2$  in pres. of  $Cu(OAc)_2$  or peroxide catalysts and in an org. solv. such as  $AcOH$  to hydroxylated cpds. see (75).]

Reactions involving the halogen atom of  $\bar{C}$ . [ $\bar{C}$  +  $H_2$  over activated charcoal at 300–500° gives (58% yield (77)) propylene; note that the double bond is not (77) hydrogenated.]

[ $\bar{C}$  passed over activated charcoal contg. 1–2%  $KOH$  is dehalogenated (78) at 375° to extent of 21%; at 400°, 58%.]

[ $\bar{C}$  with aq. vapor at 550–850° + cat. (79) or under press. with alkali hydroxides (80) or with  $HCl/Cu_2Cl_2$  (108) yields (cf. (43) (44)) allyl alcohol (1:7145). —  $\bar{C}$  with alc.  $KOH$  (81) (107) or alc.  $NaOH$  (12) yields allyl ethyl ether (1:7850) + alkali chloride; for use of this reactn. in detn. of  $\bar{C}$  in pres. of *cis*-1-chloropropene-1 (3:7030) and *trans*-1-chloropropene-1 (3:7030) see (12); for study of rate of reactn. of  $\bar{C}$  with  $NaOMe$  at 16–18° (82) or of  $\bar{C}$  with  $NaOEt$  at 35° and 50° (83) see indic. refs.]

[ $\bar{C}$  with alc.  $KSH$  gives mainly (84) di-allyl sulfide [Beil. I-441,  $I_1$ -(226),  $I_2$ -(478)], b.p. 138–139° (84).] — [For reactn. of  $\bar{C}$  with alkali polysulfides in prepn. of rubber-like prod. see (85).]

[For studies of rate of reactn. of  $\bar{C}$  with  $KI$  in acetone at 20° (83), 25° (86), or 60° (87) cf. (9) see indic. refs.; for reactn. of  $\bar{C}$  with  $Na_3AsO_3$  yielding allylarsinic acid see (88); for reactn. of  $\bar{C}$  with  $CuCN$  giving (85% yield (22)) allyl cyanide (vinylacetoneitrile) [Beil. II-408,  $II_1$ -(187),  $II_2$ -(389)], b.p. 117.8–118.2° at 757 mm. (22), see indic. refs.; for reactn. of  $\bar{C}$  with  $Mg$  + acetone, giving allyl-dimethyl-carbinol [Beil. I-445,  $I_2$ -(487)], b.p. 118–120°,  $D_4^{17} = 0.83452$ ,  $n_D^{17} = 1.4300$  see (89).]

[ $\bar{C}$  with conc. aq.  $NH_4OH$  as directed (90) yields allylamine [Beil. IV-205,  $IV_1$ -(389),  $IV_2$ -(662)], b.p. 56°, misc. aq. — For study of rate of addn. of  $\bar{C}$  to pyridine or reactn. with piperidine see (82) (91); for sepn. of  $\bar{C}$  from other chloro-olefins, e.g., 1-chloropropene-1 (3:7030) or 2-chloropropene-1 (3:7020), by conv. of  $\bar{C}$  to quaternary salt see (111).]

$\bar{C}$  with  $Mg$  in dry ether under carefully regulated conditions gives (84% yield (102))

cf. (109) (119) allyl MgCl; note that if this prod. reacts with phenyl isocyanate in a fashion analogous (103) to allyl MgBr the prod. obtd. should be crotonanilide, m.p. 113-114° cor. (103).

( $\bar{C}$  with Mg in dry ether as directed gives (63% yield crude, 27% pure (92), 60% (93)) hexadiene-1,5 (1:8045). —  $\bar{C}$  with NaNH<sub>2</sub> in liq. NH<sub>3</sub> as directed gives (30% yield (94)) hexatriene-1,3,5 (Beil. I-263, I<sub>2</sub>(243)), b.p. 76-80°,  $D_4^{20} = 0.7182$ ,  $n_D^{20} = 1.4330$  (94); during the reactn. an intermediate chlorohexadiene (95), b.p. 115° at 748 sl. dec., 46-47.5° at 96 mm.,  $n_D^{20} = 1.4483$ , appears to be formed, and the hexatriene is accompanied (94) (95) by variable amts. of its dimer, trimer, and tetramer. — For reaction of  $\bar{C}$  with monosodium acetylene in liq. NH<sub>3</sub> see (96).]

( $\bar{C}$  with 1-chloro-2-methylpropene-2 (methallyl chloride) (3:7145) + Mg in ether gives (93) 47% 2-methylhexadiene-1,5 (b.p. 88.1° at 760 mm.,  $D_4^{20} = 0.7198$ ,  $n_D^{20} = 1.4184$ ) + 30% 2,5-dimethylhexadiene-1,5 (b.p. 114.3° at 760 mm.,  $D_4^{20} = 0.7423$ ,  $n_D^{20} = 1.4293$ ) + 12% hexadiene-1,5 (biallyl) (1:8045). —  $\bar{C}$  with crotyl chloride (the equil. mixt. of 1-chlorobutene-2 (3:7205) and 3-chlorobutene-1 (3:7090)) + Mg in ether gives 34% heptadiene-1,5 (b.p. 93.7° at 760 mm.,  $D_4^{20} = 0.7186$ ,  $n_D^{20} = 1.4200$ ) + 21% 3-methylheptadiene-1,5 (b.p. 111.0° at 760 mm.,  $D_4^{20} = 0.7291$ ,  $n_D^{20} = 1.4240$ ) + 10% hexadiene-1,5 (1:8045) + 10% 3-methylhexadiene-1,5 (b.p. 80.0° at 760 mm.,  $D_4^{20} = 0.7103$ ,  $n_D^{20} = 1.4116$ ) + 1% octadiene-1,6 (b.p. 124.5° at 760 mm.,  $D_4^{20} = 0.7441$ ,  $n_D^{20} = 1.4336$ ) (93).]

[ $\bar{C}$  reacts with RMgX cpds. in normal coupling; e.g.,  $\bar{C}$  with EtMgBr gives (97) pentene-1 (1:8205);  $\bar{C}$  with *n*-PrMgBr gives (97) hexene-1 (1:8255);  $\bar{C}$  + *n*-C<sub>8</sub>H<sub>17</sub>MgCl gives (80% yield (93)) octene-1 (1:8375);  $\bar{C}$  with iso-AmMgCl gives (60% yield (93)) 6-methylheptene-1 (b.p. 113.2° at 760 mm.,  $D_4^{20} = 0.7119$ ,  $n_D^{20} = 1.4068$ );  $\bar{C}$  with *o*-tolyl MgBr gives (98) *o*-allyltoluene (b.p. 182-183° at 757 mm.,  $D_4^{20} = 0.9001$ ,  $n_D^{20} = 1.5186$ ).]

Miscellaneous reactions of  $\bar{C}$ . [ $\bar{C}$  with phenol (1:1420) + conc. H<sub>2</sub>SO<sub>4</sub> stood at room temp. for 6 months gives (99) *o*-isopropenylphenol [Beil. VI-572, VI<sub>1</sub>-(233)]; for analogous prods. from  $\bar{C}$  with *o*-cresol (1:1400), *m*-cresol (1:1730), and *p*-cresol (1:1410) see (99).]

⊙ *S*-Allylthiourea picrate: m.p. 155° (100). [From  $\bar{C}$  thiourea in EtOH, refluxed for 5 min., treated with PhOH (100).]

— *N*-(Allyl)phthalimide [Beil. XXI-464, XXI<sub>1</sub>-(364)]: m.p. 70°. [The direct prepn. of this cpd. from  $\bar{C}$  has not been reported; it has, however, been obtd. from allyl bromide with K phthalimide in s.t. at 150° for 2-3 hrs. (50% yield (104)) and has also been prepd. by numerous indirect means; with Cl<sub>2</sub> in CHCl<sub>3</sub> it yields *N*-(β,γ-dichloro-*n*-propyl)phthalimide, ndls. from alc., m.p. 93° (104); with Br<sub>2</sub> in CHCl<sub>3</sub> it yields *N*-(β,γ-dibromo-*n*-propyl)phthalimide, m.p. 113-114° (104).]

— *N*-(Allyl)-3-nitrophthalimide: pl. from CS<sub>2</sub>, m.p. 100-101° (112). [Not reported from  $\bar{C}$  but obtd. from allyl bromide with K 3-nitrophthalimide (112), for photographs of cryst. see (113).]

— *N*-(Allyl)tetrachlorophthalimide: unreported.

⊕ *N*-(Allyl)-*o*-sulfobenzoic imide (*N*-allylsaccharin): m.p. 58° (114). [From  $\bar{C}$  with sodium saccharin in aq. butylcarbitol (1:6517) on refluxing 30 min. (114).]

— *N*-(Allyl)-*N*-(*p*-bromobenzenesulfonyl)-*p*-aniside: m.p. 82° u.c. (115). [Not reported from  $\bar{C}$  but obtd. from allyl bromide with *N*-(*p*-bromobenzenesulfonyl)-*p*-anisidine in alc. KOH (115).]

— *p*-Allyloxybenzoic acid: m.p. 162-163° u.c. (116). [From  $\bar{C}$  (?) or from allyl bromide with ethyl *p*-hydroxybenzoate (1:1534) in abs. alc. NaOEt on refluxing 1 hr. (116); note, however, that m.p. of prod. is almost identical with corresp. deriv., m.p. 160-163°, from isopropyl halides.]

- Allyl  $\alpha$ -naphthyl ether: m.p.  $-10^{\circ}$  (117) (corresp. picrate, m.p.  $100.5-101.0^{\circ}$  cor. (117)).
- Allyl  $\beta$ -naphthyl ether: m.p.  $+16^{\circ}$  (117) (corresp. picrate, m.p.  $98.5-99.0^{\circ}$  cor. (117)).

Colorless limpid liquid with not unpleasant odor. — Almost insol. aq. [for precise data see (10) (11) (12)].

$\bar{C}$  with MeOH, b.p. 64.7°, forms const.-boilg. mixt., b.p. 40.5°, contg. 90.5 wt. %  $\bar{C}$  (13);  $\bar{C}$  with EtOH, b.p. 78.3°, forms const.-boilg. mixt., b.p. 45.0°, contg. 94 wt. %  $\bar{C}$  (14);  $\bar{C}$  with isopropyl alc., b.p. 82.5°, forms const.-boilg. mixt., b.p. 46.4°, contg. 97.2 wt. %  $\bar{C}$  (14);  $\bar{C}$  with CS<sub>2</sub>, b.p. 46.3°, forms const.-boilg. mixt., b.p. 42.05°, contg. 44.5 wt. %  $\bar{C}$  (14). — [For f.p./compn. data on mixts. of  $\bar{C}$  with cyclohexyl chloride (3:8040) or with isopropyl bromide see (15).]

[For prepn. of  $\bar{C}$  from propanol-1 (1:6150) with conc.  $HCl$  (16), 70–72% (16), 65–70% (17), 61% (18) (19)); with  $PCl_5$  (20) (21) (22) (23) (24) (25) (26) (27) (28) (29) (30) (31) (32) (33) (34) (35) (36) (37) (38) (39) (40) (41) (42) (43) (44) (45) (46) (47) (48) (49) (50) (51) (52) (53) (54) (55) (56) (57) (58) (59) (60) (61) (62) (63) (64) (65) (66) (67) (68) (69) (70) (71) (72) (73) (74) (75) (76) (77) (78) (79) (80) (81) (82) (83) (84) (85) (86) (87) (88) (89) (90) (91) (92) (93) (94) (95) (96) (97) (98) (99) (100); with  $PCl_5$  (5) +  $ZnCl_2$  (76% yield (19)); with  $SOCl_2$  + refs.; for other misc. methods see Beil.]

[For formn. of  $\bar{C}$  (together with  $\bar{C}$ ) (1) (2) (3) (4) (5) (6) (7) (8) (9) (10) (11) (12) (13) (14) (15) (16) (17) (18) (19) (20) (21) (22) (23) (24) (25) (26) (27) (28) (29) (30) (31) (32) (33) (34) (35) (36) (37) (38) (39) (40) (41) (42) (43) (44) (45) (46) (47) (48) (49) (50) (51) (52) (53) (54) (55) (56) (57) (58) (59) (60) (61) (62) (63) (64) (65) (66) (67) (68) (69) (70) (71) (72) (73) (74) (75) (76) (77) (78) (79) (80) (81) (82) (83) (84) (85) (86) (87) (88) (89) (90) (91) (92) (93) (94) (95) (96) (97) (98) (99) (100); for further actn. of  $Cl_2$  on  $\bar{C}$  (1) (2) (3) (4) (5) (6) (7) (8) (9) (10) (11) (12) (13) (14) (15) (16) (17) (18) (19) (20) (21) (22) (23) (24) (25) (26) (27) (28) (29) (30) (31) (32) (33) (34) (35) (36) (37) (38) (39) (40) (41) (42) (43) (44) (45) (46) (47) (48) (49) (50) (51) (52) (53) (54) (55) (56) (57) (58) (59) (60) (61) (62) (63) (64) (65) (66) (67) (68) (69) (70) (71) (72) (73) (74) (75) (76) (77) (78) (79) (80) (81) (82) (83) (84) (85) (86) (87) (88) (89) (90) (91) (92) (93) (94) (95) (96) (97) (98) (99) (100); for isomerization of  $\bar{C}$  (1) (2) (3) (4) (5) (6) (7) (8) (9) (10) (11) (12) (13) (14) (15) (16) (17) (18) (19) (20) (21) (22) (23) (24) (25) (26) (27) (28) (29) (30) (31) (32) (33) (34) (35) (36) (37) (38) (39) (40) (41) (42) (43) (44) (45) (46) (47) (48) (49) (50) (51) (52) (53) (54) (55) (56) (57) (58) (59) (60) (61) (62) (63) (64) (65) (66) (67) (68) (69) (70) (71) (72) (73) (74) (75) (76) (77) (78) (79) (80) (81) (82) (83) (84) (85) (86) (87) (88) (89) (90) (91) (92) (93) (94) (95) (96) (97) (98) (99) (100); for isomerization of  $\bar{C}$  accompanying alkylation see (29); for  $\bar{C}$  in Friedel-Crafts reactn. see (30).]

[For isomerization of  $\bar{C}$  (1) (2) (3) (4) (5) (6) (7) (8) (9) (10) (11) (12) (13) (14) (15) (16) (17) (18) (19) (20) (21) (22) (23) (24) (25) (26) (27) (28) (29) (30) (31) (32) (33) (34) (35) (36) (37) (38) (39) (40) (41) (42) (43) (44) (45) (46) (47) (48) (49) (50) (51) (52) (53) (54) (55) (56) (57) (58) (59) (60) (61) (62) (63) (64) (65) (66) (67) (68) (69) (70) (71) (72) (73) (74) (75) (76) (77) (78) (79) (80) (81) (82) (83) (84) (85) (86) (87) (88) (89) (90) (91) (92) (93) (94) (95) (96) (97) (98) (99) (100); for isomerization of  $\bar{C}$  accompanying alkylation see (29); for  $\bar{C}$  in Friedel-Crafts reactn. see (30).]

$\bar{C}$  on passing over various cat. espec. at elevated temps. loses  $HCl$  (30) (31) + Beil. I<sub>2</sub> (72).  
[For study of behavior of  $\bar{C}$  with  $KI$  see (33); toward  $Na$  see (34) (35) (36); with  $Mg$  in dry ether see (37) (note that  $\bar{C}$  with  $Mg$  in dry ether contg. trace of  $I_2$  gives in absence of air 98.2% yield (51)  $RMgCl$ ).]

① *n*-Butyranilide: m.p. 96° (38); 97° (39); 92° cor. (40), u.c. (41). [From  $\bar{C}$  (41) or *n*-propyl bromide (40) via conversion to  $RMgX$  and reactn. with phenyl isocyanate (41).]

— *n*-Butyr-*p*-toluidide: m.p. 75° (38); 74–75° (42); 73–74° (43). [Presumably similarly obtainable via  $RMgCl$  + *p*-tolyl isocyanate, but not actually so recorded.]

② *n*-Butyr- $\alpha$ -naphthalide: m.p. 120° (44); 121° (45). [From  $RMgBr$  via reactn. with  $\alpha$ -naphthyl isocyanate (45).]

— *n*-Propyl mercuric chloride: m.p. 140° (46).

③ *S*-(*n*-Propyl)isothioureia picrate: m.p. 176° (47). [In small yield from  $\bar{C}$  on htg. 5 hrs. with thiourea in alc., followed by addn. of  $PKOH$  (47).]

— *n*-Propyl 2,4,6-triiodophenyl ether: m.p. 82° cor. (48). [From *n*-propyl bromide on refluxing with 2,4,6-triiodophenol, m.p. 157–158°, in alc.  $NaOEt$  (48).] [Note that this ether depresses m.p. of corresp. Et 2,4,6-triiodophenyl ether, m.p. 82° cor. (48).]

— *N*-(*n*-Propyl)-3-nitrophthalimide: ndls. from  $CS_2$ , m.p. 84–85° (49). [From *n*-propyl bromide on refluxing with  $K$  3-nitrophthalimide (49).]

— *n*-Propyl  $\alpha$ -naphthyl ether: h.p. 293.5° cor. (50) [picrate: m.p. 99.5–100° cor. (50)].

— *n*-Propyl  $\beta$ -naphthyl ether: h.p. 297.0° cor., m.p. 39.5–40.0° cor. (50) [picrate: m.p. 80.5–81.5° cor. (50)].

[See also 1-chloro-2-methylpropane (3:7135).]

Binary systems of  $\bar{\text{C}}$  with other org. cpds. — For f.p./compn. data of mixts. of  $\bar{\text{C}}$  with  $\text{CCl}_4$  (3:5100) (23) (13), with *n*-butyl chloride (3:7160) (19), with *n*-butyl bromide (19), or with isobutyl bromide (19) see indic. refs.

$\bar{\text{C}}$  with MeOH (1:6120) forms a const.-boilg. mixt., b.p. 43.75°, contg. 90%  $\bar{\text{C}}$  (24);  $\bar{\text{C}}$  with formic acid (1:1005) forms a const.-boilg. mixt., b.p. 50.0°, contg. 88.8%  $\bar{\text{C}}$  (3);  $\bar{\text{C}}$  with  $\text{CS}_2$  forms a const.-boilg. mixt., b.p. 43.3°, contg. 37%  $\bar{\text{C}}$  (25). — Note that  $\bar{\text{C}}$  gives no azeotrope with *ter*-BuOH (1:6140) (9).

Preparation of  $\bar{\text{C}}$ . [For prepn. of  $\bar{\text{C}}$  from *ter*-BuOH (1:6140) with conc. HCl (3 vols.) by shaking in cold (espec. in pres. of  $\text{CaCl}_2$ ) (78-83% yield (26)) or by distillation (using

7-8 pts. by wt. conc. HCl (94% yield (27)), or with dil. aq. HCl (18-20 B6) in pres. of inorg. halide cat. (28) see indic. refs.]

[For prepn. of  $\bar{C}$  from *ter*-BuOH (1:6140) with dry HCl gas in cold (1) (29), with HCl gas in pres. of pyridine at elevated temp. (some isobutyl chloride (3:7135) is also formed (30)); with  $PCl_3$  (31),  $PCl_3 + ZnCl_2$  (92% yield (32)),  $PCl_5$  (33) (34),  $PCl_5 + ZnCl_2$  (85% yield (32)), or excess  $AlCl_3$  (35); with oxalyl (di)chloride (3:5060) (36) or with trichloromethyl chloroformate (diphosgene) (3:5515) (20) see indic. refs.]

$\bar{C}$  can also be obtained from various isobutyl cpds. (see following paragraphs), but it must be constantly kept in mind that reactns. of this type involve the equilibrium between  $\bar{C}$ , isobutylene, and isobutyl chloride, and the proportions of the two halides may vary widely according to particular conditions; for some types of utilization, however, such a mixture may serve just as well as pure  $\bar{C}$ .

[For prepn. of  $\bar{C}$  from 2-methylpropane (isobutane) with  $Cl_2$  see (37) (38) (39); from isobutylene with HCl gas (40) (41) (4) (18), with conc. aq. HCl (42) (43) (44), with HCl gas +  $AlCl_3$  at  $-50^\circ$  (45), with HCl gas + cat. (46), from tech. cracked gas (contg. isobutylene) with HCl (47) (48) (49) (57), with chloromethyl methyl ether (3:7085) +  $HgCl_2$  (other prods. are also formed (50)), or even with  $Cl_2$  (other prods. also formed) (51) (52) (53) see indic. refs.]

[For prepn. of  $\bar{C}$  from 1-chloro-2-methylpropane (isobutyl chloride) (3:7135) by hgt. at  $306^\circ$  (8%  $\bar{C}$  (54)), or passing vapor over  $BaCl_2$  at  $380-400^\circ$  (40%  $\bar{C}$  (55)), or over suitable cat. at  $200^\circ$  as directed (56); from isobutyl iodide with ICl (58); from isobutylamine with  $NOCl$  in xylene at  $-15^\circ$  (59); from isobutyl alcohol (1:6165) with HCl gas (60) cf. (1), with HCl gas over  $Al_2O_3$  at  $420^\circ$  (61), or with  $PCl_3 + ZnCl_2$  (62) see indic. refs.]

[For formn. of  $\bar{C}$  from 2-chloro-2-methylbutane (*ter*-amyl chloride) (3:7220) by cleavage with  $AlCl_3$  (35) or with anhydrous HF at  $0^\circ$  (10-17% yield (17)) see indic. refs.]

Pyrolysis of  $\bar{C}$ . [ $\bar{C}$  on suitable hgt. dec. into isobutylene + HCl; this begins to occur at  $300^\circ$  even in absence of cat. (63) for study of equilibria involved see (4) (18)]; for study of reactn. over  $ThO_2$  at  $100^\circ$  (64), over pumice at  $400-500^\circ$  (65), or over activated carbon contg. 1-2% KOH (dehalogenation is 19.8% at  $375^\circ$ , 51% at  $400^\circ$  (66)) see indic. refs. — Note that  $\bar{C}$  passed over activated carbon at  $400^\circ$  in pres. of  $H_2$  is 51% dehalogenated but the isobutylene is not reduced (67).]

Further halogenation of  $\bar{C}$ . [ $\bar{C}$  in liq. phase with  $Cl_2$  in light gives (68) a mixt. of chlorination prods. contg. approx. 37% 1,2,3-trichloro-2-methylpropane (3:5885) + 25% 1,1,2-trichloro-2-methylpropane (3:5710) + 21% 1,1,2,3-tetrachloro-2-methylpropane (3:6165) + 10% 1,2-dichloro-2-methylpropane (3:7430) + 6% 1,2,3-trichloro-2-(chloromethyl)propane (3:6335) + a trace of 1,1,1,2-tetrachloro-2-methylpropane (3:4725). —  $\bar{C}$  in vapor phase under reduced press. with  $Cl_2$  in u.v. light or in dark electric discharge (69) or  $\bar{C}$  with  $SbCl_3$  (1 mole) with cooling (34) gives 1,2-dichloro-2-methylpropane (3:7430).]

$\bar{C}$  with  $Br_2$  in pres. of Fe (70) or in liq.  $SO_2$  at room temp. for 14 hrs. (100% yield (72)) evolves HCl and gives 1,2-dibromo-2-methylbutane (isobutylene dibromide) [Beil. I-127, I<sub>1</sub>-(41), I<sub>2</sub>-(90)], b.p.  $149.0^\circ$ .

Reactions of the halogen atom of  $\bar{C}$ . The tertiary chlorine atom of  $\bar{C}$  is very reactive and therefore readily hydrolyzed or alcoholized. —  $\bar{C}$  on shaking with aq. for 24 hrs. at room temp. (6) or  $\bar{C}$  on refluxing with 2 vols. aq. for 8 hrs. (71% hydrolysis (72)) yields *ter*-BuOH (1:6140); note rate of hydrolysis of  $\bar{C}$  is greater in pure aq. than in 5% aq.  $Na_2CO_3$  (72); for use of this facile hydrolysis in removal of  $\bar{C}$  from isobutyl chloride (3:7135) see under latter). [For details of studies of kinetics of hydrol. of  $\bar{C}$  under various circumstances, e.g., in aq. alc., see (73) (74) (75) (6) (11); in formic acid (14) (77) (78).] [For use in prepn. of *ter*-butyl alc. (1:6140) see (79).]

[ $\bar{C}$  (2 moles) in ether shaken with  $Ag_2CO_3$  (1 mole) gives (35% yield (114)) di-*ter*-butyl ether, b.p.  $106.5-107^\circ$ ,  $D_4^{20} = 0.7658$ ,  $n_D^{20} = 1.3949$  (114).]

$\bar{C}$  in the presence of small amts.  $AlCl_3$  exchanges halogen with reactive H atoms of certain hydrocarbons; e.g.,  $\bar{C}$  with 2,3-dimethylbutane (1:8515) +  $AlCl_3$  shaken for  $\frac{1}{2}$  min. at room temp. gives (23% yield (112)) 2-chloro-2,3-dimethylbutane (3:7600);  $\bar{C}$  with 2,2,3-trimethylbutane (1:8544) +  $AlCl_3$  shaken for 30-45 seconds gives (16% yield (112)) 3-chloro-2,2,3-trimethylbutane (3:4020); for other examples see (112).]

$\bar{C}$  also undergoes alcoholysis; e.g.,  $\bar{C}$  shaken with equal vol. 50 mole % MeOH for several days (74) (11) seps. a non-aq. phase of *ter*-butyl methyl ether (1:7830), b.p. 55°;  $\bar{C}$  with EtOH gives (11) *ter*-butyl ethyl ether (1:7860), b.p. 73°; for study of this equilibrium and deto. of these ethers see (11).]

[For rate of reactn. of  $\bar{C}$  with KI in acetone at 60° see (80); for reactn. of  $\bar{C}$  with Ca formate yielding (77) (78) *ter*-butyl formate (1:3033), b.p. 83°, see iodic. refs.; for conv. of  $\bar{C}$  to esters by htg. with alkali salt of a suitable acid under press. at 125-225° in pres. of Cu and the use of this reactn. in sepn. of  $\bar{C}$  from less reactive chlorine cpds. see (81).]

$\bar{C}$  readily condenses with arom. hydrocarbons and phenols; e.g.,  $\bar{C}$  with  $Al/Hg + C_6H_6$  gives (74 5% yield (109)) or  $\bar{C}$  with  $C_6H_6 + AlCl_3$  gives (yields: 69% (82), 60% (83)) (62) (1) mainly *ter*-butylbenzene (1:7460), b.p. 168.8°, often accompanied by some *p*-(di-*ter*-butyl)benzene, cryst. from alc., m.p. 77° (82); this same condensation can also be effected in anhydrous HCl at 235° under press. (88% yield (84)) or in anhydrous HF (yield: 60% di- + 10% mono- (85)). —  $\bar{C}$  with toluene +  $AlCl_3$  gives both *p*-*ter*-butyltoluene and *m*-*ter*-butyltoluene (in ratio of 30-35/65-70, resp. (85)) but  $\bar{C}$  with toluene in anhyd. HCl or HF (85) (22) cf. (113) gives exclusively (84) *p*-*ter*-butyltoluene, b.p. 188-189°,  $n_D^{20} = 1.4930$  (84). — For reactn. of  $\bar{C}$  with naphthalene +  $AlCl_3$  (87) or  $Al/Hg$  (109) or  $\bar{C}$  with *m*-cymene +  $AlCl_3$  (88) see iodic. refs.]

$\bar{C}$  with phenol (1:1420) in anhyd. HF gives (85% yield (89)) *p*-*ter*-butylphenol (1:1510);  $\bar{C}$  with  $\beta$ -naphthol (1:1540) +  $AlCl_3$  gives (90) 4-(*ter*-butyl)naphthol-2, m.p. 102° (90). —  $\bar{C}$  with anisole (1:7445) +  $ZnF_2$  gives (30 6% yield (91)) *p*-*ter*-butylanisole, but  $\bar{C}$  does not react with anisole +  $AlF_3$  or with furan +  $ZnF_2$  (91)]

$\bar{C}$  with acetanilide +  $AlCl_3$  in ethylene dichloride at -10° gives (93% yield) *N*-acetyl-*p*-*ter*-butylaniline (111).]

$\bar{C}$  under proper conditions gives the corresponding  $RMgCl$  cpd.: e.g.,  $\bar{C}$  with Mg in dry ether as directed gives (yields: 80% (92), 62% (93), 60% (95)) cf. (94) *ter*-BuMgCl; this  $RMgCl$  cpd. undergoes the usual reactions (see also below under @'s) including the following: *ter*-BuMgCl with  $O_2$  below 0° gives (80% yield (95)) *ter*-BuOH (1:6140) q.v.; with acetyl chloride (1 mole) in  $C_6H_6$  gives (40-54% yield (92)) *ter*-butyl methyl ketone (pinacolone) (1:5425) (note, however, that *ter*-BuMgCl with excess acetyl chloride takes a different course (97) and that with various other acyl halides the reducing action of the *ter*-BuMgCl becomes conspicuous cf. (98) (99) (100));  $\bar{C}$  with ethyl chloroformate (3:7295) or diethyl carbonate (1:3150) gives (56% yield (92)) ethyl trimethylacetate (ethyl pivalate) (1:3117), with  $\bar{C}$  itself to give (10% yield (96)) hexamethylethane (1:7090).

$\bar{C}$  reacts with other  $RMgX$  cpds. in conventional fashion; e.g.,  $\bar{C}$  with  $MeMgCl$  gives (42-50% yield (108)) tetramethylmethane (neopentane) (1:8499);  $\bar{C}$  with *n*-PrMgBr in ether +  $HgCl_2$  gives (yield 21% (101), 20% (110)) 2,2-dimethylpentane (1:8543); the numerous other reactions of *ter*-BuMgCl cannot be reviewed here.

[For reactn. of  $\bar{C}$  with  $Et_2Zn$  and numerous homologs see (102).]

Ⓐ *ter*-Butyl alcohol (1:6140): m.p. 25.6°, b.p. 82.5°. [From  $\bar{C}$  by shaking with aq. for 24 hrs. at room temp. (6), or on refluxing with 2 vols. aq. for 8 hrs. (72), neutralizing with  $Na_2CO_3$ , salting out the alcohol with NaCl, drying over anhyd.  $Na_2CO_3$ , and distilling.]

Ⓑ Trimethylacetic acid (pivalic acid) (1:0410): m.p. 35.5°, b.p. 163-164°. [From  $\bar{C}$  by

conversion to *ter*-BuMgCl (see above) and reactn. of latter with dry CO<sub>2</sub> (yields based on  $\bar{C}$ , 75% (92), 62% (93), 42.5% (17)) (94).]

⑤ Trimethylacetic anilide (pivalanilide): m.p. 132–133° u.c. (103), 132.5–133° (17). [From  $\bar{C}$  by conv. to *ter*-BuMgCl (see above) and reactn. of latter with phenyl isocyanate in dry ether (17) (103) (104).]

⑥ Trimethylaceto-*p*-toluidide (pivalo-*p*-tolnide): m.p. 119–120° u.c. (103). [From  $\bar{C}$  by conversion to *ter*-BuMgCl (see above) and reactn. of latter with *p*-tolyl isocyanate in dry ether (103).]

⑦ Trimethylaceto- $\alpha$ -naphthalide (pivalo- $\alpha$ -naphthalide): m.p. 146–147° u.c. (103) [From  $\bar{C}$  by conversion to *ter*-BuMgCl (see above) and reactn. of latter with  $\alpha$ -naphthyl isocyanate in dry ether (103).]

— *ter*-Butyl mercuric chloride: long ndls. from aq. acetone as directed (105), m.p. 122–123° dec. (105). [From *ter*-BuMgCl with HgCl<sub>2</sub> (105).]

— *S-ter*-Butylisothiourca picrate: m.p. 160–161° (106). [From  $\bar{C}$  with thiourea on htg. in alc. followed by conversion of the resultant hydrochloride to picrate (106); note, however, that, because of the lability of the *ter*-butyl radical, reactions carried out in MeOH or EtOH may give the corresp. *S*-methylisothiourca picrate, m.p. 224°, or *S*-ethylisothiourca picrate, m.p. 188°, and this definitely occurs (107) starting with *ter*-butyl iodide.]

— *N-(ter-Butyl)phthalimide*: unreported.

— *ter*-Butyl 2,4,6-triliodophenyl ether: unreported.

— *ter*-Butyl  $\alpha$ -naphthyl ether: unreported.

— *ter*-Butyl  $\beta$ -naphthyl ether: unreported.

Colorless mobile liq. with sharp and penetrating odor. — Note that ordinary samples of  $\bar{C}$  may (according to their method of preparation) contain more or less  $\text{PCl}_3$  (b.p. 75.95° at 760 mm.),  $\text{POCl}_3$  (b.p. 107.2° at 760 mm.),  $\text{SOCl}_2$  (b.p. 78.8°),  $\text{AcOH}$  (b.p. 118.2°),  $\text{Ac}_2\text{O}$  (b.p. 140.0°), or various acetylated derivs. of phosphorous acid (if present in large amt. the last in part form a white ppt. on long stdg.), removal of which is difficult; the presence of these impurities doubtless accounts for various instances of abnormally high b.p.'s cf. (7). —  $\bar{C}$  may be freed from dissolved  $\text{HCl}$  and from  $\text{AcOH}$  by distn. with dimethylaniline (13) or by treatment with powdered basic oxides, hydroxides, carbonates, etc. (14).

PREPARATION OF  $\bar{C}$ 

$\bar{C}$  can be prepared from various sources with a wide variety of reagents; examples of the more important types of combinations are given below grouped under indicated subheadings. — It must also be recognized that many other processes (notably for manufacture of  $\text{Ac}_2\text{O}$ ) involve the formation of  $\bar{C}$  but immediately utilize it without separate isolation; these cannot be included here.

Preparation of  $\bar{C}$  from  $\text{AcOH}$ . [For prepn. of  $\bar{C}$  from  $\text{AcOH}$  with  $\text{PCl}_3$  (79% yield (20)) (15) (16) (7) (17) under press. at 80° (yield 100% (18)) or in  $\text{Ac}_2\text{O}$  (85% yield (19)) see indic. refs. (note particularly the formn. of  $\text{Ac}_2\text{O}$  and of  $\text{AcO.P(OH)}_2$  discussed in (17)): with  $\text{PCl}_3 + \text{ZnCl}_2$  (90% yield) see (20); with  $\text{PCl}_5$  (80% yield (20)) (21) see indic. refs.; with  $\text{POCl}_3$  (22) (23) see indic. refs.; with  $\text{P}_2\text{O}_5 + \text{HCl}$  gas at 0° see (24) (25); with  $\text{P} + \text{Cl}_2$  in  $\text{POCl}_3$  see (26).]

[For prepn. of  $\bar{C}$  from  $\text{AcOH}$  with  $\text{SOCl}_2$  (46% yield (20)), with  $\text{S}_2\text{Cl}_2 + \text{Cl}_2$  at -4° in pres. of  $\text{Fe}$  (95.5% yield (27)), with  $\text{ClSO}_3\text{H}$  (20-25% yield (28)); with sodium chlorosulfonate (29) in pres. of  $\text{NaCl}$  or  $\text{Na}_2\text{S}_2\text{O}_7$  (30) (31), or with  $\text{SiCl}_4$  in toluene (85% yield (32)), see indic. refs.]

[For prepn. of  $\bar{C}$  from  $\text{AcOH}$  with  $\text{COCl}_2$  (3:5000) at 110-120° (33) in vapor phase at 160° over  $\text{MgCl}_2$  on diatomaceous earth (34) cf. (35) (36); with an arylsulfochloride such as *p*-toluenesulfonyl chloride +  $\text{NaCl}$  (30); with another org. acid chloride such as chloroacetyl chloride (3:5235) (37), dichloroacetyl chloride (3:5290) (38), or benzoyl chloride (3:6240) (yield 85-88% (39), 70% (42)) (40) (41); with benzotrichloride (3:6540) (90% yield (42)) see indic. refs.]

Preparation of  $\bar{C}$  from salts of acetic acid. [For prepn. of  $\bar{C}$  from  $\text{NaOAc}$  (or other metallic acetates) with  $\text{POCl}_3$  (43) (44); with  $\text{SO}_2\text{Cl}_2$  (45) (46); with sodium chlorosulfonate

(29) cf. (30); with  $\text{SiCl}_4$  (47) (48); with  $\text{COCl}_2$  at  $120^\circ$  under press. (49); with *p*-toluene-sulfonyl chloride (50); with benzoyl chloride (3:6240) (40) see indic. refs.; from  $\text{NaOAc}/\text{H}_2\text{SO}_3$  compd. with  $\text{Cl}_2$  see (51).]

Preparation of  $\bar{\text{C}}$  from acetic anhydride. [For prepn. of  $\bar{\text{C}}$  from  $\text{Ac}_2\text{O}$  (1:1015) with  $\text{Cl}_2$  (52); with dry  $\text{HCl}$  gas at  $100^\circ$  (52) or in continuous process at  $85\text{--}90^\circ$  (93% yield (53)) or under 18–42 atm. press. (100% yield (54)); with  $\text{PCl}_3$  (15); with  $\text{PCl}_5$  (21); with  $\text{SOCl}_2$  at  $20\text{--}25^\circ$  ( $\text{SO}_2$  being evolved) (55), or with sodium chlorosulfonate (29) see indic. refs.]

[For prepn. of  $\bar{\text{C}}$  from  $\text{Ac}_2\text{O}$  (1:1015) with phosgene (3:5000) + cat. (56); with benzoyl chloride (3:6240) (77% yield (42)) (41) (40); with *nx*alyl (di)chloride (3:5060) (80–95% yield (57)); with benzo-trichloride (3:6540) +  $\text{ZnCl}_2$  (33% yield (58)); with benzyl chloride (3:8535) + cat. (59) see indic. refs.; for formn. of  $\bar{\text{C}}$  as by-prod. from reactn. of ethylene with  $\text{Cl}_2$  in  $\text{Ac}_2\text{O}$  see (60).]

Preparation of  $\bar{\text{C}}$  from methyl chloride. [For prepn. of  $\bar{\text{C}}$  from  $\text{CH}_3\text{Cl}$  (3:7005) with  $\text{CO}$  at  $700\text{--}800^\circ$  over pumice contg. sodium metaphosphate (61) or with  $\text{CO}$ ,  $\text{COCl}_2$ , or  $\text{COS}$  at  $700\text{--}900^\circ$  in pres. of metallic cat. (62) see indic. refs.]

Preparation of  $\bar{\text{C}}$  from miscellaneous sources. [For prepn. of  $\bar{\text{C}}$  from 1,1,1-trichloroethane (methylchloroform) (3:5085) by partial cat. hydrolysis (63) (64); from ketene + liq.  $\text{HCl}$  (65) or with  $\text{HCl}$  gas over activated carbon at  $100^\circ$  (100% yield (66)); from ethyl, isobutyl, isoamyl, benzyl, phenyl, or *p*-tolyl acetates with  $\text{SiCl}_4$  (67); from  $\alpha$ -chloroethyl acetate (3:7625) (68) (69) or  $\alpha,\beta$ -dichloroethyl acetate (69) with  $\text{ZnCl}_2$  (68) or over pumice at  $250\text{--}300^\circ$  (69); from  $\beta$ -bromo- $\alpha,\beta$ -dichlorovinyl ethyl ether with  $\text{AcOH}$  (70); from acetyl bromide with  $\text{HCl}$  gas at ord. temp. (71); from *N,N*-diacetylaniline (diacetanilide) with  $\text{HCl}$  gas at  $150\text{--}170^\circ$  (72); from diacetyl sulfite (see below) with  $\text{SOCl}_2$  (73) see indic. refs.]

### PYROLYSIS OF $\bar{\text{C}}$

[ $\bar{\text{C}}$  in absence of cat. is stable to heat up to at least  $450^\circ$  (74). —  $\bar{\text{C}}$  passed at  $700\text{--}850^\circ$  over hot Pt wire gives ethylene +  $\text{CO}$  +  $\text{HCl}$  (75), but at  $400^\circ$  over Pt on pumice gives (74) 45%  $\text{MeCl}$  (3:7005) + 49%  $\text{CO}$  + 5%  $\text{H}_2$ . —  $\bar{\text{C}}$  over Cu filings at  $350^\circ$  is partially decomposed yielding (74)  $\text{MeCl}$  (3:7005) +  $\text{CO}$  +  $\text{CO}_2$  +  $\text{H}_2$  + dehydroacetic acid (1:0700) + acetone. —  $\bar{\text{C}}$  over  $\text{ZnCl}_2$  on pumice at  $400^\circ$  gives (74)  $\text{HCl}$  + dehydroacetic acid (1:0700) + gas mixt. contg. 87%  $\text{CO}_2$  + 4%  $\text{CO}$  + 2%  $\text{H}_2$ . —  $\bar{\text{C}}$  over Ni at  $420^\circ$  gives (76)  $\text{HCl}$  + gas mixt. contg. 62%  $\text{CO}$  + 32%  $\text{H}_2$ . — For studies on pyrolysis of  $\bar{\text{C}}$  over  $\text{Al}_2\text{O}_3$ ,  $\text{Cu}_2\text{Cl}_2$ ,  $\text{CuO}$ , Ni, etc., see (74).]

### REACTIONS OF $\bar{\text{C}}$ WITH INORGANIC REAGENTS

Reaction of  $\bar{\text{C}}$  with  $\text{H}_2\text{O}$  (hydrolysis).  $\bar{\text{C}}$  reacts violently with aq. hydrolyzing to  $\text{AcOH}$  (1:1010) +  $\text{HCl}$  (for kinetic studies see (77)); for use of this reactn. in volumetric detn. of  $\text{H}_2\text{O}$  in org. liquids see (185) (78). — Because of its ease of reactn. with aq.  $\bar{\text{C}}$  is widely used for condensations, ring closures, etc.

Reaction of  $\bar{\text{C}}$  with  $\text{NH}_3$  and similar cpds.  $\bar{\text{C}}$  with cold conc. aq.  $\text{NH}_4\text{OH}$  (16) or  $\bar{\text{C}}$  with liq.  $\text{NH}_3$  (79) gives (yields: 77% (16), 88% (79)) acetamide, very sol. aq., m.p.  $81.5^\circ$ , b.p.  $222^\circ$  (best recrystd. from dry  $\text{AcOEt}$  by addn. of dry ether).

[The direct reaction of  $\bar{\text{C}}$  with  $\text{NH}_2\text{OH}$  (or its salts) seems to be unreported, but the presumable prod., viz., *N*-acetylhydroxylamine (acethydroxamic acid) [Beil. II-187, II<sub>2</sub>-(85), II<sub>2</sub>-(181)], very eas. sol. aq. or alc., insol. ether, cryst. from  $\text{EtOAc}$ , m.p. anhydrous  $89^\circ$ , contg. crystal aq.  $57^\circ$ , has been obtd. indirectly.]

[The direct reactn. of  $\bar{\text{C}}$  with hydrazine hydrate,  $\text{NH}_2\text{NH}_2\cdot\text{H}_2\text{O}$ , seems to be unreported, but the presumable prod., viz., acethydrazide (acetylhydrazine) [Beil. II-191, II<sub>2</sub>-(86), II<sub>2</sub>-(185)], ndls. from alc., m.p.  $67^\circ$ , has been obtd. by indirect means.]

Reaction of  $\bar{C}$  with halogens. [ $\bar{C}$  with  $Cl_2$  in  $CCl_4$  in light (80) or in pres. of  $I_2$  (82) gives mainly chloroacetyl chloride (3:5235); for study of mechanism of chlorination see (81); for influence of  $\bar{C}$  on chlorination of  $AcOH$  or  $Ac_2O$  see (82), on bromination of  $AcOH$  see (83).]

[For studies of  $\bar{C}$  with  $Br_2$  see (84) (85) (86).]

Reaction of  $\bar{C}$  with inorganic acids. [ $\bar{C}$  with dry  $HBr$  gas for 2 hrs. gives (80% yield (87)) acetyl bromide [Beil. II-174, II<sub>1</sub>-(79), II<sub>2</sub>-(176)], b.p. 76.7° at 760 mm.,  $D_4^{15.8} = 1.6625$ ,  $n_D^{15.8} = 1.45370$ ; for details on this equilibrium see (88).]

[ $\bar{C}$  with 3 pts. dry  $HI$  in the cold gives (70% yield (87)) (89) acetyl iodide [Beil. II-174, II<sub>1</sub>-(80), II<sub>2</sub>-(177)], h.p. 104–106° at 735 mm. (89) (for studies of use of  $AcI$  in splitting of aliphatic ethers (90) or in addn. to unsatd. hydrocarbons (91) see indic. refs.).]

[ $\bar{C}$  with cold conc.  $H_2SO_4$  (1 mole) forms a mol. cpd. (88) (92) which can even be obt'd. in cryst. form (92); this cpd. loses  $HCl$  only upon htg. (88) (92), and the residual acetyl hydrogen sulfate [Beil. II-170, II<sub>1</sub>-(78), II<sub>2</sub>-(174)] which might be expected is transformed into sulfoacetic acid and other prods. (92). —  $\bar{C}$  with nitrosylsulfuric acid in  $CCl_4$  evolves  $NOCl$  and yields acetyl  $HSO_4$  which rapidly changes to sulfoacetic acid (93).]

[ $\bar{C}$  with  $ClSO_3H$  stood for several days (94) (95) evolves  $HCl$  and forms the transient acetyl sulfonyl chloride,  $CH_3CO.O.SO_2Cl$ ; above 45° this intermediate rearr. to sulfoacetyl chlorido which with water hydrolyzes to sulfoacetic acid;  $\bar{C}$  with  $ClCO_2H$  at 60–140°, however, also undergoes condensation involving 4 moles of  $\bar{C}$  with evoln. of  $HCl$  and formn. of an acid chloride which on hydrolysis with aq. gives (3% yield (94)) a monobasic acid of compn.  $C_8H_5O_4$  [Beil. XVIII-412], m.p. 99°, which is either 2,6-dimethylpyrone-4-carboxylic acid-3 or 2-methylpyrone-1,4-acetic acid-6 (96); note that this acid is isomeric with but distinct from dehydroacetic acid (1:0700), m.p. 109°. — Note also that  $\bar{C}$  in  $AcOH$  boiled with conc.  $H_2SO_4$  gives (97) traces of 2,6-dimethylpyrone.]

[ $\bar{C}$  with solid  $H_2O_2$  (0.6 mole) yields (98) about 60% acetyl hydrogen peroxide (peracetic acid) [Beil. II-109, II<sub>1</sub>-(78), II<sub>2</sub>-(174)] accompanied by some diacetyl peroxide [Beil. II-170, II<sub>1</sub>-(78), II<sub>2</sub>-(174)]. —  $\bar{C}$  with liq.  $H_2S$  yields (99) "dithioacetic acid anhydride,"  $(CH_3CS)_2S$ , white cryst., m.p. 225° (99); note that, although neither  $\bar{C}$  nor  $Ac_2O$  separately treated with  $H_2S$  gas shows any appreciable reaction, yet  $Ac_2O$  contg. 2%  $\bar{C}$  absorbs  $H_2S$  giving (70% yield (100)) thiolacetic acid [Beil. II-230, II<sub>1</sub>-(101), II<sub>2</sub>-(208)],  $CH_3CO.SH$ , b.p. 93°. —  $\bar{C}$  (4 moles) with  $H_2S_3 + ZnCl_2$  yields (101) diacetyl trisulfide.]

Reaction of  $\bar{C}$  with salts of inorganic acids. [ $\bar{C}$  with metal oxides in  $CHCl_3$  at –60 to –20° yields (102) the corresp. metallic chlorides. —  $\bar{C}$  with  $Sb_2S_3$  at 300–350° (103) or with  $K_2S$  (104) gives diacetyl sulfide [Beil. II-232], b.p. 120°. —  $\bar{C}$  with  $PbSO_3$  gives (72) diacetyl sulfite which with  $SOCl_2$  gives  $\bar{C} + SO_2$  (72).]

[ $\bar{C}$  (6 pts.) with  $KNO_3$  (first fused, then powdered) (1 pt.) (105) or  $\bar{C}$  with  $Pb(NO_3)_2$  (106) gives mainly (yields: 81–85% (105), 58% (106)) acetic anhydride (1:1015).]

[ $\bar{C}$  with  $NaN_3$  in di-isomyl ether stood overnight (108) (109), then warmed at 60–70°, evolves  $N_2$  and gives (86% yield (107)) methyl isocyanate [Beil. IV-77, IV<sub>1</sub>-(337), IV<sub>2</sub>-(578)], b.p. 27.4–27.8°; note, however, that  $\bar{C}$  with  $NaN_3$  in  $AcOH$  evolves  $N_2$  and gives (50–63% yield (110)) *N*-methylacetamide, m.p. 27–28°, b.p. 202–204° (presumably by cleavage of the  $CH_3NCO$  and acetylation of the  $MeNH_2$ ).]

[ $\bar{C}$  with  $NaHF_2$  in  $Ac_2O$  (111), with  $KF$  in  $AcOH$  (41) (42),  $AgF$  (112),  $ZnF_2$  (112) (113),  $HgF_2$  (114),  $C_6H_5HgF$  (115),  $SbF_3$  (112) (116), or  $AsF_3$  (112) gives (yields: 132% on  $\bar{C}$  or 66% on  $NaHF_2$  (111), 76% (41) (42), 40% (113), 30.8% (116)) acetyl fluoride, b.p. 20.8° at 770 mm.]

[ $\bar{C}$  with  $AlCl_3$  in  $CS_2$  at –10° gives (117) a mol. cpd.,  $\bar{C}.AlCl_3$ , as a pale yel. gummy mass;  $\bar{C}$  with  $AlCl_3.Et_2O$  gives  $EtOAc$  (70% yield (118)) +  $EtCl$  (3:7015) +  $AlCl_3$ . —  $\bar{C}$  (1 mole) with  $AlCl_3$  (6 moles) in  $CHCl_3$  gives (124)  $(CH_3CO)_2CH.CCl_2.O.AlCl_2$  (125) which with

aq. yields (124) (125) acetylacetone (1:1700). — Note also that  $\bar{C}$  forms other analogous complexes. e.g.,  $\bar{C} \cdot \text{BCl}_3$  (119),  $\bar{C} \cdot \text{BF}_3$  (119),  $\bar{C} \cdot \text{SbCl}_5$  (119) (for use of these in splitting of ethers see (119)).]

[ $\bar{C}$  with 2 pts. sublimed  $\text{FeCl}_3$  in  $\text{CS}_2$  for 24 hrs. gives (small yield (120)) dehydroacetic acid (1:0700).]

[ $\bar{C}$  with  $\text{CaI}_2$  in s.t. at 70–75° for 120 hrs. gives (121) acetyl iodide (see above under H1).]

Reaction of  $\bar{C}$  with esters of inorganic acids. [ $\bar{C}$  with  $\text{Me}_2\text{SO}_4$  (1 mole) + trace of  $\text{ZnCl}_2$  at 140–150° evolves  $\text{HCl}$  and gives (20–25% yield (122)) dimethyl sulfoacetate, b.p. 155–165° nt 20–22 mm. (122). —  $\bar{C}$  + di-*n*-propyl sulfite + trace  $\text{ZnCl}_2$  at 170–200° gives (80% yield (123)) *n*-propyl acetate (1:3075).]

Reaction of  $\bar{C}$  with metals. [ $\bar{C}$  in excess with metallic  $\text{Zn}$  gives a solid of compn.  $\text{C}_{14}\text{H}_{18}\text{O}_4$  (126), now (127) thought to be 3,8-diacetyl-5,6-dimethyldecatetraene-3,4,6,7-dione-2,9. —  $\bar{C}$  with metallic  $\text{Zn}$  in dry ether yields (128)  $\text{EtOAc}$  (1:3015) and  $\text{AcOH}$  (1:1010). —  $\bar{C}$  with metallic  $\text{Zn}$  in dry dioxane (1:6400) gives (85% yield (128)) (129) ethylene glycol diacetate (1:3511). —  $\bar{C}$  with  $\text{CuH}$  evolves  $\text{H}_2$  and gives (130) cf. (131)  $\text{EtOAc}$  (1:3015) + ethylidene diacetate (1:3383).]

## REACTIONS OF $\bar{C}$ WITH ORGANIC REAGENTS

### REACTIONS OF $\bar{C}$ WITH HYDROCARBONS

Reactions of  $\bar{C}$  with alkanes. [ $\bar{C}$  with *n*-butane (or isobutane) +  $\text{AlCl}_3$  at 60° for 15 hrs. under press. gives (small yield (132)) isobutyl methyl ketone (1:5430) —  $\bar{C}$  with *n*-pentane +  $\text{AlCl}_3$  at 15° at ord. press. gives (10% yield (133)) (134) 2,3-dimethylpentanone-4 (*unsym*-isopropyl-methyl-acetone) [Beil. I-703, I<sub>1</sub>-(360)], b.p. 135–136° (oxime, b.p. 101–105° at 20 mm., semicarbazone, m.p. 114° (133)) accompanied (134) by some 2,3-dimethylpenten-3-one-2 (*unsym*-isopropylidene-methyl-acetone) [Beil. I<sub>2</sub>-(798)] (corresp. semicarbazone, m.p. 192.5° (134)). —  $\bar{C}$  with *n*-hexane +  $\text{AlCl}_3$  in similar fashion gives (7% yield (135)) (134) 3-ethyl-2-methylpentanone-4 (*unsym*-ethyl-isopropyl-acetone) [Beil. I-707], b.p. 154–155° (semicarbazone, m.p. 120° (135)) accompanied by a little 3-ethyl-2-methylpenten-2-one-4 (*unsym*-ethyl-isopropylidene-acetone), b.p. 177–178° (semicarbazone, m.p. 220° (135)).]

Reactions of  $\bar{C}$  with alkenes. [ $\bar{C}$  in the pres. of suitable cat. can add to olefin linkages forming halogenated ketones: e.g.,  $\bar{C}$  with ethylene +  $\text{AlCl}_3$  at 0° (137) (138) or  $\bar{C}$  + ethylene over activated carbon at 100° and 50 atm. (139) gives (yields: 53% (136), 33% (137)) (138) cf. (60)  $\beta$ -chloroethyl methyl ketone (3:7640) (note that  $\bar{C}$  + ethylene +  $\text{AlCl}_3$  in  $\text{CS}_2$ , latter subsequently replaced by  $\text{C}_6\text{H}_6$ , goes further yielding (140) benzylacetone [Beil. VII-314, VII<sub>1</sub>-(167)], b.p. 235°). — For studies of analogous cat. addn. of  $\bar{C}$  to 2-methylbutene-2, 2,3-dimethylbutene-2, and 2-methylhexene-2 see (141).]

Reactions of  $\bar{C}$  with alkynes. [ $\bar{C}$  in the pres. of suitable cat. can also add to a triple unsatd linkage yielding olefinic chloroketones: e.g.,  $\bar{C}$  with acetylene +  $\text{AlCl}_3$  at 15° (142) (143) or other cat. (143) gives (25% yield (142))  $\beta$ -chlorovinyl methyl ketone, b.p. 35–38° at 12 mm. (143). —  $\bar{C}$  with butyne-1 (ethylacetylene) +  $\text{SnCl}_4$  gives (144) 4-chlorohexen-3-one-2, b.p. 46–53° at 10 mm.,  $D_4^{25} = 1.0973$ ,  $n_D^{25} = 1.4906$  (144); for analogous reactions with pentyne-1, hexyne-1, hexyne-3, heptyne-1, octyne-4, decyne-5, and dodecyne-6 together with corresp. constants of prods. see (144).]

Reaction of  $\bar{C}$  with cycloparaffins (cycloalkanes). [ $\bar{C}$  in the pres. of  $\text{AlCl}_3$  also condenses with cycloalkanes eliminating  $\text{HCl}$ ; e.g.,  $\bar{C}$  (1.9 moles) + cyclopentane (1:8400) (5.4 moles) +  $\text{AlCl}_3$  (2.2 moles) at 0° gives (145) cyclopentyl methyl ketone (acetylcyclopentane), b.p. 159.5–160.5° at 760 mm.,  $D_{20}^{20} = 0.9172$ ,  $n = \frac{20}{D} 1.44351$  (145) (semicarbazone, m.p. 142–143° (145));  $\bar{C}$  + methylcyclopentane (1:8403) +  $\text{AlCl}_3$  similarly gives (145) 1-

methylcyclopentyl-2 methyl ketone (1-acetyl-2-methylcyclopentane) accompanied by some 1-methylcyclopenten-1-yl-2 methyl ketone (1-acetyl-2-methylcyclopentene-1) (see below).]

[ $\bar{C}$  in the pres. of  $AlCl_3$  also condenses with cyclohexane, but here the reaction involves in addn. a change from a 6-membered to 5-membered ring: e.g.,  $\bar{C}$  with cyclohexane (1:8405) +  $AlCl_3$  gives (135) (146) (147) (148) 1-methylcyclopentyl-2 methyl ketone (1-acetyl-2-methylcyclopentane), b.p. 167-168° at 759 mm.,  $D_4^{20} = 0.8976$ ,  $n_D^{20} = 1.4404$  (semicarbazone, m.p. 162.5-163° (148), 158° (146)); *p*-nitrophenylhydrazine, m.p. 102.5° (148)), accompanied under certain circumstances (135) by 1-methylcyclopenten-1-yl-2 methyl ketone (1-acetyl-2-methylcyclopentene-1), b.p. 185-187° (135) (oxime, m.p. 85-85.5° (148), *p*-nitrophenylhydrazone, m.p. 162° (148), semicarbazone, m.p. 221° (148), 220° (133)); note that various hydrocarbon by-products are also formed. —  $\bar{C}$  + methylcyclohexane (hexahydrotoluene) (1:8410) +  $AlCl_3$  at room temp. similarly gives (149) 1-acetyl-2,3-dimethylcyclopentane, b.p. 182-184° at 754 mm.,  $D_4^{20} = 0.8969$ ,  $n_D^{20} = 1.44551$  (semicarbazone, m.p. 152°) (149).]

Reaction of  $\bar{C}$  with cycloalkenes. [ $\bar{C}$  in the pres. of suitable cat. adds to unsatd. linkages of cycloalkenes: e.g.,  $\bar{C}$  with cyclopentene (1:8037) +  $AlCl_3$  (2 moles) in cyclohexane at -15° gives (50% yield (150)) cyclopentyl methyl ketone (1-acetylcyclopentane) (for constants see above under  $\bar{C}$  + cyclopentane); note, however, that  $\bar{C}$  + cyclopentene (1:8037) +  $AlCl_3$  at -14° in  $CS_2$  (the latter being subsequently replaced by benzene) gives (140) 1-acetyl-3-phenylcyclopentane (note rearr.).]

[ $\bar{C}$  with cyclohexene (1:8070) +  $AlCl_3$  (2 moles) in cyclohexane gives (53% yield (150)) cyclohexyl methyl ketone (1-acetylcyclohexane) [Beil. VII-22, VII-(16)]. —  $\bar{C}$  with cyclohexene (1:8070) +  $AlCl_3$  (1 mole) in  $CS_2$  gives (21% yield (151)) (152) cyclohexen-1-yl-1 methyl ketone (1-acetylcyclohexene-1) (tetrahydroacetophenone) [Beil. VII-58, VII-(49)], b.p. 201-202°,  $D_4^{20} = 0.9655$ ,  $n_D^{20} = 1.4881$  (oxime, m.p. 99°, semicarbazone, m.p. 220-221°). —  $\bar{C}$  with cyclohexene (1:8070) +  $AlCl_3$  in  $CS_2$  at -15° gives by addn. a prod. supposed (153) to be 2-chlorocyclohexyl-1 methyl ketone (since it can be converted by loss of HCl to tetrahydroacetophenone (above)) but which when reacted with  $C_6H_6$  +  $AlCl_3$  gives (140) 4-phenylcyclohexyl-1 methyl ketone (1-acetyl-4-phenylcyclohexane); in just which phase rearr. occurs has not been established with certainty.]

Reaction of  $\bar{C}$  with aromatic hydrocarbons.  $\bar{C}$  with aromatic hydrocarbons in the presence of various cat. (notably  $AlCl_3$ ) evolves HCl and yields aryl methyl ketones; examples are cited in the following paragraphs.

[ $\bar{C}$  with  $C_6H_6$  +  $AlCl_3$  (154) in  $CS_2$  (155) gives (70% yield (155)) methyl phenyl ketone (acetophenone) (1:5515) accompanied by a little 1,3-diphenylbuten-2-one-1 (dyphone) cf. (155); for study of relative reactivity in this sense of  $AcF$ ,  $AcCl$ ,  $AcBr$ , and  $AcI$  see (111); for study of influence of other cat., e.g.,  $FeCl_3$  (156) (157),  $TiCl_3$  (158),  $ZrCl_4$  (159),  $UCl_4$  (160),  $BeCl_2$  (161), Al powder (162) or Cr powder (163), or for study of effect of various solvents with  $AlCl_3$  (164) see indic. refs.]

[ $\bar{C}$  with toluene +  $AlCl_3$  gives (70% yield (165)) (166) methyl *p*-tolyl ketone (1:5530); for study of use of  $BeCl_2$  (80% yield (161)) or of 39 other metallic chlorides (167) (168) see indic. refs. — For reactn. of  $\bar{C}$  +  $AlCl_3$  with a long series of homologous monoalkylbenzenes see (169) (170), with *p*-cymene (1:7505) see (171); many other, similar cases cannot be included here.]

[ $\bar{C}$  with naphthalene (1:7200) +  $AlCl_3$  in  $CS_2$  gives a mixt. (75% yield (172)) comprising 50-60% 1-acetylnaphthalene (1:5600) + 15-20% 2-acetylnaphthalene (1:5153). —  $\bar{C}$  with 1-methylnaphthalene (1:7600) +  $AlCl_3$  in nitrobenzene at -3° gives (173) cf. (174) 1-aceto-4-methylnaphthalene;  $\bar{C}$  with 2-methylnaphthalene (1:7605) +  $AlCl_3$  in nitrobenzene gives a mixt. (64% yield (175)) comprising mainly 6-acetyl-2-methylnaphthalene accompanied by some 8-acetyl-2-methylnaphthalene.]

[ $\bar{C}$  with biphenyl (1:7175) +  $AlCl_3$  in  $CS_2$  (176) or  $C_6H_6$  (177) gives (yields: 90% (176), 70% (177)) 4-acetylbiphenyl (*p*-phenylacetophenone) (1:5201); under appropriate conditions  $\bar{C}$  with biphenyl +  $AlCl_3$  in  $CS_2$  gives (yields: 45% (176), 43% (178)) 4,4'-diacetylbiphenyl.]

[ $\bar{C}$  with acenaphthene (1:7225) +  $AlCl_3$  in nitrobenzene (179) or with liq. HF (180) gives (20% yield (180)) 1-acetoacenaphthene.]

[Friedel-Crafts condensation can also be carried out with  $\bar{C}$  and heterocyclic systems: e.g.,  $\bar{C}$  with thiophene +  $SnCl_4$  in  $C_6H_6$  gives (79-83% yield (181)) 2-acetylthiophene (methyl 2-thienyl ketone),  $\bar{C}$  with thionaphthene +  $AlCl_3$  in  $CS_2$  gives (30% yield (182)) 3-acetylthionaphthene.]

### REACTIONS OF $\bar{C}$ WITH ORGANIC OH (OR SH) COMPOUNDS (OR THEIR METALLIC DERIVATIVES)

Reactions of  $\bar{C}$  with alcohols. [ $\bar{C}$  reacts with alcs. in general yielding the corresp. acetates: e.g.,  $\bar{C}$  with MeOH (1:6120) yields methyl acetate (1:3005),  $\bar{C}$  with EtOH (1:6130) yields EtOAc (1:3015), etc.; for studies on rate of reactn. of  $\bar{C}$  with EtOH in ether (1), or with  $\beta$ -chloroethyl alc. in dioxane (182) (183), or with benzyl alc. or cyclohexanol (182) see indic. refs.] — For use of  $\bar{C}$  in quant. detn. of OH groups in prim. and sec. alcs. see (186) (187) (188) cf. (185).

[Special interest, however, attaches to reaction of  $\bar{C}$  with *ter*-alcohols: under ord. conditions these react with  $\bar{C}$  to exchange Cl for OH yielding alkyl chloride + AcOH (e.g.,  $\bar{C}$  + *ter*-butyl alc. giving *ter*-BuCl + AcOH); note, therefore, that under special conditions  $\bar{C}$  with *ter*-alcs. also gives the corresp. esters; e.g.,  $\bar{C}$  with *ter*-butyl alc. (1:6140) in dry ether + Mg (189) (190) or dimethylaniline (191) or in xylene with pyridine (192) gives (yields: 98% (192), 83% (189), 63-68% (191), 45-55% (190)) *ter*-butyl acetate (1:3057); other *ter*-alcs. (189) and other acid chlorides (191) behave similarly.]

[For reactn. of  $\bar{C}$  with cellulose (or cotton) see (193) (194) (195); with polyoxymethylenes see (196).]

[ $\bar{C}$  with mercaptans yields the corresp. thiolacetates: e.g.,  $\bar{C}$  with  $C_2H_5SH$  gives (80% yield (197)) ethyl thiolacetate,  $CH_3CO.S C_2H_5$ , b.p. 116-117°,  $D_4^{25} = 0.0755$ ,  $n_D^{25} = 1.4503$  (197).]

Reactions of  $\bar{C}$  with phenols.  $\bar{C}$  can react with phenols in either or both of two modes: on one hand it can acetylate the phenolic OH yielding the corresp. phenol acetates, or in the pres. of suitable cat. or solvents it can condense with one or more of the nuclear H atoms yielding phenolic ketones. Furthermore the phenol acetates can more or less readily be caused to rearr. into phenolic ketones (Fries rearr.) so that the chemistry of the two classes is closely related and so voluminous that it cannot be given extensive discussion here.

[ $\bar{C}$  with phenol (1:1420) directly (198) (199) or in  $C_6H_6$  + Mg (200) gives (yields: 92% (200), 90% (199)) phenyl acetate (1:3571); other mono-, di-, and polyhydric phenols behave analogously.]

[ $\bar{C}$  with phenol (1:1420) +  $FeCl_3$  in  $CS_2$  (156) (201) or phenyl acetate (above) +  $AlCl_3$  in nitrobenzene at 20-25° for 24 hrs. (202) gives (yields: 75% (202), 33% (201)) *p*-hydroxyacetophenone (1:1527), m.p. 109° (for extensive review of the Fries rearr. reactn. see (203)); the corresp. analogous reactns. of  $\bar{C}$  with other mono-, di-, and polyhydric phenols are legion and will not be cited here.]

[For study of series of mol. cpds. of  $\bar{C}$  with various benzenesulphenols see (230).]

Reaction of  $\bar{C}$  with phenol ethers. With phenol ethers where no phenolic OH remains to interfere  $\bar{C}$  reacts in the pres. of suitable cat. in the Friedel-Crafts sense: e.g., [ $\bar{C}$  (2 moles) with methyl phenyl ether (anisole) (1:7445) (1 mole) +  $AlCl_3$  (2 moles) gives (75% yield

(204) (205) *p*-methoxyacetophenone (*p*-acetylanisole) (1:5140); note that  $\bar{C}$  + anisole do not react in the pres. of  $AlF_3$  or  $ZnF_2$  (111). — Countless analogous condensations of  $\bar{C}$  with other phenol ethers cannot be discussed here].

Reaction of  $\bar{C}$  with enols (or their metallic derivatives). [The reaction of  $\bar{C}$  with ethyl acetoacetate (1:1710) leads according to circumstances to either or both of two very closely similar derivatives; one of these is ethyl *O*-acetylacetoacetate (ethyl  $\beta$ -acetoxyacrylate) (A) [Beil. III-373, III<sub>1</sub>-(135), III<sub>2</sub>-(255)], b.p. 212–214° al. dec. (206),  $D_4^{20} = 1.060$  (207),  $n_D^{20} = 1.4447$  (207); the other is ethyl  $\alpha$ -acetylacetoacetate (ethyl diacetylacetate) (B) [Beil. III-751, III<sub>1</sub>-(263), III<sub>2</sub>-(467)], h.p. 209–211° (208),  $D_4^{20} = 1.093$  (207),  $n_D^{20} = 1.4687$  (207); note that the latter (B) as liquid is 100% enolized (209) (210) and this prop. is used (211) for detn. of both A + B in their mixtures. — Note furthermore that the *O*-ester (A) by suitable htg. (212) (213) (214) (215) (216) can be converted to the isomer (B).]

[ $\bar{C}$  with ethyl acetoacetate (1:1710) in pres. of pyridine (217) or  $\bar{C}$  with its Na enolate in ether (210) or its Cu enolate in ether or  $C_6H_6$  (220) gives mainly the *O*-acetyl deriv. (A) (above);  $\bar{C}$  with ethyl sodioacetoacetate in ether (221) (222) (223) (226) or pet. ether (216) or with the Ca enolate in  $C_6H_6$  (224) or  $\bar{C}$  with ethyl acetoacetate + Mg in  $C_6H_6$  (225) (226) gives (yields: 65% (224), 46–52% (225)) ethyl diacetylacetate (B above) (Cu enolate, m.p. 151° (220)).]

[For study of influence of  $\bar{C}$  on rate of enolization of ethyl acetoacetate see (228); for formn. of ethyl *O*-acetylacetoacetate (isomer A above) from  $\bar{C}$  + ketene diethylacetal (30% yield together with other prods.) see (229).]

Reaction of  $\bar{C}$  with acids or their salts. [ $\bar{C}$  on htg. with NaOAc or other metal salts of COOH yields acetic anhydride (1:1015); this reactn. is well known and will not be amplified here;  $\bar{C}$  with salts of acids other than acetic gives in some cases the corresp. mixed anhydride, others only the anhydride of the second acid. E.g.,  $\bar{C}$  (1 mole) with dry Na isovalerate (mole) gives at 120° the mixed anhydride contg. 1 acetyl and 1 isovaleroyl radical (231); the other hand,  $\bar{C}$  with dry Na cinnamate gives only cinnamic anhydride (231); many examples are known.]

[on htg. with AcOH under appropriate conditions (232) (233) (234) loses HCl giving yields  $Ac_2O$  (1:1016).]

to that  $\bar{C}$  in  $Ac_2O$  behaves as a weak acid and can actually be titrated with NaOAc.  $\bar{C}$  using methyl orange as indicator (235).

#### REACTION OF $\bar{C}$ WITH AMINES (OR THEIR DERIVATIVES)

Reaction of  $\bar{C}$  with primary and secondary amines.  $\bar{C}$  readily reacts with such amines under ord. conditions the *N*-acetylated derivative: e.g.,  $\bar{C}$  with  $MeNH_2$  gives *N*-acetamide [Beil. IV-58, IV<sub>1</sub>-(329), IV<sub>2</sub>-(563)], very sol. aq., m.p. 27–28°, b.p. 206°; other examples are known. Note that only 1 acetyl group is introduced into the group; also that  $\bar{C}$  with a mixture of two amines gives mainly (or even exclusively) *N*-acetyl deriv. of the more negative accompanied by the hydrochloride of the other (236). See also below under  $\bar{C}$ 's.

Reaction of  $\bar{C}$  with tertiary amines.  $\bar{C}$  (1 mole) with pyridine (1 mole) directly (237)  $C_6H_6$  (237) ppts. an addn. prod. (presumably *N*-acetylpyridinium chloride), turning red in light, m.p. abt. 100°, after darkening at 90°; for use of this cpd. of phenol ethers see (237). — For use of  $\bar{C}$  + pyridine in toluene as means of deacetylation of OH groups see (186).

[ $\bar{C}$  with  $Et_3N$  (1 mole) in 10 vols. dry  $C_6H_6$  (239) or  $\bar{C}$  in equal. vol. pyridine (238) yields dehydroacetic acid (1:0700), m.p. 209°.]

[also a novel method of intermolecular dehydrohalogenation: e.g.,  $\bar{C}$  with

lauroyl chloride (3:9858) +  $\text{Et}_3\text{N}$  in dry ether ppts.  $\text{Et}_3\text{N}\cdot\text{HCl}$  and yields (240) a mixt. of acetylketene (detene dimer) + lauroylketene and other prods. — Note further that since dehydroacetic acid (above) may be viewed as ketene tetramer, its formation from  $\bar{\text{C}}$  with *ter*-amines (above) may (241) involve preliminary formation of acetylketene followed by Diels-Alder addn. with a second identical molecule to give dehydroacetic acid.]

Reaction of  $\bar{\text{C}}$  with other miscellaneous nitrogenous systems. [ $\bar{\text{C}}$  with diazomethane in dry ether yields (242) diazoacetone (acetyldiazomethane) [Beil. I<sub>1</sub>-(396), I<sub>2</sub>-(823)] yel. liq., h.p. 49° at 13 mm. (242).]

[ $\bar{\text{C}}$  with oximes often is used to effect either dehydration to nitriles or Beckmann rearr. or both (for review see (243)).]

[ $\bar{\text{C}}$  with acetanilide refluxed for 7 hrs. gives (244) diphenylacetamidine; other anilides behave in analogous fashion (244). — However,  $\bar{\text{C}}$  with acetanilide +  $\text{AlCl}_3$  in  $\text{CS}_2$  (245) or other inert solvent (246) gives Friedel-Crafts reactn forming (57% yield (245)) *p*-(acetylamino)acetophenone [Beil. XIV-48, XIV<sub>1</sub>-(366)], m.p. 166–167°.]

[ $\bar{\text{C}}$  with thiosemicarbazide results in acetylation followed by elimination of  $\text{HCl}$  and ring closure yielding (247) (248) the hydrochloride, m.p. 110° (248), of 5-amino-2-methyl-1-thiodiazole-3,4 [Beil. XXVII-629], m.p. 235° (248). — For study of reactn. of  $\bar{\text{C}}$  with Schiff's bases see (249).]

#### REACTION OF $\bar{\text{C}}$ WITH VARIOUS ORGANOMETALLIC COMPOUNDS

Reaction of  $\bar{\text{C}}$  with Grignard reagents. [The normal reaction of  $\bar{\text{C}}$  with 1 mole  $\text{RMgX}$  is to eliminate  $\text{MgXCl}$  and yield the corresp. ketone; e.g.,  $\bar{\text{C}}$  with  $\text{EtMgBr}$  in pres. of  $\text{CdCl}_2$  gives (46% yield (250)) ethyl methyl ketone (1:5405); in the presence of excess  $\text{RMgX}$ , however (and sometimes without excess), the ketone may react further to yield the corresp. tertiary alcohol; e.g.,  $\bar{\text{C}}$  with  $\text{C}_6\text{H}_5\text{MgBr}$  gives 39% yield (251) diphenyl-methyl-carbinol; countless other examples cannot be included here.]

[Certain divergences from the above normal reaction have, however, now been recognized; these appear to be largely a function of the particular types of  $\text{RMgX}$  employed. E.g.,  $\bar{\text{C}}$  (0.5 mole) with benzyl  $\text{MgCl}$  (0.37 mole) in dry ether gives (instead of the expected phenylacetone (1:5118)) 24% yield (252) of *o*-methylacetophenone (1:5524).]

[Furthermore  $\bar{\text{C}}$  with Grignard reagents derived from tertiary alkyl halides is often reduced and the reactn. prod. then contains (in addn. to the normal prods.) other material derived from the reduction prods. E.g.,  $\bar{\text{C}}$  (in excess) with *ter*- $\text{BuMgCl}$  gives (40% yield (253) (254)) *ter*-butyl methyl ketone (pinacolone) (1:5425); note, however, that further study (255) (256) (13) has shown the formation of numerous other prods. including 2-methylpropane (isobutane), 2-methylpropene-1 (isobutylene), carbon monoxide, ethyl acetate, pinacolyl acetate, and mesityl oxide. — For study of reactn. of  $\bar{\text{C}}$  with *ter*- $\text{AmMgCl}$  (254) (13) and other *ter*- $\text{RMgX}$  cpds. (254) see indic. refs. — Note that even  $\text{RMgX}$  cpds. from even primary halides may effect reduction; e.g.,  $\bar{\text{C}}$  with *n*- $\text{BuMgCl}$  gives (255) 13% hexanol-2 (1:6210) + 8%  $\text{EtOH}$  (1:6130).]

[Note also that  $\bar{\text{C}}$  with 2,4,6-trimethylbenzyl  $\text{MgBr}$  (mesityl  $\text{MgBr}$ ) gives (257) mesitylene but not 2,4,6-trimethylacetophenone (necetomesitylene) although  $\bar{\text{C}}$  with 2,4,6-triphenylphenyl  $\text{MgBr}$  does give (258) the corresp. 2,4,6-triphenylacetophenone.]

Reaction of  $\bar{\text{C}}$  with other miscellaneous organometallic compounds. [ $\bar{\text{C}}$  with diphenylmethylsodium reacts to replace  $\text{Na}$  by  $\text{H}$  yielding (259) diphenylmethane (1:7120);  $\bar{\text{C}}$  with phenylsilver gives (260) 21% acetophenone (1:5515) + 40% biphenyl (1:7175);  $\bar{\text{C}}$  with phenylcopper gives (260) 48–54% acetophenone (1:5515).]

[ $\bar{\text{C}}$  with  $\text{Et}_2\text{Mg}$  gives (261) 3-methylpentanol-3 (1:6189) (not *ter*-butyl alc. as was formerly supposed);  $\bar{\text{C}}$  with dibenzylzinc in pet. ether gives (262) 9% ketones;  $\bar{\text{C}}$  with dibenzylcadmium in ether gives (262) 18% phenylacetone (1:5118),  $\bar{\text{C}}$  with  $\text{Et}_2\text{Hg}$  gives

{204}) {205} *p*-methoxyacetophenone (*p*-acetylanisole) (1:5140); note that  $\bar{C}$  + anisole do not react in the pres. of  $AlF_3$  or  $ZnF_2$  (111). — Countless analogous condensations of  $\bar{C}$  with other phenol ethers cannot be discussed here].

Reaction of  $\bar{C}$  with enols (or their metallic derivatives). [The reaction of  $\bar{C}$  with ethyl acetoacetate (1:1710) leads according to circumstances to either or both of two very closely similar derivatives; one of these is ethyl *O*-acetylacetoacetate (ethyl  $\beta$ -acetoxyacrylate) (A) [Beil. III-373, III<sub>1</sub>-(135), III<sub>2</sub>-(255)], b.p. 212–214° sl. dec. (206),  $D_4^{20} = 1.060$  (207),  $n_D^{20} = 1.4447$  (207); the other is ethyl  $\alpha$ -acetylacetoacetate (ethyl diacetylacetate) (B) [Beil. III-751, III<sub>1</sub>-(263), III<sub>2</sub>-(467)], b.p. 209–211° (208),  $D_4^{20} = 1.093$  (207),  $n_D^{20} = 1.4687$  (207); note that the latter (B) as liquid is 100% enolized (209) (210) and this prop. is used (211) for detn. of both A + B in their mixtures. — Note furthermore that the *O*-ester (A) by suitable htg. (212) (213) (214) (215) (216) can be converted to the isomer (B).]

[ $\bar{C}$  with ethyl acetoacetate (1:1710) in pres. of pyridine (217) or  $\bar{C}$  with its Na enolate in ether (219) or its Cu enolate in ether or  $C_6H_6$  (220) gives mainly the *O*-acetyl deriv. (A) (above);  $\bar{C}$  with ethyl sodioacetoacetate in ether (221) (222) (223) (226) or pet. ether (216) or with the Ca enolate in  $C_6H_6$  (224) or  $\bar{C}$  with ethyl acetoacetate + Mg in  $C_6H_6$  (225) (226) gives (yields: 65% (224), 46–52% (225)) ethyl diacetylacetate (B above) (Cu enolate, m.p. 151° (226)).]

[For study of influence of  $\bar{C}$  on rate of enolization of ethyl acetoacetate see (228); for formn. of ethyl *O*-acetylacetoacetate (isomer A above) from  $\bar{C}$  + ketene diethylacetal (30% yield together with other prods.) see (229).]

Reaction of  $\bar{C}$  with acids or their salts. [ $\bar{C}$  on htg. with NaOAc or other metal salts of AcOH yields acetic anhydride (1:1015); this reactn. is well known and will not be amplified here;  $\bar{C}$  with salts of acids other than acetic gives in some cases the corresp. mixed anhydride, in others only the anhydride of the second acid. E.g.,  $\bar{C}$  (1 mole) with dry Na isovalerate (1 mole) gives at 130° the mixed anhydride contg. 1 acetyl and 1 isovaleroyl radical (231); on the other hand,  $\bar{C}$  with dry Na cinnamate gives only cinnamic anhydride (231); many other examples are known.]

[ $\bar{C}$  on htg. with AcOH under appropriate conditions (232) (233) (234) loses HCl giving good yields  $Ac_2O$  (1:1015).]

Note that  $\bar{C}$  in  $Ac_2O$  behaves as a weak acid and can actually be titrated with NaOAc in  $Ac_2O$  using methyl orange as indicator (235).

### REACTION OF $\bar{C}$ WITH AMINES (OR THEIR DERIVATIVES)

Reaction of  $\bar{C}$  with primary and secondary amines.  $\bar{C}$  readily reacts with such amines to yield under ord. conditions the *N*-acetylated derivative: e.g.,  $\bar{C}$  with  $MeNH_2$  gives *N*-methylacetamide [Beil. IV-58, IV<sub>1</sub>-(329), IV<sub>2</sub>-(563)], very sol. aq., m.p. 27–28°, b.p. 206°; countless other examples are known. Note that only 1 acetyl group is introduced into each amino group; also that  $\bar{C}$  with a mixture of two amines gives mainly (or even exclusively) the *N*-acetyl deriv. of the more negative accompanied by the hydrochloride of the more positive (236). See also below under  $\bar{C}$ 's.

Reaction of  $\bar{C}$  with tertiary amines.  $\bar{C}$  (1 mole) with pyridine (1 mole) directly (237) (238) or in  $C_6H_6$  (237) ppts. an addn. prod. (presumably *N*-acetylpyridinium chloride), white cryst. turning red in light, m.p. abt. 100°, after darkening at 90°; for use of this cpd. in cleavage of phenol ethers see (237). — For use of  $\bar{C}$  + pyridine in *toluene* as means of quant. detn. of OH groups see (186).

[ $\bar{C}$  (1 mole) with  $Et_3N$  (1 mole) in 10 vols. dry  $C_6H_6$  (239) or  $\bar{C}$  in equal. vol. pyridine or picoline (238) yields dehydroacetic acid (1:0700), m.p. 209°.]

[Note here also a novel method of intermolecular dehydrohalogenation: e.g.,  $\bar{C}$  with

lauroyl chloride (3:9858) +  $\text{Et}_3\text{N}$  in dry ether ppts.  $\text{Et}_3\text{N} \cdot \text{HCl}$  and yields (240) a mixt. of acetylketene (detene dimer) + lauroylketene and other prods. — Note further that since dehydroacetic acid (above) may be viewed as ketene tetramer, its formation from  $\bar{\text{C}}$  with *ter*-amines (above) may (241) involve preliminary formation of acetylketene followed by Diels-Alder addn. with a second identical molecule to give dehydroacetic acid.]

Reaction of  $\bar{\text{C}}$  with other miscellaneous nitrogenous systems. [ $\bar{\text{C}}$  with diazomethane in dry ether yields (242) diazoacetone (acetyldiazomethane) [Beil. 1<sub>1</sub>-(396), 1<sub>2</sub>-(823)] yel. liq., b.p. 49° at 13 mm. (242).]

[ $\bar{\text{C}}$  with oximes often is used to effect either dehydration to nitriles or Beckmann rearr. or both (for review see (243))]

[ $\bar{\text{C}}$  with acetanilide refluxed for 7 hrs. gives (244) diphenylacetamidine; other anilides behave in analogous fashion (244). — However,  $\bar{\text{C}}$  with acetanilide +  $\text{AlCl}_3$  in  $\text{CS}_2$  (245) or other inert solvent (246) gives Friedel-Crafts reactn forming (57% yield (245)) *p*-(acetylamino)acetophenone [Beil. XIV-48, XIV<sub>1</sub>-(366)], m.p. 166-167°.]

[ $\bar{\text{C}}$  with thiosemicarbazide results in acetylation followed by elimination of  $\text{HCl}$  and ring closure yielding (247) (248) the hydrochloride, m.p. 110° (248), of 5-amino-2-methyl-1-thiadiazole-3,4 [Beil. XXVII-629], m.p. 235° (248). — For study of reactn. of  $\bar{\text{C}}$  with Schiff's bases see (249).]

#### REACTION OF $\bar{\text{C}}$ WITH VARIOUS ORGANOMETALLIC COMPOUNDS

Reaction of  $\bar{\text{C}}$  with Grignard reagents. (The normal reaction of  $\bar{\text{C}}$  with 1 mole  $\text{RMgX}$  is to eliminate  $\text{MgXCl}$  and yield the corresp. ketone; e.g.,  $\bar{\text{C}}$  with  $\text{EtMgBr}$  in pres. of  $\text{CdCl}_2$  gives (48% yield (250)) ethyl methyl ketone (1:5405), in the presence of excess  $\text{RMgX}$ , however (and sometimes without excess), the ketone may react further to yield the corresp. tertiary alcohol; e.g.,  $\bar{\text{C}}$  with  $\text{C}_6\text{H}_5\text{MgBr}$  gives 39% yield (251) diphenyl-methyl-carbinol; countless other examples cannot be included here.)

†Certain divergences from the above normal reaction have, however, now been recognized; these appear to be largely a function of the particular types of  $\text{RMgX}$  employed. E.g.,  $\bar{\text{C}}$  (0.5 mole) with benzyl  $\text{MgCl}$  (0.37 mole) in dry ether gives (instead of the expected phenylacetone (1:5118)) 24% yield (252) of *o*-methylacetophenone (1:5524).]

Furthermore  $\bar{\text{C}}$  with Grignard reagents derived from tertiary alkyl halides is often reduced and the reactn. prod. then contains (in addn. to the normal prods.) other material derived from the reduction prods. E.g.,  $\bar{\text{C}}$  (in excess) with *ter*- $\text{BuMgCl}$  gives (40% yield (253) (254)) *ter*-butyl methyl ketone (pinacolone) (1:5425); note, however, that further study (255) (256) (13) has shown the formation of numerous other prods. including 2-methylpropane (isobutane), 2-methylpropene-1 (isobutylene), carbon monoxide, ethyl acetate, pinacolyl acetate, and mesityl oxide. — For study of reactn. of  $\bar{\text{C}}$  with *ter*- $\text{AmMgCl}$  (254) (13) and other *ter*- $\text{RMgX}$  cpds. (254) see indic. refs. — Note that even  $\text{RMgX}$  epds. from even primary halides may effect reduction; e.g.,  $\bar{\text{C}}$  with *n*- $\text{BuMgCl}$  gives (255) 13% hexanol-2 (1:5210) + 8%  $\text{EtOH}$  (1:6130)]

[Note also that  $\bar{\text{C}}$  with 2,4,6-trimethylbenzyl  $\text{MgBr}$  (mesityl  $\text{MgBr}$ ) gives (257) mesitylene but no 2,4,6-trimethylacetophenone (acetomesitylene) although  $\bar{\text{C}}$  with 2,4,6-triphenylphenyl  $\text{MgBr}$  does give (258) the corresp. 2,4,6-triphenylacetophenone.]

Reaction of  $\bar{\text{C}}$  with other miscellaneous organometallic compounds. [ $\bar{\text{C}}$  with diphenylmethylsodium reacts to replace  $\text{Na}$  by  $\text{H}$  yielding (259) diphenylmethane (1:7120);  $\bar{\text{C}}$  with phenylsilver gives (260) 21% acetophenone (1:5515) + 40% biphenyl (1:7175);  $\bar{\text{C}}$  with phenylcopper gives (260) 48-54% acetophenone (1:5515).]

[ $\bar{\text{C}}$  with  $\text{Et}_2\text{Mg}$  gives (261) 3-methylpentanol-3 (1:6189) (not *ter*-butyl alc. as was formerly supposed);  $\bar{\text{C}}$  with dibenzylzinc in pet. ether gives (262) 9% ketones;  $\bar{\text{C}}$  with dibenzylcadmium in ether gives (262) 18% phenylacetone (1:5118);  $\bar{\text{C}}$  with  $\text{Et}_2\text{Hg}$  gives

(263)  $\text{EtHgCl} + \text{butanone-2}$  (1:5405), but  $\bar{\text{C}}$  with dibenzylmercury or with benzylmercuric chloride shows little reaction (262) even after refluxing 2 weeks.]

[ $\bar{\text{C}}$  with tetraphenyltin in s.t. at  $100^\circ$  for 15 hrs. gives (very small yield (264)) of acetophenone (1:5515); for reactn. of  $\bar{\text{C}}$  with tetraethyllead and use in defn. of latter in gasoline see (265).]

[ $\bar{\text{C}}$  with triphenylbismuth in  $\text{CCl}_4$  yields (266) acetophenone (1:5515).]

[ $\bar{\text{C}}$  (2 moles) with  $\text{Ni}(\text{CO})_4$  (1 mole) in pet. ether gives (267)  $4\text{CO} + \text{NiCl}_2 + \text{biacetyl}$  the latter sep. as a 1:1 addn. cpd. with the  $\text{NiCl}_2$ .]

⑤ Acetanilide: cryst. from hot aq., m.p.  $114^\circ$ . [From  $\bar{\text{C}}$  with aniline (2 moles) followed by recrystallization to remove aniline hydrochloride. Note that even with aniline + aq. at room temp. acetanilide formn. occurs to extent of 35–45% but its proportion diminishes with increase of temp. (268).]

⑥ Acet-*p*-toluidide: cryst. from hot aq. or dil. alc., m.p.  $153^\circ$ . [From  $\bar{\text{C}}$  + *p*-toluidine (2 moles) followed by recrystallization to remove *p*-toluidine hydrochloride.]

⑦ Acet- $\alpha$ -naphthalide: m.p.  $159^\circ$ .

⑧ Acet- $\beta$ -naphthalide: m.p.  $132^\circ$ .

—  $\beta$ -Acetophenylhydrazide ( $\beta$ -acetylphenylhydrazine) ( $\text{C}_6\text{H}_5\text{NH.NH.COCH}_3$ ) [Beil. XV-241, XV<sub>1</sub>-(63)]: m.p.  $128$ – $129^\circ$ . [Note that  $\alpha$ -acetophenylhydrazide [Beil. XV-236, XV<sub>1</sub>-(62)], m.p.  $124^\circ$ , is obtd. from  $\alpha,\beta$ -diacetylphenylhydrazine [Beil. XV-245, XV<sub>1</sub>-(64)], m.p.  $107$ – $108^\circ$ , by partial hydrolysis.]

—  $\beta$ -Acet-*p*-nitrophenylhydrazide [Beil. XV-478]: yel. ndls. from alc., m.p.  $205$ – $206^\circ$ .

—  $\beta$ -Acet-2,4-dinitrophenylhydrazide [Beil. XV-492]: yel. pr. from alc., m.p.  $201^\circ$  (269).

## 3:7070 1-CHLOROBUTEN-3-YNE-1

C<sub>4</sub>H<sub>3</sub>Cl

Beil. S.N. 13

(1-Chloro-2-vinylacetylene) CH<sub>2</sub>=CH-C≡C-Cl

B.P.

55-57° at 760 mm. (1) (2) (3) (4)

 $D_4^{20} = 1.0032$  (1) (2)  $n_D^{20} = 1.4663$  (1) (2)  
1.0034 (4) $D_4^{25} = 1.021$  (4)  $n_D^{25} = 1.4608$  (4)

Colorless oil, not explosive when pure (3) (4). —  $\bar{C}$  rapidly polymerizes on stdg. into black brittle solid sensitive to heat and shock (1); polymerization of  $\bar{C}$  catalyzed by u.v. light, peroxide, ozonides, etc. (2). After addn. of hydroquinone (3)  $\bar{C}$  can be distd. at ord. press.

[For prepn. of  $\bar{C}$  from vinylacetylene by actn. of alkaline alk. hypochlorite solns. at 0° (yield 60-65% (4), 10% (1)) see (1) (2) (3) (4).]

$\bar{C}$  treated as directed at  $-10^\circ$  with conc.  $HCl + CuCl + NH_4Cl$  gives (56% yield (4)) 1,2-dichlorobutadiene-1,3 (3:9057) q.v.

$\bar{C}$  with  $NH_4OH/AgNO_3$  gives a white ppt.; with Ilseway reagent a yel. ppt. (4).

### 3:7080 2-CHLOROBUTADIENE-1,3 (Chloroprene)

B.P.

59.4° at 760 mm. (1)

$D_4^{20} = 0.9585$  (2)

$n_D^{20} = 1.4583$  (1)

46.9° at 600 mm. (1)

1.4570 (31)

49.5° at 400 mm. (1)

$D_4^{20} = 0.9583$  (1)

1.4163 (2)

32.8° at 300 mm. (1)

0.9573 (31)

6.4° at 100 mm. (1)

Colorless liq. with ethereal odor suggesting  $C_2H_5Br$ . Only slightly sol. aq. but miscible with most org. solvs.

$\bar{C}$  was first reported in 1931 (1) and given the name chloroprene (1) because of its analogy to 2-methylbutadiene-1,3 (isoprene) in structure and reactions. Despite its immense practical importance in the manufacture of various types of synthetic rubbers and plastics, comparatively little information on  $\bar{C}$  itself has been released for publication in the scientific literature.

[For a study of the toxicity and pathology of  $\bar{C}$  see (3); for study of poisoning by  $\bar{C}$  and its treatment see (4).]

[For studies of detn. of  $\bar{C}$  (5) by diazometric methods (6) (7) see indic. refs.]

### PREPARATION OF $\bar{C}$

$\bar{C}$  has been prepared from vinylacetylene by addn. of  $HCl$ , from dichlorobutenes by elimination of 1  $HCl$ , and from various other sources. Comparatively little on these methods has appeared in the scientific literature, and most of the information is available only through patents. Such of the latter as are here cited must be regarded only as illustrative as no guarantee of complete patent coverage can be offered.

From vinylacetylene.  $\bar{C}$  is formed from vinylacetylene (8) by addn. of HCl from aqueous soln. in pres. of catalysts (usually copper salts). The initial step comprises 1,4 addition, and the primary product is 4-chlorobutadiene-1,2 (isochloroprene) (3:7225). Under certain conditions this may be isolated as the major reaction product, but it readily isomerizes (especially in the presence of cuprous chloride and/or other salts (9)) yielding chloroprene. When sufficient amounts of HCl are present further addition to  $\bar{C}$  may also occur leading to 2,4-dichlorobutene-2 (3:5550) (see also below).

[For prepn. of  $\bar{C}$  from vinylacetylene (8) with conc. aq. HCl in pres. of  $\text{Cu}_2\text{Cl}_2 + \text{NH}_4\text{Cl}$  at  $30^\circ$  for 4 hrs. (65% yield) see (1) (47); for studies of this process in foreign laboratories see (10) (11) (12) (2) (24). For examples of patents on this process see (13)–(23) incl. For analogous prepn. of certain homologs of  $\bar{C}$  such as 2-chloro-3-methylbutadiene-1,3 (3:7290) and 2-chloro-3,4-dimethylbutadiene-1,3, etc., see (25) cf. (26).]

From dichlorobutenes. [For prepn. of  $\bar{C}$  from 3,4-dichlorobutene-1 (1,2-dichlorobutene-3) (3:5350) with powdered KOH or alc. NaOH see (27) (28), for 2,3-dichlorobutene-1 (3:9074) by thermal dehydrochlorination at  $530^\circ$  without cat. see (29); from 2,4-dichlorobutene-2 (3:5550) by dehydrochlorination (and isomerization) in pres. of fused KOH at  $180$ – $190^\circ$  (30) or over silica gel or clay at  $245$ – $275^\circ$  (31) cf. (30) see indie refs.; from 1,2-dichlorobutenes by dehydrochlorination with inorg. or org. bases in pres. of org. solvs. see (32).]

From other sources. [For prepn. of  $\bar{C}$  from 2,2,3-trichlorobutane (3:5680) by thermal dehydrochlorination over  $\text{MgCl}_2/\text{MgSO}_4$  cat. see (33); from polychlorobutenes of 55–66% chlorine content (corresp. to dichloro- and trichlorobutenes) by thermal dehydrochlorination at  $400$ – $500^\circ$  see (34) (note that 1-chlorobutadiene-1,3 (3:7210) is also formed; for separation of it from  $\bar{C}$  see (35)); for formn. of  $\bar{C}$  from vinyl chloride (3:7010) with acetylene in pres. of aq.  $\text{Cu}_2\text{Cl}_2/\text{NH}_4\text{Cl}$  see (36).]

## CHEMICAL BEHAVIOR OF $\bar{C}$

### ADDITION REACTIONS

With chlorine. [ $\bar{C}$  (2 moles) with  $\text{Cl}_2$  (1 mole) in  $\text{CHCl}_3$  at  $-10^\circ$  in pres. of hydroquinone gives mainly (37) cf. (38) (39) 1,2,4-trichlorobutene-2 (1,3,4-trichlorobutene-2) (3:9062) accompanied by other products such as 1,2,3-trichlorobutene-1 (37), b.p.  $40$ – $42^\circ$  at 10 mm.,  $D_4^{15} = 1.3190$ ,  $n_D^{15} = 1.4902$  (giving on oxidn.  $\alpha,\beta$ -dichloropropionic acid); note: data also consistent with 2,3,4-trichlorobutene-1 (3:9064) and 1,2-dichlorobutadiene-1,3 (3:9057), b.p.  $45$ – $48^\circ$  at 10 mm. (37),  $D_4^{15} = 1.1905$ ,  $n_D^{15} = 1.5065$  (37).]

With bromine. [ $\bar{C}$  (0.3 mole) with  $\text{Br}_2$  (0.25 mole) in  $\text{CHCl}_3$  at  $0$ – $5^\circ$  gives mainly (40) 2-chloro-1,4-dibromobutene-2, b.p.  $98$ – $101^\circ$  at 10 mm. (oxidizing with  $\text{KMnO}_4$  to bromoacetic acid), accompanied by other products; note that in pres. of anti-oxidants distn. range of prod. is much wider perhaps owing to formn. of geom. stereoisomers.]

With iodine chloride. [ $\bar{C}$  with  $\text{ICl}$  in  $\text{CHCl}_3$  at  $-5^\circ$  to  $0^\circ$  gives (70% yield (41)) a prod. regarded as 2,4-dichloro-1-iodobutene-2.]

With hydrogen chloride. [ $\bar{C}$  with conc. aq. HCl in pres. of  $\text{Cu}_2\text{Cl}_2$  (42) adds HCl giving 2,4-dichlorobutene-2 (3:5550); for behavior of  $\bar{C}$  in liq. HCl see (43).]

With hydrogen bromide. [ $\bar{C}$  (0.96 mole) with dry HBr (0.88 mole) in AcOH at  $-5^\circ$  gives (72% yield on  $\text{Br}_2$  (44)) 2-chloro-4-bromobutene-2, b.p.  $150$ – $152^\circ$ ;  $D_4^{20} = 1.5264$ ,  $D_4^{15} = 1.5335$ ;  $n_D^{15} = 1.5160$ ,  $n_D^{15} = 1.5185$ ; note that this prod. with aq.  $\text{KMnO}_4$  oxidizes to AcOH + bromoacetic acid and adds 1 mole  $\text{Br}_2$  giving 2-chloro-2,3,4-tribromobutane, b.p.  $104.5$ – $106^\circ$  at 10 mm.,  $D_4^{15} = 2.1907$ .]

With hydrochlorous acid. [The behavior of  $\bar{C}$  with  $\text{HOCl}$  appears not to have been reported; 1,4 addition to  $\bar{C}$  might be expected to yield 1,2-dichlorobuten-2-ol-1 and/or 2,4-dichlorobuten-2-ol-1, but neither is reported from any source; an isomer, viz., 2,3-

II-151, II<sub>1</sub>-(70), II<sub>2</sub>-(163)], b.p. 117-118° (3); for corresp. react. with Pb propionate or Na *n*-butyrate see (3).]

[ $\bar{C}$  in  $C_6H_6$  with  $ZnCl_2$  +  $HCl$  gas at 55-65° gives (52) cf. (28) benzyl chloride (3:8535). —  $\bar{C}$  with chlorobenzene (3:7003) + dehydrating agts. gives (28) *p*-chlorobenzyl chloride (3:0220). —  $\bar{C}$  with toluene +  $SnCl_4$  gives (35-40% yield (53)) *p*-methylbenzyl chloride (*p*-xylyl chloride) (3:8660) together with other prods.]

[ $\bar{C}$  in  $AcOH$  soln. without cat. condenses with aromatic nuclei: e.g.,  $\bar{C}$  with toluene in  $AcOH$  gives (25% yield (15)) a mixt. of *o*-xylyl chloride (3:8710) and *p*-xylyl chloride (3:8660); for analogous reactns. of  $\bar{C}$  in  $AcOH$  with *o*-xylene (1:7430), *m*-xylene (1:7420), pseudocumene (1:7470), mesitylene (1:7455), naphthalene (1:7200), tetralin (1:7550), anisole (1:7445), etc., see (15).]

[By virtue of its reactive halogen atom  $\bar{C}$  reacts readily with Grignard reagents giving (54) the corresp. methyl ethers: e.g.,  $\bar{C}$  with *n*-BuMgBr gives (67% yield (55)) (56) *n*-amyl methyl ether (1:7905);  $\bar{C}$  (2 moles) with decamethylene-bis-MgBr gives (53% yield (57)) dodecanediol-1,12-dimethyl ether;  $\bar{C}$  with  $CH_3-C\equiv C-MgBr$  gives (58)  $CH_3.C\equiv C.CH_2OCH_3$ ;  $\bar{C}$  with  $Br-Mg.C\equiv C-MgBr$  gives (63% yield (32)) 1,4-dimethoxybutyne-2;  $\bar{C}$  with  $C_6H_5MgBr$  gives (60% yield based on initial  $C_6H_5Br$  (59)) benzyl methyl ether (1:7475);  $\bar{C}$  with benzyl  $MgCl$  gives mainly (60) cf. (61) (62) methyl  $\beta$ -phenylethyl ether ( $\omega$ -methoxyethylbenzene) (Beil. VI-479, VI<sub>1</sub>-(238)], b.p. 185-187° (61), accompanied by some *o*-tolylcarbinol methyl ether and *p*-tolylcarbinol methyl ether, cf. (60).]

[In the pres. of appropriate catalysts  $\bar{C}$  adds to olefinic unsatd. linkages, addition occurring as if  $\bar{C}$  dissociated into  $(Cl\cdot)$  and  $(CH_3O\cdot CH_2\cdot)$  radicals; examples of these addition reactions are given as follows:  $\bar{C}$  with ethylene +  $BiCl_3$  at 80° under 700-800 lbs. press. for 7 hrs. gives (63)  $\gamma$ -chloro-*n*-propyl methyl ether;  $\bar{C}$  with propylene +  $BiCl_3$  similarly gives (63)  $\gamma$ -chloro-*n*-butyl methyl ether;  $\bar{C}$  with 2-methylpropene-1 (isobutylene) +  $HgCl_2$  on stdg. in s.t. 4 days at room temp. gives (60% yield (64)) 2-chloro-4-methoxy-2-methylbutane, b.p. 136° at 751 mm.  $D_4^{20} = 0.9455$ , accompanied by some *tert*-butyl chloride (3:7045); but  $\bar{C}$  with isobutylene +  $TiCl_4$  as directed (65) gives the corresp. alc., viz., 3-chloro-3-methylbutanol-1;  $\bar{C}$  with 2-methylbutene-2 (trimethylethylene) (1:8220) with  $ZnCl_2$  as directed (63) or with  $HgCl_2$  in s.t. at room temp. for 48 hrs. (64) gives (40% yield (64)) 2-chloro-4-methoxy-2,3-dimethylbutane, b.p. 153° at 761 mm., 46-46.5° at 14 mm.,  $D_4^{20} = 0.9528$ , accompanied by some *tert*-AmCl (3:7220);  $\bar{C}$  with cyclohexene (1:8070) +  $ZnCl_2$  in  $CS_2$  stirred 5 hrs. at 0°, then 3 hrs. at room temp., gives (28.7% yield (66)) cf. (64) (*o*-chlorocyclohexyl)methyl methyl ether (2-chloro-1-(methoxymethyl)cyclohexane), b.p. 88-91° at 17 mm.,  $D_4^{20} = 1.1552$  (66).]

[ $\bar{C}$  with butadiene-1,3 +  $ZnCl_2$  in s.t. at room temp. for 21 hrs. gives (70% yield (64)) *n* mixt. of 1-chloro-5-methoxypentene-2, b.p. 168° at 758 mm., 56° at 10 mm.,  $D_4^{20} = 1.0022$  (from 1,4- addn. (?)) + 3-chloro-5-methoxypentene-1, b.p. 148° at 756 mm., 35° at 10 mm.,  $D_4^{20} = 0.9740$  (from 1,2 addn. (?)) (note that these two prods. represent synionic mesomers);  $\bar{C}$  with cyclohexadiene-1,3 (1:8057) +  $HgCl_2$  under  $CO_2$  at 0° stood 24 hrs. gives (38% yield (64)) (4-chlorocyclohexenyl)methyl methyl ether, b.p. 81° at 10 mm.,  $D_4^{20} = 1.0636$  (64).]

[ $\bar{C}$  (1 mole) + vinylacetylene (1 mole) +  $BiCl_3$  (trace) + pyrogallol (trace) in dry ether nt 5-15° for 9 hrs. (with periodic addns. of  $BiCl_3$ ) gives (67) 34.8% yield 1-chloro-5-methoxy-1,3-pentadiene-2, b.p. 61° at 10 mm.,  $D_4^{20} = 1.0127$ ,  $n_D^{20} = 1.4893$  (by 1,4 addn.), (67) 1-chloro-5-methoxypentadiene-1,3, b.p. 46° at 10 mm.,  $D_4^{20} = 1.0022$  (from 1,4 addn. (?)) with other prods.; note that of the two preceding dienes the former with  $Cu_2Cl_2$  +  $HCl$  in ether at 20-40° for 2 hrs. readily isomerizes (81% yield (67)) to the latter; for further reactions of the pair see (67).]

[ $\bar{C}$  with 4.67% dislvd.  $ZnCl_2$  shaken with  $CO$  at 25-50° nt 275-625 pounds press. for 8 hrs. gives (63) methoxyacetyl chloride (3:5225).]

$\bar{C}$  with tertiary amines yields the corresp. quaternary ammonium salts: e.g.,  $\bar{C}$  with  $Me_3N$  in dry ether gives (69) methoxymethyl-trimethyl-ammonium chloride (chloroplatinate, m.p. 228–229°, picrate, m.p. 198°);  $\bar{C}$  with pyridine in dry ether gives (69) methoxymethyl-pyridinium chloride (chloroplatinate, m.p. 182–185° (70), 180–182° dec. (35),  $HgCl_2$  cpd., m.p. 91° (69));  $\bar{C}$  with quinoline in  $CHCl_3$  gives (69) methoxymethyl-quinolinium chloride (chloroplatinate, m.p. 232–234°; chloroaurate, m.p. 126–127°); for other quaternary salts see (69).

- Methoxymethyl benzoate: oil, h.p. 283° (71). [From  $\bar{C}$  with  $NaOBz$  at 100° (71).]
- Methoxymethyl *p*-nitrobenzoate: unreported.
- Methoxymethyl 3,5-dinitrobenzoate: unreported.
- *S*-(Methoxymethyl)isothiourea picrate: m.p. 163° (72). [From  $\bar{C}$  + thiourea in cold acetone giving (90% yield (72)) corresp. hydrochloride, m.p. 112° dec., which is then converted to the picrate]
- *N*-(Methoxymethyl)phthalimide: cryst. from dry  $MeOH$ , m.p. 120–121° (73), 118° (74). [Prepn reported only by indirect means (73) (74)]

62.84°	(18)	$D_4^{16} = 0.9185$ (1)			
		$D_4^0 = 0.9301$ (1)	$n_D^{13.4} = 1.4217$ (1)		

Ordinary  $\bar{\text{C}}$  (mixt.)

B.P.					
64-68°	(2)	$D_4^{20} = 0.9179$ (3)			
62-67°	(3)		$n_D^{15} = 1.4232$ (2)		
59-61° at 761 mm.	(4)	$D_4^{15} = 0.9220$ (2)			

Both stereoisomers form with abs. EtOH const.-boilg. mixts from which  $\bar{\text{C}}$  can be recovered by repeated shaking with 3 vols. aq. to remove the alc., the azeotrope with *cis*- $\bar{\text{C}}$ , b.p. 60.0-60.4° at 760 mm.,  $D_4^{15} = 0.8964$ , conts. 81.6% by wt. of *cis*- $\bar{\text{C}}$ , the azeotrope with *trans*- $\bar{\text{C}}$ , b.p. 56.8-57.2° at 760 mm.,  $D_4^{15} = 0.8960$ , conts. 84.6% by wt. of *trans*- $\bar{\text{C}}$  (1).

[For study of toxicity of  $\bar{\text{C}}$  see (5); for use as anthelmintic see (6).]

[For prepn. of the two geom. stereoisomers of  $\bar{\text{C}}$  from either *d,l*- (3:7615) or *meso*- (3:7680) 2,3-dichlorobutane with alc. KOH (1 mole + 25% excess) refluxed for 3 days see (1).]

[For prepn. of ord.  $\bar{\text{C}}$  (mixt. of *cis* + *trans* stereoisomers) from 2,2-dichlorobutane (3:7415) with alc. KOH see (8), from ord. 2,3-dichlorobutane (3:7615) with alc. KOH (1) (2) (3) (8) (9), with aq.  $\text{NaHCO}_3$  +  $\text{Na}_2\text{CO}_3$  under press. (yield 20%  $\bar{\text{C}}$  accompanied by 4% butanone-2 (ethyl methyl ketone) (1:5405) + 5% butenols (7), with aq. alkali or alkaline-earth hydroxides under press. at 118-250° (10), by passing vapor over  $\text{BaCl}_2$  at 200-300° (11), or by passing vapor + steam at 300-400° over silica gel contg.  $\text{MgCl}_2$  +  $\text{CaCl}_2$ , etc. (yields 21-25%  $\bar{\text{C}}$  accompanied by 35-38% butadiene-1,3 and 6-8% butanone-2) (3) see indic. refs.; from butanone-2 (ethyl methyl ketone) (1:5405) with  $\text{PCl}_3$  ( $\bar{\text{C}}$  is accompanied by 2-chlorobutene-1 (3:7075) (12) and by 2,2-dichlorobutane (3:7415) (4)) see indic. refs.]

[For prepn. of  $\bar{\text{C}}$  from 2,2-dichloro-3-iodobutane (see below) with alc. KOH see (2); from 2-bromo-2-chloro-3-iodobutane with alc. KOH see (2) (note that the isomeric 2-bromo-3-chloro-2-iodobutane under same circumstances gives 3-bromo-2-chlorobutene-2).]

[For prepn. of  $\bar{\text{C}}$  from 2,3-dichlorobutene-2 (3:5500) with aq. alk. or alkaline-earth hydroxides under press. at 118-250° see (13).]

If  $\bar{\text{C}}$  with Cl may add halogen, or be further substituted by halogen, or both, according to:

circumstances: e.g.,  $\bar{C}$  in liq. phase with  $Cl_2$  at 20–40° in absence of light but in pres. of cat. such as  $SnCl_4$  or  $FeCl_3$  adds  $Cl_2$  giving (14) 2,2,3-trichlorobutane (3:5680);  $\bar{C}$  in liq. phase with  $Cl_2$  in pres. of light and of  $O_2$  (15) or  $\bar{C}$  with  $Cl_2$  in pres. of  $NaHCO_3$  at 0° (4) substitutes further giving (55% yield (4)) (15) 2,3-dichlorobutene-1 (3:0074) (accompanied by 45% 2,2,3-trichlorobutane (3:5680) (4));  $\bar{C}$  with  $Cl_2$  at 350° gives (16) a mixt. of unsatd. chlorobutenes, probably 1,2-dichlorobutene-2 (3:5360) or (3:5615) and 1,3(2,4)-dichlorobutene-2 (3:5550).]

$\bar{C}$  adds  $Br_2$  yielding (2) 2,3-dibromo-2-chlorobutane, b.p. 182.5–180° sl. dec., 60–60.5° at 12 mm.,  $D_4^{15} = 1.8975$ ,  $n_D^{15} = 1.5339$  (2) (this prod. with alc. KOH loses  $HBr$  yielding (2) 3-bromo-2-chlorobutene-2, b.p. 128–129.5°,  $D_4^{15} = 1.4998$ ,  $n_D^{15} = 1.4950$  (2)).

$\bar{C}$  adds  $ICl$  yielding (2) 2,2-dichloro-3-iodobutane, b.p. 69.5° at 11.5 mm.,  $D_4^{15} = 1.8580$ ,  $n_D^{15} = 1.5595$  (2) (this prod. with KOH regenerates  $\bar{C}$ ).]

$\bar{C}$  also adds  $HOCi$  but from the addn. prod.  $HCl$  splits out immediately: e.g.,  $\bar{C}$  in  $CCl_4$  with  $Cl_2$  + aq. as directed (17) gives (85% yield (17)) 3-chlorobutanone-2 ( $\alpha$ -chloroethyl methyl ketone) (3:7598).]

[For behavior of  $\bar{C}$  with dry  $HF$  yielding 2,2-difluorobutane see (18).]

$\bar{C}$  with steam passed at 300–400° over silica gel contg.  $MgCl_2$  +  $CuCl_2$  is unchanged (3) (dif. from 3-chlorobutene-1 (3:7090) or 1-chlorobutene-2 (3:7205) which lose  $HCl$  yielding butadiene-1,3 (3)). — Note that with alc. KOH the *cis*- $\bar{C}$  splits off  $HCl$  2.5 times as fast as the *trans*- $\bar{C}$  (1).] [For dehydrohalogenation of  $\bar{C}$  yielding butadiene-1,3 see (19) (20).]

$\bar{C}$  with alcoholates or phenolates as directed (9) yields the corresp. ethers; e.g.,  $\bar{C}$  with  $NaOEt$  yields (9)  $\alpha,\beta$ -dimethylvinyl ethyl ether.]

$\bar{C}$  on oxidn. with boilg. aq.  $KMnO_4$  yields (12) acetic acid (1:1019) and propionic acid (1:1025); the *cis*- $\bar{C}$  appears to give mainly acetic acid; the *trans*- $\bar{C}$  gives mainly propionic acid (12).

$$0.918 \quad (6) \quad 1.422 \quad (7)$$

[See also 3-chloro-2-methylpropene-1 (3:7145)]

Note that for  $\bar{C}$  the designation *β,β*-dimethylvinyl chloride is now preferred, cf. (5); great care should be used to avoid confusion of  $\bar{C}$  with the isomeric and very closely related 3-chloro-2-methylpropene-1 (methallyl chloride) (3:7145); both these compounds are now commercial chemicals in the U.S.A.

[For prepn. of  $\bar{C}$  from 3-chloro-2-methylpropene-1 (methallyl chloride) (3:7145) see (2) (3): e.g., methallyl chloride (10 moles) with 80% H<sub>2</sub>SO<sub>4</sub> (1 mole) stirred at 40° for 2½ hrs. gives an upper phase contg 87%  $\bar{C}$  + 7% residual methallyl chloride + 6% dichlorides and polymers; after washing free from acid, drying, and distilling it yields 85%  $\bar{C}$  (8) (20)]

[For formn. of  $\bar{C}$  (usually accompanied by the isomeric methallyl chloride and/or other

prods.) from 2-methylpropene-1 (isobutylene) with  $\text{Cl}_2$  (5) (9); from 1,1-dichloro-2-methylpropane (isobutylidene dichloride) (3:7425) by actn. of  $\text{NH}_4\text{OH}$  or alc.  $\text{KOH}$  (4), from 1,2-dichloro-2-methylpropane (isobutylene dichloride) (3:7430) with alc.  $\text{KOH}$  (10) see indic. refs.]

[For formn. of  $\bar{\text{C}}$  (together with the isomeric methallyl chloride) from 1-chloro-2-methylpropanol-2 (isobutylene chlorohydrin) (3:7752) by soln. in cold 45%  $\text{H}_2\text{SO}_4$  and subsequent warming (giving 90%  $\bar{\text{C}}$  + 10% methallyl chloride (2) (8)), or by use of  $\text{P}_2\text{O}_5$  (11) cf. (12); from 1,1,1-trichloro-2-methylpropanol-2 (1,1,1-trichloro-*ter*-butyl alc. = "Chlore-tone") (3:2662) with Zn dust + boilg. alc. (13), or from isobutyraldehyde (1:0120) by actn. of  $\text{PCl}_5$  (4) see indic. refs.]

$\bar{\text{C}}$  forms with aq. a const.-boilg. mixt., b.p. 61.9°, contg. 7.5% aq. (2)

[For study of anesthetic props. of  $\bar{\text{C}}$  see (14).]

Reactions involving further substitution of H atoms in  $\bar{\text{C}}$ . [ $\bar{\text{C}}$  with  $\text{Cl}_2$  (in pres. of 1.5 moles  $\text{NaHCO}_3$  at 0° (15)) cf. (2) reacts not only by addn. but also by substitution (the latter involving a shift of double bond) giving respectively 32% 1,1,2-trichloro-2-methylpropane (3:5710) + 68% 1,1-dichloro-2-methylpropene-2 (3:7480).]

Reactions involving the double bond of  $\bar{\text{C}}$ . [ $\bar{\text{C}}$  adds  $\text{Cl}_2$  (see preceding paragraph).]

[ $\bar{\text{C}}$  also adds  $\text{HOCl}$  (chlorohydration); e.g.,  $\bar{\text{C}}$  with  $\text{Cl}_2$  + aq., or aq.  $\text{HOCl}$ , or even alkyl or alkyl hypochlorites as directed (16) cf. (2) (4), yields 1,1-dichloro-2-methylpropanol-2 ( $\beta,\beta$ -dichloro-*ter*-butyl alc.) (3:5772), b.p. 150°.]

[ $\bar{\text{C}}$  can also undergo catalytic hydration of the double bond; e.g.,  $\bar{\text{C}}$  (1 mole) with 90%  $\text{H}_2\text{SO}_4$  (1 mole) stirred at -10° to 0° for 2½ hrs., then poured onto cracked ice, diluted with aq., and distilled, gives 66% of the initial  $\bar{\text{C}}$  as 1-chloro-2-methylpropanol-2 ( $\beta$ -chloro-*ter*-butyl alcohol) (isobutylene chlorohydrin) (3:7752); note that other acids can also be used for this hydration, e.g., 85%  $\text{H}_3\text{PO}_4$ , 70%  $\text{HNO}_3$ , 60%  $\text{HClO}_4$ , benzenesulfonic acid, e.g., each having its own optimum conditions. Note also that some 18% of the initial  $\bar{\text{C}}$  is not hydrated but is partially isomerized to a mixt. contg. 90%  $\bar{\text{C}}$  + 10% methallyl chloride (2) (17).]

Reactions involving the halogen atom of  $\bar{\text{C}}$ . Note that in  $\bar{\text{C}}$  the halogen is extremely inert as compared with that of the isomeric methallyl chloride (3:7145); this permits removal of the latter from  $\bar{\text{C}}$  by chemical means (see below).

[ $\bar{\text{C}}$  is virtually unattacked by aq. or alc.  $\text{KOH}$  even at 100° (11) (1) (2) (dif. from methallyl chloride (3:7145)). —  $\bar{\text{C}}$  does not react with boilg. aq.  $\text{K}_2\text{CO}_3$  or  $\text{KOAc}$  (1) (dif. from methallyl chloride (3:7145)).]

[ $\bar{\text{C}}$  is not normally convertible to isobutyraldehyde except under extreme conditions (5) (dif. from methallyl chloride (3:7145) which upon acid hydrolysis or even boilg. with aq. gives isobutyraldehyde).]

—  $\beta,\beta$ -Dimethylvinyl (isocrotyl) acetate: unreported.

—  $\beta,\beta$ -Dimethylvinyl (isocrotyl) benzoate: unreported.

—  $\beta,\beta$ -Dimethylvinyl (isocrotyl) *p*-nitrobenzoate: unreported.

—  $\beta,\beta$ -Dimethylvinyl (isocrotyl) 3,5-dinitrobenzoate: unreported.

— *N*-( $\beta,\beta$ -dimethylvinyl)phthalimide: unreported.

			1.3969 (3)

(For b p. of C at various press. in range 49-285 mm. see (2).)

$n_D^{15} = 1.3994$  (1)

Liquid with agreeable ethereal odor.

[For prepn. of  $\bar{C}$  from butanol-2 (1:6155) by saturation with dry HCl gas and btg. in s.t. at 100° for several hrs. (9); by distillation with 18 wt. pts. 6 N HCl (50% yield (12)); with conc. HCl + ZnCl<sub>2</sub> (2 moles) (yields: 85-88% (13), 83% (14), 82% (5), 78% (15), 60-68% (16) (17)) (6); with PCl<sub>3</sub> + ZnCl<sub>2</sub> (yields: 67% (15), 40% (6)); with PCl<sub>5</sub> + ZnCl<sub>2</sub> (71% yield (15)); with SOCl<sub>2</sub> + pyridine (yields: 90% (15), 47% (5)); or with HCl in pres. of H<sub>3</sub>PO<sub>4</sub> (18) see indic. refs.]

[For formn. of  $\bar{C}$  from either butene-1 or butene-2 with HCl gas by addn. to unsatd. linkage (7) (19) in pres. of cat. (20) (21) (22) see indic. refs.; from *n*-butane with Cl<sub>2</sub> see (4) (23); from *n*-butylamine with HNO<sub>2</sub> (2.8% yield  $\bar{C}$  accompanied by 36.5% butenes, 25% butanol-1, 13.2% butanol-2, 5.2% *n*-butyl chloride (3:7160) and other prods.) see (24); from *sec.*-butylamine with NOCl in xylene see (25).]

[For study of anthelmintic props. of  $\bar{C}$  see (26).]

Pyrolysis of  $\bar{C}$ . [ $\bar{C}$  at 450-550° without cat. loses HCl and yields (4) (27) a mixt. contg. butene-1, *cis*-butene-2, and *trans*-butene-2 (dif. from 1-chlorobutane (3:7160) which gives only butene-1);  $\bar{C}$  at 450° in pres. of anhyd. CaCl<sub>2</sub> as cat. gives (4) (27) the same mixt. (as does also 1-chlorobutane (3:7160)). For use of this pyrolysis in distinction of  $\bar{C}$  from *ter*-butyl chloride (3:7045) see (23).]

Further halogenation of  $\bar{C}$ . [ $\bar{C}$  with  $Cl_2$  at 200–380° gives (28) a mixt. of dichlorobutanes contg. 1,3-dichlorobutane (3:7925), 2,2-dichlorobutane (3:7415), and d,l-2,3-dichlorobutane (3:7615) but no 1,2-dichlorobutane (3:7680); note, however, that  $\bar{C}$  with  $Cl_2$  in pres. of light gives (29) 1,2-dichlorobutane (3:7680), 1,3-dichlorobutane (3:7925), 2,2-dichlorobutane (3:7415), and both d,l- (3:7615) and meso- (3:7580) 2,3-dichlorobutanes.]

Reactions of the halogen atom of  $\bar{C}$ . [For study of rate of reactn. of  $\bar{C}$  with KI in acetone at 60° see (30).]

[ $\bar{C}$  with  $C_6H_6 + AlCl_3$  gives (yields: 82.5% (9), 69% (31)) *sec.*-butylbenzene (1:7490);  $\bar{C}$  with  $C_6H_6 + Al/Hg$  gives (59.5% yield (32)) *ter*-butylbenzene (1:7460);  $\bar{C}$  with naphthalene +  $AlHg$  gives (48% yield (32)) 1-(*sec.*-butyl)naphthalene.]

[ $\bar{C}$  with acetanilide +  $AlCl_3$  in nethylene dichloride (3:5130) at –5° gives (33) *N*-acetyl-*p*-(*sec.*-butyl)aniline, cryst. from di-isopropyl ether, m.p. 121–122° (33).]

$\bar{C}$  with Mg in dry ether gives (87% yield (34)) *sec.*-BuMgCl (see also below).

⑤ Ethyl-methyl-acetic acid (1:1105): h.p. 176–177°. [From  $\bar{C}$  by conversion to RMgCl and carbonation of the latter with  $CO_2$  (yields: 76–86% (35), 72%) (by adding ether soln. directly to solid  $CO_2$  (36)).]

⑥ Ethyl-methyl-acetic anilide: m.p. 110–111° (37), 108° u.c. (38), 105.5–106.5° u.c. (39). [From  $\bar{C}$  (39) (24) or *sec.*-BuBr (38) by conversion to RMgX and reactn. in dry ether with phenyl isocyanate.] [Note that this prod. does not distinguish  $\bar{C}$  from ethyl chloride (3:7015) or from isopropyl chloride (3:7025) for which the corresp. anilides melt at 101–101.5°; moreover, it is not recommended as distinction from isobutyl chloride (3:7135) for which the corresp. isovalerianilide has m.p. 109–110° u.c. (39).]

⑦ Ethyl-methyl-acetic-*p*-toluidide: m.p. 92.5–93° u.c. (39). [From  $\bar{C}$  by conversion to RMgCl (see above) and reactn. in dry ether with *p*-tolyl isocyanate (39).]

⑧ Ethyl-methyl-acetic  $\alpha$ -naphthalide: m.p. 128–129° u.c. (39). [From  $\bar{C}$  by conversion to RMgCl (see above) and reactn. in dry ether with  $\alpha$ -naphthyl isocyanate (39).] [Note that this prod. does not distinguish  $\bar{C}$  from isobutyl chloride (3:7135) for which the corresp. isovalero- $\alpha$ -naphthalide has m.p. 125–126° u.c. (39).]

— *sec.*-Butyl mercuric chloride (*sec.*-BuHgCl): cryst. from alc., m.p. 30.5° (40). [Reported only by indirect means (40).]

— *S*-(*sec.*-Butyl)isothioureia picrate: m.p. 190° (41). [Not reported from  $\bar{C}$  but obtd. from *sec.*-BuBr (0.2 g.) + thiourea (0.2 g.) refluxed in alc. (2 ml.) for 2 min., then treated with  $PhOH$  (0.2 g.) dislvd. in least possible hot alc. (41).]

— *N*-(*sec.*-Butyl)phthalimide (2-(*N*-phthalimido)butane): m.p. 24.5–25.5° (42). [Not reported from  $\bar{C}$  but obtd. (35% yield (42)) from *sec.*-BuBr with K phthalimide by htg. in s.t. at 210° for 4 hrs.; note that m.p. is too low to be recommended as deriv. for identification.]

— *N*-(*sec.*-Butyl)-3-nitrophthalimide: unreported.

— *N*-(*sec.*-Butyl)tetrachlorophthalimide: unreported.

— *N*-(*sec.*-Butyl)-*o*-sulfobenzoic imide (*N*-(*sec.*-butyl)saccharin): m.p. 81° (43). [Not reported from  $\bar{C}$  but obtd. from *sec.*-BuBr or *sec.*-BuI with sodium saccharin in aq. butylcarbitol (1:6517) on refluxing for 30 min. (43).]

— *N*-(*sec.*-Butyl)-*N*-(*p*-bromobenzenesulfonyl)-*p*-aniside: unreported.

— *p*-(*sec.*-Butoxy)benzoic acid: m.p. 121–123° u.c. (44). [From  $\bar{C}$  (?) or from *sec.*-BuBr with ethyl *p*-hydroxybenzoate (1:1534) in nbs. alc.  $NaOEt$  on refluxing 1 hr. (44).] [Note, however, that this prod. does not distinguish  $\bar{C}$  from the corresp. deriv. of *n*-amyl chloride (3:7460) whose m.p. is 123–124° u.c. (44).]

— *sec.*-Butyl 2,4,6-trifluorophenyl ether: unreported.

— *sec.*-Butyl  $\alpha$ -naphthyl ether: b.p. 293.5° cor. (45). (Corresp. picrate, m.p. 100.5–101.0° cor.; Neut. Eq. calcd. 429, found 427 (45).)

— sec.-Butyl  $\beta$ -naphthyl ether: b.p. 298.5° cor. (45), 298° (46). (Corresp. picrate, m.p. 86.0-86.5° cor (45); 85° (46); Neut. Eq., calcd. 429, found 429 (46).)

Colorless liquid. — Very spar. sol. aq.; 100 ml. aq. at 12.5° dis. 0.092 g.  $\bar{C}$  (9).

$\bar{C}$  forms with aq. a const.-boilg. mixt. (const. not reported (10)) (use in sepn. from *ter*-butyl alc. (1:6140) (10);  $\bar{C}$  also forms binary azeotropes with many org. compounds; e.g.,  $\bar{C}$  with *EtOH* (1:6130) forms a const.-boilg. mixt., b.p. 61.45° at 760 mm., contg. 72 mole %  $\bar{C}$  (11);  $\bar{C}$  with *propanol-1* (1:6150) forms a const.-boilg. mixt., b.p. 67.7° at 760 mm., contg. 78 wt. %  $\bar{C}$  (12);  $\bar{C}$  with *propanol-2* (1:6135) forms a const.-boilg. mixt., b.p. 64.8° at 760 mm., contg. 83 wt. %  $\bar{C}$  (13);  $\bar{C}$  with *ter*-butyl alc. (1:6140) forms a const.-boilg. mixt., b.p. 65.5° at 760 mm., contg. 83 wt. %  $\bar{C}$  (14);  $\bar{C}$  with *allyl alc.* (1:6145) forms a const.-boilg. mixt., b.p. 67.2° at 760 mm., contg. 93 wt. %  $\bar{C}$  (14);  $\bar{C}$  with *EtOH* (1:6130) + aq. forms a ternary const.-boilg. mixt., b.p. 58.62° at 760 mm. (2 phases), contg. 62.6 mole %  $\bar{C}$  + 19.8 mole % *EtOH* + 17.6 mole % aq. (11).

(For prepn. of  $\bar{C}$  from isobutyl alc. (1:6165) with dry HCl gas in s.t. at 120° for 8 hrs. (3) cf. (23) (gives 94% yield of a mixt. of  $\bar{C}$  + *ter*-butyl chloride (3:7045) from which latter can be removed by 5-hr. shaking with 10% aq. KOH (3) cf. (22); with dry HCl gas at 100° for 10 hrs. (4) or in pres. of pyridine (15) or CdO, ZnCl<sub>2</sub> or other cat. (16); or over Al<sub>2</sub>O<sub>3</sub> at 420° (*ter*-butyl chloride is also formed (17)); with conc. aq. HCl + ZnCl<sub>2</sub> refluxed 1 hr. (15% yield (18) (19)); with PCl<sub>3</sub> + ZnCl<sub>2</sub> (yields: 85% (20), 80% (18), 32% (21)) (note that some *ter*-butyl chloride is formed (21)); with PCl<sub>5</sub> (24) or PCl<sub>5</sub> + ZnCl<sub>2</sub> (76% yield (18)); or with SOCl<sub>2</sub> + pyridine (83% yield (18)) (5), SOCl<sub>2</sub> + dimethylaniline (70% yield (18)), SOCl<sub>2</sub> + diethylaniline (58% yield (18)) (note that use of aniline gives only 19% yield (18)) see indic. refs.)

[For formn. of  $\bar{C}$  from 2-methylpropane (isobutane) with Cl<sub>2</sub> + cat. at 180° (60% yield (25) together with other prods.) (26) see indic. refs.; for formn. of  $\bar{C}$  from isobutylene by cat. addn. of HCl (note "abnormal" addition) see (27).]

[For formn. of  $\bar{C}$  from isobutylamine with NOCl in xylene at -15° (28) or with aqua regia (29) see indic. refs.; from *n*-butyl acetate (1:3145) by pyrolysis with AlCl<sub>3</sub> see (30).]

[For sepn. of  $\bar{C}$  from *ter*-butyl chloride (3:7045) by hydrol. of latter with aq. alk. and extraction of the resultant *ter*-butyl alc. with aq. see (10) (3); for sepn. of  $\bar{C}$  from more reactive alkyl chlorides (such as *ter*-butyl chloride (3:7045), methylal chloride (3:7145), etc.) by esterification of the reactive chlorides by htg. at 125-225° under press. in pres. of Cu with alkali salt of a suitable acid, followed by fractional distn., see (47).]

[ $\bar{C}$  on suitable htg. dec. into isobutylene and HCl; if the process is so conducted that these prods. can react at lower temp. they combine to yield *ter*-butyl chloride (3:7045); e.g.,  $\bar{C}$  passed over pumice at 500° (31), or over clay at 250-300° (32), or over BaCl<sub>2</sub>, ThCl<sub>4</sub>, ThO<sub>2</sub>, kaolin, etc., at 300° (33) (34) (35) (36), or with H<sub>2</sub> over reduced Ni at 270° (35) (36) yields isobutylene + HCl; for execution of this process so as to permit recombination to *ter*-butyl chloride (3:7045) see (37). — Note that  $\bar{C}$  on htg. in s.t. at 306° for 6 hrs. gives (3) 8% *ter*-butyl chloride; for study of the equilibrium in the system  $\bar{C}$  + *ter*-butyl chloride + HCl over range 88-237° see (38).]

[ $\bar{C}$  with Cl<sub>2</sub> yields (39) (26) 1,3-dichloro-2-methylpropane (3:7960) and other prods. —  $\bar{C}$  with Br<sub>2</sub> (1 mole) in pres. of Fe in s.t. at 100° for 6 hrs. gives (40) 1,2-dibromo-2-methylpropane (isobutylene dibromide), b.p. 148° (40).]

[ $\bar{C}$  with aq. soln. or susp. of inorg. bases under press. at 120-350° yields (41) a mixt. contg. isobutyl alc. (1:6165), *ter*-butyl alc. (1:6140), and isobutylene. — For study of rate of hydrolysis of  $\bar{C}$  in 50% alc. in pres. and abs. of dil. H<sub>2</sub>SO<sub>4</sub> see (42). — In connection with hydrolysis of  $\bar{C}$  to isobutyl alc. note that these two form no azeotrope (1).]

[ $\bar{C}$  with Na in liq. NH<sub>3</sub> gives 2-methylpropane (isobutane) (43); but  $\bar{C}$  with NaNH<sub>2</sub> in liq. NH<sub>3</sub> gives isobutylene (43).]

[ $\bar{C}$  with C<sub>6</sub>H<sub>6</sub> + AlCl<sub>3</sub> gives exclusively (44) (45) (46) (21) *ter*-butylbenzene (1:7460).]

$\bar{C}$  with Mg in dry ether in pres. of trace of MeI as cat. gives in 8 hrs. (98.9% yield (48))

corresp. isobutyl MgCl; the ethereal soln. of this RMgCl undergoes the usual reactns. (see also below).

- ③ Isovaleric acid (1:1050) q.v. [From isobutyl MgCl with  $\text{CO}_2$  followed by dil. non-volatile acid and subsequent distn. (49) (yield not reported).]
- ④ Isovaleranilide: m.p. 109–110° u.c. (50). [From isobutyl MgCl (above) with phenyl isocyanate in dry ether (50).] [Note that this derivative does not distinguish  $\bar{\text{C}}$  from isoamyl chloride (3:7365) or 2-chlorobutane (3:7125) q.v.]
- ⑤ Isovalero-*p*-toluidide: m.p. 106–107° u.c. (50). [From isobutyl MgCl (above) with *p*-tolyl isocyanate in dry ether (50).] [Note that this derivative does not distinguish  $\bar{\text{C}}$  from 3-chloropentane (3:7330) q.v., but that it is the best means of distinction from 2-chlorobutane (3:7125).]
- ⑥ Isovalero- $\alpha$ -naphthalide: m.p. 125–126° u.c. (50). [From isobutyl MgCl (above) with  $\alpha$ -naphthyl isocyanate in dry ether (50).] [Note that this derivative does not distinguish  $\bar{\text{C}}$  from 2-chlorobutane (3:7125) q.v.]
- Isobutyl mercuric chloride: unreported.
- *S*-(Isobutyl)isothiourea picrate: m.p. 174° (51). [This prod. has been reported from isobutyl bromide (or iodide) (but not from  $\bar{\text{C}}$ ) by htg. with thiourea in alc. for 2 min., followed by ndln. of alc.  $\text{KOH}$  (51).]
- *N*-(Isobutyl)phthalimide (1-(*N*-phthalimido)-2-methylpropane): lfts. from  $\text{CS}_2$ , m.p. 93° (53). [This prod. has been reported from isobutyl bromide with *K* phthalimide on htg. in s.t. at 210° for 3–4 hrs. (53).]
- *N*-(Isobutyl)-3-nitrophthalimide: unreported.
- *N*-(Isobutyl)tetrachlorophthalimide: unreported.
- *N*-(Isobutyl)-*N*-(*p*-bromobenzenesulfonyl)-*p*-aniside: cryst. from 75% alc., m.p. 78–79° (57). [From  $\bar{\text{C}}$  (?) or the corresp. isobutyl bromide with *N*-(*p*-bromobenzenesulfonyl)-*p*-anisidine in alc.  $\text{KOH}$  after 1 hr. refluxing (57).]
- *N*-(Isobutyl)-*o*-sulfobenzoic imide (*N*-(isobutyl)saccharin: m.p. 75.0° (55). [Not reported from  $\bar{\text{C}}$ , but obtd. from isobutyl bromide or iodide with sodium saccharin in aq. butylcarbitol (1:6517) on refluxing 30 min. (55).]
- *p*-(Isobutoxy)benzoic acid: m.p. 140–141° u.c. (56). [From  $\bar{\text{C}}$  with ethyl *p*-hydroxybenzoate (1:1534) in nbs. alc.  $\text{NaOEt}$  on refluxing 1 hr. (56).] [Note, however, that this prod. does not distinguish  $\bar{\text{C}}$  from isoamyl chloride (3:7365) for which the corresp. *p*-(isoamoxy)benzoic acid has m.p. 141–142° (56).]
- Isobutyl 2,4,6-tri-iodophenyl ether: m.p. 48.0° cor. (52). [This prod. has been obt. from isobutyl bromide (but not  $\bar{\text{C}}$ ) with 2,4,6-tri-iodophenol in alc.  $\text{NaOEt}$  (52).] [Note that it would not distinguish  $\bar{\text{C}}$  from 1-chloropentane (3:7460) or 1-chlorohexane (3:7935).]
- Isobutyl  $\alpha$ -naphthyl ether: b.p. 301.5° cor. (54). (Corresp. picrate, m.p. 104.5–105.5° cor. (54).)
- Isobutyl  $\beta$ -naphthyl ether: b.p. 204.5° cor. (54), m.p. 33.0–33.5° cor. (54). (Corresp. picrate, m.p. 84.0–85.0° cor. (54).)

### 3:7145 3-CHLORO-2-METHYLPROPENE-1

(Methallyl chloride;  
isobutenyl chloride;  
 $\beta$ -methylallyl chloride;  
 $\gamma$ -chloroisobutylene)

$\text{C}_4\text{H}_7\text{Cl}$  Beil. I - 209

I<sub>1</sub>—  
I<sub>2</sub>—

B.P. [73.74°	(1)]	$D_4^{20} = 0.9175$ (7)	$n_D^{20} = 1.4340$ (7)
71–74°	(2)		
72.2°	(3) (8)		
71.5–72.5°	(4) (5)		
70–71° (6) at 739 mm.	(7)		

[See also 1-chloro-2-methylpropene-1 (3:7120).]

Note that for  $\bar{C}$  the designation methallyl chloride is now preferred (3); great care should be used to avoid confusion of  $\bar{C}$  with the isomeric and very closely related 1-chloro-2-methylpropene-1 = isocrotyl chloride =  $\beta,\beta$ -dimethylvinyl chloride =  $\alpha$ -chloroisobutylene (3:7120); both these compounds are now commercial products in the U.S.A.

Commercial  $\bar{C}$  contains approx. 4% (10) of the isomeric  $\beta,\beta$ -dimethylvinyl chloride (3:7120); owing to the proximity of their boiling points the two isomers are extremely difficult to separate by distillation (8), but owing to the great reactivity of the halogen of  $\bar{C}$  (see amplification below) and the relative unreactivity of the halogen of  $\beta,\beta$ -dimethylvinyl chloride (3:7120) interference from the latter in *metathetical* reactions of comml.  $\bar{C}$  need not be expected.

[For prepn. of  $\bar{C}$  from 2-methylpropene-1 (isobutylene) with  $\text{Cl}_2$  see (3) (2) (5) (9) (other prods. are also formed); for formn. of  $\bar{C}$  as its equilibrium mixt. (10%  $\bar{C}$ ) with  $\beta,\beta$ -dimethylvinyl chloride (3:7120) by actn. of  $\text{H}_2\text{SO}_4$  on latter see (8).]

[For use of  $\bar{C}$  as insecticide see (11) (12); for toxicity studies on beetles see (13); for detn. of  $\bar{C}$  (when used as industrial fumigant) by reaction with ethanolamine in dioxane

(14) or by thermal decomposition (15) see *india. refs.*; for use of  $\bar{C}$  in prepn. of cellulose ethers see (16) (17).]

Reactions involving further substitution of H atoms in  $\bar{C}$ . [ $\bar{C}$  with  $Cl_2$  at room temp. (8) cf. (5) (9) or in pres. of  $NaHCO_3$  soln. at 0° (2) gives (70% yield (8)) a mixt. of approximately equal amounts of 1,3-dichloro-2-methylpropene-1 (3:5590) and 1-chloro-2-(chloromethyl)propene-2 (3:5633) (see also next paragraph).]

Reactions involving the double bond of  $\bar{C}$ . [ $\bar{C}$  with  $Cl_2$  (5) (42) or with  $SO_2Cl_2$  (42) also (see above) adds halogen to the unsaturated linkage yielding (5) (42) 1,2,3-trichloro-2-methylpropane (3:5710), b.p. 163.5–164° at 772 mm. (5).]

[ $\bar{C}$  with  $Br_2$ , however, gives chiefly (93% yield (8)) cf. (5) (9) the expected addition prod., 1-chloro-2,3-dibromo-2-methylpropane [Beil. I-12S], b.p. 57° at 5 mm.,  $D_4^{20} = 1.9168$ ,  $n_D^{20} = 1.5834$  (8).]

[ $\bar{C}$  adds  $HCl$  with considerable difficulty; e.g.,  $\bar{C}$  with equal vol. 12 *N*  $HCl$  at 3°, or  $\bar{C}$  at b.p. treated with  $HCl$  gas for 2 hrs., shows no reaction (3); however,  $\bar{C}$  with equal vol. 12 *N*  $HCl$  shaken for 1½ hrs. at 63° forms 30% of the expected 1,2-dichloro-2-methylpropane (3:7430). —  $\bar{C}$  with dry  $HBr$  gas readily reacts giving (97% yield (8)) 1-chloro-3-bromo-2-methylpropane, b.p. 49° at 15 mm.,  $D_4^{20} = 1.4830$ ,  $n_D^{20} = 1.4816$  (8) (note that this "abnormal" mode of addition of  $HBr$  is presumably attributable to the presence in  $\bar{C}$  of peroxidic material (8)).]

[ $\bar{C}$  with aq.  $HOCl$  below 5° (1) (7) cf. (8), or  $\bar{C}$  with  $Cl_2$ /aq. (8) (18) or even org. hypochlorites (18), gives by addn. of  $HOCl$  to unsatd. linkage 1,3-dichloro-2-methylpropanol-2 (3:5977). —  $\bar{C}$  with aq.  $HOBr$  (from  $Br_2/KBr$  in aq.) at room temp. for 4 hrs. gives 97.5% yield (1) 1-bromo-3-chloro-2-methylpropanol-2, b.p. 84–85° at 20 mm.,  $D_4^{20} = 1.7578$ ,  $n_D^{20} = 1.5171$  (1). —  $\bar{C}$  in ether with aq.  $HgO + I_2$  (HOI) at room temp. for 5–6 hrs. gives (15% yield (1)) 3-chloro-1-iodo-2-methylpropanol-2, b.p. 101–103° at 18 mm.,  $n_D^{20} = 1.547$  (1).]

[ $\bar{C}$  can also add hypochlorite esters; e.g.,  $\bar{C}$  with *ter*-BuOCl (3:7165) in  $MeOH +$  trace *p*-toluenesulfonic acid at 40° for 3–4 hrs. gives (35% yield (6))  $\beta,\beta$ -dichloro-*ter*-butyl methyl ether (1,3-dichloro-2-methoxy-2-methylpropane), b.p. 170° at 748 mm.,  $D_4^{20} = 1.1953$ ,  $n_D^{20} = 1.4595$  (6).]

[ $\bar{C}$  can also undergo cat. hydration of the double bond; e.g.,  $\bar{C}$ , although but slightly sol. in 80%  $H_2SO_4$  at 0°, grad. dissolves on stirring; and after the solution is poured onto ice and the liquid distilled (8) (19) 63% of the original  $\bar{C}$  can be recovered as  $\beta$ -chloro-*ter*-butyl alcohol (isobutylene chlorohydrin) (1-chloro-2-methylpropanol-2) (3:7752). Note that other acids can also be used for this hydration, e.g., 85%  $H_3PO_4$ , 70%  $HNO_3$ , 60%  $HClO_4$ , benzenesulfonic acid, etc., each having its own optimum conditions (8). Note also that in this reaction some 32% of the initial  $\bar{C}$  is not hydrated but is partially isomerized to a mixt. contg. 10%  $\bar{C}$  with 90%  $\beta,\beta$ -dimethylvinyl chloride (3:7120) (see also below) (8).]

[ $\bar{C}$  can also be rearranged to the isomeric isocrotyl chloride; e.g.,  $\bar{C}$  (10 moles) with 80%  $H_2SO_4$  (1 mole) stirred at 40° for 2½ hrs. gives an upper phase which conts. abt. 87% isocrotyl chloride + 7%  $\bar{C}$  + 6% dichlorides and polymers; after washing free from acid, drying, and distilling it yields 85%  $\beta,\beta$ -dimethylvinyl chloride (3:7120) (8) (20).]

[ $\bar{C}$  on sulfonation with dioxann sulfotrioxide in ethylene dichloride gives (21) a complex mixt. of prods.; about 40% of the  $SO_3$  adds to the unsatd. linkage giving a cyclic anhydride of the carboxyl sulfate type, the remainder substituting to yield the three isomeric mono-sulfonic acids of  $\bar{C}$ ; neither polymerization nor disulfonation takes place; for details the original paper (21) should be consulted.]

[For polymerization of  $\bar{C}$  in the pres. of peroxides see (22).]

[ $\bar{C}$  condensed with  $C_6H_6$  in pres. of anhydrous liq.  $HF$  at 0–10° for 20 hrs. as directed

gives (58% yield on CuCN (10)) (27) methallyl cyanide, b.p. 136.2–136.4°,  $D_4^{20} = 0.844$ ,  $n_D^{20} = 1.4202$  (10); note that use of NaCN gives a prod. of somewhat higher b.p., 138.0–139.5° (10), indicating pres. (by rearr.) of some  $\beta,\beta$ -dimethylacrylonitrile, b.p. 140–142°.]

$\bar{C}$  (1 mole) with conc. aq.  $NH_4OH$  (10 moles) at 90° under press. reacts completely within 2 minutes giving (10) (32) mixt. of 56% methallylamine, b.p. 78.8°,  $D_4^{20} = 0.782$ ,  $n_D^{20} = 1.431$  (10) ( $\bar{B}.HCl$ , m.p. 190–191° cor. (41));  $\bar{B}.P.KOH$ , m.p. 202–206° cor. (41)) + 26% di-(methallyl)amine, b.p. 148–149°,  $D_4^{20} = 0.799$ ,  $n_D^{20} = 1.446$  (10), + 8% tri-(methallyl)amine, b.p. 194–195° (32), 83–85° at 15 mm.,  $D_4^{20} = 0.8256$ ,  $n_D^{20} = 1.457$  (10), together with 5% tetra(methallyl)ammonium chloride;  $\bar{C}$  htd. with primary amines behaves in analogous fashion (10) (32).]

$\bar{C}$  with Mg in dry ether under very carefully regulated conditions (using large excess of Mg + ether and slow addn. of  $\bar{C}$ ) gives as high as 90% yield (10) corresp. methallyl  $MgCl$ ; this with acetaldehyde (1:0100) gives (65% yield (10)) the expected secondary alc. 4-methylpenten-4-ol-2, b.p. 129° (10); similarly  $\bar{C}$  with Mg + acetone (1:5400) in dry ether gives (59 mole % yield (10)) 2,4-dimethylpentene-4-ol-2, b.p. 126° (10) accompanied by (37 mole % yield (10)) of the coupling prod. di-methallyl (see next paragraph); note that this coupling reaction is very difficult to suppress.]

$\bar{C}$  with Mg in dry ether (10) (33), or with Na in dry ether (34), gives (yields: 90 mole % (10), 65% (33)) di-methallyl (2,5-dimethylhexadiene-1,5) [Beil. I-259,  $I_1$ -(122),  $I_2$ -(237)], b.p. 114.3° at 760 mm. (10) (33),  $D_4^{20} = 0.7487$  (10), 0.7423 (33),  $n_D^{20} = 1.4293$  (33). — Coupling of  $\bar{C}$  with other reactive alkenyl chlorides can also be effected: e.g.,  $\bar{C}$  with allyl chloride (3:7035) + Mg in dry ether gives (33) 47% yield 2-methylhexadiene-1,5 [Beil. I-257,  $I_1$ -(120)], b.p. 83.1° at 760 mm.,  $D_4^{20} = 0.7198$ ,  $n_D^{20} = 1.4184$  (33), + 30% di-methallyl (see above) + 12% hexadiene-1,5 (biallyl) (1:8045). — For analogous mixed couplings with 2-chloropentene-3 (piperylene hydrochloride) (3:7400) and with 4-chloro-2-methylbutene-2 (isoprene hydrochloride) (3:7465) see (36).]

$\bar{C}$  with  $NaNH_2$  in liq.  $NH_3$  gives (27% yield (35)) 2,5-dimethylhexatriene-1,3,5, b.p. 145° at 747 mm., 90.2° at 200 mm., m.p. -9°,  $n_D^{21} = 1.5150$  (35); note that an intermediate  $\alpha$ -chloro-2,5-dimethylhexadiene, b.p. 33–34° at 5 mm.,  $n_D^{20} = 1.4612$ , has been detected (35).]

$\bar{C}$  reacts normally with other  $RMgX$  compounds: e.g.,  $\bar{C}$  with  $MeMgBr$  in di-isopropyl ether (ord. ether boils too close to prod.) gives (10) 2-methylbutene-1 (1:8210);  $\bar{C}$  with  $n$ -BuMgCl gives (83 mole % yield (10)) (33) 2-methylheptene-1, b.p. 119.3° at 760 mm.,  $D_4^{20} = 0.7206$ ,  $n_D^{20} = 1.4123$  (33) (contaminated with 2-methylheptene-2 formed by rearr. of the former by the inevitable  $MgCl_2$  (33));  $\bar{C}$  with iso-AmMgCl gives (10) 2,6-dimethylheptene-1, b.p. 140–143° (10);  $\bar{C}$  with  $C_6H_5MgBr$  gives (10) methallylbenzene (2-methyl-1-phenylpropene-1), b.p. 175–176° (10).]

[For reactn. of  $\bar{C}$  with diethyl malonate (1:3581) and with various diethyl alkylmalonates see (37); for prepn. of methallyl substituted barbituric acids (37) (4) or thiobarbituric acids (38) see indic. refs.]

— Methallyl acetate [Beil. I-137,  $I_2$ -(150)]; b.p. 124° at 760 mm.,  $D_4^{20} = 0.9239$ ,  $n_D^{20} = 1.4129$  (39). [From  $\bar{C}$  + KOAc at 150° in s.t. (5) (9) cf. (10).] [For data on the formate, propionate, and  $n$ -butyrate see (39).]

— Methallyl benzoate: yel. odorless oil, b.p. 120° at 50 mm. (40). [Prepd. indirectly (40).]

— Methallyl  $p$ -nitrobenzoate: unreported.

— Methallyl 3,5-dinitrobenzoate: unreported.

⑦  $N$ -(Methallyl)phthalimide: white cryst. from MeOH, m.p. 88.5–90° cor. (41). [From  $\bar{C}$  + K phthalimide in s.t. at 150° for 3 hrs. (41).]

Note 1: For further data on b.p. at press. over range 565-760 mm. see (15).

Note 2:  $\hat{\text{C}}$  is very spar. sol. aq.; e.g., 0.066 wt. % at  $12^\circ$  (20).

Binary systems of  $\hat{\text{C}}$  with other org. cpds. For f.p./compn. data on mixts. of  $\hat{\text{C}}$  with *tert*-BuCl (3:7015) see (21); for partial vapor press. (17) or  $n_D^{20}$  (22) of mixts. of  $\hat{\text{C}}$  with *n*-heptane (1:5575) or *n*-BuBr see indic. refs.

$\bar{C}$  forms azeotropes with various other org. cpds.; e.g.,  $\bar{C}$  with MeOH (1:6120) forms a const.-boilg. mixt., b.p. 57.0° at 760 mm., contg. 73 wt. %  $\bar{C}$  (4);  $\bar{C}$  with EtOH (1:6130) forms a const.-boilg. mixt., b.p. 65.7° at 760 mm., contg. 79.7 wt. %  $\bar{C}$  (4);  $\bar{C}$  with *n*-PrOH (1:6150) forms a const.-boilg. mixt., b.p. 74.8° at 760 mm., contg. about 82 wt. %  $\bar{C}$  (4);  $\bar{C}$  with *iso*-PrOH (1:6135) forms a const.-boilg. mixt., b.p. 70.8° at 760 mm., contg. 77 wt. %  $\bar{C}$  (4);  $\bar{C}$  with isobutyl alc. (1:6165) forms a const.-boilg. mixt., b.p. 77.65° at 760 mm., contg. 96 wt. %  $\bar{C}$  (4);  $\bar{C}$  with EtOAc (1:2015) forms a const.-boilg. mixt., b.p. 75.5° at 760 mm., contg. 55 wt. %  $\bar{C}$  (23).

[For prepn. of  $\bar{C}$  from *n*-butyl alc. (1:6180) with dry HCl gas on protracted htg. (11) (13) (24) (25), with conc. aq. HCl + ZnCl<sub>2</sub> (2' moles) (yields: 76-78% (26) (27) (23), 66-72% (30), 64-66% (28), 65% (8)) (31), other metal salts (31) (32), or H<sub>3</sub>PO<sub>4</sub> (33); with PCl<sub>3</sub> + ZnCl<sub>2</sub> (60% yield (30)) (34) or PCl<sub>3</sub> + pyridine (for important study of mechanism see (35) (36)); with PCl<sub>3</sub> + ZnCl<sub>2</sub> (74% yield (30)) cf. (35) (36); with SOCl<sub>2</sub> + pyridine (71% yield (8)) (for important study of mechanism see (37) (36)) see indic. refs.]

[For formn. of  $\bar{C}$  from *n*-butyl HSO<sub>4</sub> with HCl (25); from *n*-butyl MgBr with *p*-toluenesulfonyl chloride (8.7% yield (38)); from *n*-butyl *p*-toluenesulfonate as by-prod. of its reactn. with benzyl MgCl in prepn. of *n*-amylbenzene (39) cf. (40) (41); from *n*-butyl iodide with HgCl<sub>2</sub> in a.t. at 120-120° for 2 hrs. (10); from *n*-butylamine with HNO<sub>2</sub> (5.2%  $\bar{C}$  accompanied by 36.5% butenes + 25% butanol-1 + 13.2% butanol-2 + 2.8% 2-chlorobutane (42)); from *n*-butane with Cl<sub>2</sub> at 400-475° (together with other prods. (3)) see indic. refs.]

[For use as denaturant for alc. see (43) (for detn. of  $\bar{C}$  in denatured alc. see (4)); for use in removal of water from volatile fatty acids see (45); for study of anthelmintic props. see (46).]

Pyrolysis of  $\bar{C}$ . [ $\bar{C}$  at 450-650° without catalyst loses HCl and yields exclusively butene-1 (3) (47); however,  $\bar{C}$  passed at 450° over CaCl<sub>2</sub> cat. gives mixt. contg. 20% butene-1 + 80% *cis* + *trans* isomers of butene-2 (3) (47) (for influence of other cat. cf. (45) (49)).]

Further halogenation of  $\bar{C}$ . [ $\bar{C}$  with Cl<sub>2</sub> under various conditions (50) (51) (52) (53) (54) (5) gives a mixt. of 1,1-dichlorobutane (3:7350), 1,2-dichlorobutane (3:7650), 1,3-dichlorobutane (3:7925), and 1,4-dichlorobutane (3:5835) (together with higher chlorination prods.); note that the chlorination is facilitated by peroxides or by light but inhibited by O<sub>2</sub> (e.g.,  $\bar{C}$  with Cl<sub>2</sub> in absence of air at 0° in dark reacts 7% in 20 hrs. but in pres. of 2 mole % ascaridole 85% in same time or in light 100% in 1 min.; in pres. of 2% O<sub>2</sub> in dark no reactn. occurs in 96 hrs. (18). —  $\bar{C}$  (2.5 moles) with SO<sub>2</sub>Cl<sub>2</sub> (1 mole) + trace dibenzoyl peroxide 3 hrs. under reflux in the dark gives (55) mixt. contg. 25% 1,2-dichlorobutane (3:7680) + 50% 1,3-dichlorobutane (3:7925) + 25% 1,4-dichlorobutane (3:5835). —  $\bar{C}$  (1 mole) with SbCl<sub>5</sub> (1 mole) gives on warming (56) 2,3-dichlorobutane (3:7615).]

$\bar{C}$  with Br<sub>2</sub> in pres. of Fe gives (57) 1,2-dibromobutane [Beil. I-120, I<sub>2</sub>-(83)], b.p. 166°.

Reactions of the halogen atom of  $\bar{C}$ . Note that in  $\bar{C}$  the chlorine atom is much less reactive than that of *sec*-butyl chloride (3:7125) or *ter*-butyl chloride (3:7045).

[For study of hydrolysis of  $\bar{C}$  in pres. and abs. of acid see (53).]

[For study of rate of reactn. of  $\bar{C}$  with LiI, NaI, or KI in acetone see (59) (60).]

[For study of rate of reactn. of  $\bar{C}$  with Na *n*-propylate see (61).]

[ $\bar{C}$  with aniline as directed yields (62) *N*-(*n*-butyl)aniline and/or *N,N*-di-(*n*-butyl)aniline; for analogous study of  $\bar{C}$  with *N*-methylaniline (63), *N*-ethylaniline (63), *o*-toluidine (64), *p*-toluidine (64), *unsym.-m*-xylylidine (65) see indic. refs.]

[ $\bar{C}$  with C<sub>6</sub>H<sub>6</sub> + AlCl<sub>3</sub> gives (66) *sec*-butylbenzene (1:7490) (note isomerization of carbon chain) (for comparison of reactivity of  $\bar{C}$  with other *n*-butyl halides see (67));  $\bar{C}$  with C<sub>6</sub>H<sub>6</sub> + Al/Hg gives both (68) *sec*-butylbenzene (1:7490) and *n*-butylbenzene

(1:7515). —  $\bar{C}$  with toluene +  $AlCl_3$  gives (45% yield (69) of a mixt. of both *m*- and *p*-*sec*-butyltoluenes.]

[ $\bar{C}$  with  $C_6H_6$  in dry liq.  $HCl$  at  $195^\circ$  under press. gives (70) 30% yield *sec*-butylbenzene (1:7490) + 50% di-(*sec*-butyl)benzene; for analogous behavior of  $\bar{C}$  with toluene see (70).]

[ $\bar{C}$  with  $CO$  +  $AlCl_3$  or similar cat. under press. yields (71) acids and ketones.]

Reaction of  $\bar{C}$  to form organometallic cpds. [ $\bar{C}$  with metallic  $Li$  in dry ether under  $N_2$  gives (yields: 75–80% (72), 77% (73), 70–75% (74)) *n*-butyllithium (for study of rate of formn. of *n*-BuLi as compared with *n*-BuBr,  $C_6H_5Br$ ,  $C_6H_5I$  see (85)); this prod. with dry  $CO_2$  in ether at  $0^\circ$  gives (45% yield (75)) di-*n*-butyl ketone (1:5493) or with  $CO_2$  in  $C_6H_6$  at room temp. also (75) tri-*n*-butylcarbinol; for study of relative reactivity of *n*-BuLi as compared with *n*-BuMgBr,  $C_6H_5MgBr$ , etc., see (76); note, however, that full chemistry of *n*-BuLi cannot be discussed here.]

[ $\bar{C}$  with metallic  $Na$  in pet. ether yields (77) *n*-butylsodium; on carbonatioo with  $CO_2$  this prod. gives (77) (78) (79) (80) both *n*-valeric acid (1:1060) and *n*-propylmalonic acid; for study of reactn. of *n*-BuNa with  $C_6H_6$  see (77); note, however, that full chemistry of *n*-BuNa cannot be covered here.]

$\bar{C}$  with  $Mg$  in dry ether gives (yields: 98.5% (81), 91.2% (82) (83), 85% (84)) *n*-BuMgCl; for studies on rate of formn. of *n*-BuMgCl (as compared with  $C_6H_5MgBr$ , or with other *n*-Bu halides, etc.) (85), on effect of rapid addn. of  $\bar{C}$  on yield (83), on effect of concentration of  $\bar{C}$  (84) see indic. refs.; for study of equilibrium composition of ether solns. of *n*-BuMgCl see (86) (87); for study of competitive reaction of mixts. of  $\bar{C}$  with *n*-BuBr and with *n*-BuI in formn. of  $RMgX$  see (88). — For certain important reactions of *n*-BuMgCl see below but note that full chemistry of this cpd. cannot be included here.

[ $\bar{C}$  with  $Mg$  + trace of  $I_2$  but without solvent at  $79$ – $82^\circ$  for 3 hrs. gives (10% yield (89)) *n*-octaoe (1:8655);  $\bar{C}$  +  $Mg$  +  $I_2$  in toluene in similar fashion gives (6% yield (89)) *p*-(*n*-butyl)toluene.]

Ⓐ *n*-Valeric acid (1:1060) q.v. [From  $\bar{C}$  by coconversion to *n*-BuMgCl (see above) and carbonatioo with  $CO_2$  (yields: 72–73% (90), 80% (91)) (note that this prod. may be accompanied by more or less di-*n*-butyl ketone (1:5493) and tri-*n*-butylcarbinol (91)), or by coconversion of  $\bar{C}$  with  $KCN$  to *n*-valeronitrile and hydrolysis of the latter with 67%  $H_2SO_4$  (92) (92).]

Ⓑ *n*-Valeramide: m.p.  $62$ – $63^\circ$  u.c. (93),  $63^\circ$  cor. (94). [From  $\bar{C}$  by conversion to *n*-BuMgCl (see above) and reactn. in dry ether with phenyl isocyanate (93) (42) cf. (93).]

Ⓒ *n*-Valero-*p*-toluidide: m.p.  $72$ – $73^\circ$  u.c. (93). [From  $\bar{C}$  by coconversion to *n*-BuMgCl (see above) and reactn. in dry ether with *p*-tolyl isocyanate (93).] — [Note that this derivative does not afford good distinction from *n*-amyl chloride (3:7460) for which the corresp. *n*-capro-*p*-toluidide has m.p.  $74$ – $75^\circ$  u.c. (93).]

Ⓓ *n*-Valero- $\alpha$ -naphthalide: m.p.  $109$ – $110^\circ$  u.c. (93). [From  $\bar{C}$  by conversion to *n*-BuMgCl (see above) and reactn. in dry ether with  $\alpha$ -naphthyl isocyanate (93).] — [Note that this derivative does not afford good distinction from isoamyl chloride (3:7365) for which the corresp. isocaproic  $\alpha$ -naphthalide has m.p.  $110$ – $111^\circ$  u.c. (93).]

— *n*-Butyl mercuric chloride (*n*-BuHgCl): m.p.  $130^\circ$  cor. (95),  $129^\circ$  (96),  $127.5^\circ$  (98),  $126^\circ$  (96),  $125.5^\circ$  (97),  $125^\circ$  (99). [Prepd. indirectly but should be easily preparable from *n*-BuMgCl +  $HgCl_2$  cf. (98), since it has been similarly prepd. from *n*-BuMgBr (95).]

Ⓔ *S*-(*n*-Butyl)isothioureia picrate: m.p.  $177^\circ$  (100). [From  $\bar{C}$  (1 g.) with thiourea (1 g.) in alc. (10 ml.) on refluxing for 2 hrs., then adding  $PhOH$  (1 g.), htg. until a clear soln. results, then cooling (100).] — [Note that this derivative does not dis-

tinguish  $\bar{C}$  from *n*-propyl chloride (3:7049) for which the corresp. *S*-(*n*-propyl)-isothiourac picrate has m.p. 175° (109), nor from isocamyl chloride (3:7365) for which the corresp. *S*-(isocamyl)-isothiourac picrate has m.p. 173° (103).]

— *N*-(*n*-Butyl)-phthalimide (1-(*N*-phthalimido)butane): cryst. from dil.  $\text{AcOH}$ , m.p. 34° (101), b.p. 311.5° cor. at 738 mm. (102). [Prepd. indirectly from *n*-butylamine (101) (102); direct prepn., e.g., from  $\bar{C} + \text{K phthalimide}$  in pres. of  $\text{KI}$  never reported and m.p. too low to serve as good derivative.]

⑥ *N*-(*n*-Butyl)-3-nitrophthalimide: pr. from  $\text{CS}_2$ , m.p. 71–72° (103). [From  $\bar{C}$  with  $\text{K 3-nitrophthalimide}$  on refluxing for 10 hrs. (103); for photographs of crystals see (104).]

⑦ *N*-(*n*-Butyl)-tetrachlorophthalimide: pl. from alc., m.p. 153–154° (105). [From  $\bar{C}$  with  $\text{K tetrachlorophthalimide}$  by hfg. at 200° for 10 hrs. (105).]

⑧ *N*-(*n*-Butyl)-saccharin: cryst. from dil. alc., m.p. 38° (106). [From  $\bar{C}$  with sodium saccharin in aq. butylcarbitol (1:6317) contg.  $\text{KI}$  on refluxing for 30 min. (106).]

— *N*-(*n*-Butyl)-*N*-(*p*-bromobenzenesulfonyl)-*p*-aniside: cryst. from 75% alc., m.p. 74.5° u.c. (107). [This prod. has not been reported from  $\bar{C}$  but has been obt. from *n*-BuBr with *N*-(*p*-bromobenzenesulfonyl)-*p*-aniside in alc.  $\text{KOH}$  after 1 hr. reflux (107).]

— *p*-(*n*-Butoxy)benzoic acid: m.p. 147–148° (108), changing to a cloudy viscous liq. clearing sharply at 160° (108) cf. (109). [From  $\bar{C}$  with ethyl *p*-hydroxybenzoate (1:1534) in abs. alc.  $\text{NaOEt}$  on refluxing 1 hr. (108)]. — [Note, however, that this prod. does not distinguish  $\bar{C}$  from *n*-propyl chloride for which the corresp. *p*-(*n*-propoxy)benzoic acid has m.p. 143.5–147°; the two prods. do, of course, have slightly different Neut. Eqs.]

— *n*-Butyl 2,4,6-triiodophenyl ether: m.p. 66° cor. (110). [This prod. has not been reported for  $\bar{C}$  itself but has been obt. from *n*-BuBr with 2,4,6-triiodobenzol in abs. alc.  $\text{NaOEt}$  on refluxing for 30 min. (110).]

— *n*-Butyl  $\alpha$ -naphthyl ether: b.p. 308.5° cor. (111), 310° (112) (corresp. picrate, m.p. 83.0° cor., Neut. Eq. 429 (111)).

— *n*-Butyl  $\beta$ -naphthyl ether: b.p. 309.0° cor. (111), 311° (112); m.p. 53.0–53.5° (111) (corresp. picrate, m.p. 67.0–67.5° cor. (111), 67° (115)).

3:7165 *ter*-BUTYL HYPOCHLORITE  $(\text{CH}_3)_3\text{C}-\text{OCl}$   $\text{C}_4\text{H}_9\text{OCl}$  Beil. I —  
 (Trimethylcarbinyl hypochlorite) I —  
 I<sub>2</sub>-(415)

B.P. 79.6° at 750 mm. (1)  
 77-79° (16)

$D_4^{25} = 0.0583$  (1)

Pale yellow mobile liquid with characteristic irritating odor. —  $\dot{\text{C}}$  violently attacks the eyes and mucous membranes. —  $\dot{\text{C}}$  is relatively stable and if protected from bright light can be kept at ordinary temp. for months with little or no decomposition (1).  $\dot{\text{C}}$  should, however, be handled with care since it is particularly susceptible to photochemical decomposition which may occur with explosive violence (2).

[For prepn. of  $\dot{\text{C}}$  from *ter*-butyl alcohol (1:6140) +  $\text{Cl}_2$  + alk. in pract. quant. yield see (1) (2) (3), 60% yield (16); from *ter*-butyl alc. (1:6140) +  $\text{HOCl}$  in  $\text{CCl}_4$  see (15); for manufacture of  $\dot{\text{C}}$  see (4).] [For use in bleaching of textiles, fruits, etc., see (5) (6) (7).]

[For general survey of reactns. of  $\dot{\text{C}}$  see (8); for study of reactns. of  $\dot{\text{C}}$  with olefins (2) (13) (16) (17) (18) or olefins contg. activating groups (9) (10), with group  $\text{R}_2\text{C}=\text{N.MgX}$  (3); or with Schiff's bases (11) (12) see indic. refs.; for study of  $\dot{\text{C}}$  in Friedel-Crafts reactn. see (14).]

$\dot{\text{C}}$  on sufficient htg. or on exposure to bright sunlight yields (1) acetone (1:5400) + methyl chloride (3:7005). — [For data on stability of  $\dot{\text{C}}$  in aq. or in  $\text{CCl}_4$  see (15).]

$\dot{\text{C}}$  with aq. KI acidified with  $\text{AcOH}$  yields  $\text{I}_2$  (use in detn. of  $\dot{\text{C}}$  (1)).

 78.3° (6)  
 77.8-78.3° at 723.7 mm. (7)  $D_4^{25} = 1.0646$  (7)  $n_D^{25} = 1.4057$  (7)  
 77-78.5° (8) 1.0565 (5) 1.4038 (5)

[For prepn. of  $\dot{\text{C}}$  from propionic acid (1:1025) with  $\text{PCl}_5$  (77% yield (11)), with  $\text{PCl}_5$  (yields: 67.5% (12), 61% (13), 46% (14)) (15) (16) (note that excess  $\text{PCl}_5$  may not be

used since its b.p.,  $76^\circ$ , is too close to that of  $\bar{C}$  for subsequent sepn.), with  $\text{PCl}_5 + \text{ZnCl}_2$  (91% yield (11)), with  $\text{SOCl}_2$  (4) (note that excess  $\text{SOCl}_2$  may not be used since its b.p.,  $79^\circ$ , is almost identical with that of  $\bar{C}$ ), with benzoyl chloride (3:6240) (yield 84-89% (8)) (17), with sodium chlorosulfonate (18), with benzenesulfonyl chloride +  $\text{NaCl}$  (18), with  $\text{Cl}_2 + \text{S}_2\text{Cl}_2$  in cold (37% yield (19)), with  $\text{SiCl}_4$  in xylene at  $50^\circ$  (50% yield (20)), or with acetonitrile +  $\text{HCl}$  gas at  $0^\circ$  (21) see indie. refs., for prepn. of  $\bar{C}$  from propionic anhydride (1:1100) with phosgene (3:5000) + cat. as directed see (22).]

[ $\bar{C}$  with  $\text{Cl}_2$  (67) or  $\text{CCl}_4$  in sunlight (15) at  $0^\circ$  (23) or in dark at  $40^\circ$  (24) or  $\bar{C}$  with  $\text{SO}_2\text{Cl}_2$  in  $\text{CCl}_4$  in pres. of dibenzoyl peroxide refluxed 4-6 hrs. in dark (25) gives a mixt. contg. mainly  $\beta$ -chloropropionyl chloride (3:5690) accompanied also by  $\alpha$ -chloropropionyl chloride (3:5320) yield: 60%  $\beta$  isomer + 40%  $\alpha$  isomer (25)], note that in the pres. of  $\text{I}_2$  instead of dibenzoyl peroxide only  $\alpha$ -chloropropionyl chloride (3:5320) (45% yield (26)) is produced (25)].

[ $\bar{C}$  with  $\text{Br}_2$  (1 mole) at  $80^\circ$  evolves  $\text{HCl}$  and gives (100% yield (12)) (27) (28)  $\alpha$ -bromopropionyl bromide [Beil. II-256, II<sub>2</sub>-(230)], b.p.  $153-155^\circ$  (12); the reaction is accelerated by light, but the photobromination is retarded by  $\text{O}_2$  (29).]

[ $\bar{C}$  with  $\text{Na}$  propionate on hfg. (14) (30) or  $\bar{C}$  with  $\text{Ag}$  propionate on distn. (31) gives (80% yield (31)) propionic anhydride (1:1100).]

[ $\bar{C}$  passed over heated  $\text{Ni}$  cat. decomposes (32) into ethylene,  $\text{HCl}$  +  $\text{CO}$ , accompanied by smaller amts. methane, hydrogen, and  $\text{CO}_2$ . —  $\bar{C}$  with  $\text{Na}$  in abs. ether is claimed (33) to yield the dipropionate of hexen-3-diol-3,4 [Beil. II-242], b.p.  $108-109^\circ$  at 10 mm. (33).]

[ $\bar{C}$  with *tert*-butyl  $\text{MgBr}$  in dry ether yields (34) not only the expected coupling product *tert*-butyl methyl ketone (pinacolone) (1:5425) but also diethyl ketone (1:5420), propanol-1 (1:6150), and propionic acid (1:1025) accompanied by the propionates of *tert*-butyl-ethyl-carbinol (2,2-dimethylpentanol-3) [Beil. I<sub>1</sub>-(207), I<sub>2</sub>-(446)] and of diethylcarbinol (pentanol-3) (1:6175) (reduction products). —  $\bar{C}$  with  $\text{C}_6\text{H}_5\text{MgBr}$  in ether gives (57% yield (35)) diphenyl-ethyl-carbinol [Beil. VI-687, VI<sub>1</sub>-(331)], m.p.  $95^\circ$ , but  $\bar{C}$  with  $\text{C}_6\text{H}_5\text{MgBr}$  with  $\text{CdCl}_2$  in ether gives (76% yield (36)) ethyl phenyl ketone (propiophenone) (1:5525).]

[ $\bar{C}$  + 2,5-dimethylpyrrole *N*-magnesium bromide in dry ether gives (by rearr.) (37) 3-propionyl-2,5-dimethylpyrrole, colorless cryst. from  $\text{AcOH}$ , m.p.  $102.5^\circ$  (37);  $\bar{C}$  with benzimidazolyl *N*-magnesium bromide in dry ether yields (38) (39) *N*-(propionyl)benzimidazole, m.p.  $125^\circ$  (38) (39) (corresp. picrate, m.p.  $225^\circ$  (38) (39)).]

[ $\bar{C}$  + ethyl acetoacetate +  $\text{Mg}$  in  $\text{C}_6\text{H}_6$  refluxed 2 hrs., treated with aq. gives (36% yield (40)) ethyl  $\alpha$ -propionylacetoacetate, b.p.  $104-106^\circ$  at 12 mm. (40) (isolated as  $\text{Cu}$  enolate, m.p.  $78-79^\circ$ , blue ndlx. from  $\text{MeOH}/\text{aq}$ , violet ndlx. from pet. ether (40)).]

[ $\bar{C}$  with  $\text{FeCl}_3$  (1 mole) on warming evolves  $\text{HCl}$  and gives a prod. which with aq. gives (31% yield (41)) (42) diethyl ketone (1:5420) +  $\text{CO}_2$ , or with alc. yields (43) ethyl  $\alpha$ -propionylpropionate [Beil. III-686, III<sub>2</sub>-(436).]

[ $\bar{C}$  with equal wt.  $\text{ClSO}_3\text{H}$  stood at room temp. 5-10 days, poured into aq. (44), or  $\bar{C}$  with tripropylamine in 1gr. (45) gives (cf. (42)) in small yield 3,5-dimethyl-2-ethyl-6-hydroxypyron-4 [Beil. XVII-453], cryst. from aq. or  $\text{AcOH}$ , m.p.  $151^\circ$  (45).]

[ $\bar{C}$  with olefins or cyclo-olefins (cycloenes) in pres. of cat. adds to unsatn. yielding chloroketones; e.g.,  $\bar{C}$  with ethylene +  $\text{AlCl}_3$  at  $0^\circ$  gives (50% yield (46)) (47)  $\beta$ -chloroethyl ketone (1-chloropentanone-3) (3:9265),  $\bar{C}$  with trimethylethylene (2-methylbutene-2) (1:8220) +  $\text{SnCl}_4$  gives (57% yield (48)) 2-chloro-2,3-dimethylhexanone-4, b.p.  $74-78^\circ$  at 17 mm.,  $D_4^{20} = 0.975$  (48) (note that this prod. on hfg. with dimethylaniline loses  $\text{HCl}$  giving (60% yield (49)) of a mixt. of 2,3-dimethylhexen-2-one-4, b.p.  $164-166^\circ$  at 750 mm.,  $D_4^{20} = 0.872$ ,  $n_D^{20} = 1.4537$  (semicarbazone, m.p.  $209^\circ$  (48)) and 2,3-dimethylhexen-1-one-4, b.p.  $135-162^\circ$  at 750 mm.,  $D_4^{20} = 0.862$ ,  $n_D^{20} = 1.4450$  (semicarbazone, m.p.  $105-110^\circ$  (48));  $\bar{C}$  with cyclohexene (1:8070) +  $\text{SnCl}_4$  gives a prod. which with dimethylaniline loses  $\text{HCl}$

to cyclohexen-1-yl ethyl ketone, b.p. 60° at 10 mm.,  $D_4^{25} = 0.981$ ,  $n_D^{25} = 1.6005$  (oxime, m.p. 79°, semicarbazone, m.p. 195° (40)). — Note, however, that addn. of  $\bar{C}$  to certain types of olefins is followed by spontaneous loss of HCl so that the unsatd. ketone forms the direct product; e.g.,  $\bar{C}$  with isobutylene (2-methylpropene-1) +  $\text{SnCl}_4$  gives (30% yield (48)) 2-methylhexen-2-one-4, b.p. 147–148° at 760 mm.,  $D_4^{25} = 0.859$ ,  $n_D^{25} = 1.4496$  (48) (semicarbazone, m.p. 163° (48)).]

[ $\bar{C}$  with aromatic hydrocarbons + cat. evolves HCl yielding corresp. ketones: e.g.,  $\bar{C}$  with  $\text{C}_6\text{H}_6$  +  $\text{AlCl}_3$  in  $\text{CS}_2$  gives (84% yield (19)) (50) ethyl phenyl ketone (propiophenone) (1:5525);  $\bar{C}$  with toluene (1:7405) +  $\text{AlCl}_3$  in  $\text{CS}_2$  gives (yields: 60% (51), 50% (52)) (53) ethyl *p*-tolyl ketone [Beil. VII-317, VII<sub>1</sub>-(170)], b.p. 238–239°; for analogous reactions of  $\bar{C}$  with *o*-xylene (1:7430) (54), 2-methylnaphthalene (1:7605) (55), anthracene (1:7235) (56), phenanthrene (1:7240) (57), or acenaphthene (1:7225) (58) see indie. refs.; for analogous reactions of  $\bar{C}$  with heterocyclic systems, e.g.,  $\bar{C}$  + 2-nitrofurran +  $\text{TiCl}_4$  (59) or  $\bar{C}$  + thiophene +  $\text{P}_2\text{O}_5$  at 210° for 10–12 hrs. (60), see indie. refs.]

[ $\bar{C}$  with alcs. reacts normally yielding corresp. esters: e.g.,  $\bar{C}$  with MeOH yields methyl propionate (1:3020),  $\bar{C}$  with EtOH yields ethyl propionate (1:3070), etc.; for use of Mg in reaction of  $\bar{C}$  with tertiary alcs., e.g.,  $\bar{C}$  + *ter*-butyl alc. (1:6140) + Mg giving (68% yield (61)) *ter*-butyl propionate, b.p. 115–116.5° (61), or  $\bar{C}$  + *ter*-amyl alc. (1:6160) + Mg giving (75% yield (61)) *ter*-amyl propionate, b.p. 153–156° at 710 mm. (61), see indie. refs.]

[ $\bar{C}$  with phenols gives the corresp. phenol esters: e.g.,  $\bar{C}$  with phenol gives (62) phenyl propionate (1:3696), etc.; note, however, that these phenol esters on htg. with  $\text{AlCl}_3$  in appropriate solvents, especially nitrobenzene, undergo the Fries rearr. yielding *o*- and *p*-propiophenols; this complete sequence is often carried through without isolation of the intermediate ester, e.g., for  $\bar{C}$  + phenol +  $\text{AlCl}_3$  giving directly *o*-hydroxypropiophenone [Beil. VIII-102, VIII<sub>1</sub>-(547)] (50% yield) and *p*-hydroxypropiophenone [Beil. VIII-102 (25% yield) see (63); for key refs. on direct rearr. of phenyl propionate to these products see (64) (65); scores of analogous cases with other phenols or their ethers cannot be included here.]

[ $\bar{C}$  with certain hydroxy-azo-compounds in dry ether yields addn. cpds. usually (but not always) of 1:1 type: e.g.,  $\bar{C}$  with *p*-hydroxy-azobenzene [Beil. XVI-96, XVI<sub>1</sub>-(233)], m.p. 152°, in dry ether on stdg. at room temp. ppts. 1:1 cpd., m.p. 162° (66); for numerous analogous cases using homologous hydroxy-azo cpds. see (66).]

$\bar{C}$  hydrolyzes with aq. yielding propionic acid (1:1025); for the amide, anilide, *p*-toluidide, and other derivs. corresp. to  $\bar{C}$  see under propionic acid (1:1025).

**3:7175 1-CHLOROBUTYNE-2**  $\text{CH}_3\text{—C}\equiv\text{C—CH}_2\text{Cl}$   $\text{C}_4\text{H}_5\text{Cl}$  **Beil. S.N. 12**  
 ( $\gamma$ -Methylpropargyl chloride)

**B.P. 81-84° (1)**

Pale yel. oil.

[For prepn. of  $\bar{C}$  (44% yield) from butyn-2-ol-1 +  $\text{PCl}_5$  in ether see (1).]

$\bar{C}$  in ether/acetone soln. on treatment with  $\text{K}_2\text{CO}_3$  + phenol gives (57% yield)  $\gamma$ -methylpropargyl phenyl ether, b.p. 123-126° at 25 mm.,  $n_D^{20} = 1.3894$  (1).

**3:7175 (1)** Hurd, Cohen, *J. Am. Chem. Soc.* 53, 1074-1075 (1931).

**3:7195 CHLOROMETHYLETHYL ETHER**  $\text{C}_2\text{H}_5\text{OCl}$  **Beil. I - 581**  
 $\text{ClCH}_2\text{O.C}_2\text{H}_5$  **I<sub>1</sub>-(304)**  
**I<sub>2</sub>-(645)**

B.P. 83° at 763.1 mm. (1)	$D_4^{20} = 1.0263$ (3)	$n_D^{20} = 1.40308$ (1)
82° (2)	1.0127 (1)	
81-82° (3)	$D_4^{15} = 1.0188$ (1)	$n_D^{12} = 1.0282$ (3) (7)
80° (4)		
79-80° (5) (6)		

$\bar{C}$  undergoes some decompn. at b.p.

[For prepn from ethyl alc. (1:6130) + trioxymethylene (1:0050) + dry  $\text{HCl}$  see (3) (1); from ethyl alc. + formalin +  $\text{HCl}$  (42-41% yield (6)) see (6).]

$\bar{C}$  on shaking with aq. readily hydrolyzes yielding formaldehyde (1:0145), ethyl alc. (1:6130), +  $\text{HCl}$ .

to cyclohexen-1-yl ethyl ketone, b.p. 90° at 10 mm.,  $D_4^{15.5} = 0.881$ ,  $n_D^{15.5} = 1.5005$  (crime, m.p. 79°, semicarbazone, m.p. 195° (49)). — Note, however, that addn. of  $\bar{C}$  to certain types of olefins is followed by spontaneous loss of HCl so that the unsatd. ketone forms the direct product; e.g.,  $\bar{C}$  with isobutylene (2-methylpropene-1) +  $\text{SnCl}_4$  gives (50% yield (48)) 2-methylhexen-2-one-4, b.p. 147–148° at 760 mm.,  $D_4^{15} = 0.839$ ,  $n_D^{15} = 1.4496$  (48) (semicarbazone, m.p. 163° (48)).]

[ $\bar{C}$  with aromatic hydrocarbons + cat. evolves HCl yielding corresp. ketones: e.g.,  $\bar{C}$  with  $\text{C}_6\text{H}_6$  +  $\text{AlCl}_3$  in  $\text{CS}_2$  gives (84% yield (19)) (50) ethyl phenyl ketone (propiophenone) (1:5525);  $\bar{C}$  with toluene (1:7405) +  $\text{AlCl}_3$  in  $\text{CS}_2$  gives (yields: 60% (51), 50% (52)) (53) ethyl p-tolyl ketone [Beil. VII-317, VII<sub>r</sub>-(170)], b.p. 238–239°; for analogous reactions of  $\bar{C}$  with o-xylene (1:7430) (54), 2-methylnaphthalene (1:7605) (55), anthracene (1:7233) (56), phenanthrene (1:7240) (57), or acenaphthene (1:7225) (58) see indic. refs.; for analogous reactions of  $\bar{C}$  with heterocyclic systems, e.g.,  $\bar{C}$  + 2-nitrofurran +  $\text{TiCl}_4$  (59) or  $\bar{C}$  + thiophene +  $\text{P}_2\text{O}_5$  at 210° for 10–12 hrs. (60), see indic. refs.]

[ $\bar{C}$  with alic. reacts normally yielding corresp. esters: e.g.,  $\bar{C}$  with MeOH yields methyl propionate (1:3020),  $\bar{C}$  with EtOH yields ethyl propionate (1:3070), etc.; for use of Mg in reaction of  $\bar{C}$  with tertiary alic., e.g.,  $\bar{C}$  + *tert*-butyl alc. (1:6140) + Mg giving (63% yield (61)) *tert*-butyl propionate, b.p. 115–116.5° (61), or  $\bar{C}$  + *tert*-amyl alc. (1:6160) + Mg giving (75% yield (61)) *tert*-amyl propionate, b.p. 153–156° at 710 mm. (61), see indic. refs.]

[ $\bar{C}$  with phenols gives the corresp. phenol esters: e.g.,  $\bar{C}$  with phenol gives (62) phenyl propionate (1:3096), etc.; note, however, that these phenol esters on htg. with  $\text{AlCl}_3$  in appropriate solvents, especially nitrobenzene, undergo the Fries rearr. yielding o- and p-propiophenols; this complete sequence is often carried through without isolation of the intermediate ester, e.g., for  $\bar{C}$  + phenol +  $\text{AlCl}_3$  giving directly o-hydroxypropiophenone [Beil. VIII-102, VIII<sub>r</sub>-(547)] (50% yield) and p-hydroxypropiophenone [Beil. VIII-102 (25% yield) see (63); for key refs. on direct rearr. of phenyl propionate to these products see (64) (65); scores of analogous cases with other phenols or their ethers cannot be included here.]

[ $\bar{C}$  with certain hydroxy-aro-compounds in dry ether yields addn. cpds. usually (but not always) of 1:1 type: e.g.,  $\bar{C}$  with p-hydroxy-arobenzene [Beil. XVI-96, XVI<sub>r</sub>-(233)], m.p. 152°, in dry ether on stdg. at room temp. ppts. 1:1 cpd., m.p. 162° (66); for numerous analogous cases using homologous hydroxy-aro cpds. see (66).]

$\bar{C}$  hydrolyzes with aq. yielding propionic acid (1:1025); for the amide, anilide, p-toluidide, and other derivs. corresp. to  $\bar{C}$  see under propionic acid (1:1025).

43.7-44.0°	at 177 mm. (5)			
-2°	at 18 mm. (6)			

Because of the close interrelationship of  $\tilde{\text{C}}$  with the isomeric 3-chlorobutene-1 (3:7090) some confusion exists regarding the nomenclature. The compound here described (1-chlorobutene-2) is by some authors designated as crotyl chloride; this name, however, is better reserved for the equilibrium mixture of 1-chlorobutene-2 and 3-chlorobutene-1 as indicated by (7).

Pure  $\tilde{\text{C}}$  (in the absence of catalysts) is quite stable (1) and may be kept at room temperature as long as a year (5) without significant increase in  $n_D^{20}$ . However, in the presence of  $\text{FeCl}_3$ ,  $\text{HCl}$ , or  $\text{CuCl}_2 + \text{HCl}$ ,  $\tilde{\text{C}}$  is in part isomerized to 3-chlorobutene-1 and an equilibrium mixt. is formed. The composition of this equilibrium mixt. depends upon the temperature, catalyst, and other factors. E.g., with  $\text{FeCl}_3$  the equilibrium mixt. conts. 50%  $\tilde{\text{C}}$ ; with 1 mole  $\text{HCl}$  it conts. 75%  $\tilde{\text{C}}$ . Although the two compounds can easily be separated by careful fractional distillation (5) yet consideration must always be given to the possible formation during chem. reaction of the derivatives of the other isomer. The refractive index of mixts. of 1-chlorobutene-2 and 3-chlorobutene-1 is a linear function of the composition (1). Although *cis* and *trans* stereoisomers of  $\tilde{\text{C}}$  are possible, no record of their isolation has been published.

[For the prepn. of a mixt. of  $\tilde{\text{C}}$  + 3-chlorobutene-1 from butadiene-1,3 +  $\text{HCl}$  see (1) (7) (8) (9); for prepn. of  $\tilde{\text{C}}$  from crotonyl alcohol with  $\text{PCl}_3$  + pyridine see (3) (5), with  $\text{HCl}$  +  $\text{Cu}_2\text{Cl}_2$  see (1), with conc.  $\text{HCl}$  see (5) ]

$\tilde{\text{C}}$  passed over soda-lime in an iron furnace at 530-550° yields (11) butadiene-1,3. [Use in prepn. of 1,2,3,4-tetrabromobutane (11).]

[For study of reactivity of  $\tilde{\text{C}}$  with  $\text{KI}$  soln. at 20° or  $\text{NaOEt}$  soln. at 20° and 50° see (3); for reaction with  $\text{Mg}$ ,  $\text{Zn}$ , etc., see (12); for use in formn. of cellulose ethers see (13); for study of hydrolysis of  $\tilde{\text{C}}$  under various conditions see (16); for behavior of  $\tilde{\text{C}}$  with cuprous cyanide see (17) ]

— Crotonyl 3,5-dinitrobenzoate: cryst. from alc., m.p. 54° (9). [This cpd. has never been reported from  $\tilde{\text{C}}$  but only (cf., however (15)) from the corresp. bromide via reaction with silver 3,5-dinitrobenzoate in ether (9); it is possible that the material of m.p. 54° represents a mixt. of the two esters corresponding to crotonyl bromide and the isomeric 3-bromobutene-1 since from the former a 3,5-dinitrobenzoate, m.p. 51°, 50-51° (15), and from the latter a 3,5-dinitrobenzoate, m.p. 59°, have been reported (14).]

## 3:7212 CHLOROACETALDEHYDE

B.P. 85-86° (1)  
 85.0-85.5° cor. at 748 mm. (2)  
 84.5-85° at 759 mm. (3)

Colorless liq. with sharp and penetrating odor; vigorously attacks mucous membrane. —  $\bar{C}$  with aq. forms (2) a crystn. hemihydrate,  $\bar{C} \cdot \frac{1}{2}\text{H}_2\text{O}$ ; this does not have a sharp m.p. but about 43-50° begins to liquefy and on further htg. yields  $\bar{C}$ , whose vapor may be dried by passing over anhydr.  $\text{CuSO}_4$  (2) (3); this hemihydrate is sol. in aq. from which it may be recovered by evaporation in a stream of dry  $\text{CO}_2$ ; it is also sol. in alc. or ether, eesp. unchanged on evapn. of solvent (2) (for prepn. (60% yield) from glycerol  $\alpha$ -monochlorohydrin (3:9038) by oxidn. with  $\text{HIO}_4$  see (40)). —  $\bar{C}$  also forms (4) with EtOH a liq. chloroacetaldehyde ethylalcoholate (chloroacetaldehyde ethyl-hemi-acetal), but in excess alc. on protracted stdg. at room temp. (4) this is converted to chloroacetaldehyde diethylacetal (3:8228), or on treatment with dry HCl yields (4)  $\alpha,\beta$ -dichloroethyl ethyl ether (3:5640).

[For prepn. of  $\bar{C}$  from its crystn. trimer (3:2300) by distn. at ord. press. see (2) (5) (6); from chloroacetaldehyde diethylacetal (3:8228) by htg. at 150° in  $\text{CO}_2$  with anhydr. oxalic acid (2), AcOH (2), or dil.  $\text{H}_2\text{SO}_4$  (2) (7) see indic. refs.; from chloroacetaldehyde ethylalcoholate (see above) by htg. with anhydr. oxalic acid at 150° (90% yield) see (8) (note that the netn. of  $\text{Cl}_2$  on paraldhydo (1:0170) gives acc. to conditions either  $\bar{C}$  (9) or  $\alpha,\beta$ -trichloro-*n*-butyraldehyde (butylchloral) (3:5910) (10) (11)].

[For prepn. of  $\bar{C}$  from vinyl chloride (3:7010) with  $\text{Cl}_2$  + aq. in the dark at 35° see (12) (13) (14) (15); from methylene dichloride (3:5020) with formaldehyde +  $\text{SO}_2\text{Cl}_2$  at 300° with cat. see (16); from  $\alpha,\beta$ -dichloroethyl ethyl ether (3:5640) with conc.  $\text{H}_2\text{SO}_4$  see (17); from  $\alpha,\beta$ -dichloroethyl acetate on distn. with a little  $\text{ZnCl}_2$  (acetyl chloride also formed) (18) or from  $\alpha,\beta$ -dichloroethyl benzoate similarly (benzoyl chloride also being formed) (19) or from  $\alpha,\beta$ -dichloroethyl laurate (lauroyl chloride also being formed) (19) see indic. refs.]

[For formn. of  $\bar{C}$  from sodium  $\beta,\beta$ -dichloro- $\alpha$ -hydroxypropionate on boilg. with aq. see (20); from  $\beta$ -chloroethylidene-diurethane on warming with dil. HCl see (21); from acetaldehyde (1:0100) with ethyl hypochlorite followed by distn. with anhydr. oxalic acid see (22); from chloroacetaldehyde-sulfonic acid [Beil. I<sub>2</sub>-(818)] by treatment with steam in 60% H<sub>2</sub>SO<sub>4</sub> (23) or by htg. with 80% H<sub>2</sub>SO<sub>4</sub> (24) see indic. refs.]

$\bar{C}$  gives positive fuchsin-aldehyde test (1). —  $\bar{C}$  reduces NH<sub>4</sub>OH/AgNO<sub>3</sub> on warming (2).

$\bar{C}$  does not oxidize in the air (2) but is oxidized by conc. HNO<sub>3</sub> (2) (20) or by AgOH (20) or by dil. H<sub>2</sub>O<sub>2</sub> (25) to chloroacetic acid (3:1370). —  $\bar{C}$  on treatment as directed (26) with halogen magnesium alcoholate (e.g., EtOMgCl) is reduced to  $\beta$ -chloroethanol (3:5552).

$\bar{C}$  on stdg. in a. t. is rapidly converted to an amorphous polymer (2);  $\bar{C}$  (or its hemihydrate) on shaking with  $\frac{1}{2}$  vol. cold conc. H<sub>2</sub>SO<sub>4</sub> yields (1) a cryst. trimer, 2,4,6-tris-(chloromethyl)-trioxane-1,3,5 (3:2300), m.p. 87–87.5°, which on distn. at ord. press. depolymerizes to  $\bar{C}$ .

The hemihydrate of  $\bar{C}$  htd. alone or in pres. of a few drops of conc. H<sub>2</sub>SO<sub>4</sub> condenses with itself yielding (27) (28)  $\alpha,\gamma$ -dichlorocrotonaldehyde [Beil. I-731, I<sub>2</sub>-(789)].

[ $\bar{C}$  warmed with EtOH (4) or the ethylalcoholate of  $\bar{C}$  in EtOH treated with dry HCl gas (8) yields chloroacetaldehyde diethylacetal (3:8228), b.p. 157°, and in the latter case also (4)  $\alpha,\beta$ -dichloroethyl ethyl ether (3:5640).]

[ $\bar{C}$  with KCN yields (29) (7) an oily prod. (cyanohydrin?) which by hydrolysis with HCl gives  $\beta$ -chlorolactic acid [Beil. III-286, III<sub>1</sub>-(116), III<sub>2</sub>-(209)] + AcOH,  $\bar{C}$  + NaCN + BzCl yields (30)  $\alpha$ -benzoxy- $\beta$ -chlorolactonitrile; note, however, that  $\bar{C}$  boiled with aic. KCN yields (31) EtOAc, or with aq. KCN yields (31) AcOH.]

[For behavior of  $\bar{C}$  with AcCl (2), Ac<sub>2</sub>O (32), see indic. refs.;  $\bar{C}$  with ethyl diazoacetate yields (3) ethyl  $\gamma$ -chloroacetoacetate (3:6375);  $\bar{C}$  with EtMgBr in ether yields (6) 1-chloro-ethyl-2 (3:8025);  $\bar{C}$  with nitromethane as directed (33) yields 1-chloro-3-nitropropanol-2, with nitroethane, 1-chloro-3-nitrobutanol-2;  $\bar{C}$  with thioformamide (35) or  $\bar{C}$  + formamide + P<sub>2</sub>S<sub>5</sub> (34) yields thiazole [Beil. XXVII-15, XXVII<sub>1</sub>-(207)], m.p. 116°.]

— Chloroacetaldoxime: lachrymatory oil dec. on distn. at 10 mm. (36). [From  $\bar{C}$  with 4 moles NH<sub>2</sub>OH.HCl (36).]

Ⓐ Chloroacetaldehyde semicarbazone: ndls. from alc., m.p. 148° (37), 134–135° dec. (38), 134° (40). [From  $\bar{C}$  + semicarbazide hydrochloride + NaOAc (37).]

— Chloroacetaldehyde dimethone: unreported. [Note that  $\bar{C}$  with warm alc. soln. of "dimethone" ("dimegone") (dimethyldihydroresorcinol) not only condenses normally but also loses HCl yielding (39) same prod., m.p. 227° u c., 237.5° cor. (39), as obtd. from hydroxyacetaldehyde.]

85.4-85.6°	at 762 mm. (5)	-73.3° (9)	$D_4^{13.5} = 0.86989$ (10)
84.5°	at 759 mm. (28)		$n_D^{20} = 1.4058$ (5)
83.0-84.5°	at 744 mm. (6)		1.40520 (28)
51°	at 238 mm. (7)		1.4055 (7)
37-38°	at 150 mm. (8)		$n_D^{13.5} = 1.4082$ (10)

$\bar{C}$  with aq. forms binary const.-boilg. mixt., b.p. 76° (2);  $\bar{C}$  with aq. + *ter*-amyl alc. (1:6160) forms a ternary const.-boilg. mixt. (2).

[For prepn. of  $\bar{C}$  from *ter*-amyl alc. (1:6160) with HCl gas see (11); with conc. HCl (yield: 93-98% (12), 65% (13)) see (12) (13); with  $PCl_3$  (41% yield (6)) or  $PCl_3 + ZnCl_2$  (98% yield (14)) see (6) (14); with  $PCl_5$  (80% yield (14)) see (1) (14); with  $SOCl_2$  (yield: 99% (14), 41% (6)) see (14) (6); with *n*-octyl chloride see (6); with oxalyl chloride (3:5060) (yield 18% (6)) see (15) (6); with diphosgene (3:5515) see (16); with *p*-nitrobenzoyl chloride see (17).]

[For prepn. of  $\bar{C}$  from isopropyl-methyl-carbinol (2-methylbutanol-3) (1:6170) by

rearr. with conc.  $\text{HCl} + \text{ZnCl}_2$  (80% yield (7)), or with  $\text{HCl}$  on long stdg. (97% yield (7)), or with  $\text{PCl}_5$  (76% yield (7)), or with  $\text{SOCl}_2 + \text{pyridine}$  (73% yield (7)) see (7).]

[For prepn. of  $\bar{\text{C}}$  from trimethylethylene (2-methylbutene-2) (1:8220) by addn. of  $\text{HCl}$  see (18) (19) (20); from isopropylethylene (3-methylbutene-1) (1:8200) see (5).]

[For formn. of  $\bar{\text{C}}$  from 2-methylbutane (isopentane) (1:8500) by shaking 2 min. with diisobutylene hydrochloride (3:8113) +  $\text{AlCl}_3$  see (20).]

$\bar{\text{C}}$  very rapidly loses  $\text{HCl}$  by boilg. aq., e.g., 88.6% in 15 min., 94.9% in 30 min., 95.4% in 60 min. (7) Note that hydrolysis with *hot* aq. or aq.  $\text{Na}_2\text{CO}_3$  gives exclusively olefins (20) (6) but that with *cold* aq. or *cold* aq.  $\text{NaOH}$  some *ter*-amyl alc. (1:6160) is also formed (20), although the latter may result from hydration of the olefin. [For further studies of hydrolysis of  $\bar{\text{C}}$  see (2) (6) (20) (21) (22) ]

$\bar{\text{C}}$  on passing over  $\text{BaCl}_2 + \text{soda-lime}$  at  $350-400^\circ\text{C}$  gives (85% yield (5)) a mixture of trimethylethylene (2-methylbutene-2) (1:8220) + *unsym.*-ethyl-methyl-ethylene (2-methylbutene-1) (1:8210).

$\bar{\text{C}}$  with  $\text{Mg}$  in dry ether gives (yield: 73.6% (23), 38% (26))  $\text{RMgCl}$ ; this with  $\text{CO}_2$  gives (60% yield (13)) dimethyl-ethyl-acetic acid (1:1113) q.v. (see also derivatives below).

$\bar{\text{C}}$  with  $\text{Ag}$  3,5-dinitrobenzoate does not (21) yield expected *ter*-amyl 3,5-dinitrobenzoate

① Dimethyl-ethyl-acetanilide: m.p.  $90-91^\circ$  u.c. (25),  $92^\circ$  cor. (26),  $91.4^\circ$  (27). [From  $\text{RMgCl}$  + phenyl isocyanate (25) (26).] [Note that this same product results by rearr., however, from similar treatment of the  $\text{RMgCl}$  epds. from 3-chlor-2-methylbutane (3:7275) q.v.]

② Dimethyl-ethyl-acet-*p*-toluidide: m.p.  $83.0-83.5^\circ$  u.c. (25),  $83.3^\circ$  (27). [From  $\text{RMgCl}$  + *p*-tolyl isocyanate (25) ]

③ Dimethyl-ethyl-acet- $\alpha$ -naphthalide: m.p.  $137-138^\circ$  u.c. (25). [From  $\text{RMgCl}$  +  $\alpha$ -naphthyl isocyanate (25).]

### 3:7225 4-CHLOROBUTADIENE-1,2

$\text{C}_4\text{H}_7\text{Cl}$  Beil S.N. 12

B.P.  $88^\circ$  (1)

$\bar{\text{C}}$  represents the initial step in the formn. of 3-chlorobutadiene-1,3 ("Chloroprene") (3:7000) by addn. of aq.  $\text{HCl}$  (1) (2) to vinylacetylene; under certain conditions  $\bar{\text{C}}$  can

be isolated as the major reactn. product, but it readily undergoes isomerization to "Chloroprene" especially in the presence of certain salts, e.g.,  $\text{CuCl}$  (3). When sufficient  $\text{HCl}$  is present the reactn. proceeds further (1) with formn. of 2,4-dichlorobutene-2 (3:5550).

$\bar{\text{C}}$  shaken with 3 pts. 18%  $\text{HCl}$  contg.  $\text{CuCl}$  for 16 hrs. at  $20^\circ$  gives (4) (3) (2) butadiene-1,3 ("Chloroprene") (3:7080), the rest being chloroprene polymer. —  $\bar{\text{C}}$  with 3% dry  $\text{FeCl}_3$  spontaneously evolves heat and yields (4) chloroprene (3:7080).

$\bar{\text{C}}$  stirred with aq.  $\text{Na}_2\text{CO}_3$  at  $60-90^\circ$  for 15 hrs. gives (10) (50% yield (4)) 4-hydroxybutadiene-1,2, colorless lachrymatory, strongly vesicant liq. with sharp pungent odor, misc. aq. and org. solvents, b.p.  $126-128^\circ$  at 756 mm.,  $68-70^\circ$  at 53 mm.,  $D_4^{20} = 0.9164$ ,  $n_D^{20} = 1.4759$ . [This prod. on cat. hydrogenation gives (4) butanol-1 (1:6180) but is unaffected by refluxing with alc.  $\text{NaOEt}$ , 25% aq.  $\text{H}_2\text{SO}_4$ , or 2% aq.  $\text{HCl}$ ; for many other reactns. and derivatives see (4) (10).]

$\bar{\text{C}}$  in 50% alc. or in acetone with  $\text{NaI}$ , stood for 3 hrs. then diluted with aq., gives (46% yield (4)) 4-iodobutadiene-1,2, b.p.  $43-45^\circ$  at 38 mm.,  $D_4^{20} = 1.7129$ ,  $n_D^{20} = 1.5709$  (4), which on btg. at  $125-130^\circ$  polymerizes vigorously to iodoprene. —  $\bar{\text{C}}$  with alc.  $\text{NaCN}$  yields (5) 4-cyanobutadiene-1,3 ( $\beta$ -vinylacrylonitrile), b.p.  $135-138^\circ$  at 760 mm.,  $65-68^\circ$  at 58 mm.,  $48-50^\circ$  at 28 mm.,  $D_4^{20} = 0.8644$ ,  $n_D^{20} = 1.4580$  (5). —  $\bar{\text{C}}$  with liq.  $\text{NH}_3$  at  $-40$  to  $-50^\circ$  yields (6) (7) tris-(butadien-1,2,3-tri-4)amine (for extension to many other amines see (7)).

$\bar{\text{C}}$  added dropwise to 3 vols. conc.  $\text{H}_2\text{SO}_4$  at  $-5^\circ$  to  $+3^\circ$ , then poured onto ice, yields (1) 4-chlorobutanone-2 (3:7640), b.p.  $120-122^\circ$  at 760 mm. (1).

$\bar{\text{C}}$  with  $\text{Cl}_2$  yields (5) (9) mixt. of 2,3,4-trichlorobutene-1 (3:9064) and 1,2,4-trichlorobutene-2 (3:9062) which reacts further to produce 1,2,2,3,4-pentachlorobutane (3:9070).

$\bar{\text{C}}$  in aq.  $\text{Na}_2\text{CO}_3$  suspension, oxidized with  $\text{KMnO}_4$ , yields (1) chloroacetic acid (3:1370), but neither acetic acid nor oxalic acid. —  $\bar{\text{C}}$  in  $\text{CHCl}_3$  treated with  $\text{O}_2$  for 12 hrs. at  $0^\circ$ , then with aq., yields (1) formaldehyde (1:0145) and chloroacetaldehyde (3:7212) (the latter not detected directly but only after  $\text{KMnO}_4$  oxidn. (1) to chloroacetic acid (3:1370)).

3:7235  $\alpha$ -CHLORO-ISOBUTYRALDEHYDE  $\text{CH}_3$   $\text{C}_4\text{H}_7\text{OCl}$  Beil. I - 676  
 (2-Chloro-2-methylpropanal-1)

I<sub>1</sub>—  
 I<sub>2</sub>—

B.P. 90° (1) (2)

$D_4^{15} = 1.053$  (1) (2)

Colorless liq with piquant odor suggestive of chloral.

[For prepn. of  $\bar{C}$  from 2-methylpropanol-1 (isobutyl alc.) (1:6165) with  $\text{Cl}_2$  see (1) (2); from  $\alpha,\beta$ -dichloroisobutyl isobutyl ether (see below) by hfg. with aq. at 100° see (1) (2); from  $\alpha$ -chloroisobutyraldehyde diisobutylacetal (see below) with anhydrous oxalic acid (1:0535) or with  $\text{Ac}_2\text{O}$  (1:1015) on hfg. see (2);  $\bar{C}$  is not (2) formed by chlorination of isobutyraldehyde (1:0120).]

$\bar{C}$  reduces Tollens' reagent, Fehling's soln., or  $\text{KMnO}_4$  (1) (2);  $\bar{C}$  on oxidn. with alk.  $\text{KMnO}_4$  yields (2)  $\alpha$ -hydroxyisobutyric acid (1:0431), m.p. 79°.

$\bar{C}$  adds  $\text{NaHSO}_3$  yielding a compd. from which  $\bar{C}$  is regenerated with difficulty (1) (2).

$\bar{C}$  on shaking with conc.  $\text{H}_2\text{SO}_4$  (3/5 vol.) yields (1) (2) the corresp. trimer, viz., para- $\alpha$  chloro-isobutyraldehyde (2,4,6-tris-( $\alpha$ -chloroisopropyl)trioxane-1,3,5) (3:3220), m.p. 107° (1) (2).

[ $\bar{C}$  with isobutyl alc. (1:6165) treated with  $\text{HCl}$  gas gives (2)  $\alpha,\beta$ -dichloroisobutyl isobutyl ether, b.p. 192.5° at 760 mm., 83° at 15 mm.,  $D_4^{15} = 1.031$ ,  $n_D^{19} = 1.437$  (2), also obtd. from isobutyl alc. directly with  $\text{Cl}_2$  in the cold (2); note that this prod. with aq. on hfg. gives  $\bar{C}$  +  $\alpha$ -chloroisobutyraldehyde di-isobutylacetal, h.p. 218° at 760 mm., 102° at 15 mm.,  $D_4^{15} = 0.9355$ ,  $n_D^{17} = 1.428$  (2).]

[ $\bar{C}$  (or the above  $\alpha$ -chloroisobutyraldehyde di-isobutylacetal) with ethyl carbamate acid. with  $\text{HCl}$  gas gives (2)  $\alpha$ -chloroisobutyridene bis-urethane  $(\text{CH}_3)_2\text{C}(\text{Cl})\cdot\text{CH}(\text{NH}\cdot\text{COOC}_2\text{H}_5)_2$ , m.p. 122° (2).]

[For complex behavior of  $\bar{C}$  with  $\text{MeMgBr}$  see (3).]

—  $\alpha$ -Chloro-isobutyraldoxime: m.p. 96-97° (4). [Prepd. indirectly from isobutylene with amyl nitrite +  $\text{HCl}$  (4).]

[For prepn. of  $\bar{C}$  from isobutyric acid (1:1030) with  $PCl_3$  (81% yield (9)), with  $PCl_3$  (yield: 94% (6), 75% (2)) (8) (4), with  $PCl_3$  +  $ZnCl_2$  (92% yield (9)), with  $SOCl_2$  (yield: 90% (30), 75% (4) (5), 70% (10), 44% (9)), with benzoyl chloride (82-88% yield (13)), or with  $SiCl_4$  in xylene (52% yield (11)) see indic. refs.; for prepn. of  $\bar{C}$  from sodium isobutyrate with  $POCl_3$  see (1) (12).]

[ $\bar{C}$  with isobutyric acid (1:1030) (14) or  $\bar{C}$  with pyridine in ether (15) yields isobutyric anhydride (1:1110), b.p. 182.5°.]

[ $\bar{C}$  on passing over Ni at 420° dec. (15) into  $HCl$ ,  $CO$ ,  $CO_2$ ,  $H_2$ ,  $CH_4$  + propylene;  $\bar{C}$  +  $NH_3$  over  $Al_2O_3$  at 490-500° yields (17) isobutyronitrile, b.p. 108°.]

[ $\bar{C}$  with  $Et_3N$  in dry ether or lgr. at room temp. gives (18) 95% yield triethylamine hydrochloride + 57% yield dimethylketene dimer, cf. also (19) (20).]

[ $\bar{C}$  with  $Cl_2$  (31) in  $CCl_4$  gives (12) cf. (21) 60-70%  $\alpha$ -chloroisobutyryl chloride (3:5385) + 30-40%  $\beta$ -chloroisobutyryl chloride (3:9101);  $\bar{C}$  with  $SO_2Cl_2$  in pres. of dibenzoyl peroxide gives (22) 20%  $\alpha$ -chloroisobutyryl chloride (3:5385) + 80%  $\beta$ -chloroisobutyryl

see indicated refs.] [Note that  $\bar{C}$  cannot be prepd. from the corresp. alc., 2-methylbutanol-3 (1:6170) + HCl since only *ter*-amyl chloride (3:7220) results (11).]

[For formn. of  $\bar{C}$  from either 2-methylbutene-1 (1:8210) or 2-methylbutene-2 (1:8220) at  $-80^\circ$  in presence of  $AlCl_3$  see (7); from isoamyl alcohol (1:6200) + HCl over  $Al_2O_3$  at  $430^\circ$  see (8); from isoamyl chloride (3:7365) over  $ThCl_4$  or  $BaCl_2$  at  $250^\circ$ , finally over pumice at  $200^\circ$ , see (9); from 2-methylbutane (1:8500) +  $Cl_2$  see (10) (1).]

[For study of reactn. of  $\bar{C}$  with Na see (12) (13).]

$\bar{C}$  with Mg in dry ether yields (1) (2) corresponding R.Mg.Cl whose treatment with dry  $O_2$  followed by hydrolysis yields (1) (2) 2-methylbutanol-3 (1:6170); [3,5-dinitrobenzoate, cryst. from dil. MeOH (1) or dil. EtOH (2), m.p.  $76^\circ$  (1) (2); *N*-( $\alpha$ -naphthyl)-carbamate, cryst. from pct. eth., m.p.  $111-112^\circ$  (2) (1).] — This R.Mg.Cl should also react according to method of (11) with phenyl isocyanate to yield isopropyl-methyl-acetanilide, m.p.  $78.4^\circ$  (14),  $75^\circ$  (15), although the execution of this reactn. is not recorded.

$\bar{C}$  with excess  $N/10$   $AgNO_3$  is practically completely hydrolyzed in 60 hrs. (2) [dif. from isoamyl chloride (3:7365) which reacts only to extent of 3-4%].

### 3:7280 2-CHLOROPENTENE-1

B.P.  $95-97^\circ$  (1)

The structure of this material is inadequately supported; the prod. may very possibly be identical with 2-chloropentene-2 (3:7285) q.v.

[For prepn. of  $\bar{C}$  from 2,2-dichloropentane (3:7755) with alc. KOH see (1).]

$\bar{C}$  on further treatment with alc. KOH yields (1) pentyne-1 (1:8025), b.p.  $39.7^\circ$ .

3:7280 (1) Bruylants, *Ber.* 8, 411 (1875).

### 3:7285 2-CHLOROPENTENE-2

B.P.  $95-97^\circ$  (1)

$D_4^{24} = 0.903$  (2)

$n_D^{24} = 1.421$  (2)

$88-89^\circ$  at 760 mm. (2)

$45^\circ$  at 130 mm. (2)

Two geom. stereoisomers of  $\bar{C}$  are possible but as yet unrecognized.

[For prepn. of  $\bar{C}$  from 2,2-dichloropentane (3:7755) with boilg. 10% alc. KOH see (1); from pentanone-2 (1:5415) with  $PCl_5$  see (2).]

$\bar{C}$  with conc.  $H_2SO_4$  followed by aq. yields (1) methyl-*n*-propyl ketone (pentanone-2 (1:5415), b.p.  $102^\circ$ ).

[ $\bar{C}$  with  $NaNH_2$  in xylene at  $130^\circ$  followed by ice water gives (3) pentyne-1 (1:8025).]

$\bar{C}$  on oxidn. with  $KMnO_4$  yields (1) propionic acid (1:1025) + AcOH (1:1010).

3: 7290 3-CHLORO-2-METHYLBUTADIENE-1,3  $C_5H_7Cl$  Beil S.N. 12  
(2-Chloro-3-methylbutadiene-1,3;  
"β-Chloroisoprene")

B.P. 93° at 760 mm. (1)

$D_4^{20} = 0.9593$  (1)

$n_D^{20} = 1.4689$  (1)

41° at 113 mm. (1) (2)

37° at 105 mm. (1)

[For prepn. of  $\bar{C}$  (40% yield (1)) from 2-methylbutene-1-yne-3 by treatment as specified (1) with  $HCl + Cu_2Cl_2 + NH_4Cl$  see (1) (2) (10); for prepn. (60% yield (3) (4)) from 2,3,3-trichloro-2-methylbutane (3:4755) with quinoline (2 moles) at 140-225° see (3) (4).]

$\bar{C}$  readily polymerizes; for details see (1) (2). [For prepn. of plastic polymers from  $\bar{C}$  see (5).]

$\bar{C}$  htd. in s.t. 16 hrs. at 160° with  $SO_2$  in ord. (not dry) ether yields (6) (7) (10) by 1,4-addition a compd. designated (6) (7) as 1,1-dioxo-3-chloro-4-methylthiascyclopentene-3, ndls. from aq. (7) or alc. (6), m.p. 120.0-120.5° (6) (7). [For extensive study of this prod. see (7).] [The corresponding selenium analog, in very poor (2%) yield from  $\bar{C} + SeO_2$  in  $CHCl_3$  (8), has m.p. 110° dec. (8).]

$\bar{C}$  (1 g.) with 1,4-naphthoquinone (1:9040) htd. at 100° for  $\frac{1}{2}$  hr. gives (1) on cooling 2-chloro-3-methyltetrahydroanthraquinone, white ndls. from acetone, m.p. 165-166° u.c. (1); this prod. on suspension in dil. alc. NaOH and oxidn. of the blue soln. with air until yel., followed by dilution with aq., gives (1) 2-chloro-3-methylanthraquinone, cryst. from AcOH, m.p. 214-215° u.c. (1), 215° u.c. (9).
